CLOPÆDIA OF INDIA

AND OF

STERN AND SOUTHERN ASIA,

Commercial, Industrial and Scientific:

PRODUCTS OF THE
INERAL, VEGETABLE AND ANIMAL KINGDOMS,
USEFUL ARTS AND MANUFACTURES;

EDITED BY

EDWARD BALFOUR, L. R. C. S. E.,

NSPECTOR GENERAL OF HOSPITALS, MADRAS MEDICAL DEPARTMENT,
FELLOW OF THE UNIVERSITY OF MADRAS,
RESPONDING MEMBER OF THE IMPERIAL GEOLOGICAL INSTITUTE, VIENNA

SECOND EDITION.

VOL. V.

MADRAS:
PRINTED AT THE LAWRENCE AND ADELPHI PRESSES,
1873.

Copyright.

S

S, the 19th letter of the English language, is a sibilant consonant, and has a hissing sound. It has two uses, one generally at the beginning or end of words, to pronounce a mere hissing as in sabbath, sack, sin, &c.—the other a vocal hissing, precisely like that of *z*, as in muse, music, wise, but its sound in the middle and end of words can only be learned by practice. In a few words it is silent as in isle, viscount. The simple sibilant of Europe occurs in Arabic, Sanscrit and in all Indian alphabets. The palatal S of the Nagari alphabet, in use in words of Sanscrit origin, is commonly pronounced *s*, *sh* somewhat softened. The Arabic alphabet has two letters to which in India is given the sound of *s*. One of these called in India sad swad, has, amongst the Arabs, the sound of d or dhad, the other Arabic letter is called Arabia, say or thay, but in India it has only e sibilant sound of *s*. The Persian letter , has the simple sound of the English letter The Nagari letter *sh*, has the sound of *sh* the English alphabet. On the Western stricts of British India, and along the line the Indus river the letters *h* and *s* are inrchangeable, so that Sind becomes Hind, d sing'h a lion, is changed into hing, garlic.

SA, THIBETAN, Salt.

SAAD KOFI, HIND. Cyperus longus, C. otundus, &c.

SAADI, a poet of the Persians. He lived bove an hundred years, and died in A.D. 1292. afiz, another Persian poet, died in 791, of he Hijerah, or A. D. 1388, not 1340, as, rough some mistake, Kæmpfer and others ve calculated.—*Amæn.*, *Exot.*, *p.* 370 ; *seley's Travels*, *Vol.* ii, *p.* 3.

SAAR, LEPCHI. Himalayan larch.

SAB, ARAB. Cyperus hexastachyus, *Rottl.*

SABA, an ancient town in the district of alad-ul-Jahaf, in Yemen, and the capital of e ancient Sabeans, and to this day the disrict is termed Urd-es-Shaba—or, "land of heba." It is doubtless identical with the ealm whence the Queen of the East came, ho undertook a pilgrimage to Jerusalem to isit Solomon. Mareb, the present capital the district, is built on the site of the ient Saba. It contains about three hun- small houses and several ruins, which are attributed to Queen Balkees. A dyke or dam of masonry Sail-el-Arim or Sedd Mareb, famous in Arab history, was drawn across the valley, between two hills called Balak, six hundred paces asunder. The Haram Balkees, the palace of the Queen of Sheba, is west of the town of Mareb. About one-fourth of the wall is still standing and covered with Himyaritic inscriptions. The ancient residence of the Queen of Sheba, which formed the city, is about a mile and a half in diameter. At the time of the Periplus of the Erythrean Sea, the Sabeans monopolized the commerce of India, and acted as intermediate agents between the merchants of India and Egypt. In the reign of Ptolemy Phileter (A. D. 177) the Greek sovereigns in Egypt had not traded directly to India, but imported their Indian commodities through Saba, the capital of Arabia Felix. The port of Berenice was not used for that commerce, but Myos Hormos or Arsenoe was still the emporium, and the only trade down the coast of Africa, was for elephant's teeth. The trade to the East had been monopolized by the merchants of Sabæa, from the patriarchal days of Job. The period at which the kingdom of Saba or Hamyar flourished, was the golden age of Arabic poetry. The religion of the Hamyarites, in their devotion, was directed to a multitude of deities of which the principal were represented by the sun, moon and planets. Saba, surnamed Heber, was the father of Kahtan (Joqtan), father of Yoorab, father of Yahsab, father of Abd-us-Shams. Abul Feda ascribes the construction of the Mareb-dam to Abd-us-Shams, but other historians ascribe it to Loqman, king of that remnant of the Adites who renounced idolatry on the preaching of the prophet Hud, and who are usually styled the second Adites. Saba, was also a name applied to Abid-us-Shams, founder of Mariaba. Amongst his sons were Hamyar, Amru, Kablan and Ashaar.—*Playfair's Aden* ; *Early Christianity*. See Abid-us-Shams, Mareb.

SABA, said to signify a host, particularly the host of heaven, or the celestial bodies, in the adoration of which the Sabæan ritual is believed to have consisted ; the celestial bodies, the planets and constellations were personified in the Genii of Good and Evil.

Sabæism, was formally re-introduced in Kuseem, by Darim, about the year 1200, and prevailed till the Wahabi revival. In the Vedic Sabæanism only the elemental powers are invoked. Sabean worship, once extensively previled in South America. There is a curious passage in Tavernier concerning the aversion of the Sabæans to blue ; and there exists a similar antipathy among the Kurdish sect of the Yezidi (who appear to have been once christians) for that colour, grounded on a different, although not less absurd reason. Tavernier makes mention of another peculiarity of the Sabæans and calls it the ceremony of the fowl, which their priests alone have the right to kill ; but he does not explain in what this ceremony consists, so that we cannot now judge whether it has any connexion with a custom prevalent among the Gurani tribe of the Zagros chain, between Kermanshah and Zohab. The Gurani, are all of the Ali-Ilahi sect, or believers in the divinity of Ali (the cousin and son-in-law of Muhammed), and they have a yearly festival, which they call the feast of the fowl. In every village, each head of a family brings a fowl to their sheikh or priest. When the contribution is collected, and the fowls killed and cleaned, they are thrown into a large kettle and boiled. So soon as they are ready, the people assemble ; a cloth is thrown over the kettle, which is placed before the priest, who dips his hand into it, and, taking it out piecemeal, presents a morsel to each person present in rotation. The individual to whose share falls the head of the fowl, is supposed to be more favoured than the rest by Ali, during the course of the year. It is supposed that the Ali-Ilahi are of Jewish extraction, and this ceremony of the fowl may proceed from the Rabbinical custom of sacrificing a cock once a year on the eve of the day of atonement, although nowhere countenanced by the law of Moses. On the eve of the day of atonement, in order to make atonement, a cock is taken for a man, and a hen for a woman ; and for a pregnant woman, a hen and also a cock, on account of the child. The father of the family makes the atonement for himself ; for the high priest first atoned for himself, then for his family, and afterwards for all Israel. He takes the cock in his hand, and says these verses : 'The children of men that sit in darkness and the shadow of death, being bound in affliction and iron, he brought them out of darkness and the shadow of death, and broke their bonds in sunder. Fools, because of their transgression and because of their iniquities, are afflicted. Their soul abhorreth all manner of meat ; and they draw near unto the gates of death. Then they cry unto the Lord in their trouble, and he saveth them out of their distresses. He sendeth his word, and healeth them, and delivereth them from their destruction. Oh, that men would praise the Lord for his goodness, and for his wonderful works to the children of men.' (Psalm, cvii.) 'Le there be for him an angel, an intercessor, one, among a thousand, to show unto man his uprightness ; then he is gracious unto him and saith, Deliver him from going down to the pit ; I have found a ransom.' (Job. xxxii, 23.) Whilst moving the atonement round his head, he says : 'This is my substitute, this is my commutation, this is my atonement. This cock goeth to death ; but may I be gathered and enter into a long and happy life, and into peace.' He then begins again at the words, 'The children of men,' and so he does three times. Then follow the various alterations that are to be made when the atonement is for a woman, or another person, &c. Then is added : 'As soon as one has performed the order of the atonement he should lay the hands on it, as the hands used to be laid [illegible] the sacrifices, and immediately after give [illegible] to be slaughtered'. This similarity of custom between the Jews and the Ali-Ilahi expl[illegible] why the latter offer the figure of a coc[illegible] the shrine of their holy men. Baron de B[illegible], found several of these cocks, some carv[illegible] wood, others made of porcelain, placed o[illegible] top of the tombs of their several Pir in [illegible] mountainous districts of Holivan and Zoh[illegible] among the Gurani tribes.—*Palgrave* ; *Bar*[illegible] *C. A. De Bode's Travels in Luristan a*[illegible] *Arabistan, Vol.* ii, *pp.* 177—184 ; *Taylo*[illegible] *Chatfield, Hindoostan, p.* 145 ; *Sale's Pr*[illegible] *lim. Disc. Koran, Vol.* i, *p.* xx ; *Hyde* *Rel. Vet. Persar, Chaps.* iii *and* v. S[illegible] Chaldea, Karund, Kibla.

SABAB, a mountain of Siam, near whi[illegible] and on the frontiers of the Xong tribes, precious stones consisting of rock crystal, cat's eyes, topazes, garnets, sapphires and rubies are found, which are sold at from 16 to 6[illegible] francs the pound.

SABADILLA, fruit of Veratrum sabadilla, of Asagræa officinalis, and several oth[illegible] Melanthaceæ, *Ben. Phar.*

SABAGRÆ, according to Orosius, [illegible] people who made their submission to Alexander the Great, during his halt at the confluence of the Panjab rivers. According [illegible] Curtius they were called Sambracæ or Sab[illegible]cæ ; and according to Diodorus, who plac[illegible] them to the east of the river, Sambast[illegible]. They were a powerful nation, second to no[illegible] in India for courage and numbers. The[illegible] forces consisted of 60,000 foot, 6,000 hor[illegible] and 500 chariots. The military reputatio[illegible] he clan suggests to General Cunningham the robability that the Greek name may be lescriptive of their warlike character, just as Yaudheya means "warrior or soldier." He hinks therefore that the true Greek name nay have been Sambagræ, for the Sanskrit amvagri, that is, the "united warriors," or υνμωαχοι, which, as they were formed of hree allied tribes, would have been an apropriate appellation. In support of this urmise, he mentions that the country of which Bikaner is now the capital was origally called Bagar-des, or the land of the Bagri or "warriors," whose leader was Bagri Rao. The word Bhati also means "warrior or soldier," and thus at the present day, the tribes calling themselves "warriors," form a large proportion of the population in the countries to the east of the Sutlej; namely, the Johiya or Yaudheya along the river, the Bagri in Bikanor, and the Bhati in Jesalmer. All three are of acknowledged mar descent. He thinks it possible that name Sambagri might have been applied these three clans, and not to the three es of the Yaudheya, but he thinks, that Yaudheya have a superior claim, both on unt of their undoubted antiquity. To he attributes the foundation of the town Ajudhan, or Ayodhanam, the "battle-' which is evidently connected with their name of Yaudheya, or Ajudheya, the arriors," and he thinks the latter form of name is most probably preserved in the sadii of Arrian, a free people who tendered ir allegiance to Alexander at the conflu-ce of the Panjab rivers.—*Cunningham's ncient Geog. of India*, p. 246.

SABAKTAGIN, father of Mahmud, the aznavi, died in 997. His name is also itten Sabaqtagin. He ruled from A. D. 976 l A. D. 997. He was a Turk, purchased by laptagin, whom he succeeded in Affghanis-n, Ghazni and Candahar. He twice defeated aipal, whom he drove to the banks of the idus. He was succeeded by his son Ismael, it Ismael after a few months was put aside Mahmud. Sabaqtagin, established an inpendent dominion over all the southern parts Affghanistan, making Ghazni his capital. s son Mahmud, who died A. D. 1028, enned Affghanistan with the spoils of India. the reign of the cruel Bahram, one of the artar's descendants, the Sabaktagin dynasty re deprived of all but the Panjab, and this , in A. D. 1160, they lost. See Affghanis-ı, Gour, Ismael Samani, Mahmud.

SA-BA-LEN, BURM. Andropogon citra-n, also Andropogon schænanthus, *Linn.*

SABALIA in Guzerat, a low caste, emed in tending cattle.

SABAO, PORT. Soap.

SABARÆ. The Sabaræ of Ptolemy, are the Suari of Pliny, and both may be identified with the aboriginal Savara or Suari, now a wild race of wood-cutters who live in the mountainous parts of the north-eastern districts of Peninsular India. The Savari or Saharia of the Gwalior territory occupy the jungle on the Kota frontier to the westward of Marwar and Guna.—*Cunningham's Ancient Geog. of India*, p. 509. See Suar, Chensuar.

SABARMATI, a river of Cambay.

SABATHU, in lat. 30° 51', long. 76° 58', a military station, a few miles N. E. of Simla. The cantonment is 4,205 ft., and the fort is 4,283 ft. above the sea, *Ger.*

SABBA JAYA, HIND. Canna indica, *Linn.*

SAB-CHEER, BENG. Spilornis cheela, *Daud.*

SABEE, a river near Fattehbad in Ajmir, and runs near Janth in Palondie.

SABERMATY, see Kalmuck, Sabarmati.

SUBERNARIKA, a river that separates Bengal from Orissa, and opens into the Bay of Bengal.

SABHA, SANS. A committee, an assembly.

SABHA-MANDAP, HIND. A portico, or an erection in front of a hindoo temple where people assemble: the open space of a temple in front of the apartment of the idol: an audience hall, an assembly room.

SABI, the christians of St. John, the Mendai Yahia, called Sabi, by the Persians. It is not known whether these be the Sabeans alluded to in Scripture, (Joel iii, 8), who, in the times of Abraham, worshipped the host of heaven. They believe in the divinity of our Saviour and the Holy Trinity. They recognize John the Baptist as their Great Prophet, and call him Paighambar Yahanna, hence their name, Christians of St. John. They dwell principally at Shuster and Dizful. —*Chesney.* See Saba, Sibi.

SABLE.

Zibelline,	FR., IT.	Sobol,	RUS.
Zobel,	GER.		

One of the weasels, Mustela zibellina, a native of Northern Europe and Siberia, with a fine fur, the hairs of which turn with equal ease in every direction. Its colour is generallly of a deep glossy brown or black, and sometimes, though very rarely, yellow and white. —*Faulkner*; *Bingley*; *McCulloch.*

SABLE FISH.

Willum mutchie,	DUK.	Willum meen,	TAM.

A species of Clupea.

SABO FRANGI, MALAY. Cucumis melo.

SABOON, ARAB, GUZ., HIND., MALAY., also Sujah, MALAY. Soap.

SABQTA-SINDHU, see Hindoo.

SABR or Sibr, AR. Aloe litoralis, *Kœnig.* Aloes.

SABRE-PODDED CANAVALIA, ENG. Canavalia gladiata.—*D. Cand.* ; *Roxb.* ; *W. & A.*

SUBTANG. The Bashee islands consist of a chain, in the Eastern Archipelago mostly high, lying north of the Babuyan islands, from lat. 19° 58′ N. to long. 21° 13′ N. Their names are

Balintang or Richmond	L. 19° 58′,	L. 122° 14′
Batan or Dampier's Grafton...	20 17¼,	121 57
Sabtang or Sabtan, Monmouth Island of Dampier.		
Bashee Island, Bayat, or Orange Island.		

The north Bashee islands consist of one large and two small islands in lat. 21° 3½′ N.—*Horsburgh, Directory.*

SABU-DANA, HIND. Sago, qu. Sagu-dana.

SABUN, HIND. Soap.

SABUNI, HIND. A kind of emerald.

SABUNI, BENG., HIND. Trianthema obcordata, also Asparagus racemosus.

SABURKAN or Shaburkan, a city of Guzjan, west of Balkh, the Shibbergan and Shubergan of the maps of Europe.

SABU-THA-BEY, BURM., is one of the largest trees of Burmah. Fruit, size of a small peach, red, very many seeds, hanging in clusters from the trunk.—*Malcom*, i, 179.

SABUVI, BENG. Trianthema obcordata, *Roxb.*, properly Sabuni.

SABZ or Sabz rang, HIND., PERS. Green.

SABZA, HIND. Emerald.

SABZAK, HIND. The green fly-catcher.

SABZI, HIND. A variety of rice, also Cannabis sativa.

SABZ-MITTI, HIND. An earth used to wash the hair.

SACÆ. The Saka of the hindoos cannot be other than the Sacæ or Sakai of classical geography. They are perpetually named in various works, and seem to have been known on the borders of India or in its western districts in the first century preceding christianity. Vikramaditya, king of Ougein, known as Sakari, or enemy of the Sacæ, his era dates B. C. 56, and it should appear that about this date, some northern tribes had settled themselves along the Indus, constituting the Indo-Scythi of Arrian. Their attempt to penetrate further to the east, by way of Kandesh and Malwa, was not improbably arrested by Vikramaditya, whence the epithet Sakari. The Sacæ are supposed by Professor Lassen to be the Szu Tartar who were expelled about 150 B. C. from the Ili valley by the Yuet-chi or White Huns, whom he supposes to be the Tochari. After occupying Tahia or Soghdiana for a time, they are further stated by the Chinese to have been driven thence also by the Yeugar some years afterwards, and to have established themselves in Kipen, in which name Lassen recognises the Kophen valley in Kabulistan. Other stranger races, however, seem to have come from the N. W. into India. One of these ones, the Yavana, is, in modern times, applied by the hindoos of Northern India to mahomedans of every description, but in works prior to the mahomedan era, some other people must have been intended. The interpretation of the word by Sir W. Jones is, Ionian or Asiatic Greek, and there are some considerations in its favour, although the chief argument in its behalf is the difficulty of attaching it to any other people. The mountaineers, or Kirata may have come from any part of India. They are known in classical geography as the Cirrhadæ or the Cirrodes, the latter in Soghdiana, near the Oxus. The Kamboja are the people of the Arachosia, or north-eastern province of Persia. For the sites of the Bahika, we are indebted to the Mahabharat, and the Parasika speak for themselves. A branch of the Sacæ, on one occasion invaded the inhabitants on the borders of the Pontic sea : whilst engaged in dividing the booty, the Persian generals surprised them at night, and exterminated them. To eternize the remembrance of this event, the Persians heaped up the earth round a rock in the plain where the battle was fought, on which they erected two temples, one to the goddess Anaitis, the other to the divinities, Omanus and Anandate, and then founded the annual festival called Sacæa, still celebrated by the possessors of Zela. Such is the account by some authors of the origin of Sacæa. According to others it dates from the reign of Cyrus only. This prince, they say, having carried the war into the country of the Sacæ (Massagetæ of Herodotus) lost a battle. Compelled to fall back on his magazines, abundantly stored with provisions, but especially wine, and having halted some time to refresh his army, he departed before the enemy, feigning a flight, and leaving his camp standing full of provisions. The Sacæ, who pursued, reaching the abandoned camp stored with provisions, gave themselves up to debauch. Cyrus returned and surprised the inebriated and senseless barbarians. Some, buried in profound sleep, were easily massacred ; others occupied in drinking and dancing, without defence, fell into the hands of armed foes ; so that all perished. The conqueror, attributing his success to divine protection, consecrated this day to the goddess honoured in his country, and decreed it should be called the day of the Sacæa. This is the battle related by Herodotus, to which Strabo alludes, between the Persian monarch and Tomyris queen of the Getæ. Amongst the Rajput Sachæ, all grand battles attended with fatal results are termed Saca. When besieged, without hope of relief, in the last effort of despair, the women and girls are immolated, and the warriors, decorated in saffron robes, rush on inevitable destruction. This is to perform saca, where every branch (sacha) is cut off. Cheetore has to boast of having thrice (and a half) suffered saca. Cheetore sac'ha ka pap, 'by the sin of the sack of Cheetore,' is the most solemn adjuration of the Gehlote Rajput. If such is the origin of the festival from the slaughter of the Sacæ of Tomyris, it will be allowed to strengthen the analogy between the Sacæ, east and west of the Indus. Sacæ, Gete, Aswa, and Takshac, are names which have crept in amongst the thirty-six royal Rajput races, common with others also to early civilization in Europe, and there is ancient authority on their original abodes. Strabo says: "All the tribes east of the Caspian are called Scythic. The Dahæ next the sea, the Massagetæ (great Gete) and Sacæ more eastward; but every tribe has a particular name. All are nomadic, but of these nomades the best known are the Asi, the Pasiani, Tachari, Saccaranli, who took Bactria from the Greeks. The Sacæ ('races') have made in Asia irruptions similar to those of the Cimmerians; thus they have been seen to possess themselves of Bactria, and the best district of Armenia, called after them Sacasenæ." Which of the tribes of Rajasthan are the offspring of the Aswa and Mede, of hindoo race, returned under new appellations, Col. Tod says, we shall not now stop to enquire, limiting our hypothesis to the fact of invasions, and adducing some evidence of such [illegible] simultaneous with migrations of the same bands into Europe. Hence the inference of a common origin between the Rajpoot and early races of Europe; to support which, a similar mythology, martial manners and poetry, language, and even music and architectural ornaments, may be adduced. Of the first migrations of the Indu-Scythic Gete, Takshac, and Asi, into India, that of Sehesnag, (Takshac), from Sehesnagdes (Techaristhan?) or Sehesnag, six centuries, by calculation, before Christ, is the first noticed by the Puranas. About this period a grand irruption of the same races conquered Asia Minor, and eventually Scandinavia; and not long after the Asi and Tachari overturned the Greek kingdom of Bactria, the Romans felt the power of the Asi, the Catti, and Cimbri, from the Baltic shore. The Asia and Tachari, are the Aswa and Takshac, or Toorshka races, of the Puranas, of Saca-Dwipa. C'est vraisemblablement d' apres le nom de Tachari, que M. D'Auville aura cru devoir placer les tribus ainsi denommees dans le territoire qui s' appele aujourdhui Tokaris-t'han, situe, dit ce grand geographe, entre les montagnes et le Gihon ou Amou. Bryant gives the following as a passage from Chærilius in the history of the Sacæan Cuthites, of whose ancestry he speaks with great honor in describing the expedition of Alexander the Great:

> Next march'd the Sacæ, fond of pastoral life
> Sprung from the Cuthite nomades, who liv'd
> Amid the plains of Asia, rich in grain
> They from the shepherd race derived their source
> Those shepherds who in ancient times were deemed
> The justest of mankind.—*Ind. Inf.*, *p.* 16.

A tribe bearing the name of Sacæ is still found in Jhalawan. It is supposed that they are the descendants of the Sacæ from between the Paropamisan mountains and the Sea of Aral who accompanied Alexander, and returning with Craterus through the Moolla pass, settled in their present position. Tod states that Sacæ in Sanscrit has the aspirate, Sac'hæ: meaning literally, the 'branches' or races. The Saca of Indian history, however, are undoubtedly the Sacæ races of Central Asia. The captive Israelites, the Sacæ, the Getæ or Gothi became blended together in some of their migrations. The Sacæ are placed by Ptolemy beside the Massagetæ, and the Sacæ and Scythians were always confounded together.—*Hind. Theat.*, *Vol.* ii, *p.* 179; *Tod's Rajasthan*, *Vol.* i, *p.* 70; *quoting Strabo*, *lib.* xi, *p.* 254; *Indian Infanticide*, *p.* 16. See Arian, Bactria, Hindoo, Kabul, Kelat, Kurmsaq, Viswamitra. *Note* 3, li, v, xi, p. 254, Strabon.

SACA-DWIPA, Scythia. The Puranas of the hindoos describe Saca-dwipa or Scythia. Diodorus, (lib. ii,) makes the Hemodus the boundary between Saca-Scythia, and India Proper. See Scythes, Scythia.

SACAM, or the white island, mentioned in the Puranas, is England. It is mentioned in the Varaha Purana as in possession of the Sakæ.—*Wilford.*

SACAMBARI, or Sacambhari, a goddess, the tutelary divinity of the Chouhon tribes, whose statue is in the middle of a lake. Colonel Tod derives Sacambhari from sacam, the plural of sachæ, 'branch or race,' and ambhar, 'covering, protecting.' The invocatiom is Om! Sacambari Mata! Om!—*Tod's Rajasthan*, *Vol.* i, *p.* 95.

SACASENÆ, the ancestors of the Saxon race. They dwelt in Armenia on the confines of Albania. La Sacasene, says a French author "etoit une contree de l' Armenie sur les confins de l' Albanie ou du Shirvan." (*Note*

—4, tome i, p. 191, Strabon.) It might not be unworthy of research to inquire whether the Kimbri, the Jut or Gete, the Sacasenæ, the Catti of the Elbe and Cimbric Chersonese, and the ancient Briton, did not bring their terms with their bards and vates (the Bhat and Bardai) from the highland of Scythia east of the Caspian, which originated the nations common to both, improved beyond the Wolga and the Indus.—*Turner's History of the Anglo-Saxons* ; *Hallam, Vol.* i ; *Tod's Rajasthan, Vol.* i, *p.* 164.

SACARE, a weight of 20 grains used in Madagascar.—*Simmond's Dict.*

SACATAI, Scythia. See Scythes, Scythia.

SACCALIUS INDICUS, see Canis.

SACCHARUM, a genus of plants of the natural order Panicaceæ and section Sacchareæ. There are many species of the genus, all growing in warm countries. Five species growing in Burmah, viz., the Ka-ing ; Kyan-mai ; La-man-myeet ; Kyan-men ; Boung kyan ; and Htee-po-ka-hsan-hsa, but have not been specifically determined. Griffith collected nearly one hundred different grasses in the Tenasserim provinces. Species of Saccharum, S. sara and S. spontaneum, are used for thatching, forming chair bottoms, and yield writing pens and arrows. Saccharum officinarum is the sugar-cane, from which is produced a large quantity of the sugar used by man. It is a native of the south and west of Asia, and was introduced by the Saracens into the south of Europe. It has several varieties, of which one is the

S. commune or Native Cane of West Indies.
β purpureum, Kajooli, BENG.
α giganteum, Kulloon, „
δ tahitense, Otaheite cane.

Two other species yielding sugar are also admitted, viz. :—

S. violcaeum, *Tussac*, said to be identical with the Otaheite cane.
S. sinense, *Roxb.*, cultivated in China.

The known species may be thus enumerated :

S. canaliculatum, *Roxb.*, of Bengal.
S. cylindricum ? Ajmir.
S. fuscum, *Roxb.*, „
S. munja, *Roxb.*, Hindustan, Sind.
S. officinarum, *Linn.*, E. Indies, China, W. Indies, Africa.
S. procerum, *Roxb.*, Bengal.
S. sara, *Roxb.*, Bengal.
S. semidecumbens, *Roxb.*, Bengal.
S. sinense, *Roxb.*, China, India.
S. spontaneum, *Linn.*, S. Asia.
S. violaceum, *Tussac*, Polynesia.

SACCHARUM CYLINDRICUM, *Roxb.*; *Hogg.* ; *Voigt.*

Saguerus cylindrica.

Horse's tail grass.		Oola,	HIND.

Grows on the Ajmere plains and flowers early in the rains.—*Genl. Med. Top.*, p. 174.

SACCHARUM FUSCUM, *Roxb.*

Khori,	BENG.	Ishwalika,	SANS.
Pati kori,	„	Kandu rellu gaddi,	TEL.

Grows in Bengal. Natives make their pens of its culms, and also use it for screens and light fences. The best dark-coloured reeds with which the natives write, are made from this species.—*Voigt.*

SACCHARUM MUNJA, *Roxb.*

Sur-pata,	HIND.	Sirki,	SIND.
Surr,	SIND.	Ponika: Munja gaddi,	TEL.

This grass grows throughout India, but in the Panjab it covers immense tracts of inundated lands, and forms the chief difficulty of the agriculturist, as it rapidly encroaches on the cultivation. The ropes made from its from the sheathing petiole, are possessed of great tenacity and used as rigging in all the vessels above Sukkur, also as tow-ropes, for tying up cattle and for tying on the buckets of persian wells. The twine made from it is used for the bottoms of bedsteads. The plant grows at Benares and in Northern Circars, is common at Ajmir, in the valleys, and very abundant, along with the Saccharum procerum, near Jeypore. The best moonj rope is made from the floral leaves of this plant, and the best sirkee rope from the culms. The plant is distinguished from Saccharum procerum by its height, which is inferior, the fineness of the culm and narrowness of the leaves. The Saccharum munja ropes are used in Bengal for tying up cattle and drawing water. With the boatmen of the Indus below Sukkur, coir rope is very generally employed, being better able, it is believed, to stand the action of salt-water. Two-inch ropes, often fifty fathoms in length, are made of its fibres, being sufficient for dragging their largest 1,200-maund boats up the Indus, and consequently against the full force of the stream, even round projecting points. The rope is light, bears without injury, alternate exposure to wet and to subsequent drying. Plants growing beyond the range of the overflowings of the river, or of the influence of the tides are best. The upper leaves, about a foot or so in length, are preferred and collected. They are made up into bundles, and are kept for use. When required for twisting into rope, they are first moistened in water, then, two men sitting opposite to each other, take one of these moist bundles and beat it alternately with mallets, until the loose cellular, are separated from the fibrous, parts. These are then ready for twisting into the ropes which are so extensively employed on the Indus. A continuation of the same process, or the employment of the dhenkee would afford a very ample supply of half-stuff for paper-makers, and at a cheap-rate. If the rope is not occasionally wetted, and allowed to become too dry, it easily breaks when used. The prepared fibre costs two rupees per maund. It was latterly being exported from Kurrachee and brings £5 to £8 per ton.—*Roxb.*; *Voigt.*; *Irvine, p.* 175; *M. E. J. R.*; *Royle, Ind. Fibres, p.* 30; *Cal. Cat. This species of the sugar-cane is supposed to be a native of the East Indies and to have spread from there to other countries into Africa, the south of Europe, the Canaries and the West Indies. A considerable portion of the sugar of commerce is manufactured from this species, but the S. violaceum is now more extensively cultivated and the juices of the palmyra and phœnix palms is also largely converted into sugar.—*Roxb.*, *Voigt. Smith, McCulloch.*

SACCHARUM PROCERUM, *Roxb.*

Lofty saccharum,	ENG.	Sarkara,	HIND.
Sirkunda,	HIND.	Sirkee,	,,

Grows in Bengal and is very abundant everywhere on the sandy ridges and plains of Ajmere where water is not very far from the surface. The lower parts of the culms, called "sirkunda," are made into outside chicks for doorways, &c.; the upper parts of the culms, called "sirkee," are made into excellent neat and cheap mats, much used in thatching, &c, the floral leaves are made into "moonj," separating the fibres, by beating the leaves; this is very much used to make string and rope.—*Roxburgh, Flor. Indica*; *Irvine, Gen. Med. Top., p.* 175.

This grass grows in every part of Hindustan; is common on islands, &c., throughout the Punjab plains; is very abundant in the plains of Ajmere where the blossom in the rains has a beautiful silvery appearance. Brooms are made of the culms, string of its leaves, and the whole is used to thatch with. The Karens in Amherst Province cover their houses with the tall grasses which are so abundant on the coast, and a few Europeans prefer this as thatch to that made from the nipa. Imperata cylindrica, syn. of Saccharum cylindricum and Saccharum spontaneum, are however used for this purpose. It is in much demand for twine; and elephants, horses, and horned cattle do not object to it as fodder. The grass grows from three to fifteen feet high, and it flowers in great profusion after the rains. A familiar couplet, in which the hunger and avarice of brahmins are sportively alluded to, shows the correct pronunciation as well as the season of its flowering:

Aye kunagut phoole Cas
Bamhun buet, he choolbe pas.

"The time (kooar) for performing the ceremony in honour of deceased ancestors has arrived, the cas is in flower and brahmins surround the fire-place."—*Dr. J. Stewart's Punjab Plants, p.* 261 ; *Mason* ; *Genl. Med. Top., p.* 175 ; *Roxb.* ; *Elliot.*

The sugar-cane plant of Polynesia is grown in India, is abundantly cultivated in the Saharunpore district ; it gives a larger percentage of sugar, but it is objected to by the natives as being too strong for the pressure of the native mill : it is therefore principally cultivated for eating. In the Deyrah Dhoon it has with much advantage been extensively cultivated for making sugar, but it is there pressed with European mills.—*Voigt.*

SACCHO-CICHORINE GUM, see Chichorium intybus.

SACCOLABIUM, an Asiatic genus of plants belonging to the natural order Orchiaceæ, of which the following species are known :—

calceolare, *Lindl.*, N. E. India.
carinatum, *Wall.*, Khassya.
guttatum, *W. Ic.*
micranthum, *Lindl.*, N. E. India.
niveum, *W. Ic.*
paniculatum, *W. Ic.*

Throughout British India, fire, snakes, stones and a species of ammonite are worshipped. It is the saligramma of the hindoos and is found in the river Gandak. The ban-lang of the hindoos is a stone rounded by attrition found in the rivers of Rajputanah. At Lanuvium, 16 miles from Rome, was a dark grove sacred to Juno, and near it the abode of a great serpent, the oracle of female chastity. Scipio Africanus is said to have believed himself to be the son of a snake. Augustus Cæsar allowed it to be understood that his mother Atia had received him from a serpent. Alexander the Great, before he undertook to prove himself the son of Jupiter Ammon, was supposed (apparently by Philip himself) to be the son of a serpent, who actually appeared to him in a dream in later years to save the life of his general, Ptolemy. The sacred grove of oaks at Dodona, supposed to have been planted by the Pelasgi, existed till the time of Constantine. Their branches were hung with bells, sacred pigeons rustled amidst the leaves. The laurel of Apollo at Delphi, was sacred like the oak at Dodona. Under the laurels shade, the python took refuge. Sacred stones exist in Fiji, to which the natives pay reverence, for instance, near Vuna and Baw, as well as in many other parts of Polynesia. Compared with remnants of priapus worship, as found at Indian temples, the Museo segreto of Naples, and in the obelisks of Egypt, it becomes evident that the object of these monoliths was to represent the generative principle ; and, the shape of the Polynesian stones, the reverence paid to them, their decoration, and the results expected from their worship, are quite in accordance with a widely-spread superstition, which assumed such offensive forms in ancient Rome, and found vent in the noblest monuments of which the land of the Pharaohs can boast. Turner had in his possession several smooth stones from [illegible] new Hebrides. He says that some of the Polynesian stone-gods were supposed to cause fecundity in pigs, rain and sunshine. According to the Earl of Roden, a stone at Mayo was carefully wrapped up in flannel, periodically worshipped, and supplicated to send wrecks on the coast. Two large stones, lying at the bottom of a moat, are said to have given birth to Degei, the supreme god of Fiji. In all instances, an addition to objects already existing was expected from the Fiji monoliths. A stone near Baw existed, which, whenever a lady of rank at the Fiji capital was confined, was fabled also to gve birth to a little stone.—*Galton's Vacation Tourists, pp.* 273–275.

SACRED BEAN PLANT, Nelumbium speciosum.

SACRED FIG TREE, Ficus religiosa.

SACRED FIRES are kept up by the Agnihotra brahmins of India and by the Parsee or Zoroastrian religionists. The brahmanie families who keep the sacred fires are supposed to descend from the seven Rishi,

Bhrigu,
Angoras,
Visvamitra,
Vasishta,
Kasyapa,
Atri,
Agastya.

The real ancestors, however, are eight,

Jamadagni,
Gautama,
Bharadvaja,
Visvamitra,
Vasishta,
Kasyapa,
Atri,
Agastya.

The eight gotra which descend from these Rishi, are again sub-divided into 49 gotra, and these 49 branch off into a still greater number. The terms Gotra, Vansa, Vaigu, Paksha and Ganu, are all used in the same sense to express the larger as well as the smaller families, descended from the eight ancestral Rishi. On the N. W. of India and at Baku near the Caspian, natural gases escape from the earth, and when set fire to burn with a feeble flame. These are deemed sacred by hindoos, many of whom make long pilgrimages to visit the sacred spots. See Baku, Jwala-mukhi, Sholah-mukhi.

SACRED INDIAN FIR, Eng. Cedrus deodara, *Lambert.*

SACRED SHELL is the Chank shell, some of which fetch great prices, Psalm lxxxi, 3, says, 'Blow up the trumpet in the new moon, in the time appointed, on our solemn feastday.' The hindoos similarly announce some of their festivals by the sound of this sacred shell. See Molluscs.

SACTA, or Sakta. The hindoo worshippers of the Sakti, the power or energy of the divine nature in action, are exceedingly numerous amongst all classes of the hindoos of Hindusthan. In the mythology of the hindoos, this active energy is personified, in the forms of the three deities, Lakshmi or Maha Lakshmi ; Parvati, Bhavani or Durga, and of Sarasvati, the consorts respectively of Vishnu, Siva and Brahma. The worship of the female principle, as distinct from the divinity, appears to have originated in the *literal interpretation of the metaphorical language of the Vedas, in which the will or purpose to create the universe*, is represented as originating from the creator and co-existent with him as his bride and part of himself. Thus, in the Ric Veda, it is said, "that divine spirit breathed without afflation single, with (Swadha) her who is sustained within him, other than him nothing existed. First, desire was formed in his mind, and that became the original productive seed." Also, the Sama Veda, speaking of the divine cause of creation, says, "He felt not delight being alone, he wished another, and instantly became such. He caused his own self to fall in twain, and thus became husband and wife. He approached her, and thus were human beings produced." It is probable that these legends may relate to the primitive tradition as to the origin of mankind, but there is in them, also a figurative representation of the first indication of wish or will in the Supreme Being. Another set of notions of some antiquity, which contributed to form the character of the Sakti, whether general or particular, were derived from the Sankhya philosophy. In this system, nature, Prakriti, or Mula Prakriti, is defined to be of eternal existence and independent origin, distinct from the Supreme Spirit, productive though no production, and the plastic origin of all things, including even the gods. In the Puranas, especially in the Brahma Vaivartta Purana, Prakriti or Maya bears a prominent part, for from the Sankhya philosophy, Prakriti has come to be regarded as the mother of gods and men, whilst as one with Matter, the source of error, it is again identified with Maya or delusion, and as co-existent with the Supreme as his Sakti, his personified energy or his bride. According to the Prakriti Khanda section of the Brahma Vaivartta Purana, Brahma or the Supreme Being, having determined to create the Universe, became two-fold, the right half becoming a male, the left half a female, which was Prakriti. She was of one nature with Brahma. She was illusion, eternal and without end : as is the soul, so its active energy,— as the faculty of burning is in fire. It is from the Tantras, that the rites and formulæ of the worship of Prakriti or Sakta is obtained. They are numerous, of great extent, and in the form of a dialogue between Siva and his bride. Many of the Sakta worshippings are nothing more than a convivial party, consisting of the members of a single family, or at which men only are assembled and the company are glad to eat flesh and drink spirits :

> Let him pledge the wine cup again and again,
> Till he measure his length on the ground ;
> Let him rise and once more the goblet drain,
> And with freedom for aye, from a life of pain,
> Shall the glorious feat be crowned.

The earliest record of Sacti is in the Periplus. The Sacti are the consorts or energies of the hindoo gods : thus Parvati is the sacti of Siva ; Lakshmi, that of Vishnu ; and Suraswati, Brahmai or Brahmini, of Brahma. As their energies, they participate in their various avatars or incarnations ; Lakshmi, in those of Vishnu, being Varahi, Narasinhi, Sita, Radha, &c., and in like manner are the other sacti. In the eighth volume of the Asiatic Researches, Mr. Colebrooke calls them also Matri or mothers, and says "they are named Brahmi, &c., because they issued from the bodies of Brahma and the other gods respectively." The sacti are said to have numerous followers in northern India ; in the Peninsula of India, the sacti sect seem to be unknown. But in N. India the sacti sect are said to worship the sacti exclusively. The emblem of worship is the yoni. One branch of the sacti worshippers is so grossly licentious and addicted to debauchery, that they are held in the utmost detestation by the other sects, and even by a large portion of their own. It is related that the energy of each god, exactly like him, with the same form, the same decorations, and the same vehicle, came to fight against the Asura or demons. The sacti of Brahma, girt with a white cord and bearing a hollow gourd, arrived on a car yoked with swans : her title is Brahmani. Maheswari came riding on a bull and bearing a trident with a vast serpent for a ring and a crescent for a gem. Cumara, bearing a lance in her hand, and riding on a peacock, being Ambica in the form of Kartikeya, came to make war on the children of Diti the giants, or Asura. The sacti named Vishnaivi also arrived sitting on an eagle, and bearing a conch, a discus, a club, a bow, and a sword, in her several hands. The energy of Hari, who assumed the unrivalled form of the holy boar, likewise came there, assuming the body of Varahi. Narasinhi, too, arrived there embodied in a form precisely similar to that of Narasinha, with an erect mane reaching to the host of stars. Aindri (Indrani) came bearing the thunderbolt in her hand, and riding on the king of elephants, and in every respect like Indra, with a hundred eyes. Lastly came the dreadful energy named Chandica, who sprung from the body of Devi, horrible, howling like a hundred jackals. She, surnamed Aparajita, the unconquered goddess, addressed Isana, whose head is encircled by his dusky braided locks." In the foregoing extract, Maheswari and Chandica are forms of Parvati ; and Narasinhi, Vishnaivi, and Varahi, those of Lakshmi. Major Moor likewise observes that in the mythology of the hindoos, Brahma, Vishnu, and Siva, have assigned them consorts which are personifications, respectively, of the active energies of their Lords, and are called Sacti. Saraswati is the Sacti of Brahma, Lakshmi of Vishnu, and Parvati of Siva : hence those, of whatever sect, who worship exclusively the female power—Parvati (*i. e.*, Devi), however, more especially, are called Sacta. The inferior deities in their own persons, and the Avatara of the superior, are likewise mated in fable, and have their wills executed by active helpmates ; each of whom, except in sex, exactly resembles the deity whose partner she is : from whose bodies indeed, as Eve from Adam's, they are, in some theogonies, supposed to have proceeded, and with whose powers and attributes they are armed. Eight of these Sacti are more particularly recorded, their names are the following :—

Maheswari....................	sacti of Mahesa, or Siva.
Brahmi, or Brahmani...	sacti of Brahma.
Narayani....................	sacti of Narayana.
Aindri........................	sacti of Indra.
Kaumari.	sacti of Kartikeya.
Varahi........................	sacti of Vishnu of the Vahar Avatara.
Narasinhi....................	sacti of Vishnu in the Narasing Avatara.
Aparajita....................	a form of Bhavani, sacti of Siva.

This list is taken from Mr. Paterson's Essay on the hindoo religion, in the eighth volume of the *As. Res.*, *p.* 68. Mr. Paterson remarks that Aparajita may be the Aphrodite of the Greeks, and Maheswari, or a female Siva, riding on a white bull, may have given rise to the story of Europa's rape ; while Brahmi, or the female Brahma, with the swan, may, in like manner, have been the origin of the fable of Jupiter and Leda. These explanations were, perhaps, invented by the Greeks, to account for symbols, of the meaning of which they were ignorant. The eight Sacti, or energies of as many deities, are also called Matri, or mothers. In some places they are thus enumerated, Brahmi, Maheswari, Aindri, Varahi, Vaishnavi, Caumari, Chamunda, and Chartica. Some reduce the number to seven ; omitting the two latter, and adding Cauveri. Prayers are addressed to the Matri on various occasions, especially in the Cavacha, or defensive incantations. Each of the Sacti or energy of the deities has the Vahan of their respective lords : Bhavani is, however, oftener seen on a lion or tiger than on Nandi, the vahan bull of her spouse.—*Coleman on the Mythology of the Hindoos, p.* 121 ; *Raya Mucuta on the Amaracosha* ; *Moor's Pantheon.* See Agni, Ballaji, Brahma, Chandra, Hiranyagharbha, Kama, Lakshmi, Maha devi, Osiris, Parvati, Saras-vati, Satarupa, Tripati.

SACRIFICE.

Sacrifice,	Fr.	Gao,	Tel.
Sacrifizio,	It.		

A sacrifice is an offering of any consecrated thing to a deity, whether an animal, anything of the mineral or vegetable world, a manufactured article, or in the form of a libation or an oblation. All nations seem to have had a stage in their history, in which to make offerings in sacrifice formed a part of their mode of worshipping the deity whom they reverenced. The earliest record of sacrifices extant, are those recorded in Genesis iv, 2, 15, 25, in the cases of Cain and Abel, where Cain, an agriculturist or, as he is styled, a tiller of the ground, brought of the fruit of the ground an offering to the Lord, and Abel, who was a nomade, a keeper of sheep, brought of the firstlings of his flock and of the fat thereof, and it is mentioned that the Lord had respect unto Abel and to his offering ; but unto Cain and to his offering he had not respect. And thus, even in those early days in the history of the human race, the blood sacrifice, the oblation and immolation of animals, was deemed by the offerer more worthy of the deity's acceptance than the fruits and flowers of the earth. In the exalted ideas of the sacrificing races, the view taken seems to have been that the most precious thing should be offered and with the object of propitiating a wrathful being, and there followed on this the offering up of human beings, of the children of the sacrificer, the children of kings, though criminals, of captives taken in war, slaves, and even women were sacrificed. Chap. xi of Judges, tells us how Jephthah when he invaded the country of the Ammonites, vowed a vow unto the Lord, and said, 'If thou shalt without fail deliver the children of Ammon into mine hands, then it shall be, that whatsoever cometh forth of the doors of my house to meet me, when I return in peace from the children of Ammon, shall surely be the Lord's, and I will offer it up for a burnt-offering. * * * * * And Jephthah came to Mizpeh unto his house, and, behold, his daughter came out to meet him with timbrels and with dances. * * * And he said, alas my daughter * * I have opened my mouth unto the Lord, and I cannot go back. * * * And it came to pass that at the end of two months, that she returned unto her father, who did with her according to his vow which he had vowed : and she knew no man.' The interpretation which from the concluding passage, has been put on the character of Jephthah's offering, viz., that his daughter remained a virgin for the Lord's sake, but this view is not supported by the preceding words, where Jephthah declares the object of his vow should be a burnt offering. The readiness with which Abraham obeyed the command to offer up his only son Isaac, indicates a knowledge of this rite. Jeremiah xix, 4 and 5, shows, says Dr. Milman, that in later times, human sacrifices were offered to Moloch and to Baal. The immolation of human victims particularly of the most precious, the favourite, the first born child, appears as a common usage, among many nations, more especially the tribes by which Abraham was surrounded, and when suddenly commanded to cut off that life on which all the splendid promises of the Almighty seemed to depend, he obeys and sets forth with his unsuspecting child to offer the fatal sacrifice on Mount Moriah. It was the distinguishing rite among the worshippers of Moloch, at a later period of Jewish history it was practised by a king of Moab, it was undoubtedly derived by the Carthagenians from their Phœnician ancestors on the shores of Syria. It was an ordinary usage in the worship of Moloch. But, besides the common worship of Moloch, the Book of Kings names the Sepharvaites as making these human sacrifices (II Kings xvii, 31) and the king of Moab (II Kings iii, 27.) These filial sacrifices were doubtless of rare and extraordinary occurrence ; they were either to expiate some dreadful guilt, to avert the imminent vengeance of an offended deity, or to extort his blessing on some important enterprise. Dr. Milman, however, considers that the Hebrew religion held human sacrifices in abhorrence, and that the great rite of sacrifice was regulated amongst the Hebrews with the utmost precision, and with three distinct objects. Every morning and every evening, the smoke from the great brazen altar of burnt offerings ascended in the name of the whole people. On the seventh day, two animals instead of one was slain, and the offering of the poorest was acceptable. The sacrifices were partly propitiatory, that is, voluntary acts of reverence in order to secure the favour of God to the devout worshipper : partly eucharistic, or expressive of gratitude for the divine blessings. Of this nature were the first fruits, and whether reaping the harvest or gathering in the vintage, the Israelite made an oblation of thanksgiving to the gracious Being who had bestowed his bounty. Lastly, the Hebrew sacrifices were piacular or expiatory ; every sin either of the nation or the individual had its appointed atonement. The tenth day of the seventh month was set apart for the solemn rite of national expiation. First a bullock was to be slain and the blood sprinkled, not only in the customary places but within the Holy of Holies itself. Then two goats were chosen, and lots cast upon them ; the one assigned to the Lord was sacrificed ; on the other, by the imprecation of the high priest, the sins of the whole people were heaped, and it was then taken beyond the camp and sent into the desert to Azazel, the spirit of evil to whom Hebrew belief assigned the waste and howling wilderness as his earthly dwelling. Sacrifices have, however, been and continue common to all races and religions. They are made in the form of offerings of the raw products of the earth, of raw food, of cooked food, of water, and of living creatures. The earliest historical record is met with in the Old Testament. The contest recorded between Cain and Abel, marks the jealous rivalry and strife between the powerful overbearing dwellers in cities who bear arms and till the ground and the harmless nomade shepherds. The first victim was Abel, but the struggle runs through the whole history of Asia. In the early ages of the world the offerings of living creatures was deemed the more acceptable, and, in the time of Solomon, an instance (II Chron. vii, 5) is recorded of the sacrifice of 22,000 oxen. Isaiah, however, (i, 10–14) openly denounced the sacrifice of animals, as an atonement for sin. 'Hear the word of the Lord, ye rulers of Sodom ; give ear unto the law of our God, ye people of Gomorrah. To what purpose *is* the multitude of your sacrifices unto me ? saith the Lord : I am full of the burnt offerings of rams, and the fat of fed beasts ; and I delight not in the blood of bullocks, or of lambs, or of he goats. When ye come to appear before me, who hath required this at your hand, to tread my courts ? Bring no more vain oblations ; incense is an abomination unto me ; the new moons and sabbaths, the calling of assemblies, I cannot away with ; *it is* iniquity, even the solemn meeting. Your new moons and your appointed feasts my soul hateth : they are a trouble unto me ; I am weary to bear *them*.' But a little after the time of Isaiah, Buddha appeared objecting to the animal sacrifices. From the times of the Vedas until now, the homa, an offering of ghi to the fire, from the dhenkna or sacrificial ladle ; also the Pasaya, sacred food of rice and milk, cooked in sacrificial kettles, are oblations of hindoos. Mr. Wheeler is of opinion that the homa was introduced by the brahmins to displace animal sacrifices. Amongst other ancient Vedic customs, was that of the self-sacrifice of wives on the funeral piles of their husbands, and it has continued in some part of Asia up to the close of the nineteenth century. It is related in the Mahabarata that after the battle of Kurukshetra, when the widows of the slain were talking over their losses, Vyasa bid them repair to the banks of the Ganges. Vyasa also was present, and called out the names of the slain. All appeared in great glory and splendour and more beautiful than when they were alive, widows went to their husbands, daughters to their fathers, mothers to their sons, sisters to their brothers, and all the fifteen years of sorrow which had passed since the war of the Mahabarata were forgotten in the ecstacy of seeing each other again. The night passed away in the fulness of joy, and when the morning dawned, all the dead mounted their horses and chariots and disappeared. But Vyasa said that the widows who wanted to rejoin their dead husbands might do so, and all the widows went and bathed in the Ganges, and came out of the water again, kissed, one by one, the feet of Dhritarashtra and Gandhari, and then went and drowned themselves in the river : and, through the prayers of Vyasa, they all went to the place they wished and obtained their several desires. In the hindoo sacrifices, the sweet smelling kusa grass, seems to have been employed, from the most ancient dates, and also a spirituous fluid which they called the soma juice, and the Persians called hom. What this fluid was is doubtful, but it had stimulating and intoxicating qualities, for the Rig Veda (ix) says, " the purifying soma, like the sea rolling its waves has poured forth songs and hymns and thoughts." It has been said to be the fermented acid juice of the Sarcostemma acidum, the shom-luta of Bengal, but the fierce exultations which are noticed in the Rig Veda, could only have been produced by a strong alcoholic drink.

The duty of offering to the Lord of the first of every product has doubtless had almost a universal hold on man. Exodus xxii, 29, commands the offer of the first fruits, and the same is enjoined in Deut. xxvi, 2 ; Lev ii, 12, and numerous other places. Gen. iv, 4, tells us that Abel brought the first of his flock, and Exod. xiii, 12, and other places enjoin this, and to the present day, in the villages around Chingleput the first-born daughter in the weaver families are devoted as deva-dasa to the gods of the hindoo temples. The pouring out of water as an oblation is a very ancient rite. David when pressed by the people of Palestine, craved for a drink from the well at the gate of Bethlehem, and afterwards would not drink it when brought by three men, " but poured it out unto the Lord." Ages prior thereto, (Gen. xxxv, 14), Jacob is mentioned as setting up a pillar and he poured a drink offering thereon, and he poured oil thereon, and to the present day, throughout British India, the lingum, the priapus or phallus, is daily worshipped by the saiva hindoos and washed with oil and milk. Wine was occasionally used as in Numbers xxviii, 7, causing the strong wine to be poured unto the Lord for a drink offering. I Samuel vii, 6, Israel gathered together to Mizpeh and drew water and poured it out before the Lord. Although the sacrificial rite of offering human beings, seems to have prevailed amongst many peoples, the ordinary Vedic offerings were of cooked food, delicious food and drink ; the Jauemajaya however, was a sacrifice of snakes, and the Rajasaya was a royal sacrifice to the gods, in acknowledgment of sovereignty and supremacy. Originally it was a great national feast.

Human sacrifices, says Bunsen, were abolished by the Egyptians, in the very earliest times, declaring it to be an abomination to the gods. Whereas in Palestine, in Syria, and in cultivated Phœnicia and Carthage, such sacrifices continued to be offered to Moloch as the very climax of religious worship. Even Rome herself, in the time of her Cæsars, buried her Gallic prisoners alive, in order to appease the wrath of their gods. Many of the kings of Judah and Israel caused their children to pass through the fire. The Greeks and Romans also were not free from these atrocities.

Animal sacrifices seem to have been a usual rite amongst all the Scythian races. Some members of this great stock appear to have wandered so far from their northern seats as the peninsula of India, in the most southern parts of which are found great numbers of cromlechs and cairns. All round Hyderabad in the Dekhan these are to be seen, and, at one place, about 12 miles from that city is a vast site of these ancient dead. In all the cairns that have been opened there, sepulchral urns have been found, and in their neighbourhood, human bones and bones of animals. From one excavated by Captain A. McGoun, there was obtained a perfect human skull. Of the race who adopted that form of burial nothing is now known. Whether they were a nomade people who wandered into India and wandered out again, remains to be guessed at, or whether they have merged into the mass of the people. But that they were nomades, dwelling in tents, seems proved by what remains in the place alluded to near Hyderabad where is to be seen a great encamping ground, the stone enclosures for each tent being perfect, and that they were tents and not houses is proved by the circumstance that within the enclosures there are no mounds of ruined houses, but in all merely a level space, and it may be a question whether the bones now found in their cairns are those of victims interred with the dead? Amongst the Arian hindoos, the sacrifice of a horse, the aswamed'ha, seems to have been practised. There are two hymns in the Ric Veda, describing the rite, and which leave no doubt, that in the early religious rites of the race, this sacrifice, as a burnt offering to the gods, was made. It was even then, however, falling into disuse, and was existing as a relic of an ante-vedic period, imported from some foreign region, possibly from Scythia, where animal victims, and especially horses, were commonly sacrificed. And in still later times, the aswamed'ha consisted in certain ceremonies ending in the liberation of the horse, just as throughout Southern India and about Benares, is still practised with a bull or cow, many of which are met with in every village, freed or let loose in the name of the hindoo gods Siva or Vishnu. Professor Max Müller reminds us of what we read in Herodotus (v, 5) that amongst the Thracians it was usual after the death of a man, to find out who had been the most beloved of his wives, and to sacrifice her upon the tomb. Mela (ii, 2) gives the same as the general custom of the Getæ line. Herodotus (iv, 71) asserts a similar fact of the Scythians, and Pausanias (iv, 2) of the Greeks. In Salamis, formerly called Coronea, a man, says William Howit, was annually sacrificed to Argaula, the daughter of Cecrops, and daughter-in-law of Argaulis. This continued to the time of Diphilus, who changed the victim to a bull. Men were sacrificed in Heliopolis, a city of Egypt, till the time of Amosis. Men were also sacrificed to Juno, as many as nine in one day, but Amosis changed the victims to waxen statutes of men. A man was sacrificed to the Omadian Bacchus in Chios and also in Tenedos. The Spartans according to Apollodorus, sacrificed men to Mars. The Phœnicians and Egyptians, Cretans and Persians had similar sacrifices. Philo Biblius tells us that the Phœnicians had a king named Israel, who sacrificed his only son Jeust, which was the origin of their custom. The Curetes sacrificed boys, and Pallas says that the sacrifices of men did not cease everywhere till the days of Hadrian the emperor.

A virgin was sacrificed annually in Laodicea to Minerva, afterwards a hart was substituted. The Carthagenians had similar sacrifices till Iphicrates abolished them. Augustus Cæsar, when he took Perusia, sacrificed 300 men of the equestrian and senatorian orders, to the manes of his uncle Julius. Porphyry says, in his time, a man was sacrificed every year at the shrine of Jupiter Latiaris. Heliogabalus offered human victims to the Syrian deity, which he introduced. With the Gauls and Germans, no business of any importance, was transacted without being prefaced by human blood. According to Lucans Pharsalia (lib. iv, 444) the gods to whom these sacrifices were made, were Thautetes, Hesus, and Taranis, and that in the midst of gloomy woods to increase the horror. Tacitus in his Annals (lib. xiii,) says that the Hermanduri sacrificed all their prisoners to Mars. The Arduenna and Hyrcinian forests were terrible for these immolations at the hands of the Druids. (See Claudian in Laudes Stilichones, lib. i.) The Massagetæ, the Scythian, the Gete, the Sarmatian, the Suevi, and all the Scandinavian races, believed that no blessing, or security could be obtained except by these horrors. Dithmar relates the same sacrifices to the god Swantowiti in Zeeland. The Druids burned men in wicker frames to the gods. Hamilcar, being defeated in Sicily, not only sacrificed a boy to Cronos on the spot, but drowned some of the priests to appease the god. The Persians, says Bunsen, buried people alive. The Cyprians, the Rhodians, the Phocians, the Ionians, the people of Chios, Lesbos and Tenedos, all had human sacrifices. The natives of the Tauric Chersonesus, offered to Diana, every stranger whom chance threw upon their coast. Aristomenes, the Messinian, slew 300 noble Lacedemonians, at once, amongst whom was Theopompus, the king of Sparta, at the altar of Jupiter of Ithome. The Spartans, in return sacrificed their captives to Mars. Phytarchus and Porphyry assert that every Grecian state, before marching against an enemy sacrificed human victims. Livy says that in the consulate of Emisius Paulus and Terentius Varro, two Gauls, a man and woman, and two Grecians, were buried alive at Rome, in the ox-market, in a place walled round and made for such purposes. Plutarch gives another instance of this a few years before, in the consulate of Flaminius and Furius. It is asserted that the principal captives led in triumph by the Romans, were, for a long time, despatched afterwards at the altar of Jupiter Capitolinus. Marius sacrificed his own daughter to the Dii Averrunci, for success against the Cimbri. Clemens, Dorotheus and Plutarch all affirm it. The Dumatians of Arabia sacrificed annually a boy. The Greeks, says Phillarchus, generally sacrificed men before they went out to battle. The Thracians and Scythians did the same.

Every classical reader will recollect the attempted sacrifice of Iphegenia, by her father, and the perfected one of the daughter of Erectheus and Praxithia by the Athenians. At this time, says Eusebius, a man is sacrificed in Megalopolis, at the feast of Jupiter Latiaris. The same had been the case to Jupiter in Arcadia, to Saturn in Carthage. In Lydia, Diodorus asserted that 200 of the sons of the nobles, and 300 of the people at large had been sacrificed. Dionysius of Halicarnassus says that Apollo and Jupiter had at one time demanded so many human sacrifices of the aborigines in Italy, that they actually decimated themselves : and, to escape from the infliction, emigrated into distant regions. This is said to have happened to the Pelasgi in Italy ; that it became the ruin of the country ; and, notwithstanding the emigration of the young men, the oracles continued to demand and the magistrates to enforce these sacrifices, till Hercules put a stop to them. Down to comparatively recent historic times, the Phœnicians, Carthagenians, Aramæans, Syrians, Babylonians and even Israelites and their neighbours on both sides of the Jordan, sacrificed their children with the hoped for object of averting any great and serious misfortune. A Phœnician legend is of El, the Strong offering up his son Yedud or Yedid the Beloved, El, being the Kronos.

Malekh Bel, was the same as the Tyrian Hercules, or Moloch or Bal-Moloch, to whom, as also to Hecate and Melekhet Artemis, dogs were sacrificed. In Babylonia ; (Is. lxvi, 3, Ex. xiii, 13, xxxiv, 20) their neck or back-bone had to be broken unless redeemed. The principal sacrifices offered to Hercules Usov, as well as to his mythical companion were human beings, which in Laodicea of Phœnicia might be ransomed by a doe. At Carthage, the practice of sacrificing their favourite children, and those of the highest rank in honour of Hercules, continued down to their latest wars. The legend of the Grecian Hercules is that he became insane, burned his own children as well as those of his twin-brother Iphicles, and murdered his guest Iphitus. We have, says Sharpe, the authority of Manetho, the Egyptian priest, for the fact that some criminals were openly burnt alive in the form of a sacrifice, every year at midsummer, in the city of Idithya. Nations less earnest in their religious feelings shuddered at the inhuman cruelty ; but it had probably gone out of use long before the Egyptians were reproached by Virgil and Ovid with sacrificing human beings to the Nile to obtain a bounteous overflow. Since that time altars have seldom been lighted for human sacrifices, but by men who, shame to say, have been struggling for theological opinions, in entire forgetfulness of the humility, mildness and brotherly kindness for which such opinions are chiefly valuable. Bunsen mentions that the sacrificial stamp of Egypt, had the figure of a man on his knees, his hands tied behind his back, with the sacrificial knife tied behind his back, indicates a human being as the primary sacrificial object of Egypt.

In the most ancient times, the Aryans offered human sacrifices to Varuna (Ouranos). To Agni, it was the fire-sacrifice with melted butter. To the Tyrian Hercules, dogs were sacrificed, and to Diana, a doe, as a substitute for Iphigenia.

In Palestine, Syria, Phœnicia and Carthage, human sacrifices were offered up as the very climax of religious worship, and even Rome in the time of the Cæsars, burned her Gallic prisoners alive in order to appease the wrath of their gods. In a war between two Arab chiefs, in the time of Belisarius, but which was carried on without the interference of either Persia or Rome, the son of Horeth fell into the power of the Mondar of Hirah, who sacrificed him to Uzza, the deity worshipped by his tribe. Captives taken in war, criminals and even innocent persons were offered by the Druids as sacrifices, slain with arrows, crucified or consumed in a general holocaust of human beings and animals, wild and domestic. Same is mentioned by Cæsar. One of the pillars in the temple of Hercules at Tyre was lighted by day, the other by night ; upon an altar of Hercules-Buzygos at Rhodes, one of the two sacrificial oxen was offered up amidst imprecations, probably to Adonis the god of spring as the ass or dog was to Typhon. The Tyrian Hercules was the same as Moloch, the King, Baal-Moloch, Malakh-Bel as he is called in the coins. No statues were erected to him at Cadiz or in Tyre, but in Tyre he was worshipped with eternal fire, which lighted up the temple by night from the reflection on the columns of Smaragdus : dogs were sacrificed to him as well as to Hecate and Melekhet-Artemis. In Babylonia, their neck or back-bone (Isa. lxvi, 3) as well as the first-born of the ass, if they were not redeemed, was, according to the law of Moses (Ex. xiii, 13 ; also xxxiv, 20), broken in honour of him. The principal sacrifices offered to Hercules-Usov, as well as to his mythical companion Melekhet-Artemis were human beings. In Laodicea, they might be ransomed by a doe, as Diana accepted that animal instead of Iphigenia. The wild boar was also sacred to the same goddess. And, in like manner, in another myth, another Artemis caused the delicate vernal Adonis to be slain by a boar instead of by Mars as he is usually said to be. At Carthage, the practice of sacrificing their favourite children, and those of the highest rank continued down to their latest wars. Hercules of the Phœnicians was called Melkath. The Grecian Hercules, is described as becoming insane, and burning his own children as well as those of his twin-brother Iphicles, and murdering his guest Iphitus. But, in Asia, the ruthless god sometimes also required this atrocious sacrifice. In Amathus, Malika (Moloch), ' the inhospitable Zeus,' sarcastically called Jupiter Hospes, had his bloody altar before the temple of Adonis (Lord) and Baaltis (Queen.) So had Saturn in Arabia whom Nonnus compares with the Syrian god. These sacrifices were offered on occasions of great misfortune but as a matter of course when there was excessive heat.

Bunsen quoting Megasthenes, (iii, 525 531) mentions the Indians tradition of Hercules, as reigning in India fifteen generations after Dyonysus. He built Palibrotha and other cities, had numerous sons, to each of whom he left an Indian kingdom, and a daughter Pandæa to whom he likewise bequeathed a realm. Bunsen following Lassen says he was chiefly worshipped in the Suras-Sen country and identifies him with Krishna, says he founded Mathura.

The "Saturday Review" of the 31st January 1863, in a review of Lord Stanhope's Miscellanies,—asks, "were human sacrifices in use among the Romans ? Lord Mahon had mentioned to Macaulay a note in Griseler's history of the Church stating, on the authority of a passage in Lactantius,that human sacrifices existed in the classic days of Rome. Macaulay denied it, Lord Mahon sent him the passage from Lactantius." Lord Macaulay says, Lactantius' words are these, "Ne Latini quidem hujus immanitatis expertes fuerunt ; siquidem Jupiter Latiaris etiam nunc sanguine colitur humano," which sentence Lord Macaulay translated thus : "Nor have even the Latins been free from this enormity, if it be true that even now Jupiter Latiaris is propitiated with human blood." According to Strabo, human victims were offered in sacrifice at the promontory on which stood the temple of Apollo Leucatas. They were offered in honor of the god and to avert evil. Bel, or Baal, the god of the sun, the Apollo of the Greeks and Latins, was worshipped as Bel, or Belenus by the Britons. Human sacrifices were common in the Æloid (Hellic) house of Athamas as well as among the Pelasgi. The Carthagenians after their defeat of Agathocles, burnt some of their captives as a sacrifice ; the Assyrians offered human sacrifices to the god Nergal. In Rome a statue of Jupiter was sprinkled every year 'with human blood, down to the second or third century before Christ, and in Northern Europe human sacrifices continued to a much later period. In Mexico and Peru they seem to have been peculiarly numerous. Müller has suggested that this may have partly arisen from the fact that these races were not softened by the possession of domestic animals. Various estimates have been made of the number of human victims annually sacrificed in the Mexican temples. Müller thinks, 2,500 is a moderate estimate ; but in one year it appears to have exceeded 10,000. Among the Jews, the twenty-eighth and twenty-ninth verses of the twenty-seventh chapter of Leviticus appear to indicate that human sacrifices were at one time habitual among the Jews.

During the Ludi Circenses of the Romans, it was not unusual for hundreds of thousands of wild beasts to be massacred in a single day, in the Flavian Amphitheatre or Colloseum. Suetonius tells us that, at its consecration by Titus, 5,000 wild and 4,000 tame animals were immolated, and Trajan, according to Don Cassius, after his victory over the Dacians, slaughtered 11,000 of these animals.

The Greek and Latin writers mention Cronos, or Saturn, as one the principal Phœnician and Carthagenian deities. As father of Jupiter, he had a definite place and history in classical mythology, though there are few traces of his independent worship. But it is by no means certain what specific name of the Phœnician mythology answered to the Cronos of the Greek. According to Sanchoniatho, it was Il ; according to Damascius, the Phœnicians and Syrians called Saturn, El, Bel, and Balathen ; but Il, or El are the Hebrew El, God ; Bal is a general name for the supreme divinity, and Balathen, a combination of Bal with some epithet. We do not obtain, therefore, from this account any specific name. The most characteristic circumstance which we learn concerning him, is that the human sacrifices of the Phœnicians and Carthagenians were specially performed in his honour, "The Phœnician history of Sanchoniatho," says Porphyry, "is full of instances, in which that people, when suffering under great calamity from war, or pestilence, or drought, chose by public vote one of those most dear to them and sacrificed him to Saturn." It is remarkable that in the fragmentary history preserved to us of Phœnicia proper, we find no mention of such a sacrifice; but in the siege under Alexander it was proposed to revive a custom suspended for many ages, and sacrifice a boy to Saturn. The elder men interposed and prevented it. That such a practice had prevailed in Phœnicia in earlier times is certain. Its existence in Palestine is at once indicated and condemned in the history of Abraham, and we know that it prevailed in the circumjacent tribes. We trace it in the Phœnician colonies, in Cyprus, Rhodes, Crete and Sardinia, where it was derived from the Carthagenians, and above all, in Carthage itself. An unusual number of victims, of the choicest quality, were sacrificed here, on occasion of any extraordinary calamity: after the victory of Agathocles two hundred noble youths are said to have been slaughtered. But it was also a part of the established ritual of the Carthagenians, and every year a youthful victim was chosen by lot.

Infants, says Kenrick, were burnt alive and their sacrifice had a special significance. The most acceptable offering of all was that of an only child. The image of Saturn, as we learn from Diodorus Siculus was of brass; the stretched out hands were hollow, turned upwards so as to receive the body of a child, which thence slid down into fiery receptacle below. Mothers brought their infants in their arms, and as any manifestation of reluctance would have made the sacrifice unacceptable to the god, stilled them by their caresses till the moment when they were thrown into the flames. Human sacrifices were not offered to one god only, nor to one specially answering to the Saturn of the Greeks and Romans; but as he was reputed to have devoured his own children, it was natural that, in witnessing the sacrifice of infants, they should call the god to whom they were offered, Saturn. Chiun, mentioned by Amos (v, 26,) as an object of idolatrous worship to the Israelites, is identical with the planet Saturn, the name being so used in Syriac and Arabic, but it does not appear that he was worshipped with infant sacrifices. There is equally no doubt that Chiun is the Siva of the Hindoos, who pronounce the name of this deity Seo, Seb, Sev, Siv, Sivin, Chivin. Chemosh, the "abomination of the Moabites," has been also identified with Saturn; and on the other hand, Saturn was presumed to be worshipped where human sacrifices were known to have anciently prevailed, as in Italy, in aboriginal times. The scriptures of the Old Testament are full of allusions to these bloody rites, and it may be inferred from them that they belonged not exclusively to the worship of one God. "They have filled this place," says the prophet Jeremiah, (xix, 4, 5), "with the blood of innocents; they have built the high places of Baal, to burn their sons with fire for burnt-offerings unto Baal." The mention of human sacrifices, however, is generally connected in scripture with the name of Moloch or Milcom, the god of the Ammonites. His statue, as described by the Rabbinical writers, closely resembled that of Saturn in Diodorus, but had none of the characteristics of the Greek and Roman Saturn. The head was that of a bull, a form under which, from the story of Europa and the Minetaur, it is probable the chief god of Phœnicia was represented; the body human, and the stretched out hands received the child, which was consumed in the fire kindled below, while the beating of a tabret by the priests drowned its cries. According to the common interpretation of the passage of Amos, the Israelites had worshipped Moloch even in the desert: the Mosaic law denounced the punishment of death against any one who should give his seed to Moloch. We do not read of it, however, among the idolatries of Israel in the interval between occupation of the land of Canaan and the reign of Solomon, who introduced "Moloch, the abomination of the children of Ammon," along with the Sidonian Ashtoreth, and Chemosh, the abomination of Moab, into Jerusalem. The valley of Tophet, or of the son of Hinnom, just beyond the limits of the city near the eastern gate, was the place in which the bloody rites were celebrated from the time of Solomon till that of Josiah, by whom the place was defiled, being appointed as a receptacle for the filth of the city and the carcases of dead animals, to consume which a perpetual fire was kept up. We do not find that these sacrifices to Moloch were reserved for any special occasion of national calamity; they appear to have been, like those of Carthage, of regular occurrence. Young children alone were the victims and were regarded as a propitiatory offering on behalf of their parents. Their sacrifice is generally described in scripture by the phrase "to be passed through the fire to Moloch," and hence it has been supposed that they were not really consumed, but symbolically passed through the flames, that they might undergo the lustration by fire. The same word which is used in the original is also applied in scripture to devotement of the first-born to Jehovah, who, in the case of human beings, were redeemed, but if the lower animals, sacrificed. "To be passed to Moloch through fire," might therefore signify no more than to be devoted to him by this ceremony; which Theodoret mentions as still existing in his time. The comparison of Jeremiah vii, 31, with xxxii, 35, shows, however, that "to pass through the fire" was equivalent to "burn," it is unquestionable that human victims were offered by fire to the gods of Palestine, and the strong abhorrence with which the rites of Moloch are spoken of in scripture is hardly reconcilable with the supposition of a mere harmless ceremony. The truth appears to be, that two motives, an expiatory offering and a religious consecration, were blended in the sacrifice of infants to Moloch, and the readiness, and even joy, with which mothers brought them to his altars seems inexplicable except on the supposition that they believed themselves to be securing their children's eternal happiness, by the sacrifice of natural feeling.

Amongst the Arian races who went to the north-west, there are no grounds for believing that the Saxons continued to offer human sacrifices after their settlement in Great Britain, but, in their own land, the immolation of captives in honour of their gods was by no means uncommon. The great temple at Upsal, in Sweden, appears to have been especially dedicated to Odin, Thor and Frea. Its periodical festivals were accompanied by different degrees of conviviality and license, in which human sacrifices were rarely wanting, varied in their number and value by the supposed exigency. In some cases even royal blood was selected that the imagined anger of the gods might be appeased. In Scandinavia, the authority of the priest was much greater than it would appear to have been among the Anglo-Saxons. It was his word often, which determined where the needed victims should be found. It was his hand that inflicted the wound, and his voice which said, "I send thee to Odin," declaring the object of the sacrifice to be that the gods might be propitiated, that there might be a fruitful season or a successful war. One king slew nine sons in order to prolong his own life, in hopes, doubtless, that what they were abridged of would, in a great measure, be added to himself; such instances however, occur not often; but the common victims were without end. Adam Bremensis, speaking of the awful grove of Upsal, where these horrid rites were celebrated, says, that there was not a single tree but what was reverenced, as if it were gifted with some portion of divinity. And all this because they were stained with gore, and foul with human putrefaction. The same is observed by Scheffer, in his account of this place. The manner in which the victims were slaughtered was divers in different places. Some of the Gaulish nations chined them with the stroke of an axe. The Celts placed the man who was to be offered for a sacrifice upon a block or an altar, with his breast upwards, and with a sword struck him forcibly across the sternum; then tumbling him to the ground, from his agonies and convulsions as well as from the effusion of blood, they formed a judgment of future events. The Cimbri ripped open the bowels, and from them they pretended to divine. In Norway they beat men's brains out with an ox-yoke. The same operation was performed in Iceland, by dashing them against an altar of stone. In many places they transfixed them with arrows. After they were dead they suspended them upon the trees, and left them to putrify. One of the writers above quoted mentions that in his time seventy carcases of this sort were found in a wood of the Suevi. Dithmar, of Mursburgh, an author of nearly the same age, speaks of a place called Sedu, in Zeeland, where there were every year ninety and nine persons sacrificed to the god Swantowite. During these bloody festivals a general joy prevailed, and banquets were most royally served. They fed, they caroused, and gave a loose to indulgence, which at other times was not permitted. They imagined that there was something mysterious in this number nine, for which reason these feasts were in some places celebrated every ninth year, in others every ninth month, and continued for nine days, when all was ended they washed the image of the deity in a pool, on account, it is supposed, of its being stained with blood, and then dismissed the assembly. Their servants were numerous, who attended during the term of their feasting, and partook of the banquet. At the close of all they were smothered in the same pool, or otherwise made away with. On which Tacitus remarks, how great an awe this circumstance must necessarily infuse into those who were not admitted to these mysteries. The accounts are handed down from a variety of authors, in different ages. Many of whom were natives of the countries which they describe, and to which they seem strongly attached. They would not, therefore, have brought so foul an imputation on the part of the world in favour of which they were each writing; nor could there be that concurrence of testimony were not the history in general true. The like custom prevailed to a great degree in Mexico, and even under the mild government of the Peruvians, and in most parts of America
Africa it is still kept up, where, in th
parts, they sacrifice some of the
taken in war to their fetiches, in ord
secure their favour. Snelgrave was in
king of Dahomi's camp after his inr

into the countries of Ardra and Whidraw, and says, that he was a witness to the cruelty of this prince, whom he saw sacrifice multitudes to the deity of his nation. These were prisoners taken in war; but among the nations of Canaan, the victims were peculiarly chosen. Their own children, and whatever was nearest and dearest to them, were deemed the most worthy offering to their god. The Carthagenians, who were a colony from Tyre, carried with them the religion of their mother country, and instituted the same worship in the parts where they settled. It consisted in the adoration of several deities, but particularly of Kronos; to whom they offered human sacrifices, and especially the blood of children. If the parents were not at hand to make an immediate offer, the magistrates did not fail to make choice of what was most fair and promising, that the god might not be defrauded of his dues. Upon a check being received in Sicily, and some other alarming circumstances happening, Hamilcar, without any hesitation, laid hold of a boy and offered him on the spot to Kronos, and at the same time drowned a number of priests to appease the deity of the sea. The Carthagenians, another time, upon a great defeat of their army by Agathocles, imputed the miscarriage to the anger of this god, whose services had been neglected. Touched with this, and seeing the enemy at their gates, they seized at once two hundred children of the prime nobility, and offered them in public for a sacrifice. Three hundred more persons, who were somehow obnoxious, yielded themselves voluntarily and were put to death with the others. The neglect of which they accused themselves, consisted in sacrificing children purchased of parents among the poorer sort, who reared them for that purpose and not selecting the most promising and the most honourable, as had been the custom of old. In short, there had been particular children brought up for the altar, as sheep are fattened for the shambles, and they were brought and butchered in the same manner; but this indiscriminate way of proceeding was thought to have given offence. It is remarkable that the Egyptians looked out for the most specious and handsome person to be sacrificed. The Albanians pitched upon the best man of the community, and made him pay for the wickedness of the rest. The Carthagenians chose what they thought the most excellent, and at the same time most dear to them, which made the lot fall heavy upon their children. This is taken notice of by Silius Italius in his fourth book. Kronus, to whom these sacrifices were exhibited, was an oriental deity, the god of light and fire; and therefore always worshipped *with some reference to that element. The Carthagenians first introduced him into Africa:* he was the same as the Orus of the Egyptians, and the Alorus of the eastern nations. That the name given him originally by the Greeks was Koranus is manifest from a place in Crete which is sacred to him, and is mentioned by the name Coronis. It is said that both the chief city and the adjacent country were thus denominated, and that the sacrifices were there offered which we know were peculiar to Kronus. If this place, as consecrated to him, (as is apparent by these offerings) was called Koronis, it is plain that his name must have been rendered by the Greek, Koronus, and both are a transposition for "Kon-Orus," or "Chon-Orus," the lord Orus. He was universally adored in Cyprus, but particularly in this part, which Porphyry supposes to have been Salamis. This is evident from Diodorus Siculus, who mentions a city Auranic here. He makes it, indeed, distinct from Salamis, but places it hard by, between that city and Carpassia, where the river Chour (the Aucaur of the Phœnicians, and the Courium of the Greeks,) runs at this day. The Greeks thought Kronus was the same, but it was an oriental name, and the etymology has to be looked for among the people of those parts. The Greeks, we find, called the deity to whom these offerings were made Agraulos, and feigned that she was a woman, and the daughter of Cecrops. But it is not shown how Cecrops came to have any connection with Cyprus. Agraulos is a corruption and transposition of the original name, which has, like many other oriental titles and names, been strangely sophisticated, and is here changed to Araulos. It was in reality the god of light, the Orus and Alorus who was always worshipped with fire. The deity was the Moloch of the Tyrians and Canaanites, and the Moloch of the east, that is, the great and principal god, the god of light, of whom fire was esteemed a symbol; and at whose shrine, instead of viler victims they offered the blood of men. Such was the Kronus of the Greeks, and the Moloch of the Phœnicians, and nothing can appear more shocking than the sacrifices of the Tyrians and Carthagenians which they performed to the idol. In all emergencies of state, and times of general calamity, they devoted that which was most necessary and valuable to them for an offering to the gods, and particularly to Moloch. But besides these undetermined times of bloodshed they had particular and prescribed seasons every year, when children were chosen out of the most noble and reputable families. If a person had an only child, it was the more liable to be put to death, as being esteemed more acceptable to the deity, and more efficacious of the general good. Those who were sacrificed to Kronus were thrown into the arms of an idol which stood in the midst of a large fire, and was red with heat. The arms of it were stretched out with the hands turned upwards as it were to receive them, yet sloping downwards, so that they dropt from thence into a glowing furnace below. To other gods they were otherwise slaughtered, and as it is implied by the very hands of their parents, the father leading the dearest of all his sons to that infernal shrine, or mother, the most engaging and affectionate of her daughters, just rising to maturity, to be slaughtered at the altar of Ashtaroth, or Baal. Justin describes this unnatural custom very pathetically. Such was their blind zeal that this was continually practised, and so much of natural affection still left unextinguished as to render the scene ten times more shocking from the tenderness which they seemed to express. They embraced their children with great fondness, and encouraged them in the gentlest terms that they might not be appalled at the sight of the hellish process, begging of them to submit with cheerfulness to this fearful operation. If there was any appearance of a tear rising, or a cry unawares escaping, the mother smothered it with her kisses, that there might not be any show of backwardness or constraint, but the whole be the free-will offering. These cruel endearments over, they stabbed them to the heart, or otherwise opened the sluices of life, and with the blood, warm as it ran, besmeared the altar and the grim visage of the idol. These were the customs which the Israelites learned of the people of Canaan, and for which they are upbraided by the Psalmist: "They did not destroy the nations concerning whom the Lord commanded them, but were mingled among the heathen, and learned their works; yea, they sacrificed their sons and their daughters unto devils, and shed innocent blood, even the blood of their sons and of their daughters, whom they sacrificed unto the idols of Canaan, and the land was polluted with blood: thus were they defiled with their own works, and went a whoring with their own inventions."

These cruel rites, writes Colonel Walker, practised in so many nations, made Plutarch debate with himself, "Whether it would not have been better for the Galato, or for the Scythians, to have had no tradition or conception of any superior beings, than to have formed to themselves notions of gods who delighted in the blood of men; of gods who esteemed human victims the most acceptable and perfect sacrifice?" "Would it not," says he, "have been more eligible for the Carthaginians to have had the atheist Critians, or Diagoras, their lawgiver, at the commencement of their polity, and to have been taught that there was neither God nor demon, than to have sacrificed in the manner they were wont to the god which they adored? Wherein they acted not as the person did whom Empedocles describes in some poetry, where he exposes this unnatural custom. The father, with many idle vows, offers up unwillingly his son for a sacrifice, but the youth was so changed in feature and figure that his father did not know him. These people used knowingly and wilfully to go through this bloody work, and slaughter their own offspring. Even they who were childless would not be exempted from this cursed tribute, but purchased children at a price, of the poorer sort, and put them to death with as little remorse as one would kill a lamb or a chicken. The mother who sacrificed her child stood by without any seeming sense of what she was losing, and without uttering a groan. If a sigh did by chance escape, she lost all the honour which she proposed to herself in the offering, and the child was notwithstanding slain. All the time of this celebrity, while the children were murdering, there was a noise of clarions and tambors sounding before the idol, that the cries and shrieks of the victims might not be heard." "Tell me, now," said Plutarch, "if the monsters of old, the Typhous and the giants, were to expel the gods, and to rule the world in their stead, could they require a service more horrid than these infernal rites and sacrifices."

Sale's Koran contains further evidence of the practice of infanticide, assimilating more than in any other case with the custom of the Jahreja race of Kutch and Kattywar. This barbarity seems to have been confined to the female infants, as is the case with the Jahreja, and it is remarkable that the difficulty of providing for them in marriage, or the apprehension of their conduct disgracing their parents, is assigned in both cases as the cause of this inhuman custom. One benefit which has resulted to mankind from the success of Mahomed has been the relinquishment of so inhuman a practice amongst his numerous followers.

Abbe Domenech says that some branches of the Scythic stock undoubtedly crossed to America in the early centuries of our era, and they seem to have carried with them the sacrificial customs which have been a peculiarity of all their offshoots. The Comanche and the Nachez, Indian tribes of North America, formerly buried the wives of a deceased chief, along with him. The Ottawa still offer a horse in sacrifice on the tomb of the dead. With the Nachez, the victims placed themselves on mats and danced the death-dance with their executioners, who formed a circle around them. The Pawnee tribes, supposed to be descendants from the ancient Mexicans also offered human sacrifices, though the rite is supposed to have lately fallen into abeyance. These sacrifices took place more particularly in the month of April, that is, at sowing time, with a view to obtaining abundant harvests from the Great Spirit. The preparation lasted four days, on the fifth the victim was bound to three stakes, placed above the funeral pile. He was painted red or black, and his breast burned and pierced with arrows, and after his heart was reached it was torn from his breast and devoured all bleeding. This barbarous ceremony was terminated either by setting the pile on fire, or by eating the victim, whose blood served to water the seeds about to be committed to the earth. But many Indian nations of the northern and western parts of North America celebrate annually solemn festivals when the leaves of the willow have attained their full size. These solemnities are in commemoration of a great event: in propitiation of the superior powers; or are offered in expiation. Among the Mandan, these are prolonged four days, and the greatest cruelties are practised on the tortured Colonel Walker observes that the Romans were accustomed to the like sacrifices. They both devoted themselves to the infernal gods, and constrained others to submit to the same horrid doom. Hence we read in Titus Livius that in the consulate of Omilius Paulus and Terentius Varro, two Gauls, a man and woman, and two in like manner of Greece, were buried alive at Rome, in the ox-market, where was a place under ground walled round to receive them, which had before been made use of for such cruel purposes. He says it was a sacrifice not properly Roman, that is, not originally of Roman institution, yet it was frequently practised there, and that too by public authority Pluturch makes mention of a like instance a few years before in the consulship of Flaminius and Furius. There is reason to think that all the principal captives who graced the triumphs of the Romans were at the close of that cruel pageantry put to death at the altar of Jupiter Capitolinus. Caius Marius offered up his own daughter for a victim to the Dü Aversunce, to procure success in a battle against the Cimbri, as we are informed by Dorotheus, quoted by Clemens; it is likewise attested by Plutarch, who says that her name was Calpurnia. Marius was a man of a sour and bloody disposition, and had probably heard of such sacrifices being offered in the enemy's camp, amongst whom they were very common. Or he might have beheld them exhibited at a distance, and therefore murdered what was nearest, and should have been dearest to him, to counteract their fearful spells, and to outdo them in their wicked machinery. Cicero, making mention of this custom being common in Gaul, adds that it prevailed among that people even at the time when he was speaking; from whence we may be led to infer that it was then discontinued among the Romans; and we are told by Pliny, that it had then and not very long been discouraged. For there was a law enacted, when Lentulus and Crassus were consuls, so late as the six hundred and fifty-seventh year of Rome, that there should be no more human sacrifices, for till that time those horrid rites had been celebrated in open day, without any mask or control, which, had we not the best evidence for the fact, would appear scarcely credible. And, however discontinued they may have been for a time, we find that they were again renewed, though they became not so public, nor so general. For not very long after this it is reported of Augustus Cæsar, when Persia surrendered in the time of the second triumvirate, that besides multitudes executed in a military manner, he offered up upon the Ides of March three hundred chosen persons, both of the equestrian and senatorian order, at an altar dedicated to the manes of his uncle Julius. Even at Rome itself this custom was revived; and Porphyry assures us that in his time a man was every year sacrificed at the shrine of Jupiter Latiaris. Heliogabalus offered the like victims to the Syrian deity, which he introduced among the Romans. The same is said of Aurelian. The Gauls and the Germans were so devoted to this shocking custom that no business of any moment was transacted among them without being prefaced by the blood of men. They were offered up to various gods, but particularly to Hesus, Taranis, and Shautates. These deities are mentioned by Lucan, where he enumerates the various nations who followed the fortunes of Cæsar. The altars of these gods were far removed from the common resort of men, being generally situated in the depth of woods, that the gloom might add to the horror of the operation, and give a reverence to the place and proceeding. The persons devoted were led thither by the Druids, who presided at the solemnity, and performed the cruel offices of the sacrifice. Tacitus takes notice of the cruelty of the Hermunduri in a war with the

Catti, wherein they had greatly the advantage, at the close of which they made one general sacrifice of all that were taken in battle. The poor remains of the Legions under Varrus suffered in some degree the same fate. There were many places allotted for this purpose all over Gaul and Germany, but especially in the mighty woods of Arduenna, and the greater Hercinian forest, a wild that extended above thirty days' journey in length. The places set apart for this solemnity were held in the utmost reverence, and only approached at particular seasons. Lucan mentions a grove of this sort near Masselea which even the Roman soldiers were afraid to violate, though commanded by Cæsar. It was one of those set apart for the sacrifices of the country. Claudian compliments Stillico, that among other advantages occurring to the Roman armies through his conduct, they could now venture into the awful forest of Hercinia, and follow the chase in those so much dreaded woods, and otherwise make use of them. These practices prevailed among all the people of the north, of whatever denomination. The Massageta, the Scythian, the Gete, the Sarmatian, all the various nations upon the Baltic, particularly the Suevi and Scandinavians, held it as a fixed principle that their happiness and security could not be obtained but at the expense of the lives of others. Their chief gods were Thor and Woden, whom they thought, they could never sufficiently glut with blood. They had many very celebrated places of worship, especially in the island of Rugen, near the mouth of the Oder and in Zeeland. Some too, very famous among the Sumnones and Nahanvalli. But the most reverenced of all, and the most frequented, was at Upsal, where there was every year a grand celebrity, which continued for nine days. During this term they sacrificed animals of all sorts, but the most acceptable victims, and the most numerous were men. Of these sacrifices none were esteemed so auspicious and salutary as a sacrifice of the prince of the country. When the lot fell for the king to die, it was received with universal acclamations and every expression of joy, as it once happened in the time of a famine, when they cast lots, and it fell to the king Domalder to be the people's victim, and he was accordingly put to death. Olaus Triliger, another prince, was burnt alive to Woden. They did not spare their own children. Harold, the son of Gunild, the first of that name, slew two of his children to obtain a storm of wind. "He did not let," says Verstegan, "to sacrifice two of his sons unto these idols, to the end he might obtain of them such a tempest at sea as should break and disperse the shipping of Harold, king of Denmark." Saxo Grammaticus mentions a like fact; he calls the king Haquin, and speaks of the persons put to death as two very hopeful young princes.

Jacob Bryant gives an account of the cruel sacrifices of the Canaanites, Phœnicians and other nations, from observations and inquiries relating to other parts of ancient history. In the Annual Register, Vol. x, for the year 1767, he says one would think it scarcely possible that so unnatural a custom as that of human sacrifices should have existed in the world, but it is very certain that it did not only exist but almost universally prevailed. The Egyptians of old brought 160 victims to their temples. Human victims and the blood of men must at one period most certainly have been offered to their gods. The Cretans had the same custom, and adhered to it a much longer time. The nations of Arabia did the same. The people of Duma in particular sacrificed every year a child, and buried it underneath an altar, which they made use of instead of an idol, for they did not admit of images. The Persians buried people alive. Amestris, the wife of Xerxes, entombed twelve persons quick, underground for the good of her soul. It would be endless to enumerate every city, or every province, where these sad practices obtained. The Cyprians, the Rhodians, the Phœnicians, those of Chois, Lesbos, Tenedos, all had human sacrifices. The natives of the Tauric Chersonesus offered up to Diana every stranger whom chance threw upon their coast. Hence arose that just expostulation in Euripides, upon the inconsistency of the proceeding wherein much good reasoning is implied. Iphigenia wonders, as the goddess delighted in the blood of men, that every villain and murderer should be privileged to escape,—may be, driven from the threshhold of the temple. Whereas, if an honest and virtuous man chanced to stray thither he only was seized upon and put to death. The Pelasgi in a time of scarcity vowed that they would give the tenth of all that should be born to them for a sacrifice, in order to procure plenty. Aristomenes, the Messenian, slew three hundred noble Lacedemonians, among whom was Theopompus, the king of Sparta, at the altar of Jupiter at Ithome: without doubt the Lacedemonians did not fail to make ample returns, for they were a severe and revengeful people, and offered the like victims to Mars. In their festival of the Deamastigosis, the Spartan boys were whipped in the sight of their parents with such severity before the altar of Diana Orthia, that they often expired under the torture. Phylarchus affirms, as he is quoted by Porphyry, that of old every Grecian state made it a rule, before they marched towards an enemy, to solicit a blessing on their undertakings by the sacrifice of human victims.

Bryant does not appear to have been aware of the existence of human sacrifices among the hindoos ; otherwise he could have added to his list of human infirmity by citing the translation of the Rudheradhyaya from the Calican Puran, by Mr. Blaquiere, as an evidence of this barbarous rite being sanctioned by the hindoo legislature. It was not only enjoined, but in the ancient rites of the hindoos was frequently practised, under the denomination of Mer, Med or Wud, the sacrifice of a man. The legend in the Vedas of the sacrifice of Sunahsepha, seems to have been handed down from Bactria. But sacrifices of animal life stil form part of the religious rites of many races in Southern Asia, and even human beings, as in the meriahs of the Kond districts in Ganjam, are still being offered up in sacrifice though it is reported that the year 1860 passed by without a single meriah. With the hindoos, however, male buffaloes, sheep, and goats, and fowls are constantly sacrificed, and mahomedans occasionally sacrifice a camel, a sheep, a goat or a cow. There is, at the close of the nineteenth century, a numerous class of brahmins who are accused of the practice. They are called Kurrada, and are inhabitants of the Konkan. They were noticed in 1808, by Colonel Walker, Resident of Baroda, in 1808, and by Sir John Malcolm in his History of India, and the latest reports from that neighbourhood show the belief that the practice of sacrificing human beings still continues amongst this sect. The object of their worship is Maha Lakshmi, to whom human sacrifices are acceptable, and the more so if the victim is a brahmin, learned in the shasters. The public performance of this sacrifice has long since fallen into disuse ; but a sect of the Kurrada brahmins are accused of effecting, by the secret operation of poison, that object which they dare not publicly avow. Colonel Walker knew several Kurrada brahmins in respectable public situations, intelligent, charitable, and humane, who would abhor the commission of this detestable crime, and who, though they admit the former existence, most strongly deny its present practice, but the power of prejudice is sometimes stronger than the completest evidence of moral conduct ; and many people under the influence of this passion would decline to eat of food prepared by a brahmin of this tribe, of which he himself should not at the same time partake. Mr. Wade remarks, that at the Chinese court, in the middle of the 19th century, some Manchu and Mongol in the five banners have the prefix tsai-sang which declares them to be employed in slaying the victims used in sacrifice. The flesh of victims is offered in the Hwan-ning-kung, the portion of the palace appropriated to the empress, every morning at 4 o'clock, and at the same hour in the afternoon ; at the monthly sacrifice performed on the second of the first moon and the first day of all succeeding ; and at the sacrifice of the morrow, performed on the third of the first, and the second of all succeeding moons. The morning daily sacrifice is to Buddha, Kwan-yin, and Kwan-ti (the Mars of China) : the evening, to nine Tartar divinities bearing long unintelligible appellations. The monthly sacrifices appear to be the same with that on 'the morrow,' *i. e.*, of the monthly sacrifice. The flesh of the victim is boiled and placed before the idols above enumerated, on the right and left of the shrine of heaven ; when removed, it is partaken of by the emperor or empress, if officiating in person, or by those to whom his majesty may direct the nobles, his proxies, to distribute it. Medha, Sanscrit, signifies to kill, and the Aswamedha, the sacrifice of the horse, was practised in India, in ancient times, but its occurrence within any recent period is not known. It seems to have been a Scythic rite, where often the horse, after certain ceremonies, was liberated, in fulfilment of a vow, or sacrificed on the deaths of chiefs. Up to the present day, in India, cows and bulls are let loose in fulfilment of vows, but the liberation of a horse is not now known. Colonel Tod surmises that the grand solstitial festival, the Aswamedha, or sacrifice of the horse (the type of the sun), which was practised by the children of Vaivaswata, the 'sun-born,' was most probably simultaneously introduced from Scythia into the plains of India and west, by the sons of Odin, Woden, or Boodha, into Scandinavia, where it became the Hi-el or Hi-ul, the festival of the winter solstice, the grand jubilee of northern nations, and in the first ages of christianity, being so near the epoch of its rise, gladly used by the first fathers of the Church to perpetuate that event. It was practised he adds by the Getes in the time of Cyrus ; deeming it right, says Herodotus, to offer the swiftest of created to the chief of uncreated beings : and this worship and sacrifice of the horse was handed down to the Rajput. The sanguinary part of this ceremony would, according to Mr. Colebroobe, appear like that of the parushamedha or human sacrifice, to be merely nominal, the horse, after certain ceremonies, being let loose. Mr. Ward, however, states that he was liberated only for a twelvemonth, when he was again taken, and being magnificently caparisoned, was, after various preliminary proceedings, slain by the hota or priest. "He who offers a hundred sacrifices of a horse is entitled to the throne of Indra." And in the Rig Vida, are two hymns, describing the sacrifice of the horse, which leave no doubt that the early ritual of hindooism did authorise this sacrifice as a burnt offering to the gods. As, however, these two, in all the body of hymns in the Rig Veda, alone relate to it, it may be inferred that even then, the rite was falling, or had already fallen, into disuse. As described in the Rig Veda, it appears that the horse was immolated, and afterwards cut up into fragments, part of which were eaten, by the assisting priests, and part offered as burnt-offering to the gods. This sacrifice is described in the Puranas as one of the highest order, insomuch that if it be performed a hundred times it elevates the sacrificer to the throne of Swarga, and thereby effects the deposal of Indra himself. In the Rig Veda, however, the object of this rite seems to be nothing more than the acquiring of wealth and posterity; and even in the Ramayana it is merely performed by king Dasaratha as the means of obtaining a son by a universal monarch, but it was performed by kings in celebration of auspicious events, especially after marriage, in the hope of securing issue, when largesses were distributed to the brahmins and officiating priests. It seems, also, to have been performed by kings, in assumption of supremacy, on which occasion their tributary sovereigns were the officiating priests. On this point Colonel Tod mentions that when Yudishtra was firmly seated on his throne, he resolved to signalise his reign and paramount sovereignty by the solemn rites of Aswamedha and Rajsoo, in which princes alone officiate, every duty, down to that of porter, being performed by royalty. On one occasion the "Steed of Sacrifice" was liberated under Arjuna's care. He wandered whither he listed for twelve months; and none daring to accept this challenge of supremacy, he was reconducted to Indraprestha, where, in the meanwhile, the hall of sacrifice was prepared, and all the princes of the land were summoned to attend. The hearts of the Kuru burned with envy at the assumption of supremacy by the Pandu, for the prince of Hastinapura's office was to serve out the sacred food. The last Aswamed'ha was undertaken by the celebrated Sowaie Jey Sing, of Amber; but the milk-white steed of the sun was not turned out. Animate creatures and inanimate things have been objects of adoration amongst most of the nations of the earth: the sun, the moon, and all the host of heaven; the sword; the serpent and the horse; and the horse seems to have been worshipped as a type of the sun by all the Scythic races.

The meriah sacrifice, the head-hunting of the Dyak, and the cannibalism of the further Archipelago, of the present day, can but be regarded as the continuance of rites which must have had a wider range in times long gone by.

Mr. Ward mentioned it as a general report in his time, the early part of the 19th century, that human sacrifices were actually performed by hindoo races in India. Major Macpherson mentions that human sacrifices were celebrated at the beginning of the 19th century by the hill rajahs of Boad, Gumsur, &c. At Bombay, Kali is worshipped as Sitali, and at other places, as Devi, Mata and Amoor Amma. At Chanda and Lanji, she has temples in which human victim have been offered almost up to the middle of the 19th century. The victim was taken to the temple in the evening and shut up and in the morning he was found dead, the dread goddess having "shown her power by coming in the night and sucking his blood." At Dantewada, in Bastar, about 60 miles S. W. of Jagdalpur, near the junction of the Sankani and Dankani, tributaries of the Indrawati, is a famous shrine of Danteswari, at which, about A. D. 1830, it is said that upwards of 25 full-grown men were immolated on a single occasion by a rajah of Bastar. Since then, adds Mr. Hislop, numerous complaints reached the Nagpore authorities of the continuance of the practice, up to the time of the annexation by the British. Happily, says Captain Postans, writing of Western India, these blood-stained oblations have ceased in Western India; and the last of which he remembered to have heard, was amongst the brahmins of the Deckan, who long preserved the custom of yearly sacrificing an aged woman, on the occasion of the rajah of Sattara's visit to the fort of Purtabghur. Sir John Malcolm states of the sect of Kurradee brahmins that they had a custom at Poonah, of annually sacrificing to the Sacti, a young brahmin; and as, according to the sacred books, if the victim is unwilling, the sacrifice is forbidden, to prevent the possibility of such an occurrence, the unsuspecting, but devoted one, is frequently the stranger, who for months or perhaps years, had shared the hospitality of his murderer. On one such case occurring orders were issued for the apprehension of a Kurradee brahmin and his family, who themselves were put to death, whilst every priest of the sect was expelled from the city of Poonah, and their return forbidden by the heaviest penalties. Captain

Clune, writing in 1828, says that when a rana of Mewar has occasion to pass the Mahi river, an individual from a tribe descended from a Chouhone Rajput and a Bhil mother is sacrificed, his throat being cut and his body being thrown into the river. This sacrifice had been once performed in the lifetime of the rana then reigning. Dr. Mason relates that when, about A. D. 1780, the gates of the new city of Tavoy were erected, a criminal was put into each post hole, and the massive posts thrown in upon him, so that his blood gushed up at the sides. His spirit was supposed to become a Nat, that would hover about the post, inflicting evil on all who came near, thereby contributing to the defence of the town. Human sacrifices and the ornaments of the victim are alluded to in the Toy Cart or Mrich-chi-kati and in Malati and Madhava, two ancient hindoo dramas. Madhava comes on the scene when the Aghoraghanta is preparing to offer Malati, and exclaims,

What luckless chance is this, that such a maid
With crimson garb and garland, like a victim
Adorned for sacrifice, should be the captive
Of impious wretches :

In like manner, the ordinary victims of the Greeks were adorned with crowns and garlands as were human victims : as thus, in the Clouds, in the scene between Socrates and Strepsiades :—

" *Socr.* —Now take this chaplet—wear it."
"*Strep.*— Why this chaplet ?
Would'st make of me another Athamas,
And sacrifice me to a cloud ?"

So also in the Heraclidæ ; Macaria, when offering herself as a victim to secure the triumph of the Athenians, exclaims,

" To the scene of death,
Conduct, with garlands crown me."

The translator of Euripides also observes, that human sacrifices at their first origin appear to have consisted of virgins or young men in the state of celibacy, and in this respect the selection of Malati offers another analogy. The words translated above impious wretches, Pashanda and Chandala, means heretics and outcastes. These epithets indicate little respect for the worshippers of Durga, and their application so publicly declared, would lead us to infer that the author's sentiments were those of his age. Jagaddahara states that in the rite two legal prohibitions are violated, of which he gives the text ; they are, " Let him not eat from the leaf of the asclepias, nor slay a female nor child," and, " Females of every description of being, it is well known, are not to be slain."

So late as 1859, the July No. of the Calcutta Review (p. 428) remarks that " in Bengal, in the worship of the bloody Kali, all castes mingle together and, after a libation of ardent spirits to the goddess, drink spirits, and eat flesh, as their fathers did in the Vedic times. It is practised also to this day in the foul and secret rites of the Tantra. A festival held in honor of Kali is called also Kali-puja, as the Dasra in honour of the same deity, under the name of Durga, is called also Durga-puja and Durgotsava." Of the many names of this goddess, those of Parvati, Bhavani, Durga, Kali, and Devi or the goddess, are the most common ; they are indeed used almost indiscriminately in the writings and conversations of the hindoos. Although in the present age, human sacrifices are no longer openly made, by the more settled people, there can be no doubt of the existence of the practice formerly, and many of the uncivilized Khonds still follow the rite. To Bhavani, in her character of Kali, it would appear they were chiefly offered ; and no religious rite can be more minutely ordered and detailed than this is in the Kalika Purana, the sanguinary chapter of which has been translated by Mr. Blaquiere and given in the fifth volume of the Asiatic Researches, Art. xxiii, and as well as the ceremonies, the implements, prayers, &c., used on these horrid occasions, are minutely described and recited. In this article, premising that Siva is supposed to address his sons, the Bhairava, initiating them in these terrible mysteries, occurs, " The flesh of the antelope and the rhinoceros give my beloved" (*i. e.*, the goddess Kali,) " delight for 500 years." " By a human sacrifice, attended by the forms laid down, Devi is pleased one thousand years, and by a sacrifice of three men, one hundred thousand years. By human flesh, Camachya, Chandica, and Bhairava who assume my shape, are pleased one thousand years. An oblation of blood which has been rendered pure by holy tests, is equal to ambrosia : the head and flesh also afford much delight to the goddess Chandica." " Blood drawn from the offerer's own body is looked upon as a proper oblation to the goddess Chandica." " Let the sacrificer repeat the word Kali twice, then the words Devi-Bajreswari, then Lawha Dandayai, Namah ! which words may be rendered—Hail, Kali ! Kali ! hail, Devi ! goddess of thunder ! hail, iron-sceptred goddess !" " Let him then take the axe in his hand and again make the same by the Calratriya text." Different mantra are used, in reference to the description of the victim to be immolated : females are not to be immolated, except on very particular occasions : the human female never. Although, as must appear evident, human sacrifices were formerly legal, they nevertheless still most pointedly prohibited in other very ancient books; such prohibition is, indeed, a further proof of the existence of the practice. In the Brahma-Purana every Neramedha, or man-sacrifice, is expressly forbidden; and in the fifth book of the Bhagavat, Sir William Jones has pointed out the following emphatical words:—"Whatever men in this world sacrifice human victims, and whatever women eat the flesh of male cattle, those men and those women shall the animals here slain torment in the mansions of Yama; and, like slaughtering giants, having cleaved their limbs with axes, shall quaff their blood." See, for comments on this passage by the learned translator, As. Res., vol. iii, p. 260. The most recent missionary accounts show that in many of the Polynesian islands, up to the present date, human beings are sacrificed on commencing to build a war-canoe, a chief's house, or on the death of a chief. In fact, the Purushamed'ha or human sacrifice, is prescribed in the Puranas, but amongst the more civilized races of India, the ceremony had long ceased to be other than emblematical, and, as above remarked, it is only the continuance of the meriah, amongst the Khond, the human sacrifices amongst the tribes on the N. E. of India, the head-hunting of the Dyak, and the cannibalism of the Eastern Archipelago, which show that the horrid practice was once more extensively followed. Human sacrifices of the most extensive character and ancestral worship still prevail in Dahomy, and there is an Amazon class, and in all Africa a serpent-worship prevails. So many as six hundred victims are offered up at Dahomy at one time and are a feature of ancestral worship. According to Dr. W. W. Hunter, the Hadi are a helot race spread over all Bengal, who take their name from the original Santali word for man, 'had,' and who have supplied such terms as 'hadd,' base, low-born; 'hadduk,' a sweeper; 'hunda,' hog, blockhead, imp; hudduka, a drunken sot, &c., also, 'Hadi,' in low Bengali, 'Hadikath,' is the name of a rude fetter or stock, by which the landholder used to confine his serfs until they agreed to his terms. It means literally the helot's log; it was also used for fastening the head of the victim in the bloody oblations which the Aryan religion adopted from the aboriginal races, especially in the human sacrifices to Kali, to which the low castes even now resort in times of special need. In an account of the last human offerings to Kali, during the famine of 1866, it was mentioned that the bleeding head was found fixed on the 'harcat,' *i. e.*, helot's log.

At Quendendes village in S. Africa, Dr. Livingstone found human sacrifices frequent: and when a chief dies, a number of his servants are slaughtered, to form his company in the other world, a custom which the Barotse also follow.

A chapter on human sacrifice in Dr. Norman Chever's book on Medical Jurisprudence contains much curious and important information, and it is worthy of note that the author writes of human sacrifice by decapitation as an existing practice (pp. 408, 410), and says there are "strong reasons for believing that there is scarcely a district in India in which human sacrifice is not still practised occasionally as a religious rite." Doubtless, the old sanguinary expiatory ideas still lurk in the breasts of the masses, and in face of impending famine or pestilence, when men's apprehensions are most deeply stirred, the offering of a human victim to the power which can inflict hunger or disease, instead of the usual goat or buffalo, is not a violent or unnatural step. Ideas of this nature, formulated under the terms sacrifice and atonement, are essential axioms in comparative religion, and their refinement is only to be hoped for as part and parcel of a refinement of national thought and habit. To this end, general education, and more particularly education in the physical sciences, and the fostering of a belief in general laws and a benevolent God, are the great and only means.

Among the Khonds of Central India, when performing the Meriah sacrifice, which was quite common up to the year 1850, a stout stake is driven into the soil, and to it the victim is fastened, seated, and anointed with ghee, oil, and turmeric, decorated with flowers, and worshipped during the day by the assembly. At nightfall the licentious revelry is resumed, and on the third morning the victim gets some milk to drink, when the presiding priest implores the goddess to shower her blessings on the people, that they may increase and multiply, prosperity attend their cattle and poultry, fertility, their fields, and happiness to the people generally. The priest recounts the origin and advantage of the rite, and concludes by stating that the goddess has been obeyed and the people assembled. Other softening expressions are recited to excite the compassion of the multitude. After the mock ceremony, nevertheless, the victim is taken to the grove where the sacrifice is to be carried out; and to prevent resistance, the bones of the arms and legs are broken, or the victim drugged with opium or datura when the Janni wounds his victim with his axe. This act is followed up by the crowd; a number now press forward to obtain a piece of his flesh, and in a moment he is stripped to the [illegible]ones. Various nations in India, besides the Khonds who have been already mentioned, used to offer up human sacrifices on extraordinary occasions ; and even now in some places, though the actual sacrifice is no longer permitted, they make human figures of flour, paste or clay, and then cut off the heads in honour of their gods. The object of the Kuki inroads on the plains is not plunder, for which they have never been known to show any desire, but they kill and carry away the heads of as many human beings as they can seize, and have been known, in one night, to carry off fifty. These are used in certain ceremonies performed at the funerals of their chiefs, and it is always after the death of one of their rajahs that their incursions occur. The Rev. Mr. Ward, writing on the hindoos in the early part of the nineteenth century, says it is difficult to form an estimate of the number of hindoos who perish annually, the victims of superstition ; but conjectures the number of victims annually sacrificed to be 10,500 as under,

Widows burnt alive on the funeral pile, in Hindoostan..	5,000
Pilgrims perishing on the roads and at sacred places...	4,000
Persons drowning themselves in the Ganges or buried or burnt alive...	500
Children immolated, including the daughters of the rajputs...	500
Sick persons whose death is hastened on the banks of the Ganges...	500

In his day persons cast themselves under the wheels of the cars of hindoo idols and were instantly crushed to death. Great numbers of these cars are to be seen in Bengal ; and every year, in some place or other, persons thus destroyed themselves. According to former accounts, writes Malcolm, self-destruction among men, by casting themselves during public festivals, from a rock at Onkar Mundattah, and from a precipice near Jawad, was once common. The sacrifices have of late years seldom occurred. The men who sacrifice themselves were generally of low tribes, usually the Bheel, Dher, or Chumar. One of the leading motives by which they were said to be actuated, is a belief that they will be re-born rajas in their next state of transmigration. In the Rig Veda mention is made of the Agnihotra, or offering of clarified butter, and in the Samaveda of the juice of the Soma plant.

In the Achariah Brahmana, translated by Roth it is related that : " Harichandra had been married to a hundred wives and yet there was no man-child born to him. At the suggestion of Narada, a sage, he went to king Varma, and promised that if his prayers were heard and a son granted to him, he would offer him up in sacrifice to the king. Accordingly, in due time, a son was born who was called Rohita. Varma wanted to keep Harichandra to his promise, but the latter put forth various excuses till Rohita grew up. But then, Rohita objected, and fled to the woods, where he wandered for six years, until he fell in with the rishi Agastya. The rishi had three sons, and he promised to Rohita, his second, Sunasepha, on receipt of 100 cows. But another difficulty occurred, for no one would bind the victim until Rohita gave 200 cows more. Sunasepha unwilling to be sacrificed, interceded first with Prajapati and then with Agni and Savitra, who referred him to Varuna by whom again he was referred to Indra. Such is a tale of the rite as practised in ancient times, but in Manipore, Cachar and Assam, according to the Calcutta Review for 1860, the offering of human sacrifices is still continued. By the records of the Sudder Nizamat Adalut of Chittagong for 1852, some men of the Toonia Joom Mahals were tried for murder by sacrificing. This is a forest tract in the hills and inhabited by the Mug, Chukma, Reang, Tipperah and other races, all more or less nomadic. The place of sacrifice was a cleared spot in the jungle and staked round with bamboos about six feet high. The sacrificial pole, the Phula bans, are bamboos, scraped and stripped at the edges, the hanging strips giving a rude notion of ornament. These scrifices generally occur once a year. During its celebration at Agartollah a gun is fired every evening at sunset, when every person hurries to his home. The Kuki and all the hill tribes worship local deities, said to be fourteen in number.

There are two hymns in the Rig Veda, describing the rite of the Aswa-med'ha or sacrifice of the horse, and which leave no doubt, that in the early religion of the race, this sacrifice has had recourse to as a burnt-offering to the gods. It was even then, however, falling into disuse, and was existing as a relic of an ante-vedic period, imported from some foreign region, possibly from Scythia, where animal victims, and especially horses, were commonly sacrificed. And in still later times, the Aswamed'ha consisted in certain ceremonies ending in the liberation of the horse, as throughout Southern India is still practised with a bull or cow, many of which are met with in every village, freed or let loose in the name of the gods Siva or Vishnu. The cow is not now offered in sacrifice by any hindoo sects, but in the marriage ceremony of some parts of the country, where a milk-cow, Surabhi, is released on the intercession of a barber, sufficien remains to show that the rite was formerl practised at marriages, for the sake of hospita lity. The male buffalo is, however, frequently sacrificed, sometimes in considerable numbers, and only in 1859, the Government of Madras ordered the Magistrate of the Krishna Division to forbid the cruel rite of Ammavaru, wherein bullocks are impaled alive to appease the angry goddess, Devi, and avert cholera. On that occasion, in a small village, twelve to twenty-four bullocks were sacrificed, as also several hundred sheep, and the heads of the sacrificed buffaloes were carried in procession on the heads of men. As might be supposed from the sacrificial rites amongst the Jews, allusions to such are to be found in the New Testament. This occurs as the word Curban, (Kurban, ARAB , PERS. HIND. Sacrifice) Mark vii, 11. But ye say, if a man shall say unto his father or mother. It is Coorban, that is to say, a gift, by whatsoever thou mightest be profited by me ; he shall be free. This word is equivalent to Sadqa or Tassadooq or Fida, and is often used by men or women addressing a superior, in which case it means merely, I am your Kurban. The word is Arabic, derived from the Hebrew, has allusion to an approaching to God, and means a sacrifice, a victim, an offering, an oblation, for which also, we have the Greek *Καρπομα*. The other words, in the Arabic, Sadqa, Fida and Tasaduq mark the continuance of the sacrificial rite. Sadqa, ARAB., properly Sadaqa, from the Hebrew, means alms, propitiatory offerings and sacrifice. The words are continued into Hindustani, in Sadqe-jana or Sadqe-hona, to become a sacrifice for the welfare of another, and Sadqe-karna, to sacrifice for the welfare of another. Amongst the Bhot, in the Ladak frontiers of the western Himalaya, the people salute by raising the back of both hands to a height even with the forehead and then repeatedly describing a circle in the air with them, by dropping the fingers downwards and turning the palm inwards. This is similar to the mahomedan practice of Billaen-lena, where a woman is supposed to take upon herself all the evils which would befal the person whom she addresses.

The Bali is any offering to an idol, such as that of flowers or other things. Presentation of food to all created beings, by throwing grains up into the air ; goats and other animals offered in sacrifice. The presentation is called bali-dan or bali-danam. The offerings to Vishnu consist of rice, milk, curds, fruits, flowers and inanimate forms : but to the terrific forms of Siva, or his consort Durga, living creatures, sheep, goats, buffaloes and human beings are offered up, in which case, the heads are given to the priests, and the bodies are carried away. The Ostyak, when they kill an animal, rub some of the blood on the mouths of their idols. Even this seems at length to be replaced in some cases, as Mr. Taylor has suggested, by red paint. Thus the sacred stones in India, as Colonel Forbes Leslie has shown, are frequently ornamented with red lead. In many cases, it seems to be a necessary portion of the ceremony that the victim should be eaten by those present. Thus in India, when the sacrifice is over, the priest comes out, and distributes part of the articles which had been offered to the idols. This is received as holy, and is eaten immediately. The Woon district in East Berar, came under the care of the British about the middle of the 19th century, when Berar was assigned by the nizam of Hyderabad. Before the assignment, searchers for treasure used to offer human beings in sacrifice, but the sacrifices of victims there are now confined to buffaloes, sheep, goats and fowls. A buffaloe is sacrificed in every village in the Dusserah festival. The sacrifice is to the goddess of kine, Gaodevi, and the buffalo is led up to the house of the headman of the village, who makes to it oblations of flowers, &c. He then strikes it on the muzzle with a sword and allows the blood to fall on the ground as a libation to the goddess to appease her anger. It is then led to the door of every house in the village ; each householder makes a money present to the leader : in the evening the victim is killed by its throat being cut, and at the south boundary of the village, a drop of its blood is applied to the foreheads of the headman, of the potail, the deshpandi and deshmukhs. Outside of every Woon village is a shrine of the small-pox goddess, called there Sitla-devi. It is merely a few stones coloured with red lead and, after recovery from this ailment, the family in which the disease has been, visit the shrine, offer a goat as a victim, and prepare food for this oblation. Throughout India, generally, at the present day, in almost all the household sacrifices, in which the husband or head of the house is the priest, the oblation is used as food. In North America, the animals sacrificed are killed and eaten, or buried : sometimes, the horse instead of being killed is simply set at liberty, in the presence of the warriors of the tribe. Sonnerat relates that the Syrians, at the feast of the torches or funeral pile, and the Hebrews, at the feast of the Passover, made arbours before the temples, and carried their gods round them in procession, whom they afterwards burned. The people then presented their offerings, which commonly were lambs and sheep ; and after the priest had made the first libation upon them, each person carried his victim home to eat it. Some texts of Menu would seem to authorize the eating of animal food at all seasons, observing merely the preliminary ceremony of offering a portion of it to the gods or manes, like the heroes of Homer, with whom the sacrifice is only the prelude to a feast.

The institutes of Menu contain the following paragraph :—The sacrifice of a bull, of a man, or of a horse, in the kali age, must be avoided by twice-born men ; so must a second gift of a married young woman, whose husband has died before consummation ; the larger portion of an eldest brother, and procreation on a brother's widow or wife. The Reverend Mr. Ward, writing regarding Bengal, in the early part of the 19th centuary, mentions that at a village called Ksheeru, near the town of Burdwan, human sacrifices were offered to the goddess Yoogadya, a form of Doorga ; at Kireetukona, near Moorshedabad to Kali, and at many other places. The discovery of these murders in the name of religion was made by finding the bodies with the heads cut off near these images ; and though no one acknowledged the act, yet the natives well knew that these people had been offered in sacrifice. He says that at the village of Serampore, near Kutwa, before the temple of the goddess Tara, a human body was found without a head ; and inside the temple different offerings, as ornaments, food, flowers, spirituous liquors, &c. All who saw it knew, that a human victim had been slaughtered in the night ; and search was made after the murderers, but in vain.

At the present day, in most hindoo households, every domestic occurrence forms a subject for sacrifice, generally of the cocoanut or plantain fruit, or a fire libation with the gheo or clarified butter and an oblation by burning camphor. Mr. Forbes, in his Ras Mala of Guzerat mentions that when a young married woman has reached the fourth month of her pregnancy a bracelet is fastened upon her arm, to which is affixed, as an amulet to protect her from the evil eye, a packet of dark coloured cloth, containing scrapings from the image of Hanooman and dust from the cross-roads. A feast is given on her investiture with this bracelet, and she is released, during the time she wears it, from the performance of any part of the household duties, for in India as in England,

"Fairies and nymphs with child must have the things
"They long for."

In the sixth or eighth month of her pregnancy the people of her caste are again assembled to a feast, and the family-priest performs fire-sacrifice before them. The woman is conveyed to the house of some relation, where she performs ablutions and dresses herself in handsome clothes and ornaments. She is then conducted in procession, attended by musicians and singers, to the house of her husband. Her friends precede her as she walks thither, and strew her path with betel-nut and coins. At home she is received by her father, who has come from his village for the purpose, and who presents her with clothes, jewels, money and other offerings not forgetting the symbolical cocoanut, disposed together upon a shield. On the thirteenth day after its birth the child acquires a name. The first letter of it is fixed by the astrologer. Within a year and a quarter of the birth the relations are once more called together to witness the ceremony called "Anaprashana," performed on the child's first tasting farinaceous food. Brahmins once more worship the gotruj, and kindle the sacred sacrificial fire. In order to determine the course of life which the child is to follow, they set before it the insignia of several professions :—

"That which first the child doth touch,
"Vessel, money, weapon, or book,
"The livelihood of the child,
"By that same will be procured."

A Guzerat proverb celebrates the accomplishments of him who can handle

"The pen, the ladle, or the spear."

If a child die before the "Anaprashana" ceremony has been performed, it is buried in the ground instead of being committed to the funeral pile. A similar custom was, it appears, observed among the Greeks, in regard to infants who died before cutting a tooth. The Romans also had the same custom applied sometimes to children who did not reach their fortieth day, and the observance is particularly mentioned as having obtained in the case of members of the Gens Cornelia. In addition to that of children who have not undergone the "Anaprashana" ceremony, there is also another exception among the hindoos of Goozerat to the otherwise universal rule of cremation—that of the Sunyasee. At this devotee's interment no wailings or expressions of grief are allowed. The corpse, seated in a litter, is borne to the grave preceded by musicians and attended by persons who cast rose-coloured powder into the air, or demonstrate in other modes their joy. It is placed in the earth in a sitting posture, instead of being consumed on the pile. A small platform raised over the spot, and exhibiting the sculptured feet of the deceased, commemorates his sanctity. When age or infirmities warn a man of the near approach of death, he should (so say the Shastras) perform, to the best of his ability, "deh shooddh prayuscheet," or expiatory penances for the purification of his body. When a hindoo appears to be at the point of death his friends prepare a place on the ground by smearing it with cow-dung they strew it with sacrificial grass, with sesamum and barley. The dying man is stripped of his ornaments and of his clothes, with the exception of a single garment. The hair of his head and his moustaches are removed, and his body is washed with water. He is then laid upon the place which has been prepared, with his feet pointing northwards towards Meroo and the abodes of the blessed, and his back turned upon the city of Yuma. A small cup, containing a cake with a silver coin laid upon it, is placed in his hand. Some poor brahmin is then called in to receive the cup from the hands of the dying man. Rich persons present a cow, gold, or other valuable presents, and they promise their departing relative that they will carry his bones to Benares and cast them into the Ganges, or that they will make pilgrimage (the merit of which shall be his) to Muthoora, Dwarka, Somnath, or other celebrated holy ground. They take vows, also, on behalf of the dying man, to fast or to spend money in religious offerings, sealing the promise by presentation of a handful of water. Sometimes they offer gifts of iron to propitiate Yama, whose weapons are of that metal. These offerings are meritorious alike to the giver and to him on whose behalf they are presented. "The son," it is said, "who presents gifts by the hands of a dying father, should be honoured as the lamp of his race." At the same time they set near the dying man a lamp supplied with clarified butter, pour Ganges water into his mouth, and place thereon a leaf of the purple basil and a portion of curd. It has been pronounced that if, even when the life has reached the throat, a man declare that he has abandoned the world, he reaches Vykunth after death, and is released from further transmigration. Some persons, therefore, when they believe that their end is approaching, perform the rite of "Athoor Sunyas." When all is over the relations and neighbours assemble at the house of the deceased ; and, like an entre-acte to the tragic drama, commences the humming moan of lamentation. The nearer relatives enter the habitation, exclaiming, "O, father !" "O, brother !" The women, standing in a circle near the door, bewail the deceased, and sing a funeral dirge, beating their breasts in sad accompaniment to the measure. Young persons are lamented longer and more poignantly than those whose advanced ages seem to have pointed them out as the natural victims of the angel of death. The dirge, which usually consists of unconnected exclamations of grief, is sung by one or two women, while the remainder join in chorus. That, of which we proceed to give a part, bewails the death of an early victim, one, it will be observed, who, crowned in former days as a bridegroom-king, is now lamented as a chief and a warrior :—

Alas ! alas ! without the village the wail resounds,
Voi ! the valiant, alas ! alas !
Alas ! alas ! this is Râmjee's anger,
Voi ! the valiant, alas ! alas !
Alas ! alas ! with blood the clouds have rained,
Voi ! the valiant, alas ! alas !
Alas ! alas ! its bounds the sea has abandoned,
Voi ! the valiant ! alas ! alas !
Alas ! alas ! the home-leaving bride is plundered,
Voi ! the valiant, alas ! alas !
Alas ! alas ! Yum Raja's plunderers have come,
Voi ! the valiant, alas ! alas !
Alas ! alas ! they have slain the bridegroom-king,
Voi ! the valiant, alas ! alas !
Alas ! alas ! his mundup has been cast down,
Voi ! the valiant, alas ! alas !
Alas ! alas ! the vessels of his Choree have been broken,
Voi ! the valiant, alas ! alas !
Alas ! alas ! his life has been treacherously stolen,
Voi ! the valiant, alas ! alas !

These utterances of grief are rude, but they are far from unaffecting, even to the stranger, the sea-dwelling Englishman, and, as they alternately rise and fall, their sound, stealing from a distance upon his ear, reminds him of that measured melancholy tone which the breakers of ocean produce on some calm evening, as, by turns, they roll upon and recede from a shingled beach. This threnos" finished, the female mourners sit down panting and exhausted. A married woman returning home from a visit at her father's house is presented with clothes and anointed with red ointment on the forehead. The corpse prepared, and placed upon the litter, four persons raise it upon their shoulders. They have previously performed ablutions, and dressed themselves in silk garments. The corpse is carried forth feet first ; one man precedes it, bearing an earthen vessel which contains fire. The relations and neighbours follow, bare-headed, without shoes, and half-naked, running and calling upon their god, the son of Dusruth ; or sometimes one man alone cries to the rest as they run : "Call on Rám !" to which they reply in chorus, "Brother ! Rám !" The women follow the funeral procession to the gate of the village, and thence return slowly home. The prophet Jeremiah is supposed to be repeating part of the usual funeral dirge, when he predicts of Jehoiakim, the son of Josiah, king of Judah, that they shall not lament for him, saying, "Ah, my brother ! or, Ah, sister ! they shall not lament for him, saying, Ah, Lord ! or, Ah, his glory !" (See Jeremiah, xxii, 18, and note with references in D'Oyly and Mant, also Amos, v, 16 ; Ecclesiastes, xii, 5-6.) "The Rajpoot warrior," says Colonel Todd, "is carried to his final abode armed at all points as when alive, his shield on his back, and brand in his hand; while his steed, though not sacrificed, is often presented to the deity, and becomes a perquisite of the priest." It is written in the Shastras that the corpse should be set down at cross-roads within the village, and that the third lump offering, called "Khechur," should be offered there: this custom has, however, fallen into disuse. The Gurood Pooran prescribes that the inhabitants of a village in which a death has taken place are to abstain from food until the corpse has been carried out; at the present time the occupants of the adjoining houses alone observe this practice. So the Jews in their mourning, "Uncover not your heads, neither rend your clothes."—Leviticus, x, 6. "Forbear to cry, make no mourning for the dead, bind the tire of thine head upon thee, and put on thy shoes upon thy feet."—Ezekiel, xxiv, 17. The son, or nearest of kin to the deceased, lights a bundle of dry grass, and passing three times around the pile, places the fire as near as the wind permits him to the head of the corpse. The party of mourners sit down, and await the issue with lamentation; when the corpse is nearly consumed they pour clarified butter upon the pile to feed the fire. As soon as the cremation is finished, the ashes of the dead are collected from the pile and are cast into the river water, or if no stream be at hand they are deposited in a pit dug for the purpose, and sprinkled with water. These ceremonies complied with, the mourners perform ablution and wash their clothes, and the heir presents an offering of sesamum and water to the deceased "to cool him after the flames." The friends who have attended the corpse to the pile rejoin once more, at the house of the deceased, the women and those who have remained behind, and thence disperse to their own homes.

In India, in Bombay, and in Baroach, are sanctuaries called Pinjrarapol into which beasts are received, there, quietly to live in the certainty of never being eaten. They are called 'freed beasts,' and are the birds, beasts, or fishes which have been purchased and set free, as votive offerings to the god in whose temple grounds they are turned loose. They are tended by the priests belonging to the temple who regard them as sacred.

The *Homa*, a sacrificial rite of the hindoos, is a fire sacrifice. The ancient history of India shows that it has had four great religious eras. The Vedic, in which Agni, Indra and other personifications of spiritual existences were propitiated with feasts and invoked with the hymns of the Rig Veda, and in which maidens selected their husbands in the swayamvara, and monarchs sacrificed the horse in the Aswamedha. In the brahminic period, the Kshatriya feasts were converted into sacrifices for the atonement of sins against brahminical law, and divine worship was reduced to a system of austerities and meditations upon the Supreme Spirit as Brahma. It was in this era that the brahmins assumed the character of a great ecclesiastical hierarchy and established that priestly dominion which still extends over the minds and senses of the hindoos of India. Thirdly, the budd'hist period in which Sakyamuni appeared, and fourthly, the brahminical revival during which brahmins abandoned the worship of their god Brahma, and reverted to the old national gods and heroes of the Vedic Aryans. In this era, Vishnu came to be regarded as the Supreme Being, and Rama and Krishna as his incarnations. In Southern India, at the present day, in the sect of Vaishnava brahmans, the Vudghula Vaishnava offer living creatures in sacrifice, and Tenaghula Vaishnava and Madhawa substitute dough instead of animals. In the sacrifices of Saiva brahmans the victim's head is never cut by the Sudra but is strangled by him, so that the breath is lost without spilling blood. The Saiva brahmans do perform sacrifices of a living creature in Southern India, and never use dough images as a substitute. Amongst the Smartha and also Madhawa, each household keeps a tulasi plant in the middle of the court-yard for worshipping. Each new moon, as also on the occurrence of an eclipse, either of the sun or moon, also, at the summer and winter solstices, their "utrayanam" and "datchanayanam," every caste hindoo, whether brahman, chetria, vaisia or sudra, offers the "Tharpanam" or water-sacrifice, in the names of his deceased father, grand-fathers, great grand-fathers and their wives, seeds of the oriental sesamum being mixed with the water. It is, as a means of continuing this ceremony, that hindoos long to have a son born to them as, in their creed, it is taught that the manes of ancestors are gratified by the "Tharpanam." This is a particular part of the sacrifice called yugnu, but at present it is often performed separately. The things offered are clarified butter, sesamum flowers, boiled rice, rice boiled in milk and sweetened with honey, doorvu-grass, vilva leaves, and the tender branches, half a span long, of the ushwutthu, the doomvuru, the pulashu, the akun-du, the shumee, and the khudiru trees. Clarified butter alone is sufficient, but any or all of these things may be added. The Gond worship Bauga, Bamea, Banca and Deva, to whom they offer fowls, goats, fruit, rice, grain, spirits, and whatever the country affords.

Human sacrifices are noticed in the Vedas.

Harischandra, son of Vedas, of the family of Ikshvaku, was a king without a son. Narada bid him go to Varuna the king and say may a son be born unto me, and I shall sacrifice him to you. Varuna the king assented : a son was born to him, on which Varuna demanded him in sacrifice, but for various excuses this was deferred, until a substitute for the son, was found, in Sunasepha, the son of a rishi who, by invoking the gods Agni, fire, Savitri, the progenitor, Varuna, the king, Visva-Deva, collective gods, Indra the friendly, Asvini, divine physicians, born of the sun and Usha, the dawn, at last, was released : but not before Sunasepha was bound to the sacrificial post, and his father whitling his sword approaching to kill him, on which Sunasepha exclaimed, " They will really kill me, as if I was not a man." In the At'hareya brahmana, (6-8) it is said the gods took man for their victim, but as he was taken, the medha (the sacrifice or the spirit) went out of him. It entered the horse. Therefore the horse became the sacrificial animal. Then the gods took the horse, but as it too was taken, the medha was taken out of him and entered the ox, therefore the ox became the sacrificial animal. The same happened with the ox, afterwards the sheep, then the goat, and at last the earth became the victim. From the earth rice was produced and rice was offered in the form of puralasa, in lieu of the sacrificial animal. The drift of the story is that in former times all these victims had been offered, as we know for certain that horses and oxen were ; though, afterwards, these, also, were discontinued. In the sacrifice of the horse, part of the flesh was eaten by the assistants, and part presented as an offering to the gods. No reasonable doubt can be entertained that the ritual of the early hindoos, did authorize the sacrifice of a horse.

Neither in Southern India, nor perhaps in any part of India, is a vaishnava brahman known to offer living creatures in sacrifice. The saiva brahmans on the contrary, annually, in some towns, Conjeveram for instance, perform the bloody rite to their ancient gods, Indra, Varuna, Yama, and both in 1859 and 1860, the saiva brahmans in Madras so sacrificed. Several brahmans are employed in this rite. One brahman assisted by his wife, the couple being styled the Soma Yaji, and Soma Devi, commences the rite by performing the fire sacrifice, by pouring ghee into a large fire. The pujari, a sudra, then strikes the head from the victim and large portions of its flesh being thrown into the fire, and reduced to ashes, portions are distributed to the assembly. This being a Prasad'ham or food offered to the gods, all castes can partake of it. Many saiva, when aversion to take life prevents them sacrificing an animal, substitute an image made of dough.

In Southern India the lower classes of hindoos also, though rarely, sacrifice pigs to the inferior gods. Living sacrifices of animals are an essential part of the worship of all the tutelary village goddesses in Southern India, as also of the goddesses of cholera, small-pox, &c. Their names are various, amongst the several nations, Tamul, Telugu, Canarese and Mahratta. Ammun, Amoor Amma, Balamma, Poch Amma, Yelamma, Marri Ammun, Ai, Satwai Devi, Sitla-devi, and others, amongst whom everywhere, Bal Amma and her worshippers seem dreaded, the pariahs worshipping other of the Ammun goddesses, refusing to intermarry with them. The Yelm worshippers, also are dreaded as sorcerers, and their wives are distinguishable by the mode in which they attire themselves with their sarhi which they bring from behind and from left to right. Satwai, amongst the Mahrattas, is a great goddess, to whom children's hair is devoted, the front part offered to her, the back part being retained till some other goddess possess the body (ang bharave) such as the small-pox goddess or cholera goddess Marri-ai.

In the bloody sacrifices of these non-Aryan races, the goat is more usual. The rite is, ordinarily, performed only once a year, when friends join to offer a goat and make a feast of its flesh afterwards. At all the sacrificial oblations, bread and grains are also offered and used in the after-feasting. Thousands of sheep and fowls are annually sacrificed at Periyapalayam, a village about 30 miles from Madras, and multitudes of people attend from that city and the neighbouring villages, to celebrate the yearly festival, which takes place in the bright half of the month of Adi. Large numbers of buffaloes were until the middle of the nineteenth century, offered at the funeral rites of the Toda of Ootacamund, but the Madras Government put a stop to such wholesale massacre, and restricted the rite to the killing of only two animals at a time,—a measure which the Toda race viewed with unaffected alarm and dislike, as likely to decrease their children and cattle. Human sacrifices are still, in Southern India, deemed to be requisite to mollify goddesses and demons who guard hidden treasure and who are believed to have a partiality for the blood of a pregnant woman, especially of one who is conceived of twins, and to the first-born of the goldsmith caste : indeed, in popular belief, when writing in the year 1860, one of the latter was credited to have been very recently offered. There is a shrine of

Vatrappanachiyar, the tutelary goddess of Tiruvattur, a village to the north of Madras, on the road to Ennore; this is situate in a part of the great and much frequented pagoda of Tiyagaraia Sami, for which the village is celebrated in ancient hindoo books. The sacrifice now offered is that of a male buffalo, but is conducted with so great secrecy, that people are not generally admitted to witness it. Indeed the fear of witnessing the sacrifice and its attendant ceremonies are so great that pregnant women are if possible, kept out of the village for fear of abortion, which is believed to be the certain result, should the shrieks of the men who carry the raktabali fall on their ears. This raktabali (rakta, blood; bali, sacrifice) is assumed to be the food for devils and the attendant spirits of the goddess, and consists of rice mixed with the sacrificial blood. It is carried only during the last day of the annual festival of the goddess, after midnight, in an earthen pot of a peculiar shape and design, by men specially allotted to the duty. They run and shriek and howl in the street to scare away the devils and evil spirits, and halt at the corners and windings, and throw balls of this blood-mixed rice to the demons &c. It is considered to be an evil omen for any man to meet them in their rounds, as fever, madness, and disease might befal him. All treasure concealed underground for a length of time is said to become the property of demons, who take charge of and only part with it, to those who satisfy their desire for blood—the greater the demon, the higher is the kind of sacrifice he demands. Simple-minded men, even among those who are considered to belong to the better informed classes of hindoos, believe in the divination of quacks, who pretend to point out the very places in which treasure is to be found, by a collyrium which when applied to the eye is said to give it the power of discovering the treasure. Stories are now and then spread among the people regarding this subject; and this desire for discovering and exhuming hidden treasure, and the love of making gold and silver, prevails to some extent among the educated hindoos. Bloody sacrifices form no part of the worship paid to Rama, Krishna, Hanuman, &c., of the vaishnava sectarians, nor Vigneswara, Subrahmaniya, &c., of the saiva sect, or of their respective goddesses. In addition to the village deities, noticed, the only goddess who requires them is the sakti of Siva, defined by her votaries, to be the visible energy of the divine essence symbolized as a female. She is highly venerated during the nine days of the Dassera or Navaratri (the nine nights) at the close of which a sheep is generally offered in the houses of Rajputs and Mahrattas. The sacrifice of buffaloes on the occasion is very rare, and when it is offered, the ceremony takes place in temples, sacred to this goddess, but sometimes in jungles and unfrequented parts. The goddesses and demons of the sudras, all accept bloody sacrifices, which are generally accompanied with the offering of spirituous liquors. As a general rule, the offering of such sacrifices among the houses of educated hindoos, and in the superior temples is observed with great secrecy. Madan is very little known, but with a class of native magicians, deemed a very great and powerful demon. He is generally courted by the pariah, chuckler, lubbay, and uneducated mahomedans, who offer beef and arrack to obtain his good-will and favour.

It has been noted above that the terms used for the sacrifice are Bali, TAM.; Gavu, TEL.; Yagnya magha, SANSC. When an ox, lamb or fowl is offered up in sacrifice to a Devi or Mari female deity by the sudras, the first two words are used. The words Yagnya Magha are used to indicate a sacrifice celebrated only by the brahmins on occasions in which they offer goats and not any other animals, as the following five things are forbidden in the Kaliyoga or the Iron age, the sacrifice of a horse, of a cow, the abandonment of all worldly affections, serving flesh to brahmins invited to the celebration of the funeral obsequies, or to have issue by a brother-in-law, that is, husband's brother, in case of a woman not having any children by her husband. In the present day, the cow is not offered in sacrifice by any hindoo sect or race, but in the marriage ceremony of some parts of the country, where a milk-cow, surabhi, is released on the intercession of a barber, sufficient remains to show that the rite was formerly practised at marriages, for the sake of hospitality. The male buffalo is, however, frequently sacrificed, sometimes in considerable numbers, and only in 1859, the government of Madras ordered the magistrate of the Krishna division to forbid the cruel rite of Ammavaru, wherein bullocks are impaled alive to appease that angry goddess, and avert cholera. On that occasion, in a small village, bullocks to the extent of twelve or twenty-four were sacrificed, as also several hundred sheep, and the heads of sacrificed buffaloes were carried in procession on the heads of men. As might be supposed from the sacrificial rites amongst the Jews, allusions to such are to be found in the New Testament. One such occurs as the word Corban (Kurban, ARAB., PERS., HIND. Sacrifice) Mark, vii, 11. "But ye say, if a man shall say unto his father or mother, it is Corban, that is to say, a gift, by whatsoever thou mightest be profited by me; he shall be free." The word Kurban is now almost equivalent to Sadqa or Tassaduq or Fida, and is often used by men or women addressing a superior, in which case it means merely, I am your Kurban. The word is Arabic, derived from the Hebrew, has allusion to an approaching to god, and means a sacrifice, a victim, an offering, an oblation: for which also, we have the Greek *Καρπομα.* The other Arabic words, Sadqa, Fida and Tassaduq, mark the continuance of the sacrificial rite. Sadqa, ARAB., properly Sadaqa, from the Hebrew, means alms, propitiatory offerings and sacrifice. The words are continued into Hindustani, in Sadqe-jana or Sadqe-hona, to become a sacrifice for the welfare of another, and Sadqe-karna, to sacrifice for the welfare of another. Amongst the Bhot race, in the Ladak frontiers of the Western Himalaya, the people salute by raising the back of both hands to a height even with the forehead and then repeatedly describing a circle in the air with them, ending by drooping the fingers downwards and turning the palm inwards. There is a similar mahomedan practice of Billain-lena, where a woman is supposed to take upon herself all the evils which would befal the person whom she addresses and thus encircles. Though, as has been seen, in Southern Asia, human and other sacrifices still continue to be made, the increasing power of the British in India may soon lead to the discontinuance of such barbarities. Mention has been made above of the Soma sacrificial priests, the Soma Yaji and Soma Devi. The Soma, was an ancient Arian rite, a sacrifice to Indra (Zeus) of an intoxicating potion, consisting of fermented juice of plants mixed with milk. Soma juice and its effects are repeatedly mentioned in the Vedas, (*Vols.* i, *pp.* 21, 139; ii, *pp.* 169, 233, 260; *and* iii, *p.* 470,) but the Soma sacrifice, now-a-days, is not made with any spirituous fluid.

The Irular race of the Neilgherries sacrifice to their deities a he-goat or cock, by cutting the victims throat, and throwing them at the feet of the idol. This is a winnow or fan, which they call Mahri and is evidently the emblem of Ceres; and, at a short distance in front of the rude thatched shed which serves as a temple are two rude stones, one called Moshani, the other Konadi Mahri, but which are subordinate to the fan occupying the interior of the temple.

The Veddah are a semi-savage race in Ceylon, some of whom in the interior dwell in hollow trees or caves. *They are dexterous hunters, using bows and arrows and clubs of* iron or wood. They are supposed to worship the planets, evil-spirits and the spirits of their deceased ancestors.

The Rhodia, an out-caste race at Suffragam, Dombera, and other parts of the Kandian province of Ceylon, are nominally buddhists, but are also devil-worshippers.

The Khond of Kimedy have long been addicted to sacrifice human beings to the earth-goddess. The victim is always purchased, and is destroyed with much ceremony, in the midst of assembled Khonds, each of whom tears a portion of the body to bury in his field as a propitiation.

With the Kol, one or two of the hindoo gods are reverenced, but, they have many of their own, to which they mostly resort. They sacrifice fowls, and pour libations before eating. Colonel Tod describes a lofty three-peaked mountain in the Vindhya range on which is a temple dedicated to Aya-mata, also called Isani, the tutelary divinity of the Kol, and he mentions that Isani and the effigy of the horse are the only objects worshipped among this aboriginal race. He mentions that Isani means Mother-earth, from Isa, goddess, and Anani, earth. The chief divinity of the Lurka Kol is the sun, suraj; and next to the sun ranks the moon, chandoo; and then the stars, which they believe to be the children of the latter. Besides the sun and moon, there are spirits called bhonga which inhabit the trees and groves in and around the village, and those trees are never denuded of their branches or cut down. When labour-pains come on, the women are shut up in a lonely hut, offerings are hung up near to propitiate the bhonga, and no one ventures to approach till the labour is over.

Amongst the gods, of which the various Vedas and the more recent Puranas make no mention, are the village deities. Every hamlet of the southern parts of the Peninsula has its own object of adoration, always supposed to be a goddess; and the idol, is generally a black stone. Amongst names given to it are:—

Ankal-Amma.
Poni-Amma or gold mother.
Kani-Amma.
Yegata or sole mother.
Mutialamma or pearl mother.
Tripura-sundari or the beautiful of three cities:—
Paleri Amma or great goddess.
Osuramma.
Sellamma.
Yellamma.
Padavettu Amma.
Tulukan Amma.
Muttumari.
Poteramma.
Karikatta.
Tanthoniamma.
Dandumari.
Mallamma.
Chinnamma.
Ammanamma.
Choundeswari.
Vadivatta.
Nagattamma.

They are also called Amman, which, with Amma, Amani, Ai, is generally supposed to mean mother. The villagers believe that these goddesses protect them from sickness and losses, and that their worship averts such or mitigates them. A pujali or pujari, a worshipping priest, of the sudra caste, is appointed for her daily worship. He anoints her daily and puts ashes on her head, really on the top of the stone, for it is not an image being entirely without shape. In a small pot, he cooks rice, which he collects from the villagers in turn, presents it to the idol and then takes it to his own home. He breaks a cocoanut in front of the idol, to which he offers it. But the one-half he keeps for himself and gives the other to the families from whom he collected the fruit. The villagers make vows to their goddess to offer up to her fowls and sheep in sacrifice, if she will fulfil their desires. Once a year, the villagers collect money by subscription and celebrate a feast in honour of their goddess during which sheep and fowls are largely sacrificed. Many of the sudra and the entire servile tribes in the south of India, have the fullest faith in their respective village goddesses. When they or their children are overtaken by sickness, they seek the idol, and consult the pujari, who sings songs, affects to hear the Amman's voice, and then announces to the worshipper the offering that must be presented. If cholera break out, it is not unusual for some neighbouring village deity suddenly to rise into great importance and the sacrificial rite is then almost unceasingly performed. The hindoos too have even personified this pestilence into a goddess whom they have named Maha-Kali, the Great-Kali, also, Mari-Ai, the Death Mother, and believe that if they neglect her worship she destroys them by the disease. Indeed gods are still in process of establishment, and small pox and cholera have thus been personified. Maha-Kali of Ujjain being the goddess of cholera and Mari-Amman of the Tamil people, the Sitla-amman of Western India, a small pox deity. When a person is attacked with small pox, they believe that the goddess has taken possession of the sick man. They entertain a great dread of this goddess. While in the house, the sexes remain apart until recovery and until the sick has been purified by ablution. They place the leaves of the margosa tree beside the sick person, because the goddess is supposed to delight in this tree. They give cooling food but employ neither internal nor external remedies, in reverence for the deity. The women of the household, offer rice flour mixed with jagri or coarse sugar and black gram (pairu Tam. pesalu, Tel.,) before the patient, in honour of the goddess, and afterwards distribute offerings to sudras and others. On the seventh day, *i. e.*, what medical men call the 15th day, the invalid is bathed in cold water, and the whole body rubbed with a pasty mixture of leaves of the margosa (melia and azadirachta) mixed with turmeric, and on the same day rice mixed with curds are distributed to Sudras. If in the virulence of the disease an eye be lost, it is attributed to something having been done, displeasing to the goddess. The goddess indeed is supposed to appear in three forms as Tattu ammavaru or Chinnamavaru, *i. e.*, little small goddess; Peddamavaru or great goddess, and Pairammavaru or goddess of green gram, the two last of which are most feared.

The Amman worshippers almost all practice and believe in the efficacy of demon, or devil or evil spirit rites, amongst which sacrifices always form a part. The sacrifice of the cock, to the demon, peisachi, in this respect similar to the devil-worshippers in Kurdistan, is practised by all the non-Arian people in the south of India, whether of the brahminical hindoo persuasion, or of the servile non-hindoo people. Demons are recognised in the legendary writings of the brahminical hindoos, invariably as waging war with or attempting overcome the gods; in the avatars of Vishnu for instance, given in the histories of severa deified heroes, who were engaged in attacking and destroying demons. Even the demons of the Vedic hindoos, the Assur, Rakhus, and others were only hostile Assyrian and Arachosian nations with whom the intruding Arians came in contact in their migration to the south, for it is established that Semiramis attacked them and was obliged to retire with great loss; and the term Raksha or Rakshisa came subsequently to be applied to other opponents, and is now a common term for a demon. The present characters of the brahmanical deities differ widely from those in which the Vedas paint their deified mortals or embodiments of the elements and plants, Indra and Varuna and Soma and Chandra. And the two-fold character in which some of them are now represented, the one of mercy and the other a cruel sanguinary character, with a horrific form is probably acquired from the demonolatrous people with whom they have been dwelling; just as the buddhists of Burmah and Ceylon have superadded the worship of demons, though nothing can be supposed more foreign to the genius of buddhism than such a system. The intruding brahmans, in their progress of conquest and civilization, seem to have absorbed the demon and local gods of most of the races whom they overcame or induced to pay reverence to them, by accepting them as incarnations of their own deities, or their deities under other names, and while thus smoothing the road to proselytes, necessarily admitted a large amount of the old faith and old worship of their converts. Before the influx of the brahmans from Central Asia, demonolatry was the religion of the early Tamil inhabitants of India, and the brahmans have never been able to extirpate it. In all brahminical books, the unconquered people are described as eaters of flesh and offering bloody sacrifices, and the terms by which the devils are known are not of Sanscrit origin. The words used with reference to devil-worship being exclusively Tamil, indicate its establishment in the arid plain of Tinnevelly and amongst the Travancore jungles and hills at a period long anterior to the influx of the brahmans and their civilization of the primitive Tamil tribes. Every act of worship in the brahminical religion requires a priest and even the worship of the inferior deities, the sanguinary worship of the brahmanical emanations and Ammans (systems of religion opposed to the claim of the brahmins but to a considerable extent influenced by their example), the person who officiates must be exclusively devoted to the duty and a member of a priestly family. But in devil-worship, every individual may be his own priest. The headman not unfrequently acts for the whole village, but any voluntary devotee, male or female may supersede him. In the devil-worship of the Shanar race, goats, sheep, fowls, &c., are offered in sacrifice, for the purpose of appeasing the anger of the demons and inducing them to remove the calamities they have inflicted, or abstain from inflicting the calamities which they are supposed to have threatened. The animal which is to be offered in sacrifice is led to the altar of the devil-temple adorned with red ochre and garlands of flowers. Ordinarily its head is separated from the body by a single stroke of a bill-hook; the sacrifice being considered unacceptable to the demon if more than one blow is required. The decapitated body is then held up so that all the blood it contains may flow out upon the demon's altar. The sacrifice being now completed the animal is cut up on the spot, made into curry, and, with the addition of the boiled rice and fruit offered to the demon on the same occasion, forms a sacred meal of which all who have joined in the sacrifice receive a share. The sole object of the sacrifice is the removal of the devil's anger or of the calamities which his anger brings down. It should be distinctly understood that sacrifices to devils are never offered on account of the sins of the worshippers, and that the devil's anger is not excited by any moral offence. The religion of the Shanars, such as it is, has no connection with morals. The most common motive in sacrificing to the devil is that of obtaining relief in sickness; and in that case at least the rationale of the rite is sufficiently clear. It consists in offering the demon, life for life—blood for blood. The demon thirsts for the life of his votary or for that of his child; and by a little ceremony and show of respect, a little music and a little coaxing, he may be prevailed upon to be content with the life of a goat instead. Dr. Caldwell adds, that there are reasons to believe that the doctrine of substitution was formerly carried to the extent of offering human victims in sacrifice to the Shanar demons, and he points to the practice among the Khond race up to the present time.

In Southern India sometimes as many as twenty goats are sacrificed at one time. The flesh is generally cut up, cooked and eaten on the spot; and round the shrines may often be seen numbers of small earthen ovens. The strongest oath a sudra can take is to swear by the most famous devil of the district; and often before a law suit is carried into Court, the aggrieved party will say to his opponent,—"I will be satisfied, if you will go to such a demon's shrine, and there, on the justice of your cause, blow out the flame of a lamp in the presence of the Kali." A man who would not hesitate a moment to commit perjury in court, would never dare to perform this ceremony knowing his cause to be unjust, for then he firmly believes that he would immediately be stricken down by the demon. So swears Latinus in the Æneid :—

"Tango aras, medios ignes et numina testor"—

Under this ever-present fear of demons, the hindoo often hesitates to go even a hundred yards in the dark; he will not enter a forest alone; he fears to stand on the borders of a lonely lake, for there dwells the spirit which in Scotland is known as the Water-Kelpie, and it is near the water that he has heard may be often seen in the darkness of the night, the "fiery-mouthed devil" (Ignis fatuus.) But most of all, he fears the sandy plain, for it is a notion thoroughly oriental, that the unclean spirit "Walketh through dry places," which are called in Tamil Pay Kadu, "Devil Deserts." Devils are especially said to abound in the sandy wastes between Madura and Tinnevelly, where the mirage (in Tamil, Pay Ter, the Devil's chariot), is frequently seen, and is said to be produced by them. Does a fire take place in a village, it is owing to the wrath of the Village-Devil. His worship has been neglected, or some insult has been offered to him, and he thirsts for revenge. Near the village of Vediarpuram, in the Tanjore district, for the past four or five years, accidental fires have been of annual occurrence, and it is commonly reported to be owing to the anger of Aiyanar, a demon whose shrine is situated to the west of the village. A banyan tree near the spot dedicated to him, was some years ago, felled without his permission, and since that time, the enraged demon, refusing to be propitiated by the usual sacrifices, yearly burns down a house or two. Many races besides hindoos, have been accustomed to make vows in time of sickness. Formerly we are told, people used to go from all parts of England to Canterbury—

> " The holy blissful martyr for to seek,
> "That them hath holpen when that they were sick."

The hindoo makes a vow to go to a particular shrine, and there pour offerings of oil and spices. If a diseased member have been restored, often-times a golden image of it is made and presented to the shrine. A person suffered from a serious affection of the eyes, made a vow that in case of recovery, two golden eyes should be made and presented to the shrine of Mari Amman. In like manner, the Philistines, we read, when afflicted with emerods, thought after consulting with their soothsayers, that they could best propitiate the God of Israel by making and offering to him, golden images of the emerods. As may be expected the devils are most busy in the

> " last scene of all
> That ends this strange eventful history ;"

a young girl fears to cross a dying man lest his latest breath should pass into her in which case she would be possessed beyond recovery. For a similar reason, a hindoo at the point of death is always removed to expire without the house, which would otherwise be haunted. As the corpse is carried away, parched rice is scattered along the route of the funeral procession. It is believed that the devils will stop to pick it up, and it is considered advisable to keep them so engaged till next sun-rise, for should they return to the house before that time they would probably not be satisfied without another victim. A native proverb says :—" A Saturday's corpse goes not alone ;" when, therefore, a death takes place on a Saturday, to prevent evil consequences, a live cock is taken with the corpse to the burning ground, and it is there given away to some person of low caste, or like the scapegoat of old, allowed to escape into the adjacent jungle. Brahmans averse to bloody sacrifices, substitute for a cock, the bolt of the door of the house, which they burn with the corpse. When a dead body is buried instead of being burnt, as in the case of sunniyasi (wandering devotees) Roman and Lutheran christians, salt is placed in the grave, and frequently with it the leaves of the margosa tree so famous as a charm against devils. Salt was till recently, also, in England placed on the corpse for the avowed purpose of keeping it secure from the evil one, and the practice is still said to linger in the Highlands of Scotland. The Highlanders indeed in many of their superstitions are remarkably similar to the hindoos. They formerly planted the rowan, or mountain-ash regarding it as a safe-guard against devils, just as the hindoos regard the margosa. Throughout India, the belief is as common as it was formerly in Europe, that a man who dies a sudden or a violent death, becomes a demon. All the women in the district are immediately possessed by him, and innumerable mischiefs result. A brahman accidentally drowned in the river Kaveri about the year 1870, became in consequence a " Brahma Rakshasa," one of the fiercest of demons. Dr. Caldwell mentions the case of an English officer mortally wounded at the taking of the Travancore lines in 1809, who was afterwards worshipped as a demon ; cigars and spirituous liquors being added to the usual offerings made in such cases. An English or French officer of artillery, killed at the battle of Assaye and buried there near a large tree, continues (up to 1869) to be worshipped by the Mahrattas. A few years ago, a brahman who was sentenced to be hanged at Madras for the murder of another brahman, going on pilgrimage from Benares to Ramesaram, threatened that though they were about to hang him, he would not die, but would become a Brahman Rakshasa and torment all those who had given evidence against him.

Bells and chains are almost always used in the devil-worship and exorcism of Southern India the notion involved seems less to be that of scaring the devil, than that of charming him, just as a snake-charmer charms a snake by music. Near the fanes of the popular devils, there are massive iron chains hanging from the trees, with bells and knives attached to them. In the well-known Sanskrit work, the Hitopadesa occurs a story relating to a famous devil called Ghantakarna or Bell-ear. This Rakshasa was believed to dwell on the top of a mountain near the town of Brahmaputra. One day, a thief having stolen a bell, (probably one of those near the demon's fane,) was killed by a tiger, as he was carrying off his plunder. The monkeys who dwelt in the adjacent forest,obtained the bell and amused themselves by ringing it. The people of the town, having found the dead-body of the man and continually hearing the sound of the bell were filled with intense horror fully believing that the demon enraged, had killed the thief, and was now ringing the bell. The town was in consequence nearly deserted, when an old woman guessing the truth, went to the king and said that for a small sum she would undertake to settle the demon. The king, delighted, gave her what she asked, and the old woman after tracing the cabalistic circle,—(the Kolam) and pretending to go through certain incantations, entered the forest. By means of fruits which she strewed on the ground, she was enabled to decoy the monkeys, and having obtained the bell as a trophy of her victory over the demon, she returned in triumph to the town. So little has the belief in devils been shaken, that in the India of the close of the 19th century, it would in a like case, be just as easy to deceive the people and even their rajahs. Annually amongst the Rajputs of the Solar line, the white boar is hunted and slain as a sacrifice to Ceres, known there as Gouri. On one occasion as related by Tod, scarcely was the ceremony over, when the young prince remarked, it was the festival of the Ahairea, nor must ancient customs be forgotten : "therefore to horse, and slay a boar to Gouri and take the omen for the ensuing year." They slew abundance of game, and in the mimic field of war, the nobles who surrounded the gallant Pertab anticipated happier days for Mewar. Proverbs, xvii, 1, speaks of a "house full of sacrifices." A hindoo priest, who officiates at a great festival, sometimes receives so many offerings, that his house may be said to be filled with them : many articles are damaged before they can be used.—*Milman's History of the Jews, 4th Ed., Vol.* i, *pp.* 24, 25, 154, 155 ; *William Howit, The Supernatural, Vol.* i ; *Bunsen, Egypt's Place in Universal History, Vols.* i, *pp.* 17-179 ; ii, 467-72 ; iii, 286, 525, 531, 687 ; iv, 210, 214, 695 ; *Georgic, lib.* iii, *p.* 5 ; *Ars. SACRIFICE ISLAND, is thus mentioned by Dr. Fryer who visited India in 1673. At Mangalore the Dutch have a fort, and six miles to the north the French have a flag flying : within a league off which a grey rock extols its hoary head eight fathoms above water, navigable on all sides, justly called by us Sacrifice Island, in remembrance of a bloody butchery on some English by the pirate Malabars who are the worst Pickeroons on this coast, going in fleets, and are set out by the great men ashore, the chief of whom lives at Durmapatan.—*A New account of East India and Persia, &c., p.* 55, *Lond.*, 1698, *quoted in Ouseley's Travels, Vol.* i, *p.* 68.

SACSANDER or Satasanda, Singh. Aristolochia indica.

SAD, Pers., a hundred ; hence Saddi, a century. Sau, Hind., a hundred, hence Saikra, per hundred.

SAD also Spanmal, Sw. Corn.

SADA, hindoo unitarians, which their name, Sad'ha, Hind. Pure or Puritan, implies. They originated in A. D. 1658, with a person named Birbhan. They have no temples.

SADA-BASNA, Hind. The white-flowered variety of Coronilla grandiflora.

SADA-BORI, Hind. Asparagus racemosus, *Willde.*

SADACHOO MARAM, Tam. Grewia tiliæfolia, *Vahl.*

SADA-DEBDHAN, Beng. Sorghum saccharatum.

SADA HAJAR MANI, or Sada Hajur Muni, Beng. Phyllanthus niruri, *Linn.*

The saddles of Europe are made with a wooden framework covered with leather of different kinds, and with intervening padding. Those in use in Asia, are made of cloth or felt (numdah) with or without a wooden framework. At the Exhibition of 1851, the saddle-cloths and match-lock accoutrements from the rajah of Kotah, a pattern was produced with gold-headed nails, fixed into green velvet. The effect of this was so good as to be greatly admired by some of the best judges.—*Royle's Arts, &c. of India, p.* 508.

SADDUCEES, see Polyandry.

SAD'H, a hindoo puritan sect of the hindoos. See Hindoo, Sada.

SAD'HI RAM DAS, was the first Sik'h guroo of the Sad'hi tribe, and hence was named Ram Das Sad'hi. The Sad'hi were numerous about Muckawal, about the middle of the 19th century.—*M'Gregor's History of the Sikhs, Vol.* i, *p.* 29.

SADHUA PANTHI, a Vaishnava sect of hindoos in the North-Western Provinces of India ; originated by Sadhua, a butcher.

SAD'HYA, Sans., from sad'h, to perfect.

SADI, a Persian Poet, a beautiful writer in his own peculiar way. Though inferior to Hafiz in lyric poetry, his works are much more voluminous and diversified ; embracing all kinds of composition in prose and verse.

SADIA, generally written Suddya, in lat. 27° 49′ N., long. 95° 38′ E., in Assam, on the right side of the Kundil river, an affluent of the Brahamputra ; near this place, the level of the Brahamputra is 210 feet above the sea. —*Schl., A.*

SADI HAZUR MUNI, Hind., Beng. Phyllanthus niruri, *Linn.*

SADI MODI, Beng. Emilia sonchifolia, *DC.*

SADJEN, see Karang bollong.

SADLA, Rus. Saddles.

SADONG LINGAH, see Katiow.

SADONG RIVER, see India, Kyan.

SADOO JAUHARI, Hind. Is a peddling jeweller.

SADOZYE, an Affghan tribe. The people who dwell about Kabul and Kandahar. Shorawak and Pishin, are designated B'r-Pushtun or Upper Affghans ; and those occupying the district of Roh, which is near India, are called L'r-Pukhtun or Lower Affghans. Persian is the official language of Affghanistan, but the Pushto is alike the common tongue of the uneducated people, of the families of the former Sadozye kings, and of the dwellings of the amir. There are, however, two divisions of the Affghans, termed Pushtun and Pukhtun, who speak Pushto and Pukhto respectively. The Pushto being the western dialect with affinity to Persian, and the Pukhto the eastern with many Sanskrit and Hindi words. The Pushto is spoken, with slight variation in orthography and pronunciation, from the valley of Pishin, south of Kandahar, to Kafiristan on the north ; and from the banks of the Helmund on the west, to the Attock, Sindhu or Indus river, on the east;—throughout the Samah or plain of the Yuzufye, the mountainous districts of Bajawar, Banjhkora, Swatt and Buner to Astor, on the borders of Little Tibet,—a tract of country equal in extent to the entire Spanish peninsula; also, throughout the British districts of the Derajat, Banu Tak, Kohat, Peshawar and the Samah or plain of the Yuzufzye with the exception of Dera Ghazi Khan, nine-tenths of the people speak the Affghan language. Professor Wilson remarks that the inhabitants of the country around Kabul, at the earliest period at which we have authentic accounts of them—that of the Macedonian conquest,—were Indians; and the designation given by the Greeks is confirmed by the language upon the reverse of the coins of the Greek kings of Bactria, which, there is little doubt, is a form of Prakrit. Sadozye, ruled in Kabul from A. D. 1747, till put aside by Dost Mahomed Khan, a Barakzye chief. The advent of the Sadozye and other mahomedan tribes, now styled Affghan, is not known. See Affghan, India, Khyber.

SADQA, Arab. Sacrifice; Sadqe-hona, or Sadqe-jana, to become a sacrifice for another; Sadqe-karna, to sacrifice for the welfare of another. See Sacrifice.

SAD'R, Arab. Chief, hence Sadr Adalut, High Court of Justice. The Supreme Courts of Calcutta, Madras and Bombay were amalgamated with the Courts of Sadr Adalut of the three Presidencies, and the united body designated the High Court of Judicature. Sadr is often used in compound words, as Sadr-Amin, Sadr-Adalat, Sadr-Mohtamim, Chief Amin, Chief Court, Chief Superintendent.

SADRAS, a small town on the Coromandel Coast, in lat. 12° 32′ N., long. 80° 13′ E., about 30 miles south of Madras.

SADRUS, Hind. Cinnamomum nitidum, *Nees.*

Two species yield the safflower of commerce, viz., Carthamus tinctorius, which has small leaves and an orange flower; and C. oxyacantha, with larger leaves and a yellow flower, a native of Caucasus. The former is cultivated in Egypt, the Levant, &c., where it forms a considerable article of commerce. The former is grown in every part of the E. Indies, in China, India, Egypt, America, Spain, some of the warmer parts of Europe, is indigenous to the whole of the Indian Archipelago, and a large quantity is grown in and exported from Bali. At the Madras Exhibition of 1855, specimens were exhibited from Cuddapah, Chittledroog and

Madura, and several packets of the seeds were sent from other districts. It is cultivated extensively throughout the Ceded districts, &c., the seed yielding an oil, and the flower a dye. Of late years the exportation has fallen off, but a great deal is consumed in the country. The flower is gathered and rubbed down into a powder, and sold in this state. When used for dyeing it is put in a cloth and washed in cold water for a long time, to remove a yellow colouring matter; it is then boiled and yields the pink dyeing liquid. The Chinese safflower is worth four times the amount of the Indian article, but the loss from careless drying and preparation in India has too often been set down to the nature of the article. The dried florets yield a very beautiful colouring matter, which attaches itself without a mordant. In Madras it is chiefly used for colouring cotton, and produces various shades of pink, rose, crimson, scarlet, &c. In Bangalore, silk is dyed with it, but the dye is very fugitive, and will not bear washing. An alkaline extract precipitated by an acid (lime juice is commonly used) will give a fine blue colour either to silk or cotton. The colouring matter is not suitable to wool. The petals of the safflower contain a red colouring matter insoluble in water, derived probably from the oxidation of a peculiar principle existing in the petals: it is called carthamine, or carthameine, and by Dumas, carthamous acid. When a weak soda solution of carthamine is left in contact with oxygen, it first becomes yellow and then red, and on saturating this red liquor with citric acid, red carthamine is thrown down. The affinity of carthaméine for cotton and silk is such, that when it is recently precipitated, those substances immediately combine with it, and become at first rose-coloured, and afterwards of a fine red, so that they may be thus dyed without the intervention of a mordant; the stuffs so dyed are rendered yellow by the alkalis, and the colour is to a certain extent restored by the acids. Carthaméine is never used in dyeing wool. When it is precipitated from concentrated solutions, it furnishes a a liquid paint, which, evaporated upon saucers, leaves a residue of somewhat metallic lustre, used as a pink dye-stuff, and which, mixed with finely powdered talc and dried, constitutes common rouge. When the infusion is evaporated it leaves an extract very soluble in water, precipitated by acids and soluble in alkalis. It is not reddened by oxidizing agents. The Chinese safflower is considered the best, and that from Bombay is least esteemed. The price of safflower in the English market varies from £ 1 to £ 8 per ton, according to quality, that from Bombay about £ 1 to £ 1-10*s*. The annual quantity imported into England is from 400 to 500 tons, ⅘ths of which is sent from Calcutta, and about 150 tons is grown in the Dacca Collectorate. The pink colour of safflower is resinous in its nature, and is best dissolved by the fixed alkalis. In Bengal, the flowers are gathered, placed in a bag, and trodden under water to get rid of the yellow colour. They are then placed in a trough with soda, in the proportion of 6 lbs. to 120 lbs. of carthamus. After soaking for a time, the contents of the trough are transferred to another, having a perforated bottom, but lined with a finely-woven cloth. This perforated trough is placed over an unperforated empty one, and water is poured through the upper one. This carries with it a large amount of the colouring matter released by the alkali. When the lower trough is full the bath is placed over another trough. A little more alkali is added and fresh water, until the latter runs through without carrying any more colouring matter. Lemon juice is added to the dye stuff in the troughs, and raises the colour to a bright cherry-red; silk, in hanks, is then immersed and turned round skein-sticks in the bath so long as it will take up any colour. It is then dried, and if the colour be not deep enough, it is passed through another bath of similar strength. A final brightening is given by turning the silk round the skein-sticks, seven or eight times, in warm water, with lemon juice, in the proportion of half a pint to each pailful of water. This colour will not bear the action of soap, nor will it long withstand exposure to the sun and air; it is chiefly employed on silk for imitating the fine dye of the French called ponceau. For ponceau, or flame-colour, the silk is first boiled, and then receives a slight foundation of annotto; but it must not be alumed. Safflower dye is costly: it is chosen in flakes of a bright pink colour; that in powder, dark-coloured, or oily, is of inferior quality. The beauty of the colour, in its purest form, has caused it to be employed in the manufacture of rouge. The preparation of the finest rouge, however, is from cochineal. The delicate and beautiful rouge, known as rouge vegetale, is nothing more than the colour of safflower which has been extracted by means of crystallized soda, precipitated by citric acid, then slowly dried, and ground up with the purest talc. In the process of rouge-making from safflower the flowers, after being washed with pure water till it comes off colourless, are dried, pulverized, and digested with a weak solution of crystals of soda, which assumes thereby a yellow colour. Into this liquor a quantity of finely carded white cotton wool is plunged, and then so much lemon-juice or pure vinegar is added as to supersaturate the soda. The colouring matter is disengaged, and falls down in an impalpable powder upon the cotton filaments. The cotton, after being washed in cold water, to remove some yellow colouring particles, is to be treated with a fresh solution of carbonate of soda, which takes up the red colouring matter in a state of purity. Before precipitating this pigment a second time by the acid of lemons, some soft powdered talc should be laid in the bottom of the vessel for the purpose of absorbing the fine rouge, in proportion as it is separated from the carbonate of soda, which now holds it dissolved. The coloured mixture must be finally triturated with a few drops of olive-oil in order to make it smooth and marrowy. Upon the fineness of the talc, and the proportion of the safflower precipitate which it contains, depends the beauty and value of the cosmetic. The rouge of the above second precipitation is received sometimes upon bits of fine-twisted woollen stuff, called crepons, which ladies rub upon their cheeks. The imports into the United Kingdom of Great Britain were as under :

1835,	Tons 231,	Cwt 13	1848,	Tons 506	
1840	267	12	1849	407	
1847	405				

The annual quantity of safflower, according to Dr. Taylor, exported from the district of Dacca for eight years ending with 1839, amounted to 4,000 maunds, or about 149 tons. The exports through the Calcutta Custom House are occasionally large : in 1824-25 there were about 316 tons ; 8,500 Indian maunds were shipped from Calcutta in each of the years 1841 and 1842. The prices in the Liverpool market, in January 1853, were for Bengal, good and fine, £6 to £7 10*s.* per cwt. ; middling, £4 to £4 10*s.* ; inferior and ordinary, £2 10*s.* to £3.—*Ure's Dictionary* ; *Tomlinson, p.* 333 ; *Simmonds, p.* 450 ; *Faulkner* ; *Eng. Cyc., p.* 787 ; *Smith, Chinese Mat. Med.* ; *M. E. J. R.* ; *O'Shaughnessy, Beng. Disp.*

Crocus sativus, saffron, is a native of Asia Minor, naturalized in many parts of Europe, and cultivated in Persia and Cashmere. The Chinese obtain it from Tibet. Saffron is brought to India from England, the sea ports of the Red Sea, Persia, and Cashmere. The dried stigmata of the flower, are picked out, dried on paper either in a kiln or by the sun. If compressed into cakes it is called cake saffron : hay saffron, what is usually met with, consists of the stigmas, each about an inch and a half long, brown-red, the upper part flattened, widened, and cleft ; the lower, hair-like and yellowish. The odour is fragrant, taste bitter but agreeable. Saffron tinges the saliva yellow. One grain of good saffron contains the stigmata and styles of nine flowers, so that one ounce of saffron is equal to 4,320 flowers. Cake saffron as now met with, contains none of the real article, being prepared from the florets of the safflower or Carthamus tinctorius made into a paste with gum water. Dr. Honigberger, (p. 263,) mentions that in his time Crocus sativus was monopolized by the Cashmerean government, and that the hakims of the Punjab use saffron in melancholy, typhus fever, enlargement of the liver, and retention of urine. It is now imported into India both from Persia and Cashmere, but into the North-western parts of India from the latter only. Dr. Falconer formed the opinion that saffron could be successfully cultivated in the Himalaya, at heights varying from six thousand to six thousand five hundred feet above the sea, and that if it were once brought into the market, the demand for it would be almost unlimited. The dried pistils compressed into firm cakes or masses, are termed in India Rootla saffron ; good saffron has a sweetish, penetrating, diffusive odour ; a warm, pungent, bitterish taste ; and a rich deep orange colour. It is used in medicine, as a colouring substance, and in domestic cookery. The vytians prescribe this article in nervous affections attended with vertigo, and where there appears to be an approach to apoplexy, by accumulation of blood in the head. They also believe it to possess considerable virtue in melancholia, hysteric depressions, and kistnah dashum (typhus fever), in which last they suppose it to act as a cordial and restorative. To women, soon after the pains of childbirth are over, an infusion of saffron is frequently administered by the Tamil midwives to prevent fever, to support the animal spirits; and gently to assist in carrying off the lochia. It is besides used by the Indian practitioners as an external application in ophthalmia when mixed with a small quantity of pounded chebulic myrobolan and lime juice and applied round the eye, but close to it. The Arabians class it amongst their Mosebetat (Hypnotica) Mokewyat (Cardiaca) and Mufettehat (Deobstruentia). Used as a dye, a rich yellow-red colour is obtained which, when dried and pure, is of a scarlet hue. The use of saffron in Europe is diminishing. It is employed as a seasoning in cookery: also to colour confectionery, liqueurs, varnishes, and sometimes cheese and butter. It is used to a small extent by painters and dyers. It was formerly much used in medicine as a carminative, antispasmodic and emmenagogue, and it is still occasionally employed to promote the eruption of certain diseases of the skin. It is given to birds to assist their moulting. The colouring ingredient of this plant as "a peculiar principle to which the name of polychroite has been given; it possesses the properties of being totally destroyed by the action of the solar rays, colouring in small quantity a large body of water, and of forming blue or green tints when treated with sulphuric and nitric acid, or with sulphate of iron. In moderate doses, this substance stimulates the stomach, and in large quantities excites the vascular system. Moreover it seems to have a specific influence on the cerebro-spinal system, as it affects, it is said, the mental faculties, a result which De Candolle considers analogous to that produced by the petals of certain odorous flowers. Saffron known in commerce as a kind of fibrous cake, should be moderately moist, close, tough, and compact, the smell sweet and penetrating, the taste warm, pungent, and somewhat bitter. It is a considerable article of trade, both east and west, it is esteemed medicinal in the east with all sorts of virtues ascribed to it. To put on the saffron robe, is the sign of "no quarter" with the Rajpût warrior.—*O'Shaughnessy, p.* 654; *Rhode, MSS.*; *Faulkner*; *Ainslie's Mat. Med., p.* 38; *Tomlinson*; *Honigberger, p.* 263; *Falconer*; *Royle*; *Smith*; *Powell's Hand-book, Vol.* i, *p.* 303.

SAFI, are a widely spread people occupying Dara Nur, Dara Mazar, Dara Pech, and the valleys opening on the Khonar river and in a district called Surkh Khambar, south of Bajur. It has been noticed that they inhabit Taghow. They now speak the Affghan dialect, but also Pashai. In the emperor Baber's time, they were styled Kafir, and they were subsequently expelled by the Ghilji from the lands to the south of Taghow, and between Kabul and Jellalabad. Nadir Shah cultivated a friendship with them. They speak a dialect called Kohistani. South of the Safi, at Bahi, the first march from Goshter, on the Jellalabad river towards Bajur, are a people called Yeghani who consider themselves Affghans, but are probably converted Kafir, for they speak a dialect which no Affghan can understand.—*Masson's Journeys.* See Kelat, Kafir, Kassi.

SAFIRO, also Safir, Sp. Sapphire.

SAFLINAFF, or Zalinaf, or Laars Island, in the Java Sea, in lat. 5° 31′ S., long. 118° 25′ E., is a low woody island and the southernmost of a group lying on the north end of Laars bank.

SAGAH BARK, Anglo-Malay. A bark of Singapore, resembling mangrove bark in appearance, and employed as a dyeing material.

SAGALA, was the capital of the Bactrian dynasty that ruled in the Panjab and its name was changed by Demetrius to Euthymedia. Bayer says that according to Claudius Ptolemy, there was a town within the Hydaspes yet nearer the Indus called Sagala, *also Euthymedia, but he scarcely doubts that Demetrius called it Euthydemia, from his* father after his death and that of Menander. Colonel Tod supposes Sagala to be the Salbhanpoora of the Yadu when driven from Zabulist'han and that of the Yuti or Yuchi who were fixed there from Central Asia in the *5th* century and if so early as the second century when Ptolemy wrote, they may have originated the change to Yutimedia, the Central Yuti. Numerous medals have been found within the probable limits of the Greek kingdom of Sagala, belonging to these kings or to the Parthian kings of Minagara on the Indus. The legends are in Greek on one side, and in the Sassanian character on the reverse. The names of Apollodotus and Menander have been decyphered, and the titles of Great King, Saviour, and other epithets adopted by the Arsacidæ are perfectly legible. The devices however resemble the Parthian. These Greeks and Parthians must have gradually merged into the hindoo population.—*Hist. Reg. Bact.*, *p.* 84. See Bactrian.

A concrete gum resin supposed to be a kind of assafœtida from the Ferula persica, obtained from Smyrna, Alexandria, &c. It is found in masses formed of soft, adhesive fragments, the size of the thumb or more, somewhat transparent, reddish yellow externally, pale within, of a waxy or brittle consistence, often mixed with impurities and seeds. Its odour resembles that of garlic and assafœtida, its taste is hot, nauseous, and rather bitter. Its medicinal uses are the same asthose of assafœtida, but it is considered less energetic, and is but little employed. F. persica, a native of Persia, with a stem about two feet high, according to some authorities produces Sagapenum. Nees von Esenbeck and Lindley, however, consider it as one of many plants from which assafœtida is procured. Sapagenum is found in masses. Its odour resembles that of garlic and assafœtida, its taste is hot, nauseous, and rather bitter. It is sometimes adulterated with bdellium, gundabirosa, and other similar gum resins or turpentines. It is collected in the same manner as assafœtida ; sells at four rupees the lb.—*O'Shaughnessy, pp.* 363-64.

SAGAPU MARAM, TAM. Hymenodyction excelsum, *Wall.*

SAGAPPU SOALUM, TAM. Sorghum vulgare.

SAGAR, SANS. The sea.

SAGAR and Nerbudda territories include part of the basins of the Ganges and Nerbudda. The Sagar district of India is situated in the extreme north-west of the Central Provinces, and comprised within north latitude 23° 5′ and 24° 25′, and east longitude 78° 10′ and 79° 15′. The Vindhyan outcrops belong to the group named the "Upper Rewa," which is a mixture of thick massive strata and false-bedded flags, usually hard and compact, and often glazed or semi-vitrified, yellowish and greyish white in colour, sometimes reddish. The curious intertrappean beds of the Sagar, and the silicified trees which they contain, described by Mr. J. G. Medlicott, are the remains of lacustrine deposits, formerly accumulated in probably detached basins, and under conditions slightly differing in different places. The calcareous bands of the intertrappean rocks occur largely near Sagar. Iron-ore is found and worked at Hirapur, a small village in the extreme north-east. It is said to be of excellent quality, but at present only a few smelting-furnaces of the commonest native description exist. The greater part of the iron manufacture is sent to Cawnpore. Some of the sandstone is said to be equal to the English tiling stone. The population of the district amounts to 498,642 souls, of whom 220,070 are returned as agriculturists, and 278,572 as nonagriculturists. The best cultivators are Kurmi, Kachhi, Lodhi and Dangi. The artisans and handicraftsmen are chiefly the Lohar, Barhai, Kohri and Sunar. Except in some of the large towns, and the city of Sagar itself, the manners of the inhabitants generally are decidedly uncouth. The tribes most addicted to crime are the Lodhi, Bundela, Brahman, Khangar, Chumar and Kohri. They are mostly to be found in the borders of the district near native states, where they find protection and concealment if pressed by British police. On the whole the inhabitants of Sagar may be said to be a sturdy race. They are not high in stature, but they possess a fair share of stamina, muscles, thews and sinews. The houses are generally built of either stone, or stone and mud and are tiled. A few of the huts inhabited by the poorer classes, such as Chamar, Sunar Gond, &c., are thatched, with walls formed of wattle and dab ; but every endeavour is being made to get them to build permanent residences, not subject to be destroyed by fire. In the beginning of the year A. D. 1818, by a treaty concluded between the peshwa Baji Rao and the British government, Sagar with the greater part of the present Sagar district Damoh, Jabalpur and Mandla, were made over to the British.

SAGAR. Colonel McMurdo quotes native authors to show, that the western branch of the Indus was called the Sagara river, which, he thinks, may be identified with the Sagapa Ostium of Ptolemy, which was also the most westerly branch of the Indus in his time. Now this channel passes about two or three miles to the south of Bhambura, so that the town was also accessible from the Piti, the Phundi, the Kyar, and the Pintiani mouths of the river. General Cunningham is of opinion that the northern channel of the Ghara was the western branch of the Indus, which was navigated by Alexander and Nearchus, and that before A. D. 200, its waters found another channel more to the south, in the southern Ghara which joins the main stream of the Indus just below Laribandar. By this channel, in the time of the author of the 'Periplus,' the merchant vessels navigated the Indus up to Barbarike, where the goods were unloaded, and conveyed in boats to Minnagar, the capital of the country. But after some time this channel also failed, and in the beginning of the eighth century, when the Arabs invaded Sindh, Debal had become the chief part of the Indus, and altogether supplanted Bhambura, or the ancient Barbarike. But though the Ghara river was no longer a navigable channel, its waters still continued to flow past the old town down to the thirteenth century, about which time it would appear to have been finally deserted.—*Cunningham's Ancient Geog. of India, pp.* 295-296.

Sago, and starchy matter allied to it, is obtained from many palms. The starch is contained in the cellular tissue of the stem, and is separated by bruising and elutriation. From the soft stem of Cycas circinalis, a kind of sago is produced both in the East and West Indies. The finest is, however, procured from the stems of Sagus lævis *Rumph,* a native of Borneo and Sumatra ; and Arenga saccharifera, *Labillardiere* ; the Sagus farinifera *Gartn.* of the Eastern islands of the Indian Ocean, yields a sago. The starchy substance washed out of the stems of these palms is sago meal, and when it is granulated it forms the sago of commerce. The Arenga saccharifera also furnishes a large supply of sugar ; sago, sugar, and palm wine, are procured from the Caryota urens : in China, sago is obtained from Rhapis flabelliformis, from which, also, sago is made for native use in Travancore, Mysore, and Wynaad, in the peninsula of India. The Cochin-China sago seems from Loureiro's account to be obtained from the Arenga saccharifera and Cycas inermis. According to Thunberg it is from the Cycas revoluta that the Japanese manufacture it. In the Moluccas, large quantities are obtained from the Sagus lævis, and Arenga saccharifera ; a purious kind of arrow-root has long been made at Mergui from the same plant as that which yields the sago, but medical men have decided that it contains properties which render it unsuitable for the sick, and chemical analysis has developed that it contains only half the nutritious qualities of genuine arrow-root. The Malays prefer that of Sagus lævis, *Jack.,* Blume states that it is obtained from S. genuina. The Arenga saccharifera when exhausted of its saccharine sap, yields sago of good quality. In India, sago is obtained from the Phœnix farinifera and the Cycas circinalis. Bennet in his work on "Ceylon and its capabilities," (1843), states that sago is procured from the granulated pith of the talipot palm, Corypha unbraculifera.

Metroxylon filare, *Mart.,* a native of China, yields one of the inferior sago of commerce ; as also does the Corypha gabanga, *Blume,* of Java.

The Sagus farinifera palm is grown in great perfection in some parts of Borneo, and its sago meal is exported in large quantities from the west coast to Singapore, and also by the Bugis boats from the eastern and southern sides of the island. In Borneo, the natives prefer rice, and the Milanowe, who live on the rivers Egan, Hoya, Mocha and Bintulu, who are the principal cultivators of the sago tree, always import considerable quantities of grain for their own consumption. The tree grows in marshy places, and rarely attains a greater height than thirty feet : as it freely produces offsets, the supply is easily raised. Amongst the Dyak, who grow rice, sago is very rarely used as food except in times of scarcity. The sago palm of the Spice Islands is the most plentiful but least esteemed, that of Siak on the north coast of Sumatra being the best, and that of Borneo second in estimation. Sago meal furnishes the principal food of the Javanese being baked into cakes, its native country is between Borneo, on the one side, and New Guinea on the other ; Mindoro on the north, and Timor on the south ; and though it is naturalised in other islands of the Archipelago, is never found beyond its limits. The process of extraction differs among many of the islands, as that of Mindoro from that of the Moluccas ; so also does the size of the cake ; those of Amboyna being four inches broad, and six long ; while those of Ceram are much larger. The people of many of the islands live habitually on this nutritious substance. The mass of medulla extracted is immense ; 600 pounds is not unusually afforded by a single tree ; the refuse, after the bread is made, is thrown in heaps from which, a delicate edible mushroom springs up, and in the heaps, as well as in the decaying wood, are generated worms of a white colour, held in great estimation among the epicureans of the Molucca islands. Certain wood-worms were in the same manner prized by the ancient Romans; and the taste of the Amboynese has been shared by Europeans, after a struggle with prejudices, which are indeed, mere matters of custom.

In most of the islands of the Archipelago the sago palms are private property and sell at about seven shillings a tree. Mr. Wallace tells us that in making sago meal, a tree is cut down close to the ground, the leaves and leaf stalks cleared away, and a broad strip of the bark taken off the upper side of the trunk. This exposes the pithy matter which is of a rusty colour near the bottom of the tree, but higher up pure white, about as hard as a dry apple, but with wooden fibres running through it about a quarter of an inch apart. This pith is cut or broken down into a coarse powder by means of a tool constructed for the purpose,—a club of hard and heavy wood, having a piece of sharp quartz rock, firmly imbedded into its upper end. By successive blows of that, narrow strips of the pith are cut away till it falls down into the cylinder formed by the bark, leaving only a skin, not more than half an inch in thickness. These pith strips are then put into a washing trough, made of the large sheathing vases of the leaves, and the strainer is the fibrous covering from the leaf stalks of the young cocoanut. Water is poured on the mass of pith which is pressed against the strainer and kneaded until all the starch is dissolved, and passes through into a trough with a depression on its centre, into which it is deposited, the surplus water trickling away. When the trough is nearly full, the mass of starch, which has a slightly reddish tinge, is made up into cylinders, neatly wrapped in sago leaves, and in this state is sold as raw sago. When this is boiled with water, it forms a thick glutinous mass, with a rather astringent taste, and is eaten with salt, limes and chillies. When sago bread is to be made, raw sago is broken up, dried in the sun, powdered and finely sifted. A small clay oven with 6 or 8 slits, ¾ of an inch wide and 6 or 8 inches square, is heated over a clear fire of embers, the powder is finely siften, the openings are covered with a flat piece of sago bark, and in about five minutes the cakes are turned out sufficiently baked. They are pleasant to eat. When not wanted for immediate use, they are dried for several days in the sun and tied up in bundles of twenty. They will then keep for years, can be eaten in that state, or soaked in water and toasted or boiled. A tree twenty feet long and four or five feet in circumference will produce nine hundred pounds and a pound weight will produce three cakes, and two of these cakes are sufficient for a man for a meal. Two men will finish a tree in five days, and two women will bake it all in five days more, so that for about 12 shillings, one man's food for a year will be had.

The *sago palm of Ceram*, has a midrib 12 to 15 feet long, used in lieu of bamboo. The lower part is as thick as a man's leg, entire houses are built of them, they form admirable roofing poles for thatch; when split and well supported they do for flooring, and when selected of equal size and pegged together side by side to fill up the panels of framed wood-houses, they have a very neat appearance, and make better walls and partitions than boards, as they do not shrink, require no paint or varnish, and are not a quarter of the expense. When carefully split and shaved smooth, they are formed into light boards, with pegs of the bark itself, and are the foundation of the leaf-covered boxes of Goram. The leaflets of the sago palm, when folded and tied side by side on the smaller midribs form the "atap" or thatch, in universal use, while the product of the trunk is the staple food of some hundreds of thousands of men.

In the *Moluccas*, the pith of the sago palm is prepared for use and exportation. It constitutes the principal food of the natives of the Moluccas, especially during their sea voyages. It is cooked by simply dipping the cakes into warm water which softens them, and renders them easily masticated. It is also made into a sort of soup.

The trunk of the *Sagus farinifera*, is five or six feet round, and it grows to the height of about 20 feet. It can only be propagated by seed. It flourishes best in bogs and swampy marshes; a good plantation being often a bog, knee deep. The pith producing the sago is seldom of use till the tree is fourteen or fifteen years old; and the tree does not live longer than thirty years.

Mr. Crawfurd says there are four of the sago palms, the cultivated, the wild, one distinguished by long spines on the branches, and a fourth destitute of these spines, and called by the natives female sago. This and the cultivated species afford the best farina; the spiny variety, which has a slender trunk, and the wild tree, yield but an inferior quality of sago.

The farinaceous matter afforded by each tree is very considerable, 500 lbs. being a frequent quantity, while 300 lbs. may be taken as the common average produce of each tree. Supposing the plant set at a distance of ten feet apart, an acre would contain 435 trees, which, on coming to maturity in fifteen years, would yield at the before-mentioned rate 120,500 lbs. annually of farinaceous matter. The sago meal, in its raw state, will keep good about a month. The Malays and natives of the Eastern Islands, with whom it forms the chief article of sustenance, partially bake it in earthenware moulds into small hard cakes, which will keep for a considerable time.

The *Sagus farinifera* palm is one of the smallest of its tribe, seldom reaching to more than 30 feet in height, and growing only in a region extending west to Celebes and Borneo, north to Mindanao, south to Timor, and east to Papua. Ceram is its chief seat, and there large forests of it are found. The edible farina is the central pith, which varies considerably in different trees, and as to the time required for its attaining proper maturity. It is eaten by the natives in the form of pottage. A farina of an inferior kind is supplied by the Gomuti palm, another tree peculiar to the Eastern Archipelago growing in the valleys of hilly tracts. Perhaps several palm trees contribute to produce the ordinary sagos of commerce.

The stem of Sagus farinifera, *Gærtner*, before maturity and previous to the formation of the fruit, consists of a thin hard wall, about two inches thick, and of an enormous volume of tissue (commonly termed the medulla or pith), from which the farina or sago is obtained. As the fruit forms, the farinaceous medulla disappears, and when the tree attains full maturity, the stem is no more than a hollow shell.

Sago occurs in commerce in two states, pulverulent or granulated: 1, The meal or flour in the form of a fine amylaceous powder, whitish, with a buffy or reddish tint; odour faint, but somewhat unpleasant and musty; 2, Granulated sago of two kinds, pearl and common brown. The former occurs in small hard grains, not exceeding in size that of a pin's head, inodorous, and having little taste. They have a brownish or pinkish yellow tint, and are somewhat translucent. By the aid of a solution of chloride of lime they can be bleached, and rendered perfectly white. The dealers, it is said, pay £7 per ton for bleaching it. Common brown sago occurs in larger grains, about the size of pearl barley, which are brownish white.

Sago in its granulated form is that usually exported. The best sago is the produce of Siak, on the north coast of Sumatra. This is of a light brown colour, the grains large, and not easily broken. The sago of Borneo is the next in value; it is whiter, but more friable. The produce of the Moluccas, though greatest in quantity, is of the smallest estimation. The cost of granulated sago, from the hands of the grower or producer, was, according to Mr. Crawfurd, only a dollar a picul of 133¼ lbs. It fetches in the London market—common pearl, 20*s.* to 26*s.* the cwt., sago flour, 20*s.* the cwt. The Chinese of Malacca and Singapore have invented a process by which they refine sago, so as to give it a fine pearly lustre, and it is from thence supplies of this article, are now principally derived. The exports from Singapore in 1847 exceeded 6½ million pounds. The imports into Great Britain in 1847, 1848 and 1849 were respectively 1,930 tons; 2,758 tons, and 3,275 tons. A considerable quantity of sago is, however, exported from Singapore in the state of flour. The whole quantity made and exported there exceeds, on the average, 2,500 tons annually. The estimated value for export is set down at 14*s.* per picul of 1¼ cwt. The quantity shipped from this entrepot is shown by the annexed returns, nearly all of which was grown and manufactured in the settlement.

1843-44,	Pearl sago,	14,266	,,	Sago flour,	9,025

The imports of sago, into the United Kingdom rose from 483 tons in 1826, to 4,494 tons in 1850 and the quantity retained for home consumption from 128 tons to 4,197 tons, in the same period.

Sago is now an extensive article of diet, contributing largely to the food of the nursery, the diets of the invalid and the delicacies of the tables of the rich; wheat; sago and rice are great food staples in the world.

Calamasagus laciniosus, *Griffiths*, is supposed also to yield sago, but that known as "Mergui sago" is manufactured from the Tacca pinnatifida. Sago of Mergui may be seen in every bazar in the Tenasserim Provinces, it is the produce of an indigenous plant abounding along the sea shores, the islands, and especially at Mergui—a species of tacca, the same plant, that is common in the South Sea Islands, whose tubers there supply to the inhabitants the place of bread. Considerable quantities of sago are made at Mergui. A sago was also exhibited in the Madras Exhibition of 1855, made from the Cycas circinalis. The pith of Caryota urens is much used as sago meal in Canara, when fresh, and deserves attention. Sago is obtained in Cochin from a palm called koota pana, and sells there for 2 annas a pound, and in Cochin, the date palm flour and seed is called Eenthalkurroo. The best sago is made at Cochin from October to June, as in its preparation bright sunshine is required to mature the operation. The 1st sort may be delivered on the sea coast at Rs. 4½ per maund (25 lbs.), the 2nd sort Rs. 2¼ per maund. Sago is made in Malabar from the pith of the Talipot palm, the Corypha umbraculifera. In Java, the Arenga saccharifera is the only source of sago, which is used in considerable quantity in the western and poorer districts of the island and is offered for sale in all the markets. It is smaller in quantity than in the pith of the true sago-tree, more difficult to extract and inferior in quality : possessing a certain peculiar flavour from which the farina of the true sago is free. Some trees will produce five or six female spadices, before yielding a single male one, such trees are considered unprofitable by the toddy collectors, but in this case it is said that they yield sago equal in quality, though not in quantity, to the Cycas circinalis, from which, both in the East and West Indies a kind of sago is procured. One tree yielded about 150 lbs. of good sago meal. The farinaceous part of the trunk of old trees, of the Caryota urens or kittul palm is manufactured into sago, equal to the best farina, being highly nutritious. It is said, indeed, to be equal to that of the true sago palm. A farina is prepared in Brazil from the inside of the trunk of the "Carnauba," Copernicia cerifera. The pithy portion of the trunk of the Gebang palm, Corypha gebanga, *Blume*, yields a sort of sago, as also that of the Sabal adansonii, the sago palm of New Ireland. The Encephalartos is called " Caffir Bread." The seeds of Dion edule, in Mexico, yield starch, and in the Bahamas and other West Indian Islands, a sago is obtained from a species of Zamia.

China.—Sago is brought to China to some extent in native vessels and is said to be the produce of the Sagus farinifera which grows in Sumatra and on the western side of Borneo.

Archipelago.—Crawfurd tells us that in the Eastern Archipelago, there are supposed to be five palms producing this article, of which the most frequently cultivated are the Sagus farinifera, rambaya, Malay : and the Sagus lævis, bamban, Malay. Sago trees are found in every part of the Malayan Archipelago and Philippines as far as Mindano, wherever there is a genial soil for them, and this soil consists of a marsh or bog, composed of decayed land and vegetables, near the sea but excluding tidal action. They are most abundant in the eastern parts of the Malay Archipelago at the Moluccas and neighbouring islands, with New Guinea and Borneo, and, in the Philippines, Mindano. All these palms yield an immense quantity of farina, the wood being a mere shell containing a mass of medulla, and the sago from them is more or less the food of the inhabitants of the Archipelago. Some sago trees propagate by lateral shoots, as well as by seeds, and only produce fruit once, after which they die. From the first of their properties, a sago plantation once formed is perpetual. When a plantation has once arrived at maturity there will be a constant harvest. The trees are cultivated in small patches, and a man and his family can manage a plantation of about 400 trees, in a space of 100 square fathoms. The trees are cut down immediately before bearing fruit, which is usual about the age of 15 years. The sago tree when cut down and the top severed from it, is a cylinder about 20 inches in diameter and from 15 to 20 feet in height. Assuming this to be the average, the contents will be nearly 26 bushels, and allowing one-half for woody fibre, there will remain 13 bushels of starch, which will give about 700 pounds for each tree, or 12½ bushels. It may give some idea of the enormous rate of this produce, if it be considered that three trees yield more nutritive matter than an acre of wheat and six trees yield more than an acre of potatoes. An acre of sago, if cut down at one harvest, will yield 5220 bushels, or as much as 163 acres of wheat, so that according as we allow 7 or 15 years for the growth of a tree, an acre of sago is equal in annual produce to 23 or to 10 acres of wheat. Up till 1814 the Archipelago used to export small quantities of the granulated form of sago, of a dirty brown colour, but about the time when the trade with Europe was first thrown open, the Chinese of Malacca began to prepare a much superior article known in commerce under the name of pearl sago. Of this and sago flour, or the ungranulated starch, Singapore is at present the chief place of manufacture and principal mart, the Chinese being the sole manufacturers, and the raw material being brought from various neighbouring countries, but chiefly from the north-western coast of Borneo and the north-eastern of Sumatra, with its adjacent islands from Siak to Indragiri. In the years 1847-48, the quantity of sago exported from Singapore was about 80,000 cwt., worth on the spot about £45,000.

In most parts of the Archipelago two kinds of alluvial soil are found in greater or less abundance, one consisting chiefly of sand often thrown up in long banks, and the other principally of decomposed vegetable matter. The latter is often a consequence of the production of the former, which serves to keep out the waves of the sea, and allow a rank vegetation to flourish. In process of time, by the elevation of the surface and the extension of a similar formation seaward, the older marshes are no longer subject to tidal invasion, and become gradually filled up by the decay of fresh water plants. For these two descriptions of soil nature has provided two kinds of palm adapted in wonderful manner to the necessities of man. On the barren sand she has planted the cocoanut, and in the morass the sago tree.

Along the immense alluvial tract of the Sumatra coast from Siak to the Lampongs, and in the large plains of the rivers of the peninsula such as those of Rio, Formosa and the Muar, are hundreds of miles of sago land unoccupied and unproductive, every acre of which is capable of yielding at the rate of about twenty thousand pounds of meal yearly.

One or other of the kinds of the sago tree is found throughout the whole length of the Archipelago, from the islands off the west coast of Sumatra to New Guinea. It is probably capable of flourishing with complete vigour across nearly its entire breadth wherever its natural soil occurs, and certainly within ten degrees north and south of the equator, a band which includes all the Archipelago save the Philippines. The only countries however, where it is found growing in large forests are New Guinea, the Moluccas, Celebes, Mindanao, Borneo and Sumatra, being widely spread over the Moluccas, but confined to particular parts of the others.

In the eastern parts of the Archipelago it forms in many places the chief portion of the inhabitants food. The sago palms do not appear to be indigenous in Sumatra and the Malay Peninsula.

Moluccas.—Amongst all the trees which we have yet mentioned, says Valentyn in his account of the vegetation of the Moluccas, there is none more useful to the Amboynese than their sago tree. It shows itself at first, and for a long time afterwards, merely as a bush or shrub, consisting of different upright branches which are about 15 or 16 feet high, green, concave in the inner side, convex on the outer, and smooth. On the lower part of these, long small thorns are seen, which stand in order above each other like needles, the middle being always the longest. The leaves, which are very long and small, stand out on both sides of these branches, are longer, broader, and thinner than those of the cocoanut, and have on the sides soft, erect spines. In due time there rises from this bush a stem, which having reached twice the height of a man, gradually looses its thorns except those above, which also afterwards gradually fall off. The branches which become tolerably thick, have a broad base called gururu, about three feet long and a foot broad, being almost like a gutter which surrounds the stem and the next branch, and decreases to its top. The upper part of the branch is called gabba gabba and is about the thickness of the arm at its top and much thicker below. So long as the stem is immature, thorny branches at the bottom protect it from the wild hogs who would otherwise fatten on the meal. It gives no fruit until all its strength is expended and its death approaches, and when the branches are strewed with meal, at which time small fruits like round pigeon's eggs show themselves in great number at its top, like a crown. These are green, and when ripe sour, and they finally become yellow. This appears to be Sagus farinifera, Sumatra and Malacca, Dr. W. Jack, in his notice of the Sagus lævis, says it rises to the height of about twenty feet, and is generally surrounded by numerous smaller and younger plants which spring up around it after the manner of the plantain or Musa sapientum. The stem, which is about as thick as that of the cocoanut tree, is annulated by the vestiges of the fallen leaves, and the upper part is commonly invested with their withered sheaths. The leaves resemble those of the cocoanut, grow more erect, and are much more persistent, so that the foliage has not the same tufty appearance, but has the more graceful ascending curve of that of the Sagus farinifera ; they are pinnate, unarmed ; the leaflets linear, acute, carinate, and smooth. That tree is from fifteen to twenty years in coming to maturity, the fructification then appears, and it soon after decays and dies. The inflorescence is terminal ; several spadices rise from the summit of the stem, enveloped in sheaths at their joint ; and alternately branched. It is on these branches that the flowers and fruit are produced, and they are generally from five to eight inches in length. They are of a brown colour, and closely imbricated with broad scariose scales, within which is a quantity of dense ferruginous wool, in which the minute flowers are imbedded and completely concealed. Each scale supports two flowers which are hermaphrodite, and scarcely larger than a grain of turnip-seed. The perianth is six-leaved, of which three are inferior, the leaflets nearly equal. Stamina six, filaments very short ; anthers long, two-celled. Ovaria three, connected together in the middle, each monesporus. Style none, stigma small. Fruit single, nearly globular, somewhat depressed at the summit but with a short, acute, mucre or point in the centre; it is covered with scales which are imbricated from the top to the bottom, and are shining of a greenish straw colour, of a rhomboidal shape, and with a *longitudinal furrow down their middle*. Below the scales the rind is of a spongy consistence; and the fruit contains a single seed, of rather an irregular shape; and having the umbilicus situated laterally a little above the base of the fruit. The progress of the fruit to maturity is very slow; and is said to occupy about three years from the first appearing of the spadices to the final ripening of the fruit. During the period of inflorescence, the branches of the spadix are brown, and apparently quite bare. Afterwards a number of small green knobs appear above the brown scales, which grow enlarging till they at length acquire the size of a small apple. But few fruit come to maturity on each branch. In habit and character this tree recedes considerably from the true Palmæ. Its propagation by radical shoots, exactly in the same manner as the common cultivated plantain, is peculiar, and is not observed in the true palms. The terminal inflorescence and death of the tree after fructification is another peculiarity. It is allied to Calamus by its retroversely imbricated fruit.

This species of the sago tree is abundant in many parts of Sumatra and at Malacca, and is employed in the preparation of sago for food. Considerable quantities are made at the Peggy Islands, lying off the west coast of Sumatra, where in fact it forms the principal food of the inhabitants. The sago of Siak is remarkably fine, and is also, I believe, the produce of this species. At the Moluccas the spinous sort is considered superior to this. The Sumatra plantations contains three sago palms, one spinous both on the trunk and leaves "rumbia" (Sagus konigii); one spinous on the leaves only, "sauka;" and the other without spines "bumban," which appears to be the female sago in the Moluccas and the sagus lævis of botanists. Valentyn says the meal of the female sago does not keep so long as that of the other species.

Manufacture in Amboyna.—The native mode of preparing sago, which comes entirely within their reach and understanding, was taught to the Amboynese by Rumphius. Before his time the Amboynese like the natives at this day at various places on Ceram and Buru, and also elsewhere as on the west coast of Sumatra, used the sago mixed with the ela. The recollection of Rumphius amongst the Amboynese, was long continued, accompanied by a true recognition of the value of this most necessary mode of preparing an article of food which nature has so bountifully bestowed.

A good sago tree produces about 25 tumang of meal, which being sold at from 0·75 to 0·80 k. gives the manufacturer a good profit. The natives of the Moluccas prepare the meal in different ways, chiefly however, as a hard bread, which, if kept dry, may be preserved as long as ship's biscuits, and is called sago "lemping." The meal after having been dried for two or three days is sifted until it becomes tolerably fine but remains somewhat adhesive. It is then formed into small flat cakes which, to the number of 7 or 8, are placed in a mould of red earth and baked to the proper degree.

The sago bornek or Borne the granular sago, is dried for a shorter period, then sifted, and shaken by two men in a piece of cloth until it granulates. It is then smeared with fresh cocoanut oil and heated in an iron pan (tatyu) until it attain a certain degree of hardness, after which it is placed in the sun to dry.

A third mode of preparation is the sago tetu-pala. The meal is aired until it become red, when it is sifted, and stuffed into an entire fresh bamboo, which is placed in different rows above a fire until it bursts and the sago is roasted. Sago thus prepared may be preserved a long time if kept dry.

The fourth mode is the "sago buksona." The meal is mixed with grated santang kalapa, sagar, and a little pepper and salt, enveloped in young sago leaves, and boiled in water.

To make the "sago bagea or kwee bagea," the meal, after being dried in the air to redness, is sifted, mixed with fresh kanari kernels and then baked in young sago leaves. "Sago baruwa" are small sago cakes of different forms. The "sago sinale" is the meal baked to a cake in a pot. The "sago uha" is the meal enveloped in fresh sago leaves and baked on the fire. "Sago kalapa," like the lemping, is baked in moulds and mingled with much grated santang kalapa; the outside is smeared with gula areng, and it is eaten warm. Sago kalapa is even preferred by Europeans to bread at breakfast, and ranked as a dainty. "Papeda," "sago bubur or pap" is prepared in the same way as arrowroot.

Moluccas.—With the native of Moluccas, over and above extracting from it a wholesome and abundant article of food, no part of the sago tree is lost or suffered to remain unappropriated. The branches, dried and cut to lengths of 6 to 10 feet, and in the state called gaba gaba, soon gain a fine brown, shining colour; the hard shell preserves the spongy interior from destruction when it is not exposed to rain and humidity. The houses are partly and sometimes wholly made of gaba gaba; the best are those of which the framework is of wood and the sides of gaba gaba. The branches having a concave and a convex side are fastened to each other by small pins, and make as good a wall as planks. Instead of a wall round the yard they also use the gaba gaba, which is made to rest on a low frame work or foundation of stone, and is protected above, by a little atap copping. The gaba gaba placed on a wooden framework generally lasts from 10 to 15 years. The leaves of the tree, while still green, are made into atap, and serve to cover dwellings. When well laid on they last about 7 years. The bark of the tree furnishes a valuable fuel. The stalk of the leaf gives the well known "sapu lidi," like that of the cocoanut and gomuti. The hard rind or bark of the thicker or lower side of the branch-stem is made into a kind of bucket called gururu, in which the saguwero liquor is collected. From the extremity of the branch, while it is yet very young and green, they prepare a kind of kadas which is used for the sails of native vessels and of orembaai, and also for making the thick and middling sails called ayia ayia. The root of the tree which has been cut down produces new shoots, and is therefore not dug out. The Moluccas produce five kinds of sago trees, viz., sagu-ihar, with all its leaves depending and full of thorns ; sagu-tuni with horizontal leaves and less thorny ; sagu-molat, entirely divested of thorns ; sagu-makanaru, with leaves somewhat bent down, and sagu-rottan, like the last, but with a stem much higher than the other kinds. Forrest and his crew, during the voyage in the Tartar Galley lived much on sago, and his experiences as an actual sago-eater in the Moluccas, enable him to speak with knowledge and discretion. The following remarks by him will therefore complete the notices of sago in the Moluccas. One tree will produce from two to four hundred weight of flour. I have often found large pieces of the sago tree on the sea shore, drifts from other countries. The sago thus steeped in the salt water, had always a sour disagreeable smell ; and in this state, I dare say, the wild hogs would not taste it. The leaf of the sago tree makes the best covering for houses, of all the palm kind. Those trees of the palm kind, have all a heart like what is called the cabbage tree ; even the head of the common ratan has a small cabbage, of which I have eat. The sago tree thatch will last seven years. Coverings of the nipa leaf or common atap, from the nipa fruticans, such as they use on the south-west coast of Sumatra, will not last half the time. When sago trees are cut down, fresh ones sprout up from the roots. In Europe, sago is seldom or never seen but in a granulated state. To bring it into this state from the flour, it must be first moistened, and passed through a sieve into a very shallow iron pot held over a fire, which enables it to assume a globular form.

Thus, grained sago is half-baked, and will keep long. The pulp or powder, of which it is made, will also keep long, if preserved from the air, but, if exposed, it presently turns sour.

The Papua oven, for this flour, is made of earthenware. It is generally nine inches square, and about four deep : it is divided into two equal parts by a partition parallel to its sides. Each of those parts is subdivided into eight or nine, about an inch broad ; so the whole contains two rows of cells, about eight or nine in a row. When the cell is broad, the sago cake is not likely to be well baked ; the best sized cell is such as would contain an ordinary octavo volume upon its edge. When they are of such a size, the cakes will be properly baked, in the following manner. The oven is supposed to have at its bottom a round handle, by which the baker turns the cells downward upon the fire. When sufficiently heated, it is turned with the mouths of the cells up, and then rests upon the handle (which is now become the bottom) as on a stand. When the oven is heating, the baker is supposed to have prepared his flour, by breaking the lumps small, moistening it with water, if too dry, and passing it once or twice through a sieve, at the same time rejecting any parts that look black or smell sour. This done, he fills the cells with the flour, lays a bit of clean leaf over, and with his finger presses the flour down into the cell, then covers all up with leaves and puts a stone or piece of wood at top, to keep in the heat. In about ten or twelve minutes, this will be sufficiently baked, according to their thickness ; and bread thus baked, will keep, several years ; kept for twelve months, vermin did not affect it. It may not be amiss to mix a little salt with the flour.

Sago bread, fresh from the oven, eats just like hot rolls. Forrest grew very fond of it as did both his officers. If the baker hit his time the cakes will be nicely browned on each side. It the heat be too great, the corners of the cakes will melt into a jelly, which, when kept, becomes hard and horny ; and, if eat fresh proves insipid. When properly baked, it is in a kind of middle state, between raw and jellied. A sago cake, when hard, requires to be soaked in water, before it be eaten, it then softens and swells into a curd, like biscuit soaked ; but if eat without soaking (unless fresh from the oven) it feels disagreeable, like sand in the mouth. Agriculture is neglected in a country, where the labour of five men, in felling sago trees, beating the flour, and instantly baking the bread will maintain a hundred; my crew says Forrest, would have preferred rice; and when my small stock of rice, which I carried from Balambangan, was near expended, I have heard them grumble, and say manti makan roti Papua, "we must soon eat Papua bread." But as I took all opportunities of baking it fresh, being almost continually in port, they were very well contented. The sago bread intended for immediate use, need not be kept so long in the oven as what is intended for sea use, in which it may be said to resemble biscuit. I have, he says, often reflected how well Dampier, Furnel, Roggewein, and many other circumnavigators might have fared, when passing this way in distress for provisions, had they known where to find the groves of sago trees, with which most islands here in low latitudes abound; *Morty, near Gilolo especially. Fresh* bread made of sago flour, and the kima (a large shell fish like a cockle) would have been no bad support among the Moluccas. The kima is found in abundance, of all sizes, at low water, during spring tides, on the reefs of coral rocks. From experience, I equal says he, the fresh baked sago bread to wheat bread; and the kima stewed, is as good as most fish, nor does one tire of it; but it must be stewed sometime, or it will not be tender. Its roe will sometimes weigh six pounds; the fish altogether, when cleared of the shell, weighing twenty or thirty pounds.

The Sago of Sumatra.—The Singapore Chronicle mentions that low marshy situations shut out, but at no great distance from the sea, and well watered by fresh water seem most productive. The soil in such situations to the depth of several feet is generally a flaccid mould, composed chiefly of decayed vegetable matter and extremely pervious to water; below the above depth a stratum of marine formation generally exists. According to Sir Stamford Raffles, in Java this tree is found only in a few low marshy situations all of them being deep bogs, next to impassable to one unaccustomed to such walking, and the preparation of sago from the nature of the soil in the places we have mentioned is very similiar, cutting down and burning the jungle is all the preparation required previous to planting the palm, at about 5 fathoms apart, which is best done from the seed, a small black nut, about the size of a pullet's egg. Plantations have been tried from the suckers, but the injury sustained by their roots in the separation from the parent stem has invariably retarded their growth above a year. From seven to ten years is the time it takes for the tree to bear fruit, when planted from the seed in the first instance; the pith commences generally at about the age of 6 or 7 years; *after this period, it gradually loses* ts moisture, and is no longer fit for sago when the tree comes into bearing. Sago is cultivated in large patches, divided into lots the property of individuals, and as much as one man, his wife and family choose to look after: which is not so much as they could, if they would, attend. One man as above can manage 100 fathoms square, upon this he plants 400 seeds, and subsists *himself for the* first 6 or 7 years on his means, not unfrequently leaving the trees to take care of themselves. Marsden says, that sago is but little used by the Sumatrans, and Crawfurd presumes that in this, or the western part of the Archipelago, the sago palm is an exotic. It does not seem to exist in the native wild state to the westward of Borneo. The best sago *produced in the western islands of the* Archipelago, is *from the* islands of Appong and Panjang, which form the east bank of Brewer's Straits or properly Salat Panjang, and next in quality, is that from the rivers Mandha, Kataman, Goung Egal, Plandok, and Anak Sirka, lying between the Kampar and Indragiri rivers, on Sumatra, or Pulo Percha, as it is called by the Malays. Of least value is the produce of the islands of Buru, Ungah, and Kundor, in the straits of Dryon or Salat Duri. The sago palm is found in several other places in small quantities, but is seldom cut down by the lazy possessors of it, to whom it probably descended through a long line of equally sluggish ancestors, from some Inchi of Zaman daulu, who had better notions when he planted it: each tree throws out from 10 to 20 suckers, which increase so rapidly that the owner is obliged to thin them constantly. A good tree yields from 40 to 50 tampin, and the worst ever cut down about 25; this is on Appong. The tampin of Appong is to that of Mandha as 4 is to 5. It is a rough measure made of the leaves of the sago tree of a conical form, 20 to 30 inches long with a base of about 8 inches diameter, both ends of this are stuffed with the refuse pith to prevent the escape of the farina, and the tampin of Appong holds on an average 19 pounds avoirdupois—thus 7 tampin very nearly equal a picul of 133½ lbs. avoirdupois. The sago of each place, differs but a little in quality, 100 tampin of Appong may always be purchased on the spot, cheap or dear at other places it matters not, for 6-1-4 real or Sp. Drs. 5-12, as a Sp. Dr. or a real is the same thing with them and both go alike for 244 doit or 82 cents of a Sp. Dr. of Singapore. If the person in quest of sago take doits, they must be of the small kind, but thick. At Mandha, on the same principle the same number of tampins may be had for Sp. Drs. 9·61. Now the Appong measure yields 14 piculs, 29 catties ; and the Mandha 17 piculs 86 catties ; being a difference *against Appong of Sp. Drs. 2·61, and all because they say it has been the adat or custom to sell it so.*

*One person is sufficient to clear the under*wood away as it grows up in every lot of 100 fathoms square. The whole family are however fully occupied when they cut down the trees for manufacture which is always done on the spot where the tree is felled. They prepare the number of tampin or measures required for the reception of the sago in the first instance, and put them out to dry ; they then fell the tree, and split it in halves by means of wedges, build a temporary house over it and dig out the pith with hoes made from the rind of the tree. They then carry the pith up into the house ; the floor of which is latticed so close as just to allow the finer parts of the medulla to pass through on being wetted with water and trodden by the feet. Into this house the produce of two or three trees is brought at a time, and all the finer parts are carried down by the water into the trunks of the trees, though 3 or 4 feet in diameter, which are cleanly hollowed out and left below to receive it. In order that no wastage may take place, they lead a mat, made also of the leaves of the palm, from the floor of the work-shop down into the shells of the trees, and this carries the water without spilling any. They trample it until the water passes through clear of the farina, and then throw away the refuse, merely keeping sufficient to stuff the ends of the tampin. By the next day, the medulla has settled in the trunks of the trees, leaving the water at the top ; this is drawn off and the sago flour thrown in its wet state into the tampin already prepared, and left to strain itself : some refuse pith is then put on the end, before left open, of the base of the cone, and the work is done. The shell of the tree is cut up for firewood or in slips and thrown into the marsh, to facilitate its carriage down to the boats waiting for it. This is always the sellers duty. Sago once made is obliged to be kept wet or it would spoil in a few days ; again, kept constantly wet the tampin leaves soon rot ; cultivators cannot therefore keep a stock ready, but at great risk. They have a method of frying the meal over the fire called there sago randang, which sells for a real or 82 cents of a Sp. Dollar, for 16 of their gantong are equal to 20 of Singapore or *one picul. This, however, will not keep long ; as damp throws it all into a glutinous mass* and in a short time spoils it. At Appong the sago is made by Orang Utan or people of the woods, who speak a jargon of Malay, are not mahomedans, and eat the hogs, deer, &c., with which their island abounds. The maritime Malays who visit them for sago, are obliged *to be always upon their guard, and not unfrequently wait two months for a cargo of a few hundred tampin ; if they take money to purchase they get it much quicker, but re*quire additional caution in making advances. Most of these people are dependants of Siak and Campar, the chiefs of the former place practising a system of extortion and rapine enough to induce any other class of people less accustomed to it to desert the place : some manage to make their escape. The cultivators in the other places are Malays and much superior, though their exports are severally less, and trafficing with them is not so dangerous or uncertain. Appong has 350 souls employed and could produce 3,000 piculs. This would afford under all the disadvantages at which they sell it Sp. Dollars 1,024 per annum, a sum quite adequate to the demands for foreign luxuries of people who do not eat rice, and live upon the produce of their woods.

Siak.—The people of Siak were the chief importers of sago into Malacca, whence erroneously it got the name of Siak sago, described as the best by Crawfurd : Siak itself exports no sago.

Malays all agree that the cultivation of sago is the most profitable of agricultural pursuits, not yielding even to the cultivation of rice by Sawas, for once in bearing the trees are, ad infinitum, equally profitable and require little or no labour. It has been calculated that the profits of an English acre when the trees were once fit to cut would amount on a low estimate to 50 pounds sterling per annum after paying all expenses. The maritime Malays, who are almost the sole importers of sago, are enabled generally to realize from 80 to 120 per cent. on their cargoes : they are seldom ten days at sea, and notwithstanding the occasional detentions and annoyances they experience in carrying on this traffic, must, with few exceptions, be well recompensed. Allowing an absence of two months, in a boat of two coyan, and five men, bringing back four hundred tampin, they have a clear gain on their return cargo of 17 to 26 dollars according to the state of the market, giving each person a profit as wages, when sago is in demand, of two and a half Spanish Dollars per month, and putting aside 50 cents for wear and tear of the boat, a sum quite adequate for this purpose—independent of the prefer*ence which people bred up to a sea-faring life generally give to it over all other modes* of more profitable subsistence, and setting aside the chance of a gain which they have on their cargoes imported into the sago districts. The rude inhabitants of Appong, by calculation of their wages of labour and profits of stock, on a reduced scale compared with their more civilized and wealthier neighbours, the *Malays of Mandha and other places, have contented themselves with an average rate about 30 per cent. less, evidently arising from their poverty and barbarous condition.*

Pearl Sago.—The greater number of the Singapore manufactories are placed on the flat ground between the basis of Pearls and Oo Long's hills and the winding and branching creeks and canals of the Singapore river, a situation admirably adapted for them, for the creeks bring the sago boats up to them in front and the hill supplies them from behind with an abundance of pure water. To procure a constant supply, wells are dug on the lower slope of the hill, and the water is led into the manufactories by a succession of wooden troughs having their bottoms lined with clay and which are supported by cross sticks fastened at the place of contact by rattan. The essential features of every manufactory are, the landing place where the sago is taken from the boats to a rude shed, where it is removed from the sago leaves in which it is enveloped, a second shed where it is purified, and the large house where it is formed into pearl sago. Besides the tables, furnaces, and bins required for the sago, the latter contains the beds, stools and dining tables of the workmen, and occasionally heaps of boxes. Hitherto it has been an atap shed roughly put together and often only partially closed at the sides. But some of the more wealthy manufactures are now raising substantial edifices of brick and tile, and it is to be hoped will also introduce into their establishments a little attention to cleanliness and comfort. At present the mass of decomposing vegetable matter which surrounds the sheds produces a sour disagreeable smell. The sago leaves and refuse accumulating in some places for the last 30 years, have there formed extensive beds, spongy at the top and solid below six or seven feet in thickness.

The tampins having been placed in heaps in the shed, the first step is to open them, cast the contents on a plank frame about 12 feet square, surrounded by a rim rising about 2 inches from the surface. The sago, massed together by having remained compressed in the tampin, is here broken up by the common chankal, a kind of hoe.

The raw sago having been thus made ready *for the manufactory, the first process to which it is subjected is that of a thorough washing,* without which it would remain impure and coloured. For this purpose strong tubs are employed, about 32 inches deep, 40 inches in diameter at the top and 6 inches more at the bottom; they are bound by three hoops, each formed of about six thick rattans twisted together. A piece of thin coarse cloth is *fastened by its four corners over each tub when used, and hangs loosely into it. The moist sago being poured into this strainer, and there broken and bruised by the hand, is agitated until all its fine particles pass through* the cloth and descend to the bottom of the tub, while the fragments of leaf, fibre and other impurities which remain in the cloth, are shaken into a round mass, which is taken up in a bowl and thrown aside. The rapidity and deftness with which this and all the other manipulations are performed are very striking. The sago is next stirred about with an oar for about an hour, after which it is left to stand for about 12 hours, when the water is ladled out, and the sago, which fills about half the tub, is removed to undergo the last purifying process which precedes the granulation. This is performed in a mode at once simple and ingenious, the same principle being availed of which serves the gold and tin miners of the Archipelago to clean the ore; the more precious matter happening, in all three cases, to be heavier than that with which it is mixed; and being thus readily separable by the action of running water.

Two tubs are placed at a distance of ten or twelve feet from each other, and connected by two troughs raised by a framework above them. These troughs are about 10 inches deep, 14 inches broad at the top and 11 at the bottom, one end being closed, and the other open, but having grooves in its sides and bottom, like those of a sluice, into which a series of horizontal pieces of wood or sticks fit, each being about ⅜ths of an inch in thickness. The end of a piece of cloth of the breadth of the trough being placed over the grooves at the bottom, the shortest of the sticks is pressed down upon it, and the cloth, thus fastened, is made to hang down over the edges of the trough into the tub below it. The tub at the other end now receives the sago to about two-thirds of its depth, when it is filled up nearly to the top with water. A man now stirs up a portion of the sago with an oar till the water obtains a milky appearance, when he proceeds to pour it into the troughs. To prevent its falling abruptly, an inclined piece of wood, eight inches broad, is fixed across the trough, so as to leave only a narrow slit between it and the end of the trough. The water is poured on this, descends into the *trough, and slowly flowing to the other end deposits a portion of the sago in its progress.* The suspended cloth, becoming saturated, serves at once to maintain and equalize the overflow of the water into the tub below it. When the water is poured in, the first waves advance rapidly and carry away much of the sago, but those that succeed deposit the greater part of their more solid contents, transporting into the tub only the lighter fibrous particles which it is the object of this operation to separate from the farina, and by the time the man has performed a similar service at the other trough, and is ready to pour a fresh supply into the first, the water flowing down the cloth has lost its whiteness. This process is continued until the deposit rises nearly to the level of the stick, when the sago next to it, which generally contains some impure sediment, is taken up with the fingers and thrown into the tub. The second stick is now fixed above the first, a fold of the cloth being interposed between them to prevent any liquid sago escaping through the seam, and the operation goes on as before. When the milk in the upper tub begins to grow shallow, it is again filled up with water and more sago stirred up and mixed with it. During the interval and at other more prolonged interruptions the water in the troughs has sometimes time to deposit all its contents, the last being a fine fibrous matter which, if not removed, would leave a thin yellow layer. The surface is washed with the hand until this layer is effaced and held in suspension. When the troughs have been gradually filled up in the manner described, by succession of deposits, and the wall built up to the top by the last stick, the sago is left to consolidate for 12 or 14 hours. The farina which passes out of the troughs in the current is afterwards thrown into one of the tubs whose contents are to be washed and deposited in their turn, and some of it may even be destined to pass through the process many times before it sinks in the trough. In order to give it the degree of dryness required, it is removed from the troughs and exposed for one day to the sun in lumps about a cubic foot in size, which are placed on tables standing in the open air. Large kajang, which are mats made of the leaf of the mang-kwang, are kept in readiness to cover it when a shower of rain falls. It is next carried to the large shed where it is thrown in a heap on a long table and broken down into a pulverulent state. It then passes through an oblong sieve, 30 inches by 20 inches, of which the bottom is formed of parallel fibres from the stem of the cocoanut leaf, kept in their positions by strings which cross them at distances of about 2 inches. The lumps which do not pass through the long interstices between the fibres are thrown back into the heap. The granulation or pearling now takes place. The sifted sago is placed in a cloth of which the ends are tied to a long stick and which is kept expanded in a bag shape by a short cross stick. A horizontal vibratory motion is given to this, the whole mass being kept in constant agitation, and every part successively driven along the sides of the bag. Some experience is required in drying the sago to the proper degree preparatory to granulation. If under-dried or over-dried it will not granulate. This lasts for about a minute, when the new granular sago is again passed through a sieve similar to the preceding one, but the smaller grains which pass through are those which are now rejected. Those that remain are transferred to a circular sieve, of which the bottom is formed of fine stripes of bamboo crossing each other. The grains that pass through the square holes thus produced form the pearl sago of commerce in the unroasted state. Those that are larger than the holes are thrown back into the heap to run through the same course again. To assist the men, the oblong sieves and granulating bag are sometimes suspended by rattans from the rafters of the shed.

The roasting takes place in a row of iron pans, each about 2½ feet in diameter, which are built into a platform of masonry about 15 feet long and 4 feet in breadth, covered with flat tiles. The pans rest in an inclined position partly against the back of the platform which rises about a foot above its level, and partly on a small prop of brickwork on the right side, an offshoot from the wall. Into the top of this prop a plate is sunk in which a cloth saturated with wood oil or Miniak-krueng, is kept. Behind each pan is an open furnace mouth, and a man constantly attends to the fires, keeping them supplied with a few billets of bakau wood, and regulating them with a long two-pronged iron fork so as to maintain a moderate heat. The pan being gently rubbed with the cloth a man who sits in front of it on a low stool placed on the platform pours into it a quantity of granular sago. This he slowly stirs for a short time with a wooden implement called "weah" having a sharp curved edge. More sago is poured in until it amounts to about two chupa, when as it hardens he uses the weah more freely. After about three minutes' roasting, it is removed to a table and passed through a round sieve similar to that before described. The grains that adhere to each other are thrown aside, and those that pass through form a smoking heap which is allowed to lie undisturbed for about 12 hours. The grains are about the same size as they were before roasting, and some retain wholly or partially their white and mealy appearance, but the greater part have become translucent and glutinous, and all have acquired a certain degree of toughness, although still soft. This change appears to be brought about in this way. The water contained in the granules being heated first converts the mealy starch into a jelly and then escapes by evaporation, leaving the jelly tough. The second tumifaction drives out the remainder of the water. The final process is another roasting, which renders them hard and tough, and greatly reduces their size. The pearl sago thus prepared and fit for exportation, is put away in large open bins ready to be transferred to boxes or bags when sold.

This method of making pearl sago appears to have undergone no improvement or change whatever since it was introduced into Singapore in 1819. It was taught to the first Chinese who tried it here, by a woman who came from Bukit Batu, a place on the coast of Siak facing the large island of Bencolin, and famous for its great fishery of the trubu, the roe of which is so extensively used. In Malacca, however, manufactories had existed for many years before the establishment of Singapore. It is certain however that Malacca derived the art from Bukit Batu, where it originated about the beginning of the 19th century. It was long kept secret, but in Singapore it appears almost from the first to have been conducted without any attempt at concealment.

From 20 to 30 men are employed in the larger manufactories, but if their labours were confined to the making of pearl sago, 16 men would suffice for a manufactory such as described above, and they would produce about 450 piculs per month. Their wages are, for the roasters and the man at the troughs 4 dollars, and for the other men 2½ to 3 dollars a month, and they receive their food besides. The original outlay is probably from 300 to 400 dollars. The profit of course varies greatly; and the business cannot be so certainly lucrative as has been sometimes supposed, since there have been instances of failures. There were, about the year 1840, fifteen Chinese manufactories in Singapore, and two had recently been commenced by Europeans, whose power to compete successfully with Chinese, was doubted, unless they can introduce a more perfect washing and granulating process, that adapted at present requiring so much labour, and being attended with so much waste, that unless the full work be got from the Chinese employed, there will be little room for profit. The Chinese method of preventing all loss of labour which they carry into most of their undertakings is brought into the sago concerns also. One of the principal shareholders lives in the manufactory, and the best workmen have small shares in the profits besides their wages.

The Trade in Sago.—A large portion of the sago imported into Singapore is the produce of the marshes of Siak and Indragiri, the low island of Rantan containing the most extensive plantations. It is purchased in Siak from the Malays and Orang Sakai by Malays, chiefly of Siak and Singapore, who resort there in small boats for the purpose. In their hands its cost is enormously enhanced, the Sakai selling it to them at about 10 cents per picul, and they selling it to the Singapore manufacturers at from 70 cents to one dollar per picul. The plantations belong to Malays who employ the Sakai as serfs in planting them and preparing the sago, allowing them one-half of the produce. On this and wild animals they subsist, and the sago which they do not require they dispose of to Malays in barter for cloth, tobacco, &c. The Malays admit that by this mode of dealing the sago does not cost them much more than 10 cents per picul. This entirely agrees with the system adopted in their dealings with the Binua of Johore—(Jour. Ind. Arch., Vol. i.) The Malays at the Siak islands, and at the sago plantations between Kampar and Indragiri where they have no serfs, sell the sago on the spot at about 20 cents per picul. The price obtained by the latter for pearl sago was at first 6 dollars per picul. The Singapore manufacturers having succeeded in improving its quality by a more careful manufacture, and the demand increasing for export to Europe, the price rose in 1824 to 7 dollars. This caused the establishment of several new manufactories towards the end of that year which at once brought it down to 5½ to 6½ dollars. In 1825 the supply exceeded the demand and two of the principal manufactories, one of which had employed 55 men, were abandoned, and the price fell to 4 to 5 dollars. In 1826 it descended to 3½ dollars to 4 dollars, and by 1831 it was 2¼ to 2½ dollars. In 1838 it was so low as dollar 1¼ to 1½. After this it rose again. In 1845 it was about 3 dollars. It is now about 2 dollars 65 cents., and has for several years remained between 2 and 3 dollars. The importations during the earlier years of the settlement were as follows:—

1819—22 boats, quantity not ascertained.
1820—5,684 piculs.
1821—10,694.
1822—11,445.
1823—no imports.
1824—11,669.
1825—25,612.
1826—21,666.
1826-27—17,768.
1827-28—16,205.
1828-29—15,818.

The following tables, furnished by the Honorable the Resident Councillor, will show the state of the trade for the last five years as far as the records of the Office of Registry of exports and imports can be relied on, having been carefully prepared by Deputy Registrar, Mr. Holloway. The average of the exports for that period is about 16,000 piculs of sago flour and 24,000 piculs of pearl sago, or a total annual export of 40,000 piculs, of the value on the spot, at present prices, of 100,000 dollars :—

RAW SAGO.					Bundles
To Borneo	..	..	..	..	100

Sago is not an article which can ever displace the cereals, or which should be anywhere substituted for them, but it ought to be produced in an exportable state at such a price as to be within reach of the poorer classes, whenever a diminution in the supplies of rice or corn deprives them of a sufficient quantity of their ordinary food. This could easily be accomplished by Europeans possessed of a little mechanical skill, who would combine manufactories and plantations, and thus save the present enormous waste of labour and raw material, 25 cents per picul seems to be about the natural price of sago flour properly prepared at the plantation for exportation, and this is nearly equivalent to 10 pounds for a penny. The poor Sakai get only about a half penny for that quantity.

Singapore itself is well adapted for sago. There are considerable tracts of marshy land at present lying waste, in all of which sago would grow well, for it is in the very same kind of soil that it flourishes in the neighbouring islands along the Sumatra coast. Arrow and other roots yielding starch are now cultivated with profit, and as one manufactory will serve for the preparation of all the varieties of farina, it would be found advantageous to unite the culture of these roots with that of sago. As all the marsh valleys in the island are bounded by low hill ranges, tracts of land adapted for the purpose could readily be selected.

Forrest states the average produce of a Molucca tree to be 336 pounds, but Rumphius makes it from 600 to 800 pounds, and according to the writer in the 'Singapore Chronicle,' who seems to have paid great attention to the subject, good Sumatra trees yield from 760 to 950 pounds, and the very worst 475. Perhaps therefore 700 pounds may be assumed as an average for the Sumatra trees, which at 10 feet apart (the distance stated by Forrest and followed by Crawfurd) would give about 300,000 pounds for the harvest from one acre, and, allowing that the harvests are 15 years apart, and not seven as Forrest assumes, this will give an annual average produce of about 20,000 pounds. We believe however that 5 or 6 feet is about the average distance of the large stems in the Sumatra forests. When a plantation has once arrived at maturity there will be a constant harvest, because the natural mode of growth secures a continual succession of new plants from the time those first planted have begun to extend their roots, and this succession can be regulated by the knife in any way the planter desires. The sago tree when cut down and the top severed from it, is a cylinder about 20 inches in diameter and 15 to 20 feet in height. If we assume 20 inches by 15 feet to be an average size, the contents will be nearly 26 bushels, and allowing one-half for woody fibre there will remain 13 bushels of starch, which agrees very closely with our previous calculation, 700 pounds being equivalent to 1½ bushels. It may give some idea of the enormous rate of this produce, if it be considered that three trees yield more nutritive matter than an acre of wheat, and six trees more than an acre of potatoes. An acre of sago, if cut down at one harvest, will yield 5,220 bushels or as much as 163 acres of wheat, so that, according as we allow 7 or 15 years for the growth of a tree, an acre of sago is equal in annual produce to 23 or 10 acres of wheat.—*Jour. of the Indian Archipelago, Vols.* i; iii, *No.* v, *May* 1849, *pp.* 288 *to* 313; *Bennett's Ceylon*; *Low's Sarawak, p.* 39; *Forrest's Voyage to New Guinea, p.* 42; *Crawfurd, His. SAGOWANI, HIND. Dæmia extensa? *R. Brown.*

SAGRA. To one of the families which bring up the rear of the Coleoptera, belongs Sagra purpurea, found on Euphorbia antiquorum; S. lugubris in Ceylon, is found on the castor oil plant, and is also one of the Coleoptera of Hong Kong.

SAGRI, an Affghan tribe in the country between the plains of Peshawar and the Salt Range at Kala Bagh. The Sagri Patan tribe dwell below the Khuttuk. The tribe continued entirely independent of the Sikhs. They hold the country on the west bank of the river for nearly 30 miles above Kala Bagh, and also possess it on the opposite bank as high as the plain commencing at Hassan Abdal. They are shepherds, and have numerous flocks. The number of the Khuttuk tribe is variously stated at 6,000 and 8,000 armed men.—*Burnes' Kabul, p.* 105; *Papers, East India, Cabul and Affghanistan*, 1859, *p.* 21.

SAGU, MAL., also Sagu-Chawal, HIND., also Sagu-dana, HIND. Sago.

SAGUERUS, see Gomuto, Sagus.

SAGUEIR, palm-wine of the Arenga saccharifera. It is as intoxicating as ordinary beer, or cider.

SAGUERUS RUMPHII, *Roxb.*, syn. of Arenga saccharifera, *Labill.*

SAGUL, MAHR. Horse raddish tree.

Hyperanthera moringa. Sagul-ke-jhar-ki-jar. Its root.

SAGUN, Hind. Tectona grandis.

SAGUS FARINIFERA, *Gærtn.*

Sagus Rumphii, *Willde.* | Metroxylon sagus, *Konig.*
S. spinosus, *Roxb.*

This sago palm is a native of the peninsula of Malacca and of the Eastern Archipelago. Its pith is made into sago flour, which is the staff of life of the people of the Moluccas. The seeds are generally abortive and it propagates itself by suckers from the roots of the old trees. Hartwig says that it forms large forests, grows at first slowly and is covered with thorns, but so soon as its stem is formed, it shoots speedily to its full height of ten yards, with a girth of five or six feet. The tree is felled before the fruit begins to form as otherwise the farina would be exhausted. Cossus saguarius, a large lamelliform beetle, found in the pith of the sago palm, is considered by the natives a great delicacy.—*Roxb.*; *Voigt*; *Hartwig.*

SAGUS KONIGII, syn. of Metroxylon sagus.

SAGUS LÆVIS, *Rumph.*

Sagus inermis, *Roxb.*
True sago palm, Eng. | Rambiya, Malay.

This is a native of Sumatra, Borneo and the Moluccas. The stem, which is from 15 to 20 years in attaining maturity, is as thick as that of the cocoanut tree. The petioles and spathes unarmed. This palm furnishes most of the sago sent to Europe.—*O'Shaughnessy, p.* 640; *Roxb.*, iii, 623; *Eng. Cyc.*; *Voigt*, 639.

SAGUT-KE-JHAR KI JAR, Hind. root of Hyperanthera moringa.

SAGWAN, Hind. Teak. Tectona grandis.

SAGWIR or Gomuti palm, Anglo-Port. Arenga saccharifera. Gomuto.

SAH, Hind. Larix griffithii.

SAHAB, a place on the eastern bank of the Euphrates, near Koorna, whence caravans load and depart for Hawaizah.—*Mignan's Travels, p.* 290. See Sahal.

SAHA-BIRI, Malay. Ambergris.

SAHADEVA, one of the five Pandava. See Magadha, Mahabharata.

SAHADEVI, *Hind. Crozophora tinctoria. Sahadevi-bari is Sonchus orixensis, also Vernonia cinerea.*

SAHA-DEVI-CHETTU, Tel. Echites frutescens, *Roxb.*, also Sida acuta, *Burm.*

SAHAJNA, Sans. Moringa pterygosperma. Hyperanthera moringa.

SAHAL, see Koorna.

SAHA-MARANA, Hind. Burning of a widow at the same time and place as her husband's body.

SAHAN, Palembang. Black pepper.

SAHAN-SABED, Hind., Pers. Hematite, used as a drug.

SAHARA, Ar., Pers., Hind. A desert, a sandy plain, the sandy desert of Africa and Central Asia. The intense heat and cold of deserts is owing to the circumstance, that among crystalline bodies, rock crystal, or silica, is the best conductor of heat. This fact accounts for the steadiness of temperature in one set district, and the extremes of heat and cold presented by day and night on such sandy wastes as the Sahara. The sand which is for the most part silica, drinks in the noon-day heat, and loses it by night just as speedily. The influence of the hot winds from the Sahara has been observed in vessels traversing the Atlantic at a distance of upwards of 1,100 geographical miles from the African shores, by the coating of impalpable dust falling upon the sails.—*Curiosities of Science, p.* 165. See Khiva, Khanat, Rain.

SAHARANPUR, in lat. 29° 57′ 2″, and long. 77° 28′ 8″, is a large station in Hindostan where Botanical Gardens have been fixed. Belville, one mile south of Saharunpur is 980 to 1,013 feet according to Herb. and Hodg. above the sea. The Botanical Gardens 1,002 and 965 according to Roxb., Schl. and Jacq. South of Africa, Extra Tropical New Holland, South America beyond 23½° south lat. Saharunpore and Northern Doab have similar climates. The gardens form a central depôt, from which the requirements of the greater part of the public gardens in Upper India are supplied. During the one season, no fewer than a lac and a quarter of fruit trees, half a lac of timber trees and flowering shrubs, and about two thousand parcels of seeds were distributed among almost every station from Calcutta to Peshawur. Large supplies of pine and other hardy timber seeds were sent to Britain, and exchanges effected to the Ionian Islands, to Turin and to France. Many kinds of seeds, when acclimatised in this country, particularly those belonging to the umbelliferous and cruciferous families, degenerate in two or three seasons.

SAHARAWAN, a district of Baluchistan. The Saharawan territories are about *10,000 square miles. The population does not exceed 50,000. The borders of this elevated* plateau, the more northern of the Baluch confederate provinces runs with the Afghan districts of Peshing and Toba, dependent on Kandahar, and is separated on the east by a range of hills, from Dadar and Kach Gandava. It has only the Bolan river, and a few rivulets, but the climate is cool, and the rain ensure good grains harvests. The Raisani the most respectable of the Saharawani tribes (from "rais" Arab a ruler), are able to raise 500 fighting men. The Brahui tribes in Saharawan and Jhalawan, whose great chief is the khan of Khilat, ethnologists consider to be of the same Scythic stock as the Dravidian races in the south, and infer from this that the passage of the Dravidian tribes from Turan was along the valley of the Indus. See Beluchistan, Brahui, Kelat.

SAHASTRAPUTRA, Sans. Nelumbium speciosum.

S'AH-BUI, Malay. Ambergris.

SAHEE, a river near Furrucknuggur in the Delhi district.

SAHCOTTAY OIL, from Canara used for cutaneous diseases.—*M. E. J. R.* 1857.

SAHHARAH, Arab. A wooden box, about three feet each way.—*Burton's Pilgrimage to Meccah, Vol.* i, *p.* 182.

SAHI, Sayal, Sarsel, Hind. Hystrix leucura, *Sykes.*

SAHIB, Arab., Pers., Hind. The respectful term employed by natives of India, and by Europeans themselves, to designate a European of rank.

SAHIBAH, a lady. In Mewar, the title of the rani is simply Mahji ; at Jaipoor, where they have long used the language and manners of Delhi, they affix the Persian word Sahibah, or ' lady-mother.'—*Tod's Rajasthan, Vol.* ii, *p.* 380.

SAHIBAN, Ar. The Ullums.

SAHIB-I-NASIB, one who has eighty rupees in his possession for a year.

SAHIB-I-QARAN, a mahomedan titular term for a sovereign ruler.

SAHIB-I-TASSARUF, Ar., Pers., in speculative mahomedan theology, persons in the world holding supremacy over souls of men.

SAHIB KRAN, a Persian coin, rather less than a shilling.—*Baron C. A. DeBode's Trav. in Luristan & Arabistan, V.* ii, *p.* 233.

SAHO, also Sahocar, Pers., Hind. In India a hindoo who deals in money as a banker, or in exchanges.

SAHOE. The northern peninsula of Gilolo, and the great island of Ceram, are inhabited by the Alfuro of Sahoe and Galela. *These people are quite distinct from the Malays and almost equally so from the Papuan* race. They are tall and well-made, with Papuan features and curly hair. They are bearded and hairy limbed, but they are quite as light in colour as the Malays. They are an industrious and enterprising race. Cultivating rice and vegetables and indefatigable in their search after game, fish, tripang, pearls and tortoise shell.

SAHAJI, a rajah of Tanjore.

SAHRAI, the most numerous of the mahomedan tribes of the Indian desert, of which he is the terror. The Khossa is a branch of the Sahrai, whom in habits he resembles, plundering on camels, but they are cowardly and faithless. The name is probably from sah'ra or sahara, a desert.

SAHRASHTRA, see Sumitra.

SAHR RUD, see Koh-i-Nokreh.

SAHUT, Pers. Watches.

SAHUKAR, Hind. A money-lender, a banker, a merchant in general.

SAHUJNA, also Sahajna, Hind. Ben Tree. Moringa pterygosperma. See Ben oil, Moringa oil, Oil.

SAI, Hind., of Chamba, Deutzia staminea, also Abelia triflora and Lonicera quinquelocularis.

SAI, see Kedah.

SAIA, Tam., Hedyotis umbellata, *Lam.*

SAIDE, the modern Sidon, is built on a small promontory over-looking the sea, and has about 15,000 inhabitants.

SAIDI, Hind. A kind of emerald.

SAIFALI, a section of the Kabul khel Waziri, inhabiting the independent hills to the westward of the Bunnoo thull. They entered into an agreement or treaty with the British to do all in their power, as far as their own tribe is concerned, to check and prevent the robbery or murder of British subjects, and to cause stolen property from British territory to be returned. Also not to receive property stolen from British territory by any other tribe, and not to give shelter to any criminal guilty of a heinous offence, also if any British subjects should make a pursuit into their country for the recovery of stolen property, or the apprehension of criminals; they will not interfere. This section of the Waziri is said to have been long unfavourably distinguished as receivers of stolen cattle and other property from the Bunnoo district.—*Lahore Courant.*

SAIGA TARTARICA.

Antilope colus, *Smith.*

It inhabits the open steppes and deserts from the Danube to the Irtish eastward, and as far north as 54° of north lat., found in Poland, Moldavia, about the Caucasus and the Caspian Sea, *in Siberia, and in northern Persia. Their eye-sight is said to be defective from the reflection of the dry arid plains upon which* they mostly reside.—*Eng. Cyc., p.* 235.

SAIGON, called Luknooi by the Cochin Chinese, is in lat. 10° 15′ north, long. 106° 43′ east. The surrounding country abounds with timber and other necessary articles for ship building. See Kobo.

SAIL, Hind. Slate or schist : a slate ; a slab of stone.

SAIL, Ar. A flood.

SAILA, or Sela, HIND. Muslin.

SAILAB. A flood of the great rivers, or overflow of waters from other sources.

SAILABI, HIND. Land watered by flood.

SAILA-DEVA, see Gujarat.

SAILAGIRI, the famous Gridhrakuta, or 'Vulture's Peak,' near Rajagriha.

SAIL CLOTH, ENG. Canvas.

SAILEE. A river of the Saugor district.

SAIL-AL-ARAM, also called Sail-ul-Mareb, the flood of Aram, a great calamity which befel the Arabs of Yemen, soon after the time of Alexander the Great, Abid-Shams surnamed Saba, built the city of Saba, afterwards called Mareb, and made a great dam to form a reservoir. The water was 20 feet deep and was utilized for irrigation, but one night it burst and carried away the whole city with the neighbouring towns and people. Mahomed mentions it in the Koran. See Arim, Balak, Mareb, Saba, Yemen.

SAILING FISH, two remarkable inhabitants of the waters about Malacca and Sumatra, were described by Raffles ; the sailing fish, called by the natives ikan layer, and the dugong, mentioned by Valentyn, and so long talked of as the mermaid. The inhabitants of Singapore say that these had become very scarce.—*American Expedition to Japan, p.* 155.

SAIL-LEAF. For many of the Burmese boats, sails are made of large narrow leaves, sewed together. They are the leaves of a species of screw pine, or Pandanus, that has a trunk like a palm, which usually grows near the sea, and is very abundant. The fruit is used by the Karens, to hackle their thread.—*Mason.*

SAIMIO. A titular prince of Japan.

SAIMME KIRAI, TAM. Caladium esculentum.

SAIN, in Sind, is the "sahib" of India, the "sir" of England.—*Burton's Scinde, Vol.* i, *p.* 143.

SAIN, HIND. The flying squirrel of Kangra.

SAIN NOIN, see Kalkas.

SAIN also Asun or Arjan, HIND. Pentaptera tomentosa, P. Glabra.

SAINDHAVA, is Sindh and Balochisthan.

SAINGRI, or Sangri, HIND. The seed pods of jhand, the Prosopis spicigera, one of the common shrubs of the rakh or preserves.

SAINHIKEYA. In hindu mythology an Asura or giant, who stole amrita or nectar when the gods churned the sea of milk, for which Vishnu cut him into two pieces, called Rahu and Ketu, which are said to cause the eclipses.

SAINJ, an affluent of the Beas.

SAINT HILAIRE, M. Barthelemy, a French author of great fame, the first historian of buddhism.

SAINT JOHN'S BREAD. Ceratonia siliqua, *W.*

SAINTS. Buddhists, hindoos, jaina and mahomedans believe in saints and worship at, and make pilgrimages to, their shrines.

SAINT THOMAS' BALSAM, the Tolu balsam.

SAINT THOMAS' MOUNT, a military station of the British, ten miles south-west of Madras. It is famed amongst eastern christians as the site of the martyrdom of St. Thomas, and the church on the summit of the hill is visited by pilgrims even from Syria. It was plundered in 1752 by the troops of Chunda Sahib, under his son Rajah Sahib, and the advanced force of Hyder Ali later in the century again plundered it. The little Mount is on the right bank of the Adyar river three miles nearer Madras.

SAIR, AR., HIND. Transit duties ; a due or tax levied on certain natural productions, other than cultivated lands ; such as on date trees, fisheries and grass, &c.

SAIR also Sairi, MAHR. Bignonia xylocarpa.

SAIR YARI, PERS., TURK. Promenades.

SAIS or Syce, HIND. A groom.

SAISON, HIND. Antilope cervicapra, *Pallas.*

SAISU-NAGA, or Ses-nag. This Indian race reigned 360 years, and we find amongst them, B. C., 415, Nanda, Mahapadama, (B. C., 1602, Jones, 364 Wilson) regarding whom it was said he will bring the whole earth under one umbrella ; he will have eight sons, Sumalya and others who will reign after Mahapadma. He and his sons will govern for 100 years. The brahman Kaulilya will not root out the nine Nanda. See Magadha.

SAIRINDHA, the people of Sirindha or Sarhind.

SAITHÆ. Dionysius, (Anc. Myth., Vol. iii, p. 226,) as rendered by Bryant says, upon the banks of the great river Indus the southern Saithæ dwell.

SAIVA, a sectarian hindoo follower of Siva. Many saiva hindoos believe in the three hindu gods, Brahma, Vishnu and Saiva, as triune, and many Saiva are essentially polytheists but vaishnava hindoos are rarely in accord in this, and the bulk of the hindoo religionists regard Siva or Ishwara, Vishnu and Brahma or Para-brahma as distinct deities. The Saiva sect far out-number the Vaishnava. The essential element in the Saiva faith is a reverence for or deification of the procreative power and seems to be the same idea of natural progression which is carried on by the buddhist doctrine of gradual perfectability (raising man almost to the rank of a god.) The Vaishnava or Vedic creed is one of a separate creation of gods and their occasional incarnation in the form of man. If Saivites, buddhists and Jains be in some way connected, who they are who brought them is not known, the saiva are most in the west of India.

The Saiva, are worshippers of Siva, in one of his thousand forms, who, however, worship Siva and Bhawani conjointly.

The Ganapatia, worship Ganesa.

The Sacta, exclusively worship Bhavani or Parvati,—the sacti, or female energy of Siva.

The Ganapatya and the Sakta are sub-divisions, or ramifications of the Saiva ; of which may be traced these distinctions.—1, Saiva proper, meaning the worshippers of Siva and Parvati conjointly ; 2, Lingi or Langaet, the adorers of Siva, or his phallic type, separately, and these are a very strict and rigid sect ; 3, Sacta, the adorers of the Yoni of Bhavani, or her symbol, separately ; 4, the Ganapatya the exclusive worshippers of Ganesa, the first born of Mahadeva and Parvati. The ganapatya adore Ganesa as uniting in his person all the attributes of the Deity. The vira saiva, are very numerous in all the Canarese speaking countries and are distinguishable by their wearing the lingum in a silver or gold casket fastened round their arm or suspended from the neck.

The Avadhuta or Abd'hut of the south of India, is a religious ascetic mendicant of the saiva hindoos, who, similarly to the Virakta, Viragi, has subdued the passions and estranged himself from the interests and emotions of mankind, abandoning religious observances and wordly restraints. The Sakta have two classes of these, one the Vyakta-vadhuta, or professedly free, the other Gupta-vadhuta who privately throw off the usual restrictions of caste. The Akas-mukhi is a saiva devotee, who retains his head so long in the position of looking to the sky that he cannot restore the neck to its proper position.

Amongst vaishnava hindoos, in the south of India the Suttuthavan, TAM., are rigid Vaishnavi, are to the Vaishnavi what the Vira Saiva are to the Saivavi. They are flower selling minstrels and vagrant mendicants. They are said to have a communism of women, but if so, the practice is unknown to their neighbours.—*Wilson Gloss.* See Hindoo, Kancheliya, Kapila, Kara-Lingi, Mendicants, Sanyasi, Sikhs, Siva, Vairagi.

SAIVA NAGA, see Naga.

SAJ, ARAB. Shorea robusta.

SAJI-KHAR, also Papud-khar, HIND., PERS. Soda, Barilla, Alkali.

SAJI MATTI, coarse kind of barilla Dr. Royle alludes, to it, p. 319, as the produce of the incineration of some unknown plants. It is a mineral product very abundant near Monghyr and in the Doab.—*O'Shaughnessy, p.* 525. See Sajji-Matti.

SAJIRA SEED, Cuminum cyminum, Cummin seed.

SAJJALU, also Gantelu, TEL. Pencillaria spicata, *Swtz.*

SAJJI, or Sajja-khar, HIND. Impure carbonate of soda ; a soda salt manufactured from ashes of plants ;

Sajji-bhutni, 3rd quality of sajji.
Sajji-butha-sirsa, 2nd quality of sajji.
Sajji-chuwa sirsa, 1st quality of sajji.
Sajji-kangan-khar, 2nd quality of sajji.
Sajji-khara-sirsa, 3rd quality of sajji.
Sajji-lota, best kind of sajji.
Sajji-phul, a kind of sajji.

In the Panjab, the castes principally employed in the manufacture of sajji are the chura, dhobi, nunari, and a few arura. The Saji mutti, or Soda earth is found in many parts of India. It is called Dhobi's earth, Appli-carum, TAM., it is a coarse kind of Barilla, sold in the Indian markets. It is also prepared by the burning of plants growing on the shores of the salt lakes which are scattered through the Indian deserts.—*Powell, Handbook Econ. Prod. Punjab, p.* 87.

SAJNA, PERS., BENG., HIND., also Sahajna, HIND. Hyperanthera moringa, Moringa pterygosperma. See Moringa.

SAJOR KARANG, MALAY. Plocaria candida, *Nees.* See Agar Agar.

SAK, HIND. Bark of the kikar, put into the fermenting mass in spirit distilling : the term is also applied to other barks.

SAK, or Thoek or Thak, called Chatu or Chat by the Bengali, a small tribe who inhabit the eastern branch of the Naf-river in Arakan, in lat. 21° 20' N., and long. 21° 30' E., about 25 miles east from Elephant Point near the Koladyn river.

SAKA, SANS. Vegetables. See Sag.

SAKA, SANS. A branch.

SAKACHERA, SANS. Lawsonia inermis ; henna.

SAKADITYA, see Pandu.

SAKÆ. This name frequently occurs in hindoo annals, and Colonel Tod believed that the Saka of the hindoo annals cannot be other than the Sacæ or Sakai of classical geography. They are repeatedly named in various works and seem to have been known on the borders of India or in its western districts in the first century preceding Christianity. Vikramaditya, king of Ougein, became known as the Sakari or enemy of the Sacæ, and as his era dates B. C. 56, it would appear that about this time some northern tribes had settled themselves along the Indus, constituting the Indo-Scythi of Arrian. Their attempt to penetrate further to the east, by way of Kandesh and Malwa, was not improbably arrested by Vikramaditya, whence the epithet Sakari. The Sacæ are supposed by Professor Lassen to be the Szu Tartar who were expelled about 150 B. C., from the Ili valley by the Yue-tchi or White Huns, whom he supposes to be the Tochari. After occupying Tahia or Soghdiana for a time, they are further stated by the Chinese to have been driven thence also by the Yengar some years afterwards, and to have established themselves in Kipen, in which name Lassen recognises the Kophen valley in Kohistan. The Sakæ country was Turkestan and they seem to have been one of the Central Asia tribes to whom the vague term Scythian was applied. Little is known of the Sakæ and their migrations, but they seem to have been widely diffused, occupying and colonizing countries remote from Central Asia : It is well known to geographers that the Seghistan of the Arabs, whence Sistan, is the same as the Sakestané, or country of the Sakæ of the Greeks. The Sakæ are located by Strabo and Ptolemy on the north of the Himalaya but they were also on the south. The Sakæ, were known as Sakko on the banks of the Cheban, in Assyria. Sakæ are mentioned on the Behistun inscription ; some tribes dwelt near the Jaxartes now called the Sar-i-Darya and penetrated early into India, making their way in force from the Hindukush into Orissa. The Sakæ were pastoral and warlike and have been supposed to give their names to the Sassani, Saxani or Saxons. All the Sakæ tribes undoubtedly belonged to Saka dwipa or scythia. The Sakæ and Buddhii took possession of Kashmir, 340 B. C. some tribes of Sakæ opposed Alexander. Others of the Sakæ overran India in the reign of Asoka who, according to the Ain Aktari were expelled by his successor Jaloka. The Sakæ countries were, in those ages principally divided into Hushka, Tushka and Kanishka. The following passage occurs in D'Anville's Eclaircissemens Geographiques sur la carte de l'Inde, p. 42. " On ignore le temps auquel les Scythes sont venus occuper le Sindi. Dans le Périple de la mer Erythrée, la ville de Minnagra, le méme qúe Monsora, est qualifiée de capitale de la Scythie. Denys Périegete dit, que les Scythes meridionaux, habitents sur le fleuve Indus. Eustathe les nomme Indo-Scythes : et ce que Ptolémée appele Indo-Scythie, remònte le long de l' Indus jusqu áu fleuve Coos."

The Budii or Boudioi, of Herodotus, the Putya of the Persians, the Budii of the Babylonian inscription, are believed to be the same people, and Rawlinson supposes them to be Scythians. Putya in HEB., means broken of God. Israelites, in Media and Scythia were identical with Phut. Budii in HEB. means separated and Dr. Moore has put forward the opinion that the Sakæ were Hebrews and Buddhists and that they arrived in India about 100 years after the return of the Jews from Assyria to Palestine. The Sakai, who settled in Armenia were named Sacassani (lib vi, c. 19) Saxons, the Sacosena of Strab, lit. xi, pp. 776-788.—*Rennell's Memoir, p.* 185 ; *Isodore Char. in Hudson's Geog. Minores, Vol.* ii, *quoted in Ed. Ferrier, Jour., p.* 428. See Afghan, Arian, Kabul, Kashmir.

SAKA ERA, see Vikramaditya.

SAKAI, a pagan population in the Malay peninsula divided into the Sakai Jina and Sakai Bukit, the latter being hillmen and mountaineers—the former more settled and civilized. They are strict worshippers of the elements. Sakai is the Pahang word for an aboriginal. The Halas is a branch of the Sakai population of the Malay peninsula. They tattoo their face and breast, pierce their ears and nose and insert porcupine quills. See Kedah, Semang.

SAKAI, the Ishaqzai of independent Tartary and Bokhara.

SAKAI, in Persian synonymus for glutton and drunkard.

SAKALA or Sangala, an ancient town in the Panjab now called Sanglawala Tiba. It is the She-kie-lo of Hwen Thsang. It was the capital of raja Milinda, was subject to raja Mihirkul, is the Sangala of Alexander and has long ago been recognized in the Sakala of the brahmans and the Sagal of the buddhist. It was visited by the Chinese pilgrim Hwen Thsang in A. D. 630. Both Arrian and Curtius place Sangala to the east of the Hydraotes or Ravi ; but the itinerary of Hwen Thsang shows that it was to the west of the Ravi, and as nearly as possible in the position of the present Sanglawala-Tiba, or " Sangala Hill." Wilford, has three times described its position in the Asiatic Researches. When Hwen Thsang visited the city there was a monastery of one hundred monks who studied the Hinayana, or exoteric doctrines of buddhism, and beside it there was a stupa, 200 feet in height, where the four previous Buddha had left their footprints. The brahmanical accounts of Sakala have been collected from the Mahabharata by Professor Lassen in his 'Pentapotamia Indica.' According to that poem, Sakala, the capital of the Madra race who are also called Jartika and Bahika, was situated on the Assaga rivulet to the west of the Iravati, or Ravi river. The country is still well known as Madr-des, or the district of the Madra, which is said by some to extend from the Bias to the Jhelam but by others only to the Chenab. The buddhist notices of Sakala refer chiefly to its history in connection with buddhism. There is the legend of the seven kings who went towards Sagal to carry off Prabhavati, the wife of king Kusa. But the king, mounting an elephant, met them outside the city, and cried out with so loud a voice, "I am Kusa, that the exclamation was heard over the whole world, and the seven kings fled away in terror." This legend may have some reference to the seven brothers and sisters of Amba-Kapa, which is only 40 miles to the east of Sangala. Before the beginning of the christian era Sagal was the capital of raja Milinda, whose name is still famous in all buddhist countries as the skilful opponent of the holy Naga-Sena. The territory was then called Yona, or Yavana, which might refer either to the Greek conquerors, or to their Indo-Scythian successors ; but as Naga-Sena is said to have lived either 400, or 500 years after Buddha, the date of Milinda is uncertain.—*Genl. Cunningham's Ancient Geog. of India, p.* 179.

SAKALA PHALA SAMPENGA, also Phala sampenga also Manoranjitam, TEL. Artabotrys odoratissimus, *R. Br.*

SAKALAVA, see India.

SAKAM KUZIRA, JAPAN. Grampus sakamata, *Schlegel.*

SAKAMUNIYA, HIND. An astringent extract of resin, properly scammony, but usually an imitation is sold.

SAKANTALA, or the Lost-Ring, a Sanscrit poem by Kalidasa.

SAKAR, SIND. An embankment. This gives the name to Sakar or Sukker, a town on the Indus opposite Rori, where is a natural lime-stone mound about 100 feet high.

SAKARAN, a district in Borneo. See Borneo, Dyak, Kyan, Sakarran.

SAKARI, a title of Vikramaditya, king of Oujein, given to him because of his successful opposition of the Sacæ, an Indo-Scythic tribe who settled along the lower Indus.

SAKAR-KAND, PERS., HIND. Sweet potato.

SAKARRAN ORANG KAYA, see Kyan.

SAKASTENE, see Arians.

SAKATAI, or Chaghtai, the Saca-dwipa of the Pooran corrupted by the Greeks to Scythia, whose inhabitants worshipped the sun, and whence is the river Arverma. As the Chaghtai dynasty drew to its close in Eastern Turkestan, the priestly element began to increase: in 1678, Galdan khan, sovereign of the Eleuth or Kalmuk tribes of Dzungaria, established the khojahs of the White Mountain ; but, after a century of dissensions, the Chinese in 1757 brought the Turkestan states under their rule. See Sakæ, Sakitai.

SAKAWAND was in the territory of Kabul, which belonged to Kumlu. It is mentioned by Istakhri and Ibn Haukal as one of the dependencies of Bamian, along with Kabul, Ghazni, and Parwan. Idrisi gives it as being seven days' journey from Kabul and the same distance from Khou-i-ab for which General Cunningham reads Hariab, and believes it to be the Iryab or Irjab of Sharif-ud-din and the Hary-ab of the present day,—which is at the head of the Kuram valley, to the south-east of Kabul. Sakawand would therefore be at or near Jellalabad ; and this position agrees with Idrisi's account of the warm climate of Sakawand and Hari-ab, at which places the palm tree did not grow, and snow did not fall. The buddhist establishments mentioned by Fa Hian and Hwen Thsang were no doubt still flourishing in the time of Kumlu.—*General Cunningham.*

SAKBINAJ, HIND. Sagapenum.

SAKEEN — ? see Capreæ.

SAKELA, HIND. An iron formed by forging and welding together bars of several varieties of iron.

SAKELA WANLOO, TEL. Washermen.

SAKEN, see Arians.

SAKES, ARAB., TURK. Mastic, Pistacia lentiscus.

SAKETA, or Ajudhya, the ancient capital of Oudh.

SAKHA, SANS. A branch, the branch of a tree.

SAKHALAT, MALAY. Woollen cloth.

SAKHALIN. The Tungus are the native population of the Amur, but even including emigrant Chinese and Mantchu, the people are far from numerous. They may be estimated at 24,000 for the whole of the territory at present in possession of Russia. With two exceptions, the tribes of the Amur belong to the Tunguzian stock. The language of the Gilyak, on the lower Amur, differs from the Tunguzian dialects along the river, but the features of these Gilyak are still Mongol, they have small obliquely set eyes, prominent cheek bones, and scanty beards. With the Aino, on Sakhalin, the language differs both from the Tunguzian and Gilyak ; their features are decidedly not Mongol, and they are distinguished by a great profusion of hair. The close affinity between the various Tunguzian dialects, and the differences existing beween Tunguzian, Gilyak and Aino, will be observed in the following vocabulary :

	TUNGUZIANS						
	Yeniseisk.	Nerchinsk.	Manyarg.	Manchu.	Orochi.	Gilyak.	Aino.
One	ummukon	omon	omun	emu	omoho	niun	chine
Two	dzyur	jur	sur	juo	dhu	morsh	tu
Three	illiim	ilan	ilan	ilan	ela	chiorch	che
Four	diggin	dyggin	digin	duin	dhi	murch	yne
Five	tungya	tongna	....	sunja	thungha	torch	ashne
Six	niu ngun	niungun	nugun	ninggun	nungo	nga k	yhampe
River	birrya	bira	....	bira	bila or widhi	....	....
Sea	lamu	lamu	....	namu	namu	atui (rur)	choiza
Water	mu	mu	mu	muke	mu	....	wakka
Sun	shiggun	shivun	....	shiin	su	....	tsuhu
Reindeer	oron	sokje	....	oron	....	....	....
Thunder	addi	akdi	....	akjan	....	....	kanna-ka-
Dog	ninakin	nenaki	....	indakhun	enuk	kan	tumui or sheta

See Sagaleen, Saghalien.

SAK-HIANG, Chin. Aloes wood.

SAKHI BHAVA, a sect of vaishnava hindoos in northern India, who adopt Krishna and his mistress Radha for their special worship. They assume the female garb, and the dress, ornaments, manners and occupations of women. See Hindoo.

SAK'HYA, also styled Sak'hya muni, was the son of the rajah of Kapila, and a contemporary with Ezekiel. He is one of the religious reformers to whom is applied the title of Buddha. Of these, there seem to have been several, but the last of them was Sak'hya Singha, or Sakhya Sinha B. C. 528, who incorporated all the previous writings and it is he whom the buddhists of the present day reverence in China, Burmah, Siam, Thibet and Ceylon. The doctrines taught by Sakhya Sinha were a refinement upon the worship of the elements, paramattha and the hosts of heaven, to which the Persians and some of the corrupted Israelites are known to have been addicted : he did not honour the hereditary brahman priesthood, who sacrificed not unlike the Hebrews. Neither did he symphathise with their opponents, the Swastika sect who promised to man only annihilation at last. But he pleaded the brahminical notion of the transmigration of souls and ultimate immortality with the idea that the spirit returns to him who gave it,—or union with God, as the highest state of man. Thus he reconciled the creed of the rationalistic fatalists, who said "so be it" with a morality that forbade atheistic indifference while it encouraged the suppression of merely selfish desires as alike inconsistent with the good of society, and the souls final emancipation from sin and suffering. His original titular sectarian designation is said to have been Saddharta, and the patronymics Sak'hya and Singha were added to it, the other term, muni means a holy man. According to Tibetan books, he died near the town of Kusha in Kamrup, beneath the shade of two sal trees on the southern bank of the Brahmaputra river, then called Hiranyo.

He was a Kshetrya by caste, and of the royal race of the Sakhya, who ruled at Kapilavasta, a town near the modern Lucknow : he was born there in the year 598 B. C. He was educated royally, in all the arts and sciences of the day ; and he spent the first twenty-eight years of his life in the usual enjoyments of a court, and in the company of his three wives at one of his father's palaces. In his twenty-ninth year, reflections on the great problems of life enticed him to solitude, bent on discovering a remedy for the evils which he observed to prevail in the world. Flying from the royal palace, he cut off his hair and donned the yellow robe, which subsequently became the canonical attire of the buddhist priesthood, and he betook himself to the fastnesses of the Rajmahal Hills. He next sought out a celebrated abode of brahmans, on a hill near Gya ; but soon ascertained that their practices were naught and their doctrines bootless. He then withdrew to a solitary spot on the Nilgan river, an affluent of the Phalgu, where, with a few disciples, he spent six years in fastings and mortifications of the flesh. But finding that his mental powers became impaired by such lengthened vigils, he renounced these ascetic practices, upon which his disciples deserted him and fled to Benares to expiate the sin of their master. Thus left alone, Sakhya sat down, absorbed in thought under a budhi-tree (Ficus religiosa) ; invigorated by the more generous diet he had adopted, he succeeded in attaining the highest state of perfect knowledge and became a Buddha, or Enlightened. For the next nineteen years, he wandered about Northern Hindustan, living entirely on alms, and making converts. His royal birth secured for his doctrines a ready acceptance amongst the upper classes of society : and the rajahs of Kosala, Sravasti, and Ayodhia or Oudh, vied with his own father in erecting spacious vihara or monasteries to receive the devotees of the new faith. After promulgating during this period, the doctrines which, up to the present day, have combined the greatest number of mankind in the same belief, the royal reformer and truly great man feeling his end approaching, withdrew in company of a few disciples, to a solitary grove of sal trees (Shorea robusta) near Kusinara on the banks of the Ganduk, and there breathed his last, in the month of Vaisak, 543 B. C. The system of faith taught by him has been tersely and truly characterized by Mr. Hodgson, as "monastic asceticism in morals, and philosophical scepticism in religion." Mahomed was born in 569 A. D., he announced his mission in 609 at forty years of age, and died in 644 when he was seventy-five. In A. D. 640, or in thirty-one years from the announcement of his mission, the arms and the religion of Mahomed had spread over the ancient empires of Egypt, Syria, and Persia. The religions widely existing in the world from the time of Sakhya Muni to that of Mahomed, were several. In the earliest times of which we have any authentic record, the Arian race, both in Persia and India, was attached to the worship of the sun. In Persia, the fiery element was looked upon as the earthly type of Mithra, or the heavenly orb ; and the sacred flame was kept continually burning by the Magian priesthood. But the worship of the elements was not unknown to the Persians, for Herodotus expressly states that "they sacrificed to the sun and moon, to the earth, to fire and water, and to the wind." In Northern India, the most popular system was that of the brahmans and their followers, who believed in the immortality of the soul after transmigration, while their opponents, the Swastika, affirmed that its existence was finite, and was limited to its connection with the body. The doctrine of the transmigration of souls was one of the earliest religious beliefs of the ancient world. In Egypt, its acceptance was universal, and in India it was denied only by the atheistical swastika sect, for the brahman, notwithstanding the differences of their metaphysical schools, agreed in believing that mankind were destined, by means of successive regenerations, to a prolonged existence in this world. The migration of souls was the fundamental belief of all classes, both buddhist and brahminical. The principal difference between these two creeds lay in the means for attaining final exemption from migration. As the champion of religious liberty and social equality, however, Sakya Muni attacked the brahmans in their weakest and most vulnerable points ; in their impious assumption of all mediation between man and his Maker, and in their arrogant claims to hereditary priesthood. But his boldness was successful, and before the end of his career he had seen his principles zealously and successfully promulgated by his brahman disciples Sariputra, Mangalyana, Ananda, and Kasyapa, as well as by the vaisya Katyayana and the sudra Upali. At his death in B. C. 543, his doctrines had been firmly established, and the divinity of his mission was fully recognized by the eager claims preferred by kings and rulers for relics of their revered teacher. His ashes were distributed amongst eight cities, and the charcoal from the funeral pile was given to a ninth, but the spread of his influence is more clearly shown by the mention of the numerous cities where he lived and preached. Amongst these are Champa and Bajagriha on the east, Sravasti and Kausambi on the west. In the short space of twenty-five years, this wonderful man succeeded in establishing his own peculiar doctrines over the fairest districts of the Ganges, from the Delta to the neighbourhood of Agra and Cawnpore. This success was perhaps as much due to the early corrupt state of brahmanism, as to the greater purity and more practical wisdom of his own system. From Sakya's time until the end of the long reign of Ajatasatra, 519 B. C., the creed of buddha advanced slowly but surely. This success was partly due to the politic admission of women, who, even in the east, have always possessed much secret, though not apparent, influence over mankind. To most of them the words of buddha preached comfort in this life, and hope in the next. To the young widow, the neglected wife, and the cast-off mistress, the buddhist teachers offered an honourable career as nuns. Instead of the daily indignities to which they were subjected by grasping relatives, treacherous husbands, and faithless lords, the most miserable of the sex could now share, although still in a humble way, with the general respect accorded to all who had taken the vows. The Bhikshuni were indebted to Ananda's intercession with Sakya for their admission into the ranks of the bud'hist community, and they showed their gratitude by paying their devotions principally to his relics. The Pi-khieu-ni, or Bhikashuni, at Mathura, paid their devotions chiefly to the stupa of Anan (Ananda), because he had besought Buddha that he would grant to women, the liberty of embracing ascetic life. The observances required from the nuns are to be found in note 23, chap. xvi.

of the Fo-kwe-ki. The female ascetic even of a hundred years of age was bound to respect a monk even in the first year of his ordination. There has been some misapprehension regarding their buddha and bodhisatwa of the buddhism of Tibet, the regeneration of the Grand Lama being considered as an exceptional case of a Buddha returning amongst mankind. Mr. Hodgson, (pp. 137, 138,) however, truly calls the "divine Lama" of Tibet, Arhanta, but he believes "that a very gross superstition has wrested the just notion of the character to its own use," and so created the "immortal mortals, or present palpable divinities of Tibet." Fra Orazio says the Lama sempre sara coll'istessa anima del medesime Ciang-c'iub, oppure in altri corpi." Remusat was not aware of this fact when he stated "Les Lamas du Tibet se considerent eux mêmes comme autant de divinités (Bouddhas) incarnees pour le salut des hommes." But the explanation which Major Cunningham received in Ladak, which is the same as that obtained by Fra Orazio in Lhasa, is simple and convincing. The Grand Lama is only a regenerated bodhisatwa, who refrains from accepting buddhahood, that he may continue to be born again and again for the benefit of mankind. For a Buddha cannot possibly be regenerated, and hence the famous epithets of Sathagata, "thus gone," and Sugata, "well gone" or gone for ever.

The religious opinions of the hindoos have been greatly modified by the philosophy introduced by Sakya muni which even yet forms the faith of about 220 millions of the human race. From its rise in the sixth century before Christ the doctrines of Buddha gradually spread over the whole of India. It was extended by Asoka to Kashmir and Kabul shortly after Alexander's invasion, and it was introduced into China about the beginning of the christian era by five-hundred Kashmirian missionaries. In A. D. 400, when Fa Hian visited India, buddhism was still the dominant religion, but the vaishnava sect with a mixture of the old Arian creed, and the saiva faith, were already rising into consequence. In the middle of the seventh century, although the pilgrim Hwan Thsang found numerous temples of the saiva, whose doctrines had been embraced by Skanda Gupta and the later princes of Pataliputra, yet buddhism was still the prevailing religion of the people. But though the faith of Sakya lingered about the holy cities of Benares and Gaya for two or three centuries later, it was no longer the honoured religion of kings and princes, protected by the strong arm of power, but the persecuted heresy of a weaker party, who were forced to hide their images under ground, and were ultimately expelled from their monasteries by fire. In 1835, Major Cunningham excavated numerous buddhist images at Sarnath near Benares, all of which had evidently been purposely hidden under ground. He found quantities of ashes also, and there could be no doubt that the buildings had been destroyed by fire, and Major Kittoe, who subsequently made further excavations was of the same opinion. The buddhist religion has long been extinct in British India. Its last remnants were extinguished, in blood and violence, about the fourteenth century, dying out about Trichinopoly and along the coast line from Vizianagram to Masulipatam. But it still flourishes in the countries on its north and north-east borders, in Nepal, Tibet, Burmah, Ceylon and China, and amongst the Indo-Chinese nations of Anam, Siam and Japan. Its followers far out-number those of all other existing creeds and form one-fourth of the whole human race. The buddhist faith was pre-eminently a religion of mercy and peace and charity, and benevolence. It had, however, the vital defect of not teaching or knowing God:—in the topes dedicated to the celestial Buddha, Adinath, the invisible being who pervaded all space, no deposit was made, but the divine Spirit, who is 'Light,' was supposed to occupy the interior, and was typified on the outside by a pair of eyes, placed on each of the four sides either of the base or of the crown of the edifice. But the budd'hism taught by Sak'hya Muni, coming to the world in ages of strife and violence, of deifying mortals, and of arrogant assumptions of an ignorant priesthood, as a creed that taught gentleness and meekness and kindness to living creatures, it must have exercised a great influence over the community, must early have gained many converts amongst the peaceable and good, and largely leavened the minds even of those who did not openly become converts; and amongst this class, must be included the entire populations from the primæval land east of the Oxus to China and Japan in the furthest east, to Singapore and Ceylon in the extreme south.

The doctrines of the branch of the Aryan race occupying India have since been modified by other religionists. Since buddhism disappeared from India, its nations have been overrun and conquered by races professing creeds, with numerous followers. Rapid as was the progress of buddhism, the gentle but steady swell of its current shrinks into nothing before the sweeping flood of mahomedanism, which, in a few years, spread over one-half of the civilized world, from the sands of the Nile to the swampy fens of the

Oxus. From the 12th century when the inroads into India, of mahomedans, began, up almost to the present time when they too, as a ruling race, have in their turn almost disappeared before christians, the Semitic Arabs, the Aryan Persians, the Scythic Tartars, and the Anglo-Saxon, have successively swayed the destinies of the races who are now occupying British India, and each of the new comers has to some extent modified the beliefs and social customs of the conquered Aryan and Non-Aryan people. For, a prevailing characteristic of the Aryan races is a speculativeness or theorising on the great end of man, his duties here and his hopes in eternity, with a disposition to asceticism, as the better means of obtaining the future rewards of a good life on earth. But great changes have been retarded by the circumstance that the mahomedan and the christian came amongst them as warriors, with all the license which are to be found in camps and the arrogance and contempt for strange things which youth engenders. And it is only since a few years that the voices of the christian missionaries, the meek followers of the lowly Jesus, have been heard proclaiming amongst the varied nations, and to each of them in their own tongue, the good tidings of great joy, which shall be to all people, and saying, "Glory to God in the highest, and on earth peace, good will toward men." But even in the short time during which the christians have been labouring, the effect on the hindoo mind has been immeasurable. The first reforming sect that arose amongst the hindoos in the 19th century, was a theist body, in Calcutta, who styled themselves the Vedo-samaj'h and then the Brahmo-samaj'h. And even in the case of hindoos who have had no English education and have never heard the voice of the missionary, such are receiving instruction from others of their own people who have been so taught; and the mass has been so leavened that the great tendency amongst youthful inquiring minds is to accept some form of theism,—either to acknowledge one of their own deities, whether Vishnu or Siva, as the Lord of all, or adopt an ideal Supreme Being of their own creation, whom they clothe with attributes, purer, more just, and more worthy of reverence than any god which the hindoo pantheon possesses. Buddhism was not finally swept away from the peninsula till about the 14th century of the christian era. For ten centuries it had been the prevailing religion of India but when the unwritten Tartar faith became corrupt and feeble, brahmanism was revived, mixed with the worship of a Siva and a Vishnu and every form of absurd fetichism gathered from local idolatries and superstitions. It is this mixture of several creeds which is now styled hindooism and its followers hindoos. It is found amongst the people in every variety of belief, from the mildest demon worship and recognition of numerous forms of gods, avatara or incarnations and their idols, to a distinct theism: from the grossest ignorance and superstition to the most refined speculativeness; performed and associated with bloody and most inhuman rites, and, again, followed with the greatest tenderness for animal life. In Europe, the hindoo religion is a term which is always employed in a collective sense, to designate faiths and worships of an almost endlessly diversified description. An early division of the hindoo system and one conformable to the genius of polytheism, just as at present, is said to have separated the practical and popular belief from the speculative and philosophical doctrines. And, whilst the common people addressed their hopes and fears to stocks and stones and multiplied by their credulity and superstition the grotesque objects of their veneration, some few of deeper thought and wider contemplation plunged into the mysteries of man and nature and assiduously endeavoured to obtain just notions of th[illegible] cause, the character and the consequence of existence. Similarly with buddhism, for eighteen heresies are deplored in the Mahawanso, within two centuries of Sakya's death, and distinct sects, each rejoicing in the name of buddhists, are now to be traced amongst the remnants of his worshippers in the East and South of Asia. In its migrations to other countries since its violent dispersion by the brahmans about the eighth century, buddhism has assumed and exhibited itself in a variety of shapes. At the present day, its doctrines as cherished among the Jaina of Guzerat and Rajputana, differ widely from its mysteries, as administered by the Lama of Thibet, and both are equally distinct, from the metaphysical doctrines propounded by the monks of Nepal: or the philosophy taught in Burmah: its abstractions in Japan, and its observances have undergone a still more striking alteration from their vicinity to the Sintoo sect, and in China, they have been similarly modified in their contact with the rationalism of Lao-tsen and the social demonology of the Confucians. But in each and all, the distinction is rather in degree than in essence, and the general concurrence is unbroken in all the grand essentials of the system.

Of the three great religious systems of the Aryans that of the Hellenic and Latin races seems to have originated in the East, but to have become modified by new geographical conditions, the proximity of the sea, and the struggle for existence. The other two, the religions of Zoroaster and Sakya Muni have traces of sharp antagonism and protracted conflict. But the Dyaus of the Veda, the sky, seems to be the Zeus and Jupiter the Diespeter of classical antiquity ; Ushas is Eos and Aurora, Surya is Helios ; the Harit, horses of the sun, are the charites or Graces : solar phenomena are traced out as the foundation of legends like those of Apollo and Daphne, Kephalos and Procris, Herakles and Deianeira. The religion of the portion of the Aryans who spoke the Zend, and whose caste and creed are embodied in the Zendavesta, is a change from polytheism to a belief in one superior being and is a solemn protest against the whole worship of the powers of nature involved in the Vedas. The deva of the Vedic hymns, Indra and others, are converted into devils and every follower of Zoroaster is compelled to renounce them, and with this change, came a deeper sense of sin, a clearer vision of the mystery of evil in the heart of man and in the world. But this merged into a dualistic creed, of belief in powers almost equally omnipotent, Ormuzd the good and Ahriman the evil, Light and Darkness, and the thoughts of the devout were directed to attain the purity which belonged to a servant of the former. Many Biblical critics believe that the Hebrews had no belief in Satan, nor in angels nor in immortality, till these were received from Persia, and that the Sadducees were purely conservatives, believers in the faith of Abraham and Moses. And parallelism between the religions of Zoroaster and of Israel are noticed by Siege and Haug, the belief in a mighty Lord, supremely wise and good : in a spirit of evil, tempting and accusing ; in myriad angels who form the armies and do the pleasure of the great King ; in a tree of life and a tree of knowledge ; and a serpent, the enemy of man, the iconoclastic hatred of the common forms of polytheism, the hope of a common Deliverer, the belief in a paradise for the souls of the good and righteous.

When the next great religion began its course, the system of the Vedas had become perverted into a revolting polytheism with caste as an intolerable tyranny. The doctrine of metempsychosis had assumed a prominent position in all speculations as to the 'before' and "after" of this earthly state from which there was no ready emancipation, and thinking minds were taught to look on life with all its sensations and energies, as an illusion.

Out of this, buddism grew. Sak'hya muni discountenanced the philosophic views of the bramins, but did not deny the authority of the Vedas. M. St. Hilaire says next to the story of the gospels there is no story of self-denial, so marvellous as that of the king's son who laid aside the greatness to which he had been born, and when he had found, as he believed, the secret of emancipation from the misery of existence gave himself to a life of suffering, hardship and mendicancy to extend it to the poorest and the meanest. He says Je n' hesite pas a ajouter que sauf le Christ, tout seul, il n'est point parmi les fondateurs de religion, de figure plus pure ni plus touchante que celle du Boudha.

M. St. Hilaire, M. Eugene Burnouf and Professor Max Müller, identify the nirvana of Buddha with absolute annihilation, the pure not being, in which there is no absorption into the higher life of the uncreated essence, no consciousness of peace and freedom from evil, but the loss of being and consciousness at once. This doctrine is shadowed forth in the despair of Job and Jeremiah ; in the deep melancholy of Ecclesiastes ; in the Choruses of Sophocles, the Apologia of Plato and in the soliloquy of Hamlet, yet this has no where led to suicide, as the path to Nirvana, but to fasting, prayer, alms-giving, and self-sacrifice. But it was offered to people who held to the belief of a natural immortality and metempschycosis, to whom death brought no sure deliverance, but might lead to ills greater than in this world, new forms of human or brute life more miserable than what they had passed through. The life of self-sacrifice of its founder, his voluntary acceptance of poverty and his proclamation of a universal brother-hood made war on the caste system. But brahmanism again rose triumphant and drove buddhism into other lands, and the region of Sakya Muni's birth and labours became a place of pilgrimage to people from distant countries.

Many nations are included in the term Semitic, Phænicians, Carthaginians, Syrians, Assyrians, whose religions present forms of worship, as gross and sensuous as those of Greece or India. Until the return of the Jews from Babylon, the people generally were prone to fall into a worship of gods many and lords many, like the nations around them, which the few thinking minds amongst them could not prevent. Their entire history, shows that the people fell into the lower forms of thought and speech, their very worship of Jehovah became polytheistic even fetiche, in its nature, and it was in protest against this that their law-givers, prophets, and psalmists spoke and when Mahomed in the seventh century of the christian era, appeared with a monotheism, the most rigorous and exclusive that the world had witnessed, he was one of a semitic race who were still polytheists and fetish worshippers. The Jews belief had, as a basis, not monotheism, the belief in a deity, numerically one, but in a living God the Father and the King of men. But when Mahomed proclaimed that the Lord was One, he did so as reviving the faith of Abraham, who derived his knowledge through a special revelation of God.

The little prevalence of idolatry in Hindoostan as compared with Bengal, is noticeable. Large towns have their temples and gods. But each village, as in Bengal has not its tutelary Siva and Shusti. From Allahabad to Mynporee a hindoo traveller did not meet with one single instance of that indispensable of a Bengal village, a little round stone painted with vermillion and placed beneath an aged banyan or peepul tree, which acts as a guardian deity of a rural community. In one single street of Calcutta there are more images of Krishna and emblems of Siva, than perhaps in the whole length of the Doab. A buddhist philosophy seems to have been since B. C. 1500 *i. e.*, 850 years before Sakya Muni gave it fresh vigour, Sakya Sinha, is the household name of Gautama Buddha, it means the Scythian lion, Gautama Buddha is another appellation. The epoch of Sakya, the fifth Buddha or Gautama, is determined by concurrent testimony of the Ceylonese, Siamese, Pegu, Burmese and Chinese eras, which are all founded on the birth or death of the Buddha legislator, and though all differing more or less, concur in placing him between the limits of 544 and 638 years before Christ. The Raj Guru of Assam, a pandit well versed in Buddha literature, fixes the Nirwan or emancipation of Sakya Muni in 520 B. C. According to Mr. Csoma de Koros, the name of Kanishka occurs in a Tibetan work as a celebrated king who reigned in Northern India, at Kapila, which is supposed to be in Rohilcund or near Hurdwar. His reign dates about 400 years after Sakya (about the end of the second century) when the followers of the Buddha religion had become divided into eighteen sects (the Sakya tribes, or Sacæ) under four principal divisions, of which the names both Sanscrit and Tibetan are on record.—*Prin. Ind. Ant. Vol.* i, *p.* 39 ; *Perry's Bird's Eye View, p.* 53 ; *Csoma's Analysis of the Dulva, Res. As. Soc. Bengal, vol.* xx, *p.* 90 ; *Fo-kwe-ki, chap.* xvi. *p.* 101 ; *Fra Orazio, in Nouv. SAKI. An alcoholic liquor in use in Japan. At an entertainment there, a pair of chop sticks was placed at each corner of every table, in the centre was an earthen pot filled with saki, surrounded with four acorn cups, four large coarse China cups with clumsy spoons of the same material and four tea cups of tea. Cups of tea were first handed round, these were followed by very small cups of saki, which had the taste of French liqueur.—*American Expedition to Japan, p.* 218. See Japan.

SAKI, Hind. The astringent bark of a Panjab tree.

SAKI, Hind. The man who gives charas prepared to the drinkers.

SAKI, see Indra.

SAKI, Hind. Euonymus fimbriata.

SAKIAM, see India.

SAKITAI, or Saka-dwipa. From between the parallels of lat. 30° and 50° N., and from long. 75° to 95° E., the highlands of Central Asia, alike removed from the fires of the equator and the cold of the arctic circle, migrated the Sakæ or Scythic races which passed into Europe and within the Indus. The Takshak, the Gete, the Kamari, the Katthi and the Hun came from Sakitai or Saka-dwipa, and from the Dasht-i-Kipchak crossed the Jaxartes or jihoon and crossed the Paropamisan range into the plains of Hindusthan. See Sakæ, Sakatai.

SAKITSCHIWAN, see Juniper.

SAKKA TUNGHA, Tel. Cyperus hexastychius, *Rottl.*

SAKKARI, Tam. Sugar.

SAKKER, in lat. 27° 42', long. 68° 51' N. a town in Sindh, on the right side of the Indus. The Dak bungalo is 419 feet above the sea.—*Schl*, *Rob.* See Sakar, Sukker.

SAKKYE, see Kedah, Quedah.

SAKMUNIA, Guz., Hind. Convolvulus scammonia. Scammony.

SAKPHA, Tibet. Tetrao hodgsoniæ, also Sacfa hodgsonii, *Blyth.*

SAKRA, a name of Indra.

SAKRANT, also Sankrant, also Makar-Sankrant, a hindoo festival, held on the day that the sun enters the sign of Makar at the winter solstice. On this night, in ancient India, a horse was sacrificed to the sun or Bal-nath the god Bal. Hindoos now bathe in the sea, rub their bodies with sesamum seeds and entertain friends. See Sun.

SAKSANDARI, Singh. Aristolochia indica, *Linn.*, *Roxb.*

SAKTA, a sect of hindoos, who worship the female principle according to the ritual of the Tantra. Of these there are two divisions, *the Dakshina chari or right hand ritualists*, and the Vama *chari or left hand ritualists. The worship of the right hand division is public, and is addressed to the goddesses, in the forms of Durga, Bhavani, Parvati, Lakshmi*, Maha Lakshmi and others. The left hand ritualists worship, in preference, the Tantrica impersonations of Durga, as Devi, Kali, Syama, &c., or a woman representing the sakti. Their worship is private and unavowed and is much talked about.—*Wilson's Hindoo Sects* ; *Wilson's Gloss.* See Hindoo, Kerari, Sacti, Veda.

SAKTA BHAKHTA, worshippers of the female energy who make the universe to be developed by an inherent power in matter. They use feminine terms and symbols, and practice the magical rites of the At'harvána Veda, which has been termed the black Veda ; and the whole is sometimes termed the Tantrica system.—*Taylor*. See Veda, At'harva veda, Tantrica.

SAKTI NATH. The lord of Sakti, or the divine energy under a female personification. In this sense Sakti is applicable to every goddess, but it is more especially the name of Bhavani, and her lord or husband in Siva.

SAKTI. In hinduism, the hindoo goddesses are uniformly represented as the subordinate powers of their respective lords : thus Lakshmi, the consort of Vishnu the preserver, is the goddess of abundance and prosperity ; Bhavani, the wife of Siva or Mahadeva, is the general power of fecundity ; and Saraswati, whose husband was the creator, Brahma, possesses the powers of imagination and invention, which may justly be termed creative. She is, therefore, adored as the patroness of the fine arts, especially of music and rhetoric ; as the inventress of the Sanskrit language, of the Devanagri writing characters, and of the sciences which writing perpetuates : so that her attributes correspond with those of Minerva Musica of Greece or Italy, who invented the flute, and presided over literature. Some of the Sakti of the hindoo gods and their avatara are termed Brahmi, Maheswari, Vaishnavi, Varahi, Mahendri, Chamunda and Chandika, hideous goddesses, who attend upon Siva as Bhairava, the terrific destructive deity, who is propitiated by offerings of wine and flesh. The Sakti worshippers are almost unknown in the south of India.—*Coleman, p.* 125 ; *Hind. Theat., Vol.* ii, *p.* 52. See Kancheliya.

SAKTI-PUJA, or Sakti-worship, a hindoo form of worshipping the Sakti.

SAKUNTALA, name of a Sanscrit book. See Sakontala.

SAKWALA, Sakwala-gala, see Myen-mo.

SAKWANTI, see Pandu dynasty.

SAKYA GAUTAMA, see *Saky'ha muni.*

SAL, also Sakhu, Hind. Vatica robusta.

SAL, Hind. A kind of sugar press in the Simla *states.*

SAL, Hind. A year.

SALA, Tel. Vatica robusta.

SALABAT JUNG, son of Nizam ul Mulk ! his brother, Nassir Jung, in 1750, brought him into the Carnatic a prisoner, but in February 1751, on the death at Cuddapah of Muzaffar Jung, he was released and proclaimed Subah. He took Kurnool, and advanced to Hyderabad, where he pacified the French troops and then in May advanced to Aurungabad which he reached on the 18th June. In July he purchased a peace with the Mahrattas and proceeded against the Nirmul rajah whom he defeated, and after this he sent to the Marquis Dupleix a sunnud of Nabob of the Carnatic. In 1772-3-4, he was alterternately at war and at peace with the Mahratta peshwah, Balaji Baji Rao. But in 1755, he proceeded to Seringapatam and exacted 52 lacs of rupees as tribute. In 1756, he came to a rupture with the French under M. Bussy, dismissed and pursued them, and sought the aid of the British from Madras.—*Orme.*

SALAB MISRI, Hind. Salep, the root of Orchis mascula, Eulophia, and other plants.

SALACIA, a genus of unimportant plants of the natural order Hippocrateæ, the following East Indian species are known :

S. arnottiania, *Wight*, Malabar.
S. brunoniana, *W. & A.*, Pen. of India.
S. celastrifolia, *Wall.*
S. longifolia, *Wall.*, Khassya.
S. macrosperma, *W. I.*
S. milliflora, *Wight*, Mergui.
S. oblonga, *Wall.*, *Wight*, Pen. of India.
S. pomifera, *Wall.*, *Wight*, Pen. of India.
S. prinoides, *DC.*, Burmah.
S. reticulata, *Wight*, Ceylon.
S. roxburghii, *Wall.*, Khassya.
S. verrucosa, *Wight*, Mergui.

The East Indian species are often classed under the genus Johnia, the last named in compliment to Dr. John, a Danish missionary, who was one of the founders of the Botanic Garden at Tranquebar, and sent many new plants to Dr. Roxburgh. The whole are formed of species which have little beauty, but the fruit of both the species of Johnia is eatable.—*Roxb.* ; *Voight.*

SALADIN, see Kufra, Salah-ad-Din.

SALADANG, see Sapi.

SALAGRAMA, Fossil Ammonites, supposed by some to be the ætiles or eagle stones of the ancients. The principal sorts are the Lakshmi Narayani, (which, according to Mr. Colebrooke, must be perforated in one place only, and have four spiral curves in the perforation, with marks resembling a cow's foot and a wreath of flowers, which is supposed to contain Lakshmi as Narayani,) the Vamuna, the Demodura, the Narsingha, &c., &c., some denote the gracious, and others the vindictive incarnations of Vishnu. The former are much valued. Mr. Ward states that the Lakshmi Narayana is sometimes sold for as much as two thousand rupees. In an account of the meeting of the Asiatic Society of Calcutta in October 1830, is a notice of a letter from Dr. Gerard of Soobathoo, who had discovered in a lofty position (15,000 feet) of the Himalaya range, an extensive fossil tract of shell formation, of which he describes four classes, and of the fourth thus writes : "Belemnites and Orthoceratites mineralized by the same material as the Ammonites (iron clay and pyrites.) Their abundance in the beds of mountain torrents, especially the Gundak, has been long known, as they form an indispensable article in the sacra of the Hindoo Thakoordwari, under the name of Salagrama." This fossil, deemed sacred by the hindoos, is essential in many rites and ceremonies of the brahmans ; it is used in propitiatory oblations to Vishnu, as well as in funeral and other ceremonies. The Salagrama is also considered as a type of Mahadeva, as some other holy, particularly conical stones also are. Mr. Colebrooke, likewise informs us (As. Res. vol. iii, p. 240,) that the Salagrama are found in a part of the Gunduk river, within the limits of Nepal. They are black, mostly round, and are commonly perforated in one or more places by worms, or, as the hindoos believe, by Vishnu, in the shape of a reptile. According to the number of perforations, and of spiral curves in each, the stone is supposed to contain Vishnu in various characters. For example, such a stone perforated in one place only, with four spiral curves in the perforation, and with marks resembling a cow's foot and a wreath of flowers, contains Lakshmi Narayana. The stones called Ban-ling, found in the Nermada, are, in like manner, considered as types of Siva, but they are not fossils, merely stones rounded by attrition. The Salagrama is found upon trial not to be calcareous ; it strikes fire with steel, but scarcely at all effervesces with acids. Sonnerat also describes the Salagrama as a petrified shell, of the species cornes d' ammon, very heavy, commonly black, but sometimes violet, oval, or round, a little flat, nearly resembling a touchstone, and hollow, with only one small aperture ; within, he says, it is almost concave, with spiral lines terminating towards the middle. Some are supposed to represent the gracious incarnations of Vishnu, and are then highly prized ; but when they border a little on the violet, they denote a vindictive avatara such as Narasinga, when no man of ordinary nerve dares keep them in his house. The possessor of a Salagrama preserves it in clean cloth : it is frequently perfumed and bathed ; and the water thereby acquiring virtue, is drank, and prized for its sin-expelling property. They are common water worn Ammonites, and though hindoos are averse to show them, Europeans who attend to such things can always meet in with them. Veneration for stones may be traced among almost all nations. The following instance from our scripture reminds one strongly of hindoo simplicity :—"And Jacob rose up early in the morning, and took the stone he had put for his pillow, and set it up for a pillar, and poured oil on the top of it."—Gen. chap. xxviii, v. 18. The Grihadeva or household deity rarely bears any specific designation : is sometimes represented by a water pot, a rude figure, a Salagrama, or a Tulasi plant.—*Cole. Myth. Hind., p.* 176 ; ***Moor's Pantheon**, pp.* 309-10 ; ***Wilson's Gloss.*** See Hindoo, Saligram, Sri Sampradaya, Zonar.

SALAHIE, a beautiful village in the suburbs of Damascus, lying at the foot of the western mountains, about a mile from the limits of the city.—*Robinson's Travels, Vol.* ii, p. 116.

SALAH-UD-DIN, the leader of the armies of the khalifs, who encountered the crusaders and Richard Cœur de Lion of England, near Jerusalem. His tribe are still numerous in Kurdistan. Caliph Mamun, in A. D. 814, caused a degree of the earth's surface to be measured. This was done on the sandy plains of Mesopotamia, between Palmyra and the Euphrates, by which 56·66 miles were fixed as the equivalent of a degree of the earth's circumference. Caliph Mamun, son of Harun ur Rashid forced an entrance into the pyramids. Later, Salah-ud-din, the Saladin of Europeans, used their casings, at least, as stone quarries. Caliph Umar, was the second caliph in succession to Mahomed. His time was a period of great extension of mahomedanism. The battle of Kadesia was fought and won by his general Saad, and put an end to the Persian empire of the Parsi. He imposed the khiraj on Syria, and died and was buried at Jerusalem where his tomb still is.—*Bjornstjerna's. British Empire in the East, p.* 97 ; *Bunsen, Vol.* ii, *p.* 150. See Acre.

SALAI, a river running near Naradoul in Midnapore.

SALAI, Beng., Hind., Sans. Boswellia glabra, B. serrata, B. thurifera. Salai-gond, Olibanum.

SALAI, Tam. An idol.

SALAJIT, Hind. Lignite.

SALAKA, Jav. Silver.

SALA-KUCHOO, Beng. Colocasia fornicata.

SALAM, Arab., Heb. Peace; Salam-alaikum, Peace be unto you. O alaikus salam and unto you be peace. Salam bolo, say unto him peace. Touching the breast and forehead or lips and forehead: kissing of the lips is not known with men, only the cheeks and shoulders. The right cheek first, then the left and some times the cheeks alone are kissed, but generally the shoulders, also as Gen. 33, 4: 14, 145; Luke 15, 20.

Kissing of the hands is common as in Math. 23, 7; Mark 12, 38, and rising to receive as in Job. 29, 8.

The not returning "Salam" is a sign on the part of the Bedouins that they were out to fight, and not to make friends; but the dromedary riders, generally travel without much to rob. After the first salutation of peace, in conversation you say, "Is your illustrious disposition well," and the reply is "al hamd ul illah." Thanks be to God, or Ap ki mihrbani se, by your favour, and if assenting to a proposition, "Insha ul illah," if it please God. Salam Alaikum, is the Hebrew Shalom Alechem, Peace be to you, of Luke x, 5. Give my peace to So and So, on parting, where one says good bye, or God be with you. With peace, go in peace, Ex. iv, 18.—*Burton's Pilgrimage to Meccah, Vol.* i, *p.* 340.

SALAMANDRA MAXIMA. The large salamander of Japan, lives in the valleys of Niphon between 34° and 46° N. lat. It resides in rivulets and lakes formed by the rains at a height of from 4,000 to 5,000 feet above the level of the sea, it grows to about three feet in length.

SALAMBHA, Hind. A kind of salt.

SALA-MISRI, Tam. Salep.

SALARAS, or Silajitu, Tel. Ophelia elegans, *R. W.*

SALAMLIK, also Salamji, Turk. The place of assembly in a house.

SAL AMMONIAC,

Urmena,	Ar.	Sal Ammoniac,	Lat.
Nou-sha; Tung-sha,	Chin.	Sadar,	Malay.
Peh-ting-sha	,,	Nowshadur,	Pers.
Sel Ammoniac,	Fr.	Naschatur,	Rus.
Salmaik,	Ger.	Nowsadur,	Sans.
Nowsagur; Nowsadur,	Guz. Hind.	Vayvagarra lunu,	Singh.
Sale Ammoniaco,	It.	Navacharum,	Tam.

Sal Ammoniac is a compound of ammonia and hydrochloric acid, a hydrochlorate of ammonia, although the older term, muriate of ammonia, is also used. The substance from which this salt was first obtained, was the soot of camel's dung; by sublimation in Egypt, near the temple of Jupiter Ammon, whence its name. It is now manufactured largely in Europe, by combining hydrochloric acid either directly or indirectly with ammonia obtained from the decomposition of animal matter. In France, bones and other animal matters are distilled in large iron retorts, for the manufacture both of animal charcoal and of sal ammoniac. Coal soot was formerly used in Great Britain as a source of this salt; but since the establishment of gas works, it has been chiefly derived from the liquor obtained during the preparation of coal gas. It is found native at Etna and Vesuvius, in some of the Tuscan lakes, in Persia, Bokhara, in Mongolia and Ile from lakes and the vicinity of extinct volcanoes. That in use in China was formerly obtained from Lan-chau-fu and Ning-hia, in Kan-suh, but the country of the Tih or Sijung and Turfan formerly yielded it and the fissures in the volcanic mountain of Peh-ting in Turfan. It is met with in commerce as large cakes of a semi-circular form, translucent, and colourless, with a sharp, saline, cool taste, but no smell. It forms a considerable article of trade in Karnal, where the manufacture has been known for ages. It is important as a source of most of the compounds of ammonia, and is used at Lahore for the manufacture of solution of ammonia, for snake bites, to a considerable extent. It is extensively employed in the arts, in the preparation of aqua-regia, in soldering some of the metals, in tinning iron and copper, in the preparation of dyes, liquid ammonia, and in various chemical manufactures.—*O'Sh., Mat. Med.*; *Smith's Mat. Med. of China*; *Powell's Handbook, p.* 110; *Faulkner.* See Ammonia, Dyes.

SALAN, Hind. Panicum miliaceum, Pennisetum italicum.

SALANGAN, Hind. A bark used for fibre in Kangra.

SALANG ISLANDS, see Junk-Seylon.

SALANGORE, in lat. 3° 20′ N., long. 101° 12′ E., lies on the south side of the entrance of the river of the same name. This place was formerly frequented for tin and other articles of trade. Salangore is separated from Perak by a small river called the Runkup, a little north of the Birnam stream, in about lat. 30° 59′ N. Salangore, according to native authority, comprises three divisions. The Bugi occupy the coast.—*Newbold's*

British Settlements, Vol. ii, *p.* 27. See Kedah, Quedah, Semang.

SALARIAS ALTICUS. Near the rocks of the Ceylon coast, are multitudes of the Salarias alticus, a curious little fish which possesses the faculty of darting along the surface of the water and running up the wet stones and across the sand with the utmost ease and rapidity. Mr. Gosse has seen a species of Antennarium similarly running quickly to and fro on the surface of the great beds of floating sea weed in the gulf stream, progressing with the utmost facility by means of its pectorals and ventral fins, quite out of water. By aid of the pectoral and ventral fins and gill-cases, they move across the damp sand, ascend the roots of the mangroves, and climb up the smooth face of the rocks in search of flies ; adhering so securely as not to be detached by repeated assaults of the waves. These little creatures are so nimble, that it is almost impossible to lay hold of them, as they scramble to the edge, and plunge into the sea on the slightest attempt to molest them. They are from three to four inches in length, and of a dark brown colour, almost undistinguishable from the rocks they frequent.—*Gosse, pp.* 122-123 ; *Tennent's Sketches of the Nat. Hist. of Ceylon, p.* 332, *Vol.* ii, *p.* 493.

SALAR MUSSUOOD GAZEE or Rujub salar.

SA-LAT, BURM. Calpicarpum roxburghii, *G. Don.*

SALAT INDRA KESARI, see Inscriptions.

SALATAH, ARAB. A favourite dish made as follows. Take a cucumber, pare, slice and place it in a plate, sprinkling it over with salt. After a few minutes, season it abundantly with pepper, and put it in a bowl containing some pepper-corns, and about a pint of curds. When the dish is properly mixed, a live coal is placed upon the top of the compound to make it bind, as the Arabs say. It is considered a cooling dish, and is esteemed by the abstemious, as well as by the toper.—*Burton's Pilgrimage to Meccah, Vol.* i, *p.* 198.

SA-LAT-NEE, BURM. Graptophyllum hortense, *Nees,* also G. lurido-sanguineum, G. hortense is also called in Burmese, Gnwæ-ban.

SALATURA, the So-lo-tu-lo of the Chinese pilgrim Hwen Thsang the birthplace of Panini the grammarian, has been identified with Lahore, near Ohind. Hwen Thsang visited it, he says it was 20 li, or 3¼ miles, to the north-west of Ohind. In January 1848, at the village of Lahor, which is exactly four miles to the north-east of Ohind, General Cunningham procured several Greek and Indo-Scythian coins, from which it may be inferred, with some certainty, that the place is at least as old as the time of Panini himself, or about B. C. 350. He therefore, identifies Salatura with Lahore. The loss of the first syllable of the name is satisfactorily accounted for by the change of the palatal sibilant to the aspirate according to the well-known usage of the people of western India, by whom the Sindhu river was called Hendhu and Indus, and the people on its banks Hindus or Indians ; Salatura would, therefore have become Halatura and Alatur, which might easily have been corrupted to Lahor ; or, as General Court writes the name, to Lavor.—*Cunningham's Ancient Geog. of India, pp.* 5-8.

SALAUKER, HIND. Abelia triflora.

SALAVA MIRIALU, TEL. Cubebs, Piper cubeba.

SALAYER ISLAND, called by the Dutch, Boegerens, is about 36 miles long, of moderate height, well peopled and well cultivated. Its north point is in lat. 5° 47′ S.

SALBRA, HIND. Salvia officinalis.

SALEM, a revenue district or collectorate of the Madras Presidency formed out of the Barah-mahal, in the south of the peninsula of India, Salem town is situated in a valley, and 870 feet above the level of the sea. It is the chief town of the revenue district, to which it gives its name. The Salem collectorate has a population of 1,195,377, is part lowland, but it includes the Balaghat, of the same height as Mysore, and a rich plain of considerable elevation known as the Barahmahal. The Shevaroy hills are near the town of Salem and attain an elevation of 6,000 feet, Salem is celebrated for its steel. See India, Kerala, Silk, Steel.

SALE, IT. Salt.

SALE AMMONIACO, IT. Sal ammoniac.

SALEMANTA, or Challa munta, TEL. Fluggea leucopyrus, *Willd.* The same name is applied to F. virosa.

SALENDONG, a silk scarf of Singapore.

SALIMOTE, a silk scarf of Singapore, or sometimes embroidered with gold thread. The Salendong and Salemote with and without gold thread and silk are in use throughout the Archipelago from Sumatra to Timor. Timor is the most remote of the eastern islands, in which textile fabrics are manufactured, the countries beyond producing no other cloths than those of bark beaten out. The texture of the cotton cloths manufactured in Timor and the adjacent islands closely corresponds with those of the Batta of Sumatra and the Dyak of Borneo. The manufacture is evidently of great antiquity, and must have been introduced before that of Java of the present time, which is of hindoo origin. Cotton and dyes are grown in Timor. The silk threads introduced are made from raw-silk imported from China and the continent of Asia.—*Cat. Ex.*, 1862.

SALENDRA, Mahr. Hystrix leucura. —*Sykes.*

SALEP.

Salib misri,	Ar., Duk.	Salep,	Fr.
Salep misri,	Hind., Pers.	Sala misri.	Tam.

The tubers of the Orchis mascula, Eulophia and other plants receive this name in works on pharmacy. They are compressed, ovoid, rather transparent, and composed chiefly of bassorine, soluble gum, and a large proportion of amylaceous matter or starch. Royle states that one drachm of the powdered root requires 60 drachms of boiling water to affect its solution ; two drachms afford a sufficient meal for an invalid ; good salep carefully prepared is in truth one of the best articles of diet a convalescent can use. In India the salep of Cashmere is reckoned the best, and is obtained chiefly at the Hurdwar fair from the Cashmere merchants: from the peculiar shape of the tubera, it has gained immense, but most unmerited celebrity as an aphrodisiac remedy. The same circumstance has given the plant its name both in the Greek and Arabic language. At the Madras Exhibition of 1855, there were three samples of "Salep misree" contributed by Dr. Riddell from the Kunner Hills near Aurungabad—sold when green, and fresh dug up, at 2 pice per seer: and from Booldanah Hills in Berar—when fresh dug is sold by the Bhil at 12 seers for the Rupee. These were hard, and had a horny appearance, the two first were dirty green and the third of a yellowish white color. It is imported from the Persian Gulf, but is indigenous in some parts of the Western Presidency, though for want of cultivation, the tubers are scarcely worth the trouble of procuring. Native practitioners prescribe it in conjunction with mastich and some other ingredients, in such cases as require tonics: in England, it is supposed the chocolate makers grind it up with cocoa. Professor Royle states that the salep of Kashmir is obtained from a species of Eulophia, probably E. virens. The price of salep is about eight guineas per cwt. in the London market. A little is exported from Constantinople, excellent specimens from this quarter were shown in the Egyptian department of the Great Exhibition in 1851. It was formerly much used, but has latterly been much superseded by other articles. Major D. Williams' "(Journal of the Agri. and Hort. Soc. of India," Vol. iv, part I,) states that the Tacca plant abounds in certain parts of the province of Arracan, where the Muggrace prepare the farina for export to the China market. After removing the peel, the root is grated on a fish-skin, and the pulp having been strained through a coarse cloth, is washed three or four times in water, and then dried in the sun. Mr. Nuttall, (American Journal of Pharmacy, Vol. ix,p. 305,) says the Otaheite salep is obtained from a new species of Tacca, which he names the T. oceanica. Oriental salep, is probably obtained from Eulophia vera and E. campestris. European salep is obtained from Orchis mascula, *W.*; O. latifolia, O. morio, *W.*; O. militaris, *W.*; O. papilionacea, *W.*; O. coriophoira, *Pers*, and O. undulatifolia, *Pers.—Simmond's Commercial Products*; *O'Shaughnessy, p.* 653 ; *M. E. J. R.*; *Faulkner*; *Ains. Mat. Med., p.* 40 ; *Tomlinson.* See Eulophia ; Orchis, Tacca.

SALEP-I-SHAITAN, Pers. Conium maculatum. Cicuta virosa.

SALEP MISRI, or Saleb Misri, Ar., Duk., Guz., Hind., Pers., Tam. Salep. Eulophia virens. Salep, from Raepore, called behchandi, when pulverised, resembles arrowroot, and is made use of by natives on fast days, prepared in various ways. It is obtained from the glutinous matter which issues from the stems of a jungle plant, after being soaked in running water for some days. The Gonds prepare the behchandi. It can be had in any quantity in the Jubbulpore bazaar, but most of it comes from Mundla and Seonee. The specimens seem to consist of the dried sections of a farinaceous root containing bassorin, and allied in composition to salep.—*R. Br.*; *W. Ic.*

SALEP TACCA, Eng. Tacca pinnatifida, *Linn.*, *Forsk.*

SALESI, a Koli tribe of Central India. The Raj, Salesi, Tonkri, Dhour and Dunggali Koli reside in the Attaveesy, and in the Wun, Dandory and Nassik districts, and worship the hindoo deities Khandoba, Bhairu and Bhawani. A few Raj Koli are settled in the Konkan and Jowair. They are the same people, an offshoot of the Mahadeo Koli, and said to have been expelled for some offence. They are farmers and labourers, but the Dhour are the lowest in civilization, are the greatest drunkards and eat the flesh of animals which have died a natural death. They are ruled by chiefs styled naik.

SALFETOTSSCHNOE, Rus. Diaper.

SALGAR, Hind. of Kangra, the armadillo.

SALGI, Hind. Dark green colour.

SAL-GIRAH, Pers., or Baras-ganth, Hind. The anniversary of a person's birth, on which a knot is added on a string kept for the purpose. A girl's years are numbered by a silver loop or ring being added yearly to the gardani or silver neck ring.—*Herkl.*

SALHE, Hind. Boswellia glabra.

SALI, in Berar, silk weavers of sarhi and choli.

SALIBABOO ISLANDS, or Tulour, lying between Mindanao and Celebes, are three in number, of considerable size and moderately elevated. Kabrouang is the name of the most southerly, and has a peaked mountain on it. Its southern end is in lat. 3° 47′ N. and long. 127° 11′ E. Tolour or Karbalang is the larger and more northerly island, and lies from lat. 4° to 4° 28½′ N.

SALICACEÆ, *Lindl.* The willow tribe of plants, comprising 1 gen., 2 species, of Salix.

SALICARIA CINNAMOMEA. *Ruppell.* A curious little bird of Abyssinia, apparently congeneric with the Tribura luteoventris. —*Hodgson* ; *Mr. Blyth's Report.*

SALI CHETTU or Koriti chettu, Tel. Plecospermum spinosum, *Tric.*

SALICINE, a crystallizable, bitter principle, obtained from the leaves and young bark of the poplar, willow, aspen, &c. It forms small white silky needles, and in some respects, resembles the vegeta-alkalis, cinchona, and quina, having febrifuge properties ; but it differs from them in containing no nitrogen, and not forming salts with acids.— *Tomlinson.*

SALICOQUES, a family of crustaceæ :

Fam.—Salicoques.
Tribe.—Alphiens.

Alpheus brevirostris, *Edws.*, New Holland.
,, ventrosus, *Edws.*, Mauritius.
,, bidens, *Edws.*, Asiatic Seas.

SALICORNIA, of this genus, Wight gives, in Icones, Salicornia brachiata, fruticosa, herbacea, and Indica. See Chenopodiaceæ.

SALICORNIA ARABICA, *Wight.*

Ushnan,	Arab.	Chook,	Hind.
Arabian glasswort,	Eng.	Ghasul,	Pers.
Chubuck-sowyeh,	Hind.		

Grows in the Sunderbuns and on the Coromandel Coast, and barilla is made from it. See Barilla.

SALICORNIA BRACHIATA, *Roxb.*

Koyala, Tel.

This perennial plant grows very abundantly in the delta of the Ganges and on the Coromandel Coast, on low wet grounds overflowed by the tides. It yields a barilla for soap and glass.—*W. Ic.*, *Roxb.*

SALICORNIA INDICA, *W. Roxb.*, *W. Ic.*

Jodu palung,	Beng.	Koyya pippali,	Tel.
Jidu palung,	,,		

A very common plant on such salt grounds as are inundated by the spring tides. It is especially plentiful on the Malabar coast and is still burned there for barilla. But the probable value of this article as an Indian export has been much depreciated by the progress of chemical science in Europe, where the purest alkali is manufactured by decomposing common salt by sulphuric acid, and at the low rate of 10*l.* the ton of 30 maunds. The Salicornia, Salsola and Sueda genera, cover every patch of saline land in the Panjab. —*Eng. Cyc.* ; *Roxb.* ; *W. Ic.* ; *Voigt.*

SALIGRAM, fossil ammonites obtained from Northern India, held in high estimation by Hindoos. They are found in a part of the Gunduk river, within the limits of Nepaul. They are mostly roundish and commonly perforated in one or more places by worms, or, as the hindoos believe, by Vishnoo, in the shape of a reptile. Some are black, others are violet and oval. The possessor of a saligramu, preserves it in a clean cloth ; it is frequently perfumed and bathed, and the water thereby acquiring virtue is drank and prized for its sin-expelling property. It is always placed near persons when they are about to die. A garden or plantation is consecrated by the hindoos by marrying the Saligramma stone carried by one man, and represent the groom, to a branch of the tulsi tree carried by another to represent the bride. It is the usual marriage ceremony, somewhat modified after this consecration, the fruit can be eaten. Mr. Dunlop found two extensive lias ? beds at Takuli Shem, in Hundes, with numerous saligram, which are thence taken to Badrinath and Kailas.—*Colebrooke, in the Asiatic Researches, Vol.* vii, *p.* 241 ; *Major More, Hindoo Pantheon* ; *Wilson's Gloss.* See Hindoo, Salagrama.

SALIK, (lit. a traveller or pilgrim) a class of devotees.

SALI KAMPA, Tel. Stylosanthes mucronata, *Willd*, Arachis fruticosa, *Roxb*, iii, 282.

SALIMBOW, see Kyan.

SALINDEE, a river near Budruck in Balasore.

SALINE SPRINGS are found in Sind and in the higher portion of the Punjab ; they usually contain common salt with some sulphate of soda and small quantities of other salts, when they are not simply brine. Traces of iodine are found near Kangra. Throughout Rajpootana and in some parts of the Punjab, the wells are abundantly impregnated with soda. Some of the springs in Kemaon contain mineral impregnations, but scarcely to an extent to be considered saline. Scarcely any strong saline ones are thermal. The few thermal salines are chiefly calcareous, and one or two silicious. See Salt, Kalar, Reh, Saltpetre.

SALISBURIA ADIANTIFOLIA, *Sm.*

Gingko biloba, *Linn.* | Gingko, Jap.

A tree of Japan, much cultivated in China, and found in many gardens in Europe. Fine old specimens may be seen at Kew and in the Apothecaries' Garden at Chelsea. In congenial climates it attains the size of the walnut. It is remarkable for the form of its leaves, which are wedge or fan-shaped, deeply cut in the centre or bilobed, and finely striated with veins, having some resemblance to the leaves of some species of Adiantum, whence it is commonly called Maiden-hair tree in England. The pulp of the fruit is austere tasted, but the large kernel is sweet, with some degree of bitterness when raw, but agreeable as a dessert when roasted like chestnuts. They are much eaten in China. Mr. Fortune met with large trees of the Salisburia adiantifolia, the largest and most striking tree in some parts of the country. It is commonly called the Maiden-hair tree from the resemblance its leaves bear to a fern of that name. The Chinese are fond of dwarfing it, and it is often seen in that state in their gardens. Its fruit is sold in the markets in all Chinese towns by the name of "Pa-Hwo," and is not unlike dried almonds, only whiter, fuller, and more round. The natives seem very fond of it, although it is rarely eaten by Europeans. —*Eng. Cyc.* ; *Fortune's Wandering, pp.* 129, 248 ; *Roxb.* ; *H. B. Voight, p.* 560.

SALITAH, Hind. A canvass sheet used to contain the articles composing a camel's load. In cold weather it is converted into a blanket.—*Burton's Scinde, Vol.* ii, *p.* 43.

SALIVAHANA, was the son of a potter. He headed a successful popular movement and became the chief of a powerful monarchy in Maharashtra. He ruled at Munji-Paithan. The ruler whom Salivahana overthrew was Vikramaditya. He gave origin to a new era, which is still current in India. The era reckons from A. D. 78, the supposed date of his death. It numbers the solar years, as the era of Vikramaditya numbers the luni-solar years. Tod describes Salivahana as of the Takshak race, and states that the Salivahana era set aside that of the Tuar in the Dekhan Salivahana had three hundred wives from whom the Beis Rajputs are descended. See Era, Jalus, Vikramaditya.

SALIVERI. Tam. Cress seed.

SALIX, the Willow, of which there are 15 species in India,—5 in the peninsula, 1 in Bengal, 2 from Oude, and the rest in the Himalaya. The earliest mention of the willow tree is in the Pentateuch, where the Israelites were directed at the institution of the feast of tabernacles to "take the boughs of goodly trees, branches of palm trees, and the boughs of thick trees, and willows of the brook, and to rejoice before the Lord their God seven days." At a later period, the Psalmist describes the captives as thus lamenting—"By the rivers of Babylon, there we sat down, yea, we wept, when we remembered Zion. We hanged our harps upon the willows in the midst thereof. For there they that carried us away captive required of us a song ; and they that wasted us required of us mirth." The willow is not commonly found below 8,000 feet elevation on the Sikkim mountains, where it grows on the inner Himalaya only, and some kinds ascend to 16,000 feet ; like the poplars, the willows are valuable for their timbers, for economic purposes. Of this genus, Wight, in Icones, gives S. ichnostachya, and tetrasperma, Dr. O'Shaughnessy carefully examined Salix tetrasperma, the only willow found in lower Bengal, but could not detect in it any trace of salicine. Salix babylonica and S. ægyptiaca, (Khilaf bhalki, Arab. Bedsmooshk, Pers.) occur in gardens in Upper India. Salix lindleyana, or dwarf willow, occurs at 12,000 to 13,000 feet on the Himalaya—S. chita and rotundifolia in Kunawur ; The willows of Japan, are,

Salix japonica, *Thbg.*
,, alba, *L.*
,, subfragilis, *Anders.*
,, purpurea, *L.*
,, padifolia, *L.*
,, viridula, *Anders.*
Salix vulpina, *Anders.*
,, acutifolia, *W.*
,, Sieboldiana, *Blume.*
,, integra, *Thbg.*
,, Babylonica, *L.*

Salix arboreus, S. elegans. *Wall.* S. fragilis *L.*, and S. viminalis, *L.*, called beis, bitsu, bed, bida beli, yir, bada and bashal, grow at heights in the Punjab Himalaya from 6,000 and some of them in Ladak to 11,000 feet and the twigs and leaves of many of them are used for fodder. The wood is not valued. S. flabellaris, *Ands.* S. hastata, L. S. oxycarpa, *Ands.* bisa, bushan, jangal beli, ber, mathi, bak shel, shun, bhail and beli, are found at various elevations in the Punjab Himalaya and Ladak from 6,000 to 15,000 feet and the leaves, &c., of several are used as fodder. In Spiti baskets appear to be made from the twigs. One of the substances known as manna, the bed-khist, used as a laxative, is said to be a product on a species of willow of Khorasan : Dr. J. L. Stewart had not met with it, but Dr. Irvine states that it is said to be produced on a dark-barked cultivated willow in Turkistan. In the N. W. Himalaya, the twigs of a species of willow, the bis of those regions, and a plant of Kaghan, are used for basket work.—*Cleghorn's Panjab Report* ; *Royle* ; *O'Shaughnessy, p.* 606 ; *St. John's Forest Trees of Britain, Dr. Hooker, Himalayan Journal, Vol* ii, *p.* 240 ; *Dr. J. L. Stewart* ; *Dr. Honig., Thirty-five years in the East, Vol.* i, *pp.* 165-339.

SALIX ÆGYPTIACA. *Linn.*

Bed-i-musk,	PERS.	Khagawala,	PUSHT.

Cultivated at Lahore for the distillation, from the palms, of an aromatic water, which is much used in the hot season.

SALIX ALBA, *L.?*

Bushan,	UPPER CHENAB.	Chamma,	LADAK.

Chaumma,	LADAK.		

Dr. J. L. Stewart believes that there is considerable doubt as to this species, but it or an allied one appears to be common in Kashmir, Pangi, Lahoul, and Ladak, &c., occasionally in the last, from 5,000 up to 14,500 feet, and it seems to occur Trans-Indus. It is generally planted, but is probably in many places wild also. It reaches 8 and 9 feet in girth when well protected. Moorcroft mentions one of 16 feet, but the largest trees are very often hollow. It is planted round almost every village and along the watercourses of the Chenab. The slender branches and leaves serve as food for sheep and goats. In Kashmir the willow is used largely for basket-making ; in Tibet many of the houses are made of willow wattle and dab. Twig bridges of willow are mentioned in Spiti, Zanskar, and Ladak, where Parrotia is not found. In Kashmir, willow twigs are employed as tooth-sticks. There also, and still more on the Chenab and in Ladak, the trees are severely and systematically lopped, the young shoots and bark of the larger, removed by hand, being used as fodder. Willow timber is not much used in Lahoul, but in Tibet the whole plough except the point which is iron is generally made of willow. In Affghanistan willow wood is generally used for building, as insects do not attack it. On the Chenab, pails, &c., are rudely cut from single blocks of the willow and according to Moorcroft, combs, to remove the fine goat's hair from the animals back, are made of this in Ladak. The wood is most useful in Thibet and Spiti, and employed for boarding. The small twigs are used for basket work, and the leaves are highly valued in winter for food for sheep.—*Dr. Irvine* ; ***Aitcheson*** ; *quoted by Dr. J. L. Stewart* ; *Moorcroft's Travels, Vol. p.*

A small tree of Greece, Asia Minor, common on the sides of all the rivers and canals, as well as in the gardens of the Chinese ; is cultivated in Nepaul, gardens at Ajmir and Calcutta, common in gardens in northern India, as, also, S. Ægyptiaca, while the polyandrous S. tetrasperma, ***Roxb.***, is found in the Kherce pass, along the foot of the mountains and in other parts of India as Ajmir, Bengal and the peninsula. This and S. tetrasperma are abundant at Peshawur and in the Hazara district. The weeping willow tree is very common planted in the plains throughout the Punjab, being frequently of the graceful " weeping" type ; it also grows to 5,500 feet in the hills including Kashmir. Near Chumba Dr. Stewart saw trees of 12 feet girth. It grows rapidly, and is easily raised in moist places by cuttings, up to stakes of considerable size which are often planted to consolidate the banks of watercuts, &c. Its branches and twigs are largely used for baskets, wattles, weirs, &c. Good cricket-bats have been made from it. The leaves are reckoned tonic ; contain a neutral principle, called salicine, and tannic acid ; some consider it nearly equal to cinchona, it is also said to be anthelmintic. Colonel Lake writing from Jhullander, says wood soft, smooth and white ; the large wood is used for cricket bats, the small twigs for kiltas, baskets and rope bridges.—*Trousseau* ; *Dr. Irvine's Medical Topography, p.* 210 ; *Royle's Ill., Him. Bot., p.* 343 ; *Dr. J. L. Stewart* ; *Powell's Hand-Book, Vol.* i, *p.* 385.

SALIX CAPREA, *Linn.*

Bed-i-mushk,	PERS.	Khagawala,	PUSHTU.
Khilaf-i-balki,	,,		

Cultivated at several places in the Punjab plains. The large yellowish catkins of flowers appear in February, and are collected and sold at about 6 or 8 rupees per maund to perfumers who distil a scented water from them. This, mixed with water is drunk as a sharbat, which has a rather pleasant though somewhat medicinal taste.—*Dr. J. L.* ***Stewart*** ; *Powell's Handbook.*

In the Panjab this is less common than S. babylonica, but is planted in the plains, and is occasionally seen in the outer hills to 4,000 feet. Madden (?) mentions that it grows to 5,000 or 6,000 feet in Kumaon and on the banks of the hill streams of Kumaon ; is common at Rangamally in the Terai, in the Kheree pass, and along the foot of the mountains which is a singular fact, as the genus is characteristic of cold and arctic latitudes, and no species is found below 8,000 feet elevation on the Sikkim mountains, where it grows on the inner Himalaya only, some kinds ascending to 16,000 feet. It grows in Bengal and the peninsula of India, likewise in British Burmah. Its wood is small but tough and elastic, but is not used in Burmah. A cubic foot weighs ℔s. 37. In a full grown tree on good soil the average length of the trunk to the first branch is 10 feet, and average girth measured at 6 feet from the ground is 3 feet. It is readily raised by cuttings and grows rapidly to a considerable size. Dr. Stewart had seen trees of 6 feet girth. The names of these plants laila and majnun, are alluding to the well-known eastern love story. *Mr. Thompson* ; *Drs. Brandis, Hooker, Him. Jour., Vol.* i, *p.* 400 ; *Dr. Royle's Ill., Bot. This is a large tree, with flowers of a beautiful red colour, common in the warmer parts of Ceylon and from one end of India to the other, particularly along the foot of the Himalaya mountains, and it is one of the most abundant of the forest trees of Tenasserim : about Nelambur and the Wynaad, it is used for building. The wood is light, soft, spongy and very inferior, but used by moochies in their work, and it stands well under water. The tree grows rapidly, and is occasionally found 30 to 40 feet in girth. The tree is sometimes called S. pentapyllum, when the lobes of the leaves are 5, instead of 7, but there is no diference in species, for the trees frequently carry both kinds of leaf. When very large, their appearance is magnificent, the thick stem spreads out towards the base, at intervals into buttress-like projections, strengthening and supporting the main stem. In the spring season, the tree is covered with huge magnolia-shaped scarlet blossoms : the silky down that envelopes the seed, is used to stuff mattresses and pillows, and has occasionally been made into cloth, the young trees and branches have short flat thorns. The young flower buds are cooked and eaten in some places. In the Jhallandar it grows very tall and straight, the length of the trunk, to first branch is 30 feet, and girth 12 feet, and it attains its full size in 60 years, its white, light, brittle wood, though not strong, is there used for boxes, scabbards and doors, and water conduits ; white ants readily attack the wood. Leaves used as fodder : its gum is the mooche-ras of the bazaar, the roots of young trees produce the safed musli, which is used to make a cooling beverage.—*Dr. Cleghorn and Mr. McIvor in M. E. J. The salmon of Northern Seas does not inhabit any of the seas south of Asia, though several of the fishes S. and E. of Asia have a resemblance to the salmon. It is one of the most remarkable facts in the zoology of Asia, that no trout or salmon inhabits any of the rivers that débouche into the Indian Ocean (the so-called Himalayan trout is a species of carp). This widely distributed natural order of fish (Salmonidæ) is, however, found in the Oxus, and in all the rivers of Central Asia that flow north and west, and the Salmo orientalis, *M'Clelland*, ("Calcutta Jour. Nat. Hist." iii, p. 283), was caught by Mr. Griffith (Journals, p. 403) in the Bamian river (north of the Hindoo Koosh) which flows into the Oxus, and whose waters are separated by one narrow mountain ridge from those of the feeders of the Indus. The central Himalaya rivers often rise in Tibet from lakes full of fish, but have none (at least during the rains) in that rapid part of their course from 10,000 to 14,000 feet elevation: below that, fish abound, but, it is believed, invariably of different species from those found at the sources of the same rivers. The nature of the tropical ocean into which all the Himalaya rivers débouche, is no doubt the proximate cause of the absence of Salmoninæ. Sir John Richardson (Fishes of China Seas, &c., " in Brit. Ass. Rep. &c.") says that no species of the order has been found in the Chinese and eastern Asiatic seas. Chanos argenteus is a salmon like fish of the Malabar pond in which Hyder's fish have been specially protected, but the number of predatory fish is so great that that piece of water can scarcely be used for multiplying the latter, for the purpose of distribution. One perch-like fish in particular is unusually numerous, and the protection which has habitually been extended to this one pond, seems to have benefitted the wrong fish, the red perch rather than Hyder's salmon-like fish. Hu-minu, or flower fish, is a name given at random by the nations to several fish, simply because they are considered delicate eating. It is a sight to see a silvery salmon-like fish of 20 pounds or thereabouts face the line with a spring that clears boats and standing men and upraised nets.—*Mr. Thomas Hooker, Him. Jour.*, ii, 182; *Drs. McClelland, Richardson.*

SALMO ORIENTALIS, *Pallas.* According to Adams, p. 187, occurs in the Gulf of Pe-che-li. The Hippoglossus olivaceus is the Japanese halibut; fish are abundantly cured (without salt) in Tibet; they are caught in the Yaru and great lakes of Ramchoo, Dobtah, and Yarbru, and are chiefly carp, and allied fish, which attain a large size.—*Adams.*

SALNA, also Salun, Hind. Curry, Salnay, pl. curries.

SALOD, Hind. Aralia cachemirica.

SALOHA, Hind. Pueraria tuberosa.

SALON, Mantchu tribes on the upper Sagalin.

SALOO, a cloth of Banda, it is dyed with al-root, with a mixture of castor oil, in the proportion of one pâo to every piece of cloth, each piece of cloth being eight yards. Besides castor oil, ' Russee,' a kind of earth, is also mixed, and goats' dung and alum. The cloth is first rubbed for ten days in the castor oil, ' Russee,' and goats' dung, and then dried in the sun. After ten days it is well washed and dried, and then steeped in the oil for five days; afterwards washed and dried in the sun, and after a third application of soap and water the cloth is ready for sale. The cost of dyeing different kinds of cloth is as follows;

Nynsook cloth sells at 1 anna per yard; mulmul at ¾ anna per yard; and that used for the pagree or turban at ½ anna per yard.

It is not easy to ascertain the extent and value of the quantity of saloo cloth annually manufactured. It is exported to other parts of India, and its use is general, and not limited to particular castes. The wholesale market value is about 1 rupee, 6 annas, 6 pice, per piece according to the quality of the cloth dyed.—*Cal. Cat. Ex.* 1862.

SALOTAR. A work is extant on veterinary medicine: it is said to be by Salotar who is said to have been the tutor of Susruta. It was translated from Sanscrit in the year 1381. But professor Max. Müller states that Salotar is not known as the author of such a work and he adds that Salotariya is a name of Panini, and that the teacher of Susrūta is said to have been Divodasa.—*Müller's Lectures, p.* 142.

SALOTAR also Salastri, Hind. A veterinary surgeon.

SALSAFY. Tragopogon porrifolius.

SALSAPARIGLIA, IT. Sarsaparilla.

SALSEPAREILLE, FR. Sarsaparilla.

SALSETTE. The island that the British call Salsette, is named Sashiti or Shasta, by natives, a name supposed to be derived from She-aste, meaning, in Mahratta, eighty-six, it having formerly contained, it is said, that number of villages. It is much the largest of the many islands near the island of Bombay, and the islets of Dravee and Versova, are just off the shore of Salsette. Salsette and Bassein were taken by the British on the 28th December 1774, and Salsette, Bassein and the revenues of Baroach were ceded by Raghobah on the 6th March 1775. Dr. Buist writing in the Bombay Times of January 1847, mentioned that a party, while crossing from the promontory in Salsette called the 'Neat's Tongue,' to near Sewree, about sunset, heard long distinct sounds like the protracted booming of a distant bell, the dying cadence of an Æolian harp, the note of a pitchpipe or pitch-fork, or any other long-drawn-out musical note, it was perceived to arise from the surface of the water all round the vessel and the boatmen at once intimated that the sounds were produced by fish, abounding in the muddy creeks and shoals around Bombay and Salsette ; and that they were perfectly well known and very often heard. Accordingly on inclining the ear towards the surface of the water ; or, better still, by placing it close to the planks of the vessel, the notes appeared loud and distinct, and followed each other in constant succession. The boatmen next day produced specimens of the fish—a creature closely resembling in size and shape the fresh-water perch of the north of Europe—and spoke of them as plentiful and perfectly well known. It is supposed that the fish are confined to particular localities—shallows, estuaries, and muddy creeks. The Bombay Times of Feb. 13, 1849, contained a communication from Vizagapatam, relative to "musical sounds like the prolonged notes on the harp" having been heard to proceed from under water at that station. Bassein and Salsette were obtained from Raghoba peshwa, by treaty in 1775.—*Dr. Buist in Bombay Times* ; *Tennent's Sketches of the Natural History of Ceylon, p.* 383.

SALSOLA, *Sp.*

Gahro-lanee,	SIND.	Kharu lanee,	SIND.
Kontee-lanee,	,,		

A genus of plants belonging to the natural order Chenopodiaceæ, named from 'salsus,' salt, in consequence of many of the species yielding kelp and barilla. The species are chiefly found on the sea-shore in temperate parts of the world, and also in hot parts of the world where the soil is saline, or where there is salt water in the vicinity. Various species of Salsolaceæ, abound in the more saline dry parts of the Doabs of the western Punjab. The Salsola kali of Europe and the colder parts of Asia is mostly found on sandy shores, or arid deserts ; an annual bushy plant, with stiff thorny channelled leaves. The dried plant, when reduced to ashes, yields 25 to 30 per cent. of carbonate of soda.—*O'Shaughnessy, p.* 526.

SALSOLA GRIFFITHII, Syn. of Caroxylon Griffithii, *Moq.*

SALSOLA INDICA, *Willde.*

Ella-kura,	TEL.	Oomari-keeray,	TAM.
Ila-kura,	,,		

This, with species of Salicorneæ, and other of the Chenopodiaceæ, are natives of the salt marshes and grounds near the sea, flowering the greater part of the year. The green leaves are universally eaten by all classes of natives who live near the sea, and are reckoned very wholesome. The leaves of this plant alone saved many thousand lives during the famine in India, of 1791-92-93. It is a small procumbent weed, with linear shaped leaves, is used as greens, and is a very pleasant vegetable. This is occasionally used as a vegetable and being naturally salt, has given rise to the Teling saying, "the carping husband (finding fault without cause) says to his wife, there is no salt in the Ilakura. It grows in Malabar, where barilla is made from it.—*Roxb, Vol.* ii, *p.* 63 ; *O'Shaughnessy, p.* 525 ; *Jaffrey.* See Vegetables of Southern India, Barilla.

SALSOLA NUDIFLORA, *Willde.*

Ravakada,	TEL.	Reyyi-kada,	TEL.

This is a native of salt barren lands near the sea, and flowers during the greater part of the year. The stems are perennial, many spreading, close upon the ground, and often striking root, ramous, extremities of the branches ascending. The plant is only used for fuel, but Roxburgh believes it would doubtless yield excellent soda.—*O'Shaughnessy, p.* 225 ; *Voigt.*

SALSOLA SODA, see Barilla.

SALSOLA SPINESCENS, *Wight.*

Two kinds are distinguished, rock and sea-salt. When found native in immense masses, which only require to be dug and reduced to powder, it is termed rock salt ; and when obtained by the evaporation of sea-water, common or sea-salt. Sea-salt is extensively manufactured on account of the Indian Government at many places along the coast : the process is not everywhere exactly the same, but generally the sea-water being raised by means of pakottas is run into shallow beds or pans and evaporated : additional water being added as the evaporation goes on. The salt is raked to the side and conveyed to platforms or raised places where the salt is heaped in quantities of ten or more garce. In some places, a proportion of the salt water is obtained from wells dug near salt creaks ; in others the salt water is dammed up in the mouths of rivers, where it is partially evaporated for sometime before being run into the pans. In Bengal the sea water is generally evaporated by boiling. At the Madras Exhibition of 1855, there were fourteen specimens of common salt exhibited. That from one locality, was salt which had formed on an extensive plain to the south after the evaporation of the water driven on by the south winds, it was very white, the crystals remarkably perfect and of a large size. The salt of the Ganjam coast is particularly fine. At Nowpada the crystals are large and pure, and so hard do they become when stored, that, according to the officers of the salt department, sparks of fire are elicited from the old heaps, when they are broken up for sale with a crowbar.

In the Madras Presidency, salt is manufactured on account of government, and sold for internal consumption at two rupees per maund, or over one halfpenny per lb. The duty on imported foreign salt is now regulated by Act No. 13 of 1871 of the Imperial Council, as under—

Salt imported from any place within or without British India,

(*a*) into British Burmah ....Rs.	0-8-0	per maund.
(*b*) into Lower Provinces of Bengal,	3-4-0	,,
(*c*) into any other part of British India..............................	1-13-0	,,

In the Bombay Presidency the manufacture of salt is carried on by individuals, but subject to an excise duty of 1 rupee 13 annas (3*s*. 7½*d*.) per maund. Facilities are also afforded for the export of salt to Malabar, Travancore, Cochin, and South Canara. Salt is, also, extracted from the saline soils of several parts of India and used as a condiment. The natives of the Bellary, Kurnool and Cuddapah districts of the peninsula, and those of Ghazipoor in the villages of Tuttalapore, Ratouly, Sahory, Chilar and Becompoor all, in this way, obtain a useful condiment. A brine spring exists at Dyhunda, North Berar, from which salt is manufactured. There are also salt springs near Prome, in Pegu, from which salt is made. In Bellary salt is manufactured from saline earth in the same way as saltpetre is procured ; only in the salt manufacture the water is not boiled. It is extensively consumed in the district, though the people prefer sea salt, the greater cost of which is however a bar to its use.

The supply of salt in Bengal is provided partly by manufacture, conducted on account of the government. The manufacture is carried on, not by hired labour on the part of the government, but by a system of pecuniary advances ; the parties receiving them, being bound to deliver, at a fixed price, all the salt manufacture. Probably 100,000 labourers (called molunghee) are engaged in the manufacture in the Sunderbuns. Partly also by importation, and in one instance, as, formerly with Mr. Prinsep's salt works at Narrianpore, partly by private manufacture, under a system of excise. The duty is levied at the time of the clearance of the salt from the bonded warehouse. On the imported salt, the duty is three and a quarter rupees per maund of 82 lbs., or nearly one penny per lb. The same rate of duty is levied as excise on salt manufactured by private individuals ; and the government salt may be purchased at all times in quantities of not less than 50 maunds, at a fixed price, which is composed of the cost price, with the addition of three and a quarter rupees per maund, or a little above 1*d*. per lb. The salt agencies are located along the head of the Bay of Bengal, viz., at Hidglee, Tumlook, Chittagong, Arracan, Cuttack, Ballasore, Khoredah. The average cost price of production is about rupees 80 per 100 maunds, or a trifle below one farthing per lb., thus making the government selling price over a penny a lb. The supply of salt is no longer a monopoly ; its manufacture and sale have not been relinquished by government, but individuals participate in its provision, both by importation and manufacture, under a combined system of customs and excise.

The system of fixed prices and open warehouses, commenced in 1836-37, when the previous system of fixed quantities and periodical sales was abolished, as recommended by the Select Committee of the House of Commons in 1836.

During the seven years commencing with 1837-38 and ending with 1843-44 the duty on salt was Rs. 3-4 per maund. The annual average quantity of salt sold and imported during that period was 4,627,030 maunds of 82 lbs. In November, 1844, the duty was reduced to Rs. 3 per maund, and the annual average sale increased to 4,966,917. In April, 1847, the duty was further reduced to Rs. 2-12 per maund, and the annual sale amounted to 5,452,900. In April, 1849, the duty was again subjected to reduction, when it was fixed for 5 years at its present rate of Rs. 2-8 per maund.

Thus in the five periods above adverted to, the reduction effected in the salt tax amounted to nearly 25 per cent. But in December 1859, the duty was again raised to 3 rupees; and in March 1861, to the original figure of rupees 3-4-0.

The supply of salt to the North-West Provinces is furnished partly from the lower provinces of Bengal, partly from the Sambhur Salt Lake, in Rajpootana, and partly from the rock-salt, of the Salt Range.

Punjaub. The excise duty on salt at the Punjaub salt mines has been fixed at three rupees per maund.

English salt, it is said, may be laid down at Calcutta at 44s. per ton, or about Rs. 80 per 100 maunds. But according to the Calcutta Review,—Rs. 65 per 100 maunds is the lowest possible rate at which the transaction could be effected. But salt from the Persian Gulf and other Arab States is laid down at Calcutta at Rs. 40 per 100 maunds. It is therefore the high cost of producing Bengal salt (Rs 80 per 100 maunds) which alone enables English salt to keep a footing in the Calcutta market.

In Bengal, salt is obtained by boiling the sea-water. In Bombay, and Madras, the process is that of solar evaporation. In the Punjaub, it is extracted in a pure state from the salt mines. The Sambhur salt lake, in Rajpootana, overflows during the rains, and when the waters subside, a deep incrustation of salt is deposited on its shores for several miles round.

In 1847, salt purchased at Calcutta at 1d. per lb., the Government price, was sold at Benares (400 miles from Calcutta, where it comes into competition with the salt from Rajpootana) at 12 lbs. the rupee, or 2d. per lb.; and, moreover, it is stated to be then considerably adulterated. The consumption of salt, in India has been calculated so high as 24 to 25lbs. Sepoys on foreign service get 12drs. a day or 17lbs.: on boardship they get 1oz. a day or 22¾lbs. Mr. W. H. Bayley in his memo. on salt assumes 18lbs. or nearly 2 Rs. weight per diem; which, allowing for children, may be reduced to 15lbs. The individual consumption of salt in India is, however, usually estimated at 12 lbs. per head per annum; and assuming the wages of an agricultural labourer at three rupees per mensem, it would, at Calcutta, absorb the income of five days' labour to provide the quantity required for a year. The salt duty thus operates as a tax of about 1½ per cent. upon the labourer's wages, if he have none but himself to provide for. If he have a wife or children, the per-centage will of course be increased by the amount of their consumption. It is to be observed, however, on the other side, that the wife and children would generally contribute something to the common fund by the earnings of their labour, and thus again reduce the percentage.

At Benares in 1847 the purchase of the same quantity of salt (12 lbs.) would absorb ten days' earnings, thus constituting a charge of 3 per cent. on the labourer's income. The difference in price is occasioned by the cost of conveyance, profits of trade, wastage, &c., the ordinary charges of commerce.

The pressure of the salt-tax on the labourer is severe, although it is the only way in which he contributes to the pecuniary necessities of the State; in all other respects he is not necessarily subject to taxation.

In the Madras and Bombay territories, the duty on salt is only about one-third of that which prevails in Bengal.

A comparison of the amount of salt produced with the numbers of the population consuming it, will show that the estimate which assigns 12 lbs. as the ordinary annual consumption of an individual, is nearly in correspondence with fact. The quantity of salt sold wholesale and retail or imported was, in 1846-47, as under :—

Bengal	6,166,258	Madras	4,587,720
N. W. Provinces	2,670,943	Bombay	2,573,625

15,998,546 Maunds of 82 lbs. or 1,311,880,772 lbs.

If the entire population of British India be assumed at one-hundred millions, the above-mentioned quantity of salt would afford to each individual about 12 lbs. the facts collected by statistical research thus corroborating an estimate founded on observation of the habits of the people.

The following table exhibits the quantity of salt imported into Calcutta from all countries, and also from England, for the seven years 1844-5 to 1850-51.

—	Imported from all countries.	From England.
	Maunds.	Maunds.

[illegible]r. G. Campbell gives the following as the [illegible]al consumption of taxed salt in India.

	Salt consuming population.	Rate of Duty.	Consumption. Average quantity of Maunds per annum.	Quantity per head per annum.
		RS. A.		Seers.
Bengal........	41,848,941	2 8	65,05,604	6 1/4
Madras.......	31,798,287	0 12	51,01,276	6 2/5
Bombay......	19,815,630	0 12	32,04,427	6 3/5
Punjab........	13,000,000	2 0	9,54,801	2 4/5
North West Provinces.	33,071,885	2 0 & 2 8	22,48,234	2 2/3
Total..	139,534,743		180,14,342	

According to this statement, in Bengal, Madras, and Bombay, 14,811,367 maunds or about 541,873 tons of taxed salt is consumed annually by a population of 93,462,858 souls, giving an average consumption of about 6¾ seers or about 13 lbs. per head per annum. Salt Lakes exist in the Megam pattoo district in Ceylon, and its government derive a revenue of about £42,000 annually, from the salt monopoly.

In the officinal years 1860-61 to 1869-70 the revenue of British India derived from salt was,

1860-61	£3,805,124	1865-66	£5,342,149
61-62	4,563,081	66-67	5,345,910
62-63	5,244,150	67-68	5,726,093
63-64	5,035,696	68-69	5,588,240
64-65	5,523,584	69-70	5,888,707

Lencha, TIB., means common salt, of which in Tibetan commerce, three sorts are known;

1. *Sercha*—White and best.
2. *Chàma*—Reddish and good.
3. *Pencha*—Yellowish and bad, contains soda or magnesia and earthy matter.

All the salt consumed in eastern Tibet is the produce of lakes or mines situated to the north of the Yaroo river, or comes from "Lache," a district lying between Digarchi and Ladak, which is traversed by the Yaroo. The best information procurable is to the effect that all the salt of Tibet is the produce of lakes; still there are people who assert that it is also dug out of the ground. Possibly this is confined to the vicinity of the lakes or to their dried margins. All travellers in Tibet are agreed that the salt-producing districts are the most rugged and inaccessible that can be imagined, in the vicinity of the deposits the ruggedness is great. It is quite true that only men and sheep can reach the salt deposits. It is also true that the elevation of the deposits prevents their being worked, except for the warmer half of the year, April to November. Thousands of sheep are employed in carrying the salt from the deposits to places accessible to yaks. These latter animals carry it all over Tibet in loads up to 160 lbs. Sheep in open places will carry 20 to 24 lbs.

One of the most extensive manufactures on India's shores is that of sea salt, and, simple as the process seems, it is far from devoid of ingenuity or interest. Amongst the numerous islands which fringe the Malabar Coast, there are countless narrows, creeks and inlets, left dry at low tide, the expanse of mud then exposed being often enormous. Off the shores of Sewree the tide at springs retires nearly two miles: and this is nothing at all out of the way in the neighbourhood. When salt-pans are proposed to be established, the first thing is to construct a mud embankment,—a foundation for it being selected where the water is never more than four or five feet deep. The crest of the embankment is made to surmount this by two or three feet—the base of it is generally from two to three times its height. Openings are purposely left at intervals in the principal embankment, and from these, at right angles to the main line of the wall, other embankments are run inland, parallel to each other, leaving a current between large enough to admit of a line of salt boats running up. Immediately behind the embankments the salt-pans are laid down. These consist of rectangular compartments, from twenty to thirty feet across, and commonly twice as long as they are broad, and from a foot to a foot and a half in depth. They are separated from each other by little mud walls, about three feet across at bottom, and two at top, more or less, according as little channels for filling the pans are meant to be run along them or not. Two, three, or four lines of pans, according to the extent of the back water, are carried along the rear of each embankment—care being taken to leave an area of land capable of being flooded by the sea betwixt the pans and the mainland, three or four times the size of the pans themselves. So soon as the monsoon is fairly over, all the fresh water that has accumulated in the pans or back water is run off, and in November or December the sea is admitted to the back water through a sluice in the embankment. The pans are now carefully cleaned out, their floors and walls being made smooth and nice. In about a month after it has been admitted to the back water, the sea water, now getting reduced in quantity, and encreased in saltness by evaporation, is let into the pans. The first charge requires about six weeks to evaporate: subsequent charges are dried up in half the time of the first, thus diminishing as the season becomes hotter, and the brine more strong. The strength of the brine is judged of by its becoming red: in fact, by a curious creature, of the volvax kind, makes its appearance just as the salt is ready to crystallise,—often tinting the salt itself of a fine pinkish hue: it is the same as to be found in a fossil state in the Punjaub rock-salt, and which often tinges the waters of our seashores as if stained with blood. When very nearly dry, the salt, which has now accumulated to the thickness of an inch or two, is raked off, the upper portion of which is beautifully white, and almost quite pure, being, first taken,—the lower portion, often crystallised in pieces of half an inch cube, is taken up next,—it is slightly mixed with clay, and is that generally in use. The white and bluish salt are now piled up separately in conical heaps, about sixteen feet in diameter, and ten feet high, which are preserved with a thick thatching of grass during the monsoon. The white salt is as pure as any in the world—the black salt is mixed with about one or two per cent. of clay. Both are in a great measure free of the magnesian salts and sulphates which contaminate the pan-made salts of Europe;—everything more soluble than muriate of soda remaining behind in solution, is washed away by the rains. Salt-pans are much less efficient when new than afterwards, and they continue to improve as the ground becomes impregnated for ten or fifteen years. When the first crystallisation is unsatifactory, as it often is, a second charge of brine is let on before the salt from the first is removed. The evaporation in the back water goes on, of course, as rapidly as in the pans themselves, and by this contrivance, which requires no care or preparation, an amount of evaporating surface three or four times that of the pans is secured: the pans themselves only require trouble or attention, the back water require none. The pans are drawn from three to four times every year: as the rains approach, they are abandoned for the season. The sea is seldom let in more than once or twice into the back water: were the whole available surface kept covered, double the amount of salt at present manufactured might be made. The supply, however, is so close on the heels of the demand, and the profits are so very low, that there is no reason why production should be extended. Such is the convenience of the shores of the Peninsula for the manufacture, and so easily and so cheaply can the process of storing and carrying away the managed, that attempts made to bring salt from Sind, where it is to be had in unlimited quantity ready made, have proved unremunerative. The idea, therefore, of importing salt from England into India is about as chemerical as any that ever entered the human imagination; while the abuse heaped on the quality of the salt used in India is as undeserved as may be. The upper salt is scarcely surpassed in purity by the finest the Cheshire mines send forth: while the black salt contains as much of the pure muriate of soda as does the common pan-made salt at home. The matter which contaminates the former is conspicuous, and looks very dirty, but then it is perfectly harmless; the subtle contaminants of the latter are eminently mischievous, though invisible. An English adult is supposed to consume at an average of from fifteen to twenty pounds of salt annually, so that he would in this way swallow some three ounces of mud a year: in India, numbers of people eat pounds' weight of clay by choice.

In the Madras Presidency salt is manufactured all round the coast line from Mangalore to Ganjam. Salt pans are situated close to the creeks or inlets from the sea. The manufacturing season commences about January and closes with the partial rains in July and August. The first process is to repair the pans. The earth is rammed down to a hard smooth level and water is baled or let in from the creeks into a reservoir where it is allowed to be condensed for about one month whence it is let off into the smaller beds. In some localities the process of storing water in the reservoirs is avoided and the water taken from brine wells. In the hot season the brine in wells is so strong that it requires admixture of the ordinary sea water. The brine let into the pans, which are generally 2 to 4 inches deep, evaporates in about 5 days, but as crystals are not well-formed within that time, the process of letting brine into the pans is again repeated, sometimes as often as 3 or 4 times, and salt is scraped up after final evaporation. In certain localities the brine is allowed to remain in the pans nearly a foot thick for 40 days, and the salt when formed scraped. A pan is about half a cawny or two-thirds of an acre, three-quarters of the space is occupied by the reservoir and side beds, where the water is allowed to be condensed. The other quarter is formed into generally a dozen beds, where the brine is finally allowed to evaporate and deposit salt.

The persons who make salt have a kind of hereditary right and are paid by Government at rates varying from 6 to 26 rupees a garce, or 120 maunds of 82 lbs. each, which is from 1*d.* to 5*d.* nearly per maund in English money. The actual cost is from 4 to 6 rupees a garce. Salt is stored in heaps of 10 or 20 garce each, either where it is manufactured, or at some distance from it and sold by Government at 2 rupees a maund or a little over 2 farthings per lb. The minimum quantity sold by the Madras Government is 1 maund of 82 lbs.

In the manufacture of the earth-salt in the Bellary district of the Madras Presidency, mounds are erected generally not far from the lines of drainage of the country at any convenient spot where the soil is saline and water can be easily obtained. Patches of the most saline earth occur in various places, and their qualities tested in a simple manner by application to the tongue. The earth is dug up and heaped in a mound ten or twelve feet high ; at different levels of the mound funnels are excavated and lined with beaten earth, and the loose earth being placed in these is gradually exhausted by repeated washings. The water having been sufficiently changed with salts in its passage through the the different funnels is run on to a level floor of rammed earth surrounded by a low rim. Under the influence of a Bellary sun, evaporation is effected in a few days and a residue of salt is left. This is piled in heaps for any moisture (bittern) to drain off, and when dry, it is sold to the villagers for domestic consumption. The wholesale price is about 30 measures for a rupee, it is retailed at about eight cash per seer, which is half the price of sea salt. It is not usually sold in cantonment, as it is never used by the population of sepoys, camp followers and other people not belonging to that part of the country, its use seems to be entirely confined to the villagers.

One specimen which was brought by a man who engaged largely in the manufacture, as a fair specimen of the salt produced in his district was chemically examined.

When air-dried, it still contained 3 per cent. of moisture ; it was of slight alkaline reaction, clean but of white effloresced appearance without any regular crystals. Exsiccated, it had the following composition per cent.

Sodium chloride. ...	44·50	Calcium carbonate.	0·70
Sodium sulphate ...	49·30	Insoluble (sand, clay, &c.)	0·45
Magnesium sulphate.	4·93		
Magnesium nitrate...	0·24		
Magnesium carbonate	0·35	Total...	100·47

A person consuming daily the moderate amount of a quarter of an ounce of this salt would take along with the real salt a quantity of sodium and magnesium sulphates (anhydrous) equal to 121 grains of Glauber's salt and 12 grains of Epsom salt. Difference of taste would not warn people against this. Magnesium chloride and nitrate, and the presence of these in the mother liquor adherent to crystals of salt would give a decided unpleasant flavour. This is not, however, the case with sodium sulphate, its taste is not very disagreeable, and in this sample it seemed to be entirely concealed by that of the chloride, a slightly bitter after-taste arose from the magnesium salts present. The brackishness imparted by this salt to many of the wells sunk in the black cotton soil is different in character from that arising in consequence of previous sewage contamination. A peculiarity of the saline deposits diffused through the black cotton soil of the Ceded Districts is their tendency to accumulate in the lines of drainage, not only about dry water-courses at the low level of valleys but also near to the lower drainage system of the country. In some parts of the Ceded Districts, wells near to rivers give, as a rule brackish water, quite contrarily to what one would expect. The reason of this is probably to be found in the very partial washing which the soil undergoes from the scanty rainfall. The salts are washed from the soil of the higher tracts of country, but, by the time, the sub-soil drainage water has percolated to the lower parts of the valleys, it is much nearer to the surface and the cessation of rain with the force of evaporation causes the salts to stop on their journey towards the sea.

Cuttack salt is produced by solar evaporation: it is of two kinds, viz., Pungah salt, obtained by boiling to a residuum highly concentrated brine; and Kurkutch, or gravel salt, produced by the aid of solar evaporation only, from sea-water. The water is introduced into small beds prepared with a smooth bottom of clay, tightly depressed in the ground, and surrounded by a slight ridge of earth. A few hours exposure in the burning sun of March and the two following months, is sufficient to evaporate the water in these beds, which deposits the salt it held in solution. A fresh supply is then let in, and the process of total or only partial evaporation is continued, till the bottom of the beds is covered with a layer of this salt, more or less thick, which is then scraped up and is the salt of the sample. Both these kinds of salt are produced all along the sea board of the Cuttack province, from February to June, and under what is practically a government monopoly. The season's manufacture of 1860-61 amounted to 50,000 tons of the one, and 44,000 tons of the other. The production is considered handsomely to remunerate the petty contractors, who engage with government for its supply at 10 annas and 4 annas per maund for each kind respectively, which is equivalent to 35*s.* 4*d.* per ton for the one, and 14*s.* 5*d.* per ton for the other, in English money and measure. To the Pungah must be added about 50 per per cent. to the Kurkutch about 25 per cent. for expenses of superintendence, &c. To the more extended manufacture of the white salt, the present insalubrity of the manufacturing localities and the consequent difficulty of procuring labour as well as the insufficiency of the fuel supply, are obstacles. The coarser kind may be manufactured ad infinitum, but is nowhere appreciated so much as in the district, as, not being cooked like the Pungah, it is more acceptable to the scrupulous caste prejudices of the Uryah people. The bulk of both kinds is exported to Calcutta. The local retail price at Cuttack in the shops of the bazaar for Kurkutch is 6*s.* 3*d.* per maund of 100 English lbs. Pungah is sold at the government depôts at 8*s.* 3*d.* per maund.

The common salt made at Ramree, is used with food by the inhabitants and is sold at 1 rupee per maund. The annual production, is 100,000 maunds, but could be extended to 500,000 if necessary. The salt not required for consumption in the province is exported from Chittagong. The salt is manufactured by boiling the sea-water after it has been allowed to stand for some days on land prepared to receive it.

The Raee Namak of Lucknow is an impure chloride of sodium. Formerly the greater part of the salt consumed by natives of Oudh was made in this province, now it comes from other provinces, and this is the only kind made at present in Oudh.

Salt is also obtained from salt mines in the Shahpore district. Crystals of common salt are found in salt-pits at Futtehpore.

Mr. Plowden's report contains the discussions which took place before the salt monopoly was instituted by the British Government in 1805 and the Statistical Reporter for May 1810, shows the changes that have been made in the Monopoly price. No Native Government ever monopolized the sale of salt and when the British did so the people complained bitterly.

Rock salt is always obtainable from the Indian druggists, who retail it as a medicine.

Common salt is produced by evaporation from brine pits in the Gurgaon district, and together with the produce of the "Sambhar" and other salt lakes of the Jaipur territory, forms an important article of export eastward. The great manufacturing district of the N. W. of India for evaporated alimentary salt is Gurgaon; where it is obtained by exposing the brine or salt impregnated water in shallow pans or pools to the heat of the sun. The neighbouring foreign territory of Jaipur also produces salt, especially the lake of Sambhar, the salt of which is celebrated. These salt works supply the north-eastern parts of the Punjab, both internally and for export, just as the rock salt of the salt range mines supply the upper Punjab. Some of the salt villages are within the Gurgaon district, but those producing the best salt are in the pergunnah of Jhajjar, the territory recently taken from the nawab of Jhajjar.

The alimentary salt, used at Lahaul, is obtained from Changthan in Tibet. This salt, called in Tibet, "sa," comes from Changthan. A large quantity is imported into Ladak for consumption in this province, and for the maharaja of Kashmir's army throughout the Jammu and Kashmir territories.

All the Punjab proper, down to the southern Derajat is supplied from the mines of the salt range where vast beds of pure rock salt are either worked in open quarries or by galleries and shafts cut in the salt rock itself. Salt mines of the Trans-Indus in the southern Khuttuk hills are situated near the villages of Buhadoorkheyl, Kurruck and Lutumur. There is also a separate mine at Malgeen, a place lying east of Kohat. The headmen of these villages receive a fixed percentage on the collections at the mines to obtain their good will. The Sikhs never managed these mines at all. They farmed them out to some local chief, and left him to collect what he could. Under British rule, the control and working of the mines is in the hands of government officers ; the salt is excavated and sold at the mine at a fixed duty of two, three and four annas per maund of 80 lbs., covering all expenses. There are five salt mines worked by government in the Salt Range ; one at Kalabagh, across the Indus, and several in the Kohat district, and the supply from these sources may be said to be inexhaustible. An excise duty of 3 rupees per maund of 80 lbs. is now charged upon all salt sold, the rate having been increased from 2 rupees about the year 1855 ; and the revenue derived from this source amounted to upwards of £280,000. The salt mines are also the means of supplying the traders of the Punjab with a kind of paper currency. By payment of the regulated price at any of the Punjab treasuries, a warrant for the delivery of so much salt at the mines may be obtained ; these documents are transferable, and pass from hand to hand like banknotes.

The Friend of India has stated that the natives of North India have shewn a decided preference for imported English salt over that which is manufactured in Bengal and that the Bengal government has been anxious to retire from the monopoly of manufacture and leave it to private enterprise.

In China, at Kia-i-Chau in the province of Shansi, salt was formerly made as in India in shallow earth pans by evaporation by the heat of the sun, and this is still practised at Cheh-kiang and almost every other province on the sea shore. As in British India, salt manufacture in China is a monopoly and smuggling is extensive. It is used there medicinally, as an external application.

Leech, in his report on the passes of the Hindoo Cush, mentions that iron-smiths are regarded by the Kaffir as natural bondsmen, and are occasionally brought for sale to the musulman people of the valleys ; also, that the oath of peace of the Kaffir consists in licking a piece of salt. This is also the oath of the Kasia on the eastern frontier of Bengal. Salt is regarded amongst the mahomedans in several parts of Asia, as a social bond, and a servant will say that he has eaten the government salt, and must obey.

Ezra, iv, 14, says 'We have maintenance from the king's palace,' or, as it is in the margin of some Bibles, 'We eat the king's salt.' There is here a very remarkable coincidence with hindoo manners : multitudes of poor brahmins are fed from the houses of the rich ; and it is very common for a servant to say, I eat Sahab's salt. A faithless servant is called namak haram, from namak, salt, and haram, faithless. It is supposed this allusion intimates, as an Eastern compliment, that what salt is to food, that a master is to his servant. Malihin, ARAB., means on terms of salt. Salt among hindoos is considered the essence and preserver of the seas ; it was therefore used in their offerings to the gods. The old idea in Europe was, that salt is a body composed of various elements, into which it cannot be resolved by human means, hence, it became the type of an indissoluble tie between individuals. Homer calls salt sacred and divine, and whoever ate it with a stranger was supposed to become his friend. By the Greek authors, as by the Arabs, hospitality and salt are words expressing a kindred idea. The Bedouins of El Hejaz, have peculiar notions of the salt-law.—*Arts and Manufactures* ; *Local Exhibition Committee* ; *Report of the Madras Central Committee for the Exhibition of* 1851 ; *Rhode, MSS* ; *Cat. SALT, BLACK.

Kala namak, HIND. | Sonchal namak, HIND.

To make this medicinal substance, take 1 maund of Sambar or Dindwa salt ; $\frac{1}{2}$ seer of the fruit of Terminalia belerica ; $\frac{1}{2}$ seer of the fruit of Terminalia chebula ; $\frac{1}{2}$ seer of Aonla or Emblica officinalis ; $\frac{1}{2}$ seer of Black sajji or impure carbonate of soda : all these are put into an earthen pot over a fire and kept there till scorched ; when about 35 out of 41 seers remain, the pot is taken off and the black salt is made. About two maunds of wood are used. The price is Rs. 3 per maund. It is used as medicine in India and China. In China it seems to contain a little sulphuret of iron and is given in enlargements of the spleen and liver.—*Smith Mat. Med.* ; *Powell, Hand-book Econ. Pro. Punjab, pp.* 9 *and* 98.

SALT LAKES, see Iran, Lakes, Hooghly, Fars, Sambhar.

SALT RANGE. This range of mountains in the Panjab extends from the eastern base of the Suliman Mountains to the river Jhelum, lat. 32° 30′—33° 20′. The Salt Range runs transversely between the Jhelum and the Indus, and the Baloti Range, and Shaikh

Budin hills, which may be considered as a portion or continuation of the range Trans-Indus, lie in the vicinity of the Salt Range; having those hills on the south, the Peshawur hills on the north, and the end of the Sulaiman Range with the Waziri hills on the west. From this place onwards down the western frontier, the geological features of the branches of the Sulaiman range were represented at the Lahore Exhibition by several fossils from the Lagari, Mazari and Lower Hills belonging to the Sulaiman system. The rocks in the part of the range between lat. 32° 30' and 33° 20' are, magnesian limestone, new red sandstone, fossiliferous sandstone, red clay and sandstone, containing coal and mineral sulphur, rock salt, gypsum, brown and red iron ore and alum slate. The lower beds contain no organic remains but the upper abound in them. The iron ore is a red or brown hæmatite, so rich that in many places the needle of the compass becomes quite useless even at a considerable distance from the rocks, owing to their being highly magnetic, from the quantity of iron which they contain. The sandstone abounds with the exuviæ of enormous animals, either Saurians or Sauroid fishes. The Hills at Kala Bagh contain great quantities of aluminous slate, from which alum is obtained at various manufactories in that town. The slate, well sprinkled with water, is laid in alternate strata with wood, until the pile reaches a height of 25 to 30 feet; it is then lighted and the combustion continued for about twelve hours, in which time the colour of the slate is converted from greyish black to dark red. This change of colour indicating that the process has been carried to a sufficient extent, the mass is thrown into a tank holding as much water as it is computed the alum is competent to saturate. After three days the water, which becomes of a dark red colour, is drawn off, mixed with a due proportion of potash and boiled down. The residuum on cooling becoming a solid mass of alum. Mr. Powell mentions that the principal beds of salt occur in the red marls and sandstones of the Devonian group, on the southern side of the Salt Range. They are from 150 to 200 feet in thickness, but masses of salt are also found interspersed among the marls and detached from the main beds. There are three principal varieties of salt, viz., red, white and crystal salt. The red is preferred for merchandise, as it does not break up so readily as the others. The white variety not unfrequently passes into a grey or greenish and purplish colour. The Bahadur Khail Trans-Indus mine, yields black salt, and this is shipped at Esa Khail for export, having specific uses of its own. The Salt Range mines are of two kinds; one where the salt rock is approached by galleries and excavations, the other where, as at Kalabagh, or the Trans-Indus mines, the salt is at the surface of the rocks and is quarried rather than mined. At the Kalabagh mines, the mineral exists close to the surface and crops out behind the terraced houses of Kalabagh, forming a wall which overhangs the town.

Elphinstone, describing the town and mines of Kalabagh, says, as he passed beneath, he perceived windows and balconies at a great height crowded with women and children. The road beyond was cut out of the solid salt at the foot of cliffs of that mineral, in some places more than 100 feet high above the river. The salt is hard, clear and almost pure. It would be like crystal were it not in some parts streaked and tinged with red. In some places salt springs issue from the foot of the rocks and leave the ground covered with a crust of the most brilliant whiteness. All the earth, particularly near the town, is almost blood-red, and this with the strange and beautiful spectacle of the salt rocks, and the Indus flowing in a deep and clear stream through lofty mountains past this extraordinary town, presented such a scene of wonder as is rarely witnessed." The mines or rather quarries which were described by Elphinstone, are now closed, and the salt is extracted instead, at Mari, on the opposite side of the river. The out-turn of salts in maunds and revenue, derived from the Kheura mines alone for the four years 1861–1864, is as follows, about Rs. 2¾ the maund.

1861,	Mds. 9,16,105,	at Rs. 2-2,	value Rs. 19,46,724
1862,	7,50,490,	2-2,	18,93,413
1863,	7,35,136,	3	22,05,408
1864,	1,92,122,	3	26,76,368

In the tertiary formations of the Salt Range, gold is found in minute scales, and has doubtless been derived from plutonic and metamorphic rocks, the disintegration of which has furnished the material of which the strata of the series are composed and in the beds of numerous nullahs which flow through the "meiocene" formations, the sand is washed for gold. Gold seems to be obtained in the largest quantity towards the Indus, north of the Salt Range. The gold washing of the Salt Range are nearly all in the Jhelum district. The Salt Range of mountains, seems to be the Mons Oromenus of Pliny, and the Sanskrit Raumaka. In the year 1850, 158 cradles were at work, and they were taxed from Rs. 2 to 5 per "troon;" the total tax amounted to Rs. 525. In the streams where gold-sand is washed, grains of platinum are occasionally found in small quantities; the gold seekers call the metal "safed sona," and reject it as useless; platinum has also been found in the Tavi river of Jammu territory, and in the Kabul river at Naushera. Salt Range coal from Pind Dadun Khan costs at Multan, rupees 100 per hundred maund, and is not first-rate, and, according to Mr. Oldham, the supply is likely to be very limited. Sea-borne coal costs on the Sind Railway rupees 105, and would probably cost on the Punjab Railways rupees 140 per hundred maunds.—*Calcutta Review, February* 1868, *p.* 296; *Powell's Hand-book.*

Pottil-uppu,	TAM., TEL.

The saltpetre of commerce is obtained from the East Indies, chiefly from Oudh, Bengal and Nellore. In those districts it generally occurs as a white incrustation on the soil, being also mixed with it to a considerable depth. The earth is scraped and boiled with water. The solution is then concentrated by the heat of the sun and the water afterwards evaporated by artificial heat. From this the salt appears in impure crystals which are exported to Britain in coarse bags of sacking. In this state the salt is known as "rough saltpetre." The empty bags are soaked and boiled to extract the salt they may have imbibed and then sold to the makers of coarse wrapping paper. Its ordinary price is £38 to £40 the ton, but during the mutinies in Northern India, in 1857 and 1858, it rose to £59. It is refined by boiling and cooling, the pure crystals forming in the cold solid solution leaving the impurities still dissolved.

Madras.—At the Madras Exhibtion of 1855, eight good samples were exhibited, the jury considered that exhibited by Mr. Ouchterlony to be the best, and awarded to him a 2nd class Medal—the next and almost equally good, being that of Mr. J. Rundall, Razole, Rajahmundry—to whom the jury awarded honorable mention. The specimens of commercial saltpetre examined in Madras have, generally speaking, been very pure, and especially free from "sulphates." Saltpetre of Southern India, is made at Moganore and Errode, also of a very fine quality at Ellore. The native name of the town is Oopoo Ellore, shewing that it has long been famous for this mineral; it sells at 1 rupee the maund, very good, but they produce a twice boiled saltpetre at 2 rupees which is very superior.

Burmah.—Saltpetre is found in some of the caves of Tenasserim and is imported from Rangoon.

Sumatra.—Marsden, in his Sumatra Researches, referring to the saltpetre caverns in the country of Caltown near the land of the Davi river, states that these caves are filled with nests of innumerable birds of the swallow kind which abound the more the further one advanced into the cave and that it was their dung forming the soil (in many places from four to six and even from fifteen to twenty feet deep) which affords the nitre. A cubic foot of this earth produced on boiling 7 pounds 14 ounces of saltpetre, and a further experiment gave one-ninth more.

Bellary.—The soil of the Bellary district is very favourable for the manufacture of saltpetre. In the process, the earth is put into pits and mixed with saline water. The solution is afterwards drawn off into earthen pots, boiled, and afterwards poured into shallow vessels to crystallise.

Panjab.—Saltpetre is made in most of the plain districts of the Panjab, particularly in Multan, Dera Ghazi Khan, Jhang, and Gugara, where it effloresces spontaneously about old ruins, and is collected and purified by boiling and re-crystallization. It forms a considerable article of export both inland, beyond the frontier, and also to the seaports. A company for the manufacture of saltpetre has recently been established at Multan. Saltpetre is found naturally in the soil, in many parts of the Punjab, efflorescing near old buildings. It is not to be confused, however, with the white efflorescence often observed on the "Reh," or barren uncultivated lands, and which is usually a sulphate of soda.

Bengal.—Bengal supplies to the Europ[illegible] market, the largest portion of this salt.

Cuttack nitre is known locally as Ke[illegible] jabkhai. A black kind is obtained by a proc[illegible] of solution and filtration of the salt w[illegible] is found effloresced on old mud walls. [illegible] white kind is the same salt more carefully prepared for the most part in the hill tracts from a similar efflorescence found in the cold months on the base of cow-house walls, and there generated, it is to be supposed, by the oxidation of the ammonia thrown off from the urine of the cattle. Neither kind is manufactured extensively enough for commercial purposes; still the local manufacture furnishes a good deal of the saltpetre, if not the bulk of it, used in native gunpowder for shooting and for fireworks.

Shahabad.—Saltpetre and salt are produced abundantly in some parts of Shahabad, but crude saltpetre is prepared at from 6 to 7 rupees per local maund, by the Nooneah workmen : this, in its crude state, would be 15*l.* to 18*l.* per ton, while the salt produced with the saltpetre is of a coarse kind, and only sold to the poorest of the community, under the name of Kharree namak. It can, however, easily be purified by boiling, and then is a good and pure salt.

China.—Saltpetre is manufactured in China, from the natural efflorescence of the soil, but it is largely imported.

Palestine.—Near Shaara, distant about an hour and a half from Missema, the houses have large heaps of saline earth, containing saltpetre. It is thrown into large wooden vessels perforated with small holes on one side near the bottom. Water is then poured in, which drains through the holes into a lower vessel, from which it is taken and poured into large copper kettles ; after boiling for twenty-four hours, it is left in the open air, the sides of the kettles, then become covered with crystals.—*Quarterly Review, July* 1868 ; *Rhode MSS.* ; *Cat. M. E. of* 1857 ; *Cat. Ex.*, 1862 ; *Burckhardt*, 114 ; *Robinson's Travels, Vol.* ii, *p.* 135 ; *Marsden's Sumatra* ; *Mason's Tenasserim*. See Nitrate of Potash,

SALUER, MALAY. Trowsers of silk, or cotton, or silk and cotton mixed.

SALUNG, SIAM. A money of account, the fourth of the tical, and worth about 7½*d.*—*Simmond's Dict.*

SALUNI, HIND. Rumex vesicarius.

SALUN-KE-KATORAY, HIND. Curry cups.

SALUP, MALAY. A weight used in Sumatra, of 2 lbs. avoirdupois,—*Simmond's Dict.*

SALUTATIONS, Genesis, xxxiii, 4, says, d Esau ran to meet him, and embraced and fell on his neck." A hindoo, when eets a friend after absence, throws his round him, and his head across his lders, twice over the right shoulder, and over the left ; and uses other ceremos, according to the rank of the parties. Salutation is alluded to in Matthew, v, 47, and xxiii, 7, 12, 28. The usual way of kissing the knee, is to place the finger tips on it and then raise them to the mouth. It is an action denoting great humility, and the condescending superior who is not an immediate master returns the compliment in the same way. In salutation, the Persians say, "Afiyat bashad"—"may it be health to you ?" or "Nosh-i-jan"—"may it be a drink of life." The Arabs say, "Hania," "may it be good to you," the person addressed bows and returns, "may Allah be your preserver." Amongst mahomedans in India the ordinary salutation at meeting is salam alaikum, peace be unto you, and the return is alaik-us-salam, but a servant will exclaim dowlat-ziada, may your wealth increase ; umr daraz, may your life be prolonged, umr o dowlat-ziada, may your years and your dignity increase. A person of high rank as in Europe, first addresses a visitor by asking Khariat ? are you well, to which the reply will be, is your highness well. The salutations in India amongst mahomedans often assume the form of a blessing or prayer, as may your life be long ; may you live a century and a quarter.—*Burton's Pilgrimage to Meccah, Vol.* i, *p.* 292 ; *Burton's Scinde, Vol.* ii, *pp.* 20 *and* 21.

SALTS, a general term in technical chemistry for saline substances. The principal substances classed under the head of salts, are common rock salt, preparations of evaporated salts, saltpetre or nitrate of potash, alum, "sajji" or barilla, "naushadar" or Sal ammoniac, borax or "sohaga." "Kalar," is an efflorescent sulphate of soda, so prevalent in some parts of Northern India, as to destroy cultivation : the sulphate has not yet been utilized, but many efforts have been made to discover the cheapest method of neutralizing its evil effects on the soil. Nipah salt is made from the ashes of the Nipah palm. It is in extensive use among natives of the interior of the Malay peninsula.

SALVADORACEÆ, *Lindl.* An order of plants, comprised in one genus and five species from Arabia, Persia, the peninsula of India and Cochin-China.

Tooth brush tree.		Miswak,	PERS.
Jal,	HIND.	Sadui-jhar,	SINDH.
Irak,	PERS.	Peda vara goki,	TEL.
Leaves.		Fruit.	
Rasuna,	HIND.	Peel ; Pinjood,	HIND.

Grows towards the sea coast in the north part of the island of Ceylon, and near the sea, in both the Concans ; is found in the Panjab ; on the banks of the Jumna, and from Delhi to Saharunpore. The leaves resemble the lanceolate senna, and are also purgative ; the fruit is said to be eatable. It is not known whether the root bark possesses acrid properties. The twigs of this tree are used as tooth-brushes. Wood useless even for burning.—*O'Shaughnessy, p.* 527 ; *Dr. Honigberger, p.* 339 ; *Thirty-five years in the East* ; *Wight, Icones* ; *Thwaites* ; *Dr. Stewart.*

Fruit.	Dried Fruit.	
Pilu ; Peelu ; Pil.	Khokar ; Tak,	Tr. Ind.

This tree is very abundant in the Panjab and as far east as the Jumna fringing the sandy tract as the jhao, the Tamarix dioica, does the river. Wood close-grained, much used for fuel. It is common in the Multan division, where its wood is used for rafters and as knee timbers for boats. In some arid parts of the Panjab, it forms the only vegetation, it occurs in Sindh, and trees are met with of 11 to 14 feet in girth. It flowers in April, and when its sweetish fruit ripens at the beginning of the hot weather it is largely eaten by the people who go in numbers to gather it. A gall occurs on this tree used in dyeing, and the root is ground and applied as a blister.—*Drs. J. L. Stewart and H. Cleghorn ; Colonel Lake.*

Fruit.
Khari-piro, Sindh.

This, supposed to be the mustard tree of Scripture, grows in Arabia, the Persian gulf, is very common in Ajmir and Marwar ; is not a common tree on the Bombay side of India, except at mahomedan durgahs and places of worship ; but it grows wild on the coast in the Hubshee's country of Janjirah, and in the southern Maratha country, though it seldom reaches any size. In Sind it is more common, and grows considerably larger. It thrives well in every soil, and is in flower and fruit all the year round. The bright green of the leaves is very refreshing to the eye, as the tree grows in very barren places ; it is generally semi recumbent on the ground, and affords little shade. The leaves and bark are very acrid, smelling very strongly of cresses ; the freshly pounded bark of the roots is an active epispastic. Trunk generally crooked, from eight to ten feet high to the branches, and one foot in diameter. A decoction of the bark of the stem is said to be tonic, and the red berries eatable. Dr. Gibson was inclined to think that the wood of this [illegible]s well worthy of an extended trial, as it [illegible]ns rather strong and of compact grain.—[illegible]. *Irvine, Medical Topography of Ajmir ; [illegible]oxb.* ; *Fl. SALVIA MOORCROFTIANA.

Kanocha, Hind.

A plant of Kaghan ; growing plentifully in the valley of Cashmere ; its seeds are officinal, both at Cashmere and Lahore.—*Dr. Honig, Thirty-five years in the East, p.* 339.

SALVIA OFFICINALIS, *W.*

Garden Sage,	Eng.	Sefa kas?	Tam.
Salbia,	Hind.		

A slightly aromatic, shrubby, but dwarfish plant, of somewhat bitter and very hot, aromatic, and slightly astringent flavour. These qualities are retained on drying. It affords on distillation with water a large quantity of essential oil, containing 26 per cent. of camphor. Sage is used for stuffings and flavouring various dishes : culture difficult to manage, but some of the Indian varieties might be more useful.—*O'Shaughnessy, p.* 487 ; *Jaffrey.*

SALVINIACEÆ, *Bartl.* An order of plants comprising 1 Gen., 4 Sp.

SALVINIA CUCULLATA. This curious little floating plant, related to the ferns, of the genus Salvinia is often seen on the surface of old tanks and stagnate waters in Tenasserim.—*Mason.* See Ferns.

SALVI PUNUKARUDU, Tam. Bleaching.

SAL-VOLATILE, Lat. Liquor Ammonia.

SALWA, Tel. Aquila fulvescens, *Gray.*

SALWA, Urya. Shorea robusta, *Roxb.*

SALWA, the ancient name of a part of Rajasthan or Rajputana.

SALWEEN, or Saluen river rises north of Yunnan province, in China ; about lat. 27° 10′, long. 98° 57′ S., and disembogues into the gulf of Martaban, by two mouths, formed by Pelewgewen Island. Length, 430 miles. It receives the Attaran or Weingo, 110 ; Thoung-yin Myit, 225 ; Meloun, 90 miles. It enters the British dominions about lat. 18° 40′. The Saluen, where it borders and then flows through Yun-nan, receives from the Chinese the name of Lu-Kiang or Nu-Kiang. A few days' journey from Saddya, the frontier town of Assam, there is a station called Bonga where a Roman Catholic Bishop has his solitary home. Here is the meeting-place of the frontiers of India, Burmah, China and Thibet. Taking our stand at this spot, and looking south, we have five great rivers, all destined to play a great part in the future trade of Europe and in the regeneration of the people who swarm on their banks. To the west is the Brahmaputra, which bears the tea of Assam to its destination. To the extreme east is the Yang-tse-Kiang, the great river of China, and flowing directly south and almost parallel at distances of about 200 miles from each other are, in order from the Yang-tse-kiang, the great Mekon or Cambodia river, the Salween and the Irrawaddy. On the delta of the first the French have planted themselves, and already their steamers have sailed up towards China and Burmah till stopped by the rapids. The Salween presents the singular phenomenon of having no delta, but a hundred miles above its mouth, where Moulmein receives a busy trade, rapids impede navigation. The Irrawaddy has often been sailed up 500 miles as far as Ava, and Dr. Williams as well as others has gone higher to Bamo. Thence navigation is impeded over the 350 miles which yet remain to Mantshi, which is not far from Bonga, the place which British half-subjects, the barbarous Singpho, make it impossible to reach from any quarter but China. Rising in Eastern Tibet close to where the Yang-tse enters China, the Salween flows through the province of Yunnan, enters Burmah where it passes right through the tributary Shan States, and further gladdening the independent Karen it forms the boundary between the British province of Martaban and the Siamese Shan races. Nature evidently intended this noble river as the highway into China, the road to be taken to Esmok. Into these independent Karen States bodies of timber merchants with large quantities of specie passed every year, but they had been so often attacked and even murdered by dacoits that in 1863 they were accompanied by a military escort. More important than the Karen are the industrious Shan, who are virtually independent. The valley of the Salween is British territory only in its lower portion. The right bank of that river is a wilderness of mountains drained by various streams, the most important of which is the Yonzaleen ; but lower down, and especially below the Thoungyen river on the east bank, there are large alluvial plains which are drained by the Gyne and the Attaran rivers. Salween though a large river is not navigable owing to its rapids. The Gyne, which flows in a somewhat similar direction passes through a more open country, and there are numerous villages on its banks : it is navigable for 180 miles for small boats. A glance at the map of South-eastern Asia shows two great rivers, which at first sight, appear to be natural highways, leading from the bay of Bengal and the China Sea, far north into Central Asia. They are the Mekon, or great river of Cambodia and the Salween. But though they appear as if destined by nature, to be highways for commerce, they are barred to uninterrupted navigation, by rapids and falls. The lower course of the first named river is held by the French. As the timber trade of Moulmein with Karen-nee and the countries beyond is very valuable, it is important to extend protection thereto, and to obtain a better knowledge of the Salween river, than we now possess. The rapids lie about 100 miles above Maulmein. Large amount of specie are sent annually up the Salween to purchase timber in the states, of Karennee. There is no doubt, but that should the Salween be found navigabl steamers to any considerable distance, three or four hundred miles above the ra the result would be very advantageous commerce. See India, Rivers, Bore.

SALWEN. See India, Karen, S

SALWEN, Burm. Elæocarpus,

SALYA, a rajah of Madra sold h

Madri, to be the second wife of raja Pandu. His country was probably on the southern slopes of the Himalaya, or in Butan, and the customs of the people were barbarous. He was present at the battle of Kurukshetra, was the generalissimo of the Kaurava on the last day of the war, and was then slain, by Yudhishthará. During a dispute in the midst of the battle, Karna, when advancing to meet Arjuna angrily twitted Salya with the customs of his country, where wives, mothers, sisters, daughters, brothers and uncles all commune together in a medley.—*Wheeler, Hist. of India, pp.* 64 *to* 328.

SALYAN, see Iran.

SALYARA, HIND. Celosia argentea.

SALYODANAM, SANS. Fine rice.

SALZ, GER. Salt.

SALZSAURE, also Chlorwasser, salzsaure, Muriatic acid.

SAM, HIND. Pinus excelsa.

SAM, also Sama, and Sham or Shama, and Syama, are names of Krishna, one of the hindoo deities. With the people on the line of the Indus river, the letters 'S' and 'H' and 'Z' are permutable. Hind becomes Sind; Zalim Sing becomes Halim Hing. The difficulties however as to the letter 'H,' are not greater than in the Italian, where the initial 'H' is quiescent before a vowel and modifies the sounds of consonants. Colonel Tod says S and H are permutable letters in the Bhakka, and he supposes that Sam or Sham, the god of the Yamuna, may be the Ham or Hammon of Egypt. He also thinks it not unlikely that the Chaora, the tribe of the first dynasty of Anhulwarra, is a mere corruption of Saura; as the ch and s are perpetually interchanging The Mahrattas cannot pronounce the ch; with them Cheeto is Seeto, &c.

SAMA. Ambu of the Ravi, Glochidion velutinum, *W. Ic.*, also Nardus stricta, and Oplismenus frumentaceus.

SAMA. The name of one of the Vedas. These are generally considered as four in number, the Rig, the Yajur the Sama and the Atharva Veda, but the last of these evidently belongs to a much later age than the rest. The hymns of the Rich or Rig Veda are repeated entirely in a disjointed form in the Sama Veda; and, also, with little alterations in the Atharva, while the Yajur contains principally forms of prayer. A Veda, in its strict sense, is simply a Sanhita, or collection of hymns. These hymns form the mantra or ritual, and are the true Veda. The Rig, the Sama, and the Yajur are the three universally received. The Atharva, is of more doubtful authenticity. See Arians, Inscriptions, Vedas.

SAMADA, GUZ., HIND. Corundum, emery. See Corundum.

Karin gota, MALEAL. | Samadara-gass, SINGH.

A large tree of Ceylon, the south of India, and common in the Concans and on the Malabar Coast. Its fruit and root are used medicinally; its bark is the Niepa bark of commerce. It occurs in the south of the island of Ceylon, but is not common. The bark, root, and fruit of the plant are intensely bitter like other plants of the quassia family and is used as a medicine by the Singhalese.—*Eng. Cyc*; *Useful Plants*; *Thw. Enum. pl. Zeyl.*, *Vol.* i, *p.* 70.

SAMADERA LUCIDA, *Gærtn.*

Niota lucida.

Ka thay, BURM. | Samadera, HIND.

The low grounds near the sea coast of Tenasserim are ornamented with this species; it is a handsome shrub and bears a rather curious flower; its leaves are most intensely bitter, it is cultivated in the gardens about Batavia.—*Mason, Tenasserim*; *Dr. Wallich, Pl. As. Rar.*, *t.* 168.

SAMADERA. SINGH. Vitmannia trifolia.

SAMADH, or burying alive, was practised in Rajpootana, up till 1868. The Political Agent of Serohi furnished a list of instances in the course of six years that had come to his knowledge, chiefly in the neighbourhood of Motagaon, a border village. The practice was also carried on in the adjoining state of Marwar. Out of nine cases of Samadh reported, eight of the victims were lepers, the others having been sacrificed, no doubt at their own desire, on account of old age and poverty. The Rao of Serohi issued a proclamation forbidding the practice under the penalty of ten years' imprisonment, but there are very great difficulties in the way of carrying out such orders. In many of the cases the persons who dig the pit and cover up the unfortunate wretch, are themselves lepers, and to them death itself would be welcome, and we presume the Rao would hardly care to introduce any of them into his prisons. It would be well if some sort of lazaretto were erected in Serohi, or any other state where the practice is supposed to be carried on. The cases of leprosy are not very numerous, and the additional expense to the state would be but trifling.—*Friend of India, May* 1868.

SAMADH, SANS. The spiritual throne of the founder of a hindoo sect, the gaddi, or pillow at the seat of the original site of the sect.—*Wilson.* See Khaki, Mat'h.

SAMADHI, silent abstraction and contemplation of the Supreme Being.

SAMADHIKA, a sect who preceded Sakya Muni, who placed the attainment of everlasting bliss, on the continued practice of Samadhi, or of deep and devout abstraction.

SAMADRU, see Krishna.

Near Samarang, i the head quarters of the army of Netherland India. It is strongly fortified. Samarang anchorage is exposed in the western monsoon : the town is built on both sides of a small river.—*Bickmore, p.* 56.

SAMARCAND, the capital of the ancient Sogdiana. Shammir Yerash, the son of Yeshir, the successor of the Balkees of the Christian era, was one of the greatest warriors who ever held the throne of Yemen. He carried his victorious arms into Irak, Persia, and the neighbouring countries, attacked and nearly destroyed the ancient capital of Sogdiana, which thenceforth took the name of Samarkand ; Shammir's son restored it. Remains of Himyaritic inscriptions were long found there, and one mentioned by Aboo'l Feda began thus, " in the name of God, this building was erected by Shammir Yerash, in honour of the Lord the Sun." Shammir afterwards perished with his army in the deserts of Thibet, in an invasion of China. To revenge the death of his grand-father, Tobba ul Akran, who occupied the throne of Yemen for about fifty years, from A. D. 90 to A. D. 140, marched and rebuilt Samarcand ; carried war into China, where he founded a city which Thaalebi called El Beet, where he left a colony of 30,000 Arabs, who continued a distinct people when Hemedoun wrote in A. D. 555. Samarcand is 500 miles from

Herat, and Herat is 750 miles from the Indus, is in the midst of the beautiful valley of Soghd, it was till lately the seat of the king of Bokhara in the winter time. It was known in the time of Alexander the Great by the name of Marakanda Regio Sogdianarium ; and contains the sepulchre of Timur whose residence it was. It is still the seat of oriental literature, and called " The Ornament of the Face of the Earth." It has a mud wall, and forty thousand inhabitants ; a beautiful palace, and many houses of marble, many mosques and colleges. It was formerly inhabited by Chinese, who manufactured paper of silk, and it once had the name of Bokhara-Ishien, but received its present name from the conqueror Samar, after Christ 643. Oologh Beg erected there an observatory. There are two thousand Jews there. Near it is a little town called Sheeraz, and it is probable that the poet Hafiz alluded to the Sheeraz, near Samarcand, when he says, If that Turkish girl of Sheeraz would give me her heart, I would give for one mole of her cheek, Samarcand and Bokhara. Timur marched from Samarcand in A. D. 1397, into India, but returned the following year and proceeded against Syria, Egypt and Constantinople. On Timur's death, in 1404, Sultan Kali took possession of it. Bokhara and Samarkand are the centres of mahomedan theology. There are no mahomedans so strict as the inhabitants of Bokhara, but it is the most shameless sink of iniquity in the East. See Iran, Kara-kul, Kelat, Kesh, Zingarri.—*Dr. Wolff's Bokhara, Vol.* ii, *pp.* 4-6.

SAMARIA, a district in Palestine.

SAMARITANS, have been inhabitants of Nablus, the ancient Shechem, near Jerusalem, since the time of Nehemiah. Samaritan history is detailed in II. Kings, xvii; Ezra, iv, 2, 3. It had been attached by Sargun B. C. 745, 746, was besieged and taken B. C. 719, and the people carried away to Assyria and Medea. According to the Samaritan traditions, it was on the rock surface of Mount Gerizin that Abraham prepared to sacrifice his son Isaac. This was the Bethel of Jacob, and even to this day, the Samaritan priest, takes off his shoes as he nears the spot, because it is holy ground. Samaritans are Christians since our Saviour planted it amongst them, John, iv, 5-42. In the rites of the Yom-kippoor, or day of atonement, of the Samaritans, as witnessed at Nablus in 1861, they make in their responses, avowals of their belief in Jehovah and in Moses, and are accompanied by constant sudden prostrations, and by frequently rubbing down the whole face and beard with the right hand, a gesture frequently used by mahomedans, when any sacred name or form of words is said, and seems to be an attempt actually to catch the grace of the words, residing in the breath of the speaker himself, and communicate it to his beard and countenance.

SAMAROGH, HIND. Agaricus campestris, Morchella esculenta.

SAMARPANA, see Rudra sampradayi.

SAMARSI, see Mewar, Korum-devi, Sanjogata.

SAMATATA, the Gangetic delta.

SAMATA, or Samatta, or Balurakkisa, TEL. Fourcroya cantala, *Haw.*

SAMATRAPU TEN-KAIA, TEL. Sea-cocoanut of Seychelles, Lodoicea seychellarum.

SAMAUKA, HIND. Cucurbita citrullus.

SAMA VEDA. Amongst the hindoos there are eighteen Vidya of true knowledge, and some branches of knowledge, falsely so called. The first four are the Vedas, which are entitled, in one compound word, Rigyajushsamat'harva, or, in separate words, Rich, Yajush, Saman, and At'harvan. The Rig-veda consists of five sections ; the Yajurveda, of eighty-six ; the Samaveda, of a thousand ; and the At'harvaveda, of nine ; with eleven hundred sac'ha, or branches, in various divisions and sub-divisions. The Vedas, in truth, are infinite ; but were reduced, by Vyasa, to this number and order : the principal part of them is that which explains the duties of man in a methodical arrangement ; and in the fourth is a system of divine ordinances. From these are reduced the four Upa-veda, (Upa-veda, Upanga, Uppuran, infer a work deduced, respectively, from its principal : up, like our sub, implies inferiority,) namely, Ayush, Gandharva, Dhanush, and St'hapatya. The first of which, or Ayur-veda, was delivered to mankind by Brahma, Indra, Dhanwantari, and five other deities ; and comprises the theory of disorders and medicines, with the practical methods of curing diseases. The second, on music, was invented and explained by Bharata : it is chiefly useful in raising the mind by devotion to the felicity of the Divine Nature. The third Upaveda was composed by Viswamitra, treats on the fabrication and use of arms, and implements handled in war by the Cshatriya tribe. Viswacarma revealed the fourth, in various treatises on sixty-four mechanical arts, for the improvement of such as exercise them. Six Anga, or bodies of learning, are also derived from the same source, their subjects chiefly are—1, of the pronunciation of vocal sounds ; 2, detail of religious acts and ceremonies ; 3, grammar ; 4, prosody ; 5, astronomy ; 6, on the signification of difficult words and phrases in the Vedas. Lastly, there are four Upanga, called Purana, Nyaya, Mimansa and Dharma sastra: Eighteen Purana (that of Brahma, and the rest,) were composed by Vyasa, for the instruction and entertainment of mankind in general. Nyaya is a collection of treatises, in two parts, on metaphysics, logic, philosophy, &c. Mimansa is* somewhat similar, divided into two parts; the latter, called Uttara, abounding in questions on the Divine Nature, and other sublime speculations, was composed by Vyasa, in four chapters and sixteen sections. It may be considered as the brain and spring of all the Anga; it exposes the heretical opinions of sophists; and, in a manner suited to the comprehension of adepts, it treats on the true nature of Ganesa, Bhascara or the Sun, Nilakanta, Lakshmi, and other forms of one Divine Being. The body of law, called Smriti, consists of eighteen books, &c. &c., delivered for the instruction of the human species, by Menu, and other sacred personages. As to ethics, the Vedas contain all that relates to the duties of kings; the Purans what belong to the relation of husband and wife; and the duties of friendship and society (which complete the triple division) are taught succinctly in both. This double division of the Anga and Upanga may be considered as denoting the double benefit arising from them in theory and practice. The Bharata and Ramayana, which are both epic poems, comprise the most valuable part of antient history. Sanc'hya is two-fold that with Iswara, and that without Iswara, called Patanjala, and Kapita: the latter, in six chapters, on the production of all things by the union of Pracriti, or Nature, and Purusha, or the first male, &c. &c. These books contain infinite contradictions. The Mimansa is in two parts, the Nyaya in two, and the Sanc'hya in two; and these six schools comprehend all the doctrines of the theists. Lastly appears a work written by Budha. Amongst the hindoos there are six atheistical systems of philosophy, entitled Yogachara, Saudhanta, Vaibhashica, Madhyamica, Digambara, and Charvac; all full of indeterminate phrases, errors in sense, confusion between distinct qualities, incomprehensible notions, opinions not duly weighed, tenets destructive of natural equality containing a jumble of atheism and ethics; distributed, like other orthodox books, into a number of sections, which omit what ought to be expressed, and express what ought to be omitted; abounding in false propositions, idle propositions, and impertinent propositions. The Vedas consist of three Canda, or general heads, namely, Carma, Juyana, Upasasna; or Works, Faith, and Worship. To the first of which, the author of the Vidyadeisa, or view of learning, a rare Sanskrit book, wisely gives the preference; as Men himself prefers universal benevolence to th ceremonies of religion.—*Wilford's As. Res., Vol.* iii, *p.* 302. See India, Inscriptions, Vedas.

SAMAVUSTHANA, see Hindoo.

SAMAWAH, see Mesopotamia.

SAMBA, HIND. Berberis lycium, *Royle.*

SAMBAL, JAV. Cooked vegetables mixed with capsicum.

SAMBAR, HIND. Desmodium argenteum.

SAMBARA, SANS. Rusa equina, *Cuv.*; *Ham. Smith.* See Samber.

SAMBAH, amongst the Malay, means obeisance, homage, &c., and is used for the ordinary word "to speak" by inferiors to a king; Salaam is the simple Arabic salutation, "peace," subjects or inferiors addressing a king are said to "Sambah" not to chakap or kata or other words in commmon use.—*Jour. Ind. Arch., Vol.* v, *No. XI.*

SAMBER, see Lakes, Sambhar.

SAMBER of India, Rusa hippelaphus, *Cuv.*

Cervus aristotelis,	*Cuv.*	Cervus niger,	*Blainville.*
equinus,	,,	jarai,	*Hodgson.*
hippelaphus,	,,	heterocercus,	,,
leschonaultia,	,,	saumur,	*Ogilby.*

The Samber stag,	ENG.	Ma-ao of the Gonds.	
Sambar, HIND.,	MAHR.	Kadavi, Kadaba,	CAN.
Jarai, Jerrao on the Him.		Kannadi,	TEL.
Jerrow,	,,	Ghous or Gaoj of E. Bengal.	
Maha, in parts of the Terai.		Bhalonji, (female),	,, ,,
Mera, MAHR. of the Ghats.			

These numerous synonyms will show that men of science as well as sportsmen have found it difficult to recognise the Samber stag, at its several sites in India, but Jerdon, after seeing them in the Himalaya, in Central and Southern India considers them to be all one species. It is a noble animal, from 14 to 15 hands in height, with antlers often a foot in circumference and four feet long; it is found on the banks of the Jumna and Ganges in their mountain courses; a few stray along the sub-Himalayan valleys and have been shot and seen near Simla on the Cashmere ranges. See Cervus, Deer, Mammalia, Rusa.

SAMBHA, see Sevaji, Mahratta Governments in India.

SAMBHAR or Sambhur, a salt lake in Rajputana where salt is made. Sambhar-lun, salt from Sambhar lake. The name of the extensive salt lake was probably anterior to Ajmir, and yielded an epithet to the princes of this race, who were styled Sambu Rao.

SAMBHOSA, HIND. A fried cake, salted.

SAMBHU, see Siva, Inscriptions.

SAMBHUR, see Haravati or Harauti.

SAMBILANGS or Nine Islands, small bluff islands, covered with trees, extend 7 or 8 miles southward of Pulo Dinding. See Nicobar Islands.

SAMBLA, Sans. Flacourtia sepiaria.—*Roxb.*; *W. & A.*, *Rh.*

SAMBLI, Hind. A kind of tobacco.

SAMBOO DEER, *Bennett*, Rusa equina, R. aristotelis.—*Cuv.*; *Ham.*; *Smith*; *Gray.* See Samber.

SAMBOOL, Tam. Ashes.

SAMBRAÆ, or Sambracæ, or Sambastæ, an ancient people at the junction of the Panjab rivers, probably the same as the Yandheya, or Johiya Rajputs.

SAMBRANI, Maleal. Benjamin.

SAMBRANI CHETTU, Tel. Herpestis monniera, *Kth.* Gratiola monniera, *R.*, i, 141; *Rheede*, x, 14.

SAMBRI RAO, see Haravati or Harauti.

SAMBU, see Jam.

SAMBUCUS ADNATA and S. ebulus (Dwarf elder) grow in the Himalaya as well as in Cashmere. The roots of the latter, it is said, have purgative properties, and, as also the berries, are used in dropsy.—*Dr. Honig.*, *Thirty-five years in the East*, *p.* 340.

SAMBUL, Tam. Ashes.

SAMBUL, Hind., Pers. Hyacinthus orientalis.

SAMBULPUR, the most easterly district of the Chhattisgarh division of the Central Provinces, has important ethnological relations. It lies between lat. 19° 10′ and 22° 35′ N., and 82° 40′ and 85° 5′ E. long. Its extreme length from north to south is about 250 miles, and its extreme breadth from east to west 165 miles. The khalsa, or government, portion of the district, is computed to comprise 2,500 square miles. The greater part of this country is an undulating plain, with rugged ranges of hills rising in every direction. The principal of these ranges is the Bara Pahar in the Dakhantir, which is in fact a succession of ranges covering an area of some 350 square miles. A very large proportion of the district is occupied by crystalline metamorphic rocks. A small portion of the north-west corner of the district is composed of the same series of sand-stone, lime-stone and shale, which cover such a large area in the Raipur and Bilaspur districts. In the river Mahanadi, near Padmapur, there are large masses of lime-stone rock, almost as pure in appearance as marble. Gold dust is procured in the Mahanadi and in its affluent, the Eb, but the process of collecting it is scarcely remunerative. Diamonds used to be found also in the Mahanadi, near the Hirakhuda or Diamond Isle, also at the spot where the Eb joins. During the period of native rule, some fifteen or twenty villages were granted rent-free to a class called Jhira, in consideration of their undertaking the search for diamonds. When the country lapsed in 1850 these villages were resumed; and though an attempt was made to lease out the right to seek for diamonds, the farm only fetched some rupees 200 per annum for a short time, and even at that low rent it does not appear that the farmer made anything out of it, for he eventually gave it up. Under the native government it was the practice to give the jhira diamond-seekers a village rent-free, if they produced a good-sized diamond, land being of little or no value then. The smaller diamonds they used to secrete and sell. As far as can be learnt, the best stones ever found here were thin and flat, with flaws in them, but they were admirably suited for setting in native jewellery. The Sambulpur population amounts to 812,348, of whom 497,774 are engaged in agriculture—the Kolta, the Agharia, and Brahmin are the largest cultivators. The Kolta are a hindoo race; the Agharia claim to be rajputs: the brahmin are of two sections, the Uriya and Jharwa. The Uriya brahman are a lazy improvident sect and subsist chiefly by begging. The Jharwa brahmins are intelligent, careful and hard-working, cultivate the soil, engage in trade. The labourers are the Pab, Saoura, Ganda, Gond, Mali and Gaoli races. The Mahanti are clerks, the Bhulia, Mehra and Koshti are weavers. The Mahanadi rises in the Raipur district in a hilly range between Dhamtari and Bastar, and entering the Sambulpur district to the eastward of Seori-narain in the Bilaspur district, flows due east for some twenty-five miles, when it takes a south-easterly direction for some forty miles, passing Chandrapur and Padmapur, until it reaches the town of Sambalpur. From Sambalpur, its course is due south for some forty-five miles as far as Sonpur, where it suddenly changes to due east, following that direction until it empties itself into the sea beyond Cuttack. Its bed as far as Chandrapur is tolerably free from obstructions, but from Chandrapur to a little beyond Bod it is more or less full of them; its current is more or less hindered by boulders, jhau jungle and even trees. The other rivers deserving mention are the Eb, the Kelu and the Jhira—all tributaries of the Mahanadi. The Uriya brahmans came from Cuttack and Puri within comparatively recent times while the Jharwa settled here many hundred years ago. The Uriya consider themselves the more holy and will not eat with the Jharwa, but they are a lazy improvident set subsisting chiefly by begging. The Jharwa or jungle Brahmans, as their name denotes, are careful, hardworking, and intelligent, they are not above cultivating the soil, engaging in trade, or turning their hand to anything useful and profitable. The Mahanti are the clerks of Orissa ; they are immigrants from the districts to the east, and take occupation as clerks in government offices, school-masters, &c. They are an intelligent but somewhat effeminate race. The Rajput rajas and their descendants. The Bhulia are weavers of cotton-cloths, not celebrated for fineness of texture, but for brilliancy of colour and variety of pattern they can hardly be excelled among coarse native fabrics. Cotton-cloths are also made by the Mehra. The Koshti are weavers of tassa silk-cloth. Their manufacture is justly celebrated, the texture is very even, and the silk has a lustre which never fades, however long it may have been in wear. The Sunar or goldsmith, are apt imitators, and might improve. They manufacture all the ornaments worn by the women : these are very peculiar unlike those used in other parts of India. The prettiest ornaments made here are the "kanthu," or neck-laces of large gold-fluted beads, worn often by Brahman and Rajput sepoys of the Native army. The Kansar or workers in bell-metal and brass, make all sorts of vessels and utensils very neatly indeed. The Guria are sweetmeat sellers. Sausia are masons and stone-carvers. Their work is rough, but solid, and they soon pick up anything that is shown them. The Teli are oil-sellers—a numerous and well-to-do class. The mahomedans are chiefly merchants and government servants. The Panhari and Tamboli are betel-sellers. Kewat are fishermen and boat-men combined : they are a numerous and hardy race, and sometimes engage in small ventures of trade. Ghasi are grass-cutters and grooms, they will also perform the duties of sweepers. The aboriginal tribes of the khalsa are Gond, Pab, Saonra, Binjal or Binjawar, and Kol or Dhangar ; the latter came from the Chota-Nagpur direction : they are as a class, hard-working, honest, and light-hearted, and when not engaged in cultivating either for themselves or for others, they will take service of any kind. Road-making, palki-bearing, gardening, punkha-pulling, all come alike to them, and the women work equally hard with the men ; they are fond of strong drink, but apparently only give way to it on festive occasions ; at certain periods of the year women and men dance all linked together in a circle, pace round in a monotonous but perfectly regular measure, swaying at the same time their bodies backwards and forwards, occasionally almost touching the ground with their heads, they are all decked out in their best, the women ornamenting their hair fantastically with feathers and flowers. Ghes, is a chiefship attached to the Sambalpur district, situated some fifty miles west and a little south of the town of Sambalpur. The chief's family are Binjwar (or Binjal) and were much mixed up in the Surendra Sai rebellion.—*Central Province Gazetteer.*

SAMBUL UL TIB, HIND. Nardostachys jatamansi.

SAMI, SANS. Vachellia farnesiana, *W. & A.*

SAMIA, MOLUCCAS. Cæsalpinia sappan, *Linn.*; *Roxb.*; *W. & A.*

SAMIDAH, see Khuzistan or Arabistan.

SAMIEL, or Bad-i-Samoom, also Samoom, from the Arabic sam, a poison, a pestilential wind, which occurs in the desert tracts between Africa and India. The people say it does not come in continued long currents, but in gusts at different intervals, each blast lasting several minutes, and passing along with great rapidity but the accounts seem greatly exaggerated. No one they say stirs from their houses while this flame is sweeping over the face of the country. Previous to its approach, the atmosphere becomes thick and suffocating, and appearing particularly dense near the horizon, gives sufficient warning of the threatened mischief. Though hostile to human life, it is so far from being prejudicial to the vegetable creation, that a continuance of the Samiel tends to ripen the fruits. Porter enquired what became of the cattle during such a plague, and was told they seldom were touched by it. It seems strange that their lungs should be so perfectly insensible to what is said to be instant destruction to the health of man, but so it is said, and they are regularly driven down to water at the customary times of day, even when the blasts are at the severest. The people who attend them, are obliged to plaster their own faces, and other parts of the body usually exposed to the air, with a sort of muddy clay, which in general protects them from its most malignant effects. The periods of the wind's blowing are generally from noon till sunset ; they cease almost entirely during the night ; and the direction of the gust is always from the north-east. When it has passed over, a sulphuric and indeed loathsome smell, like putridity, remains for a long time. The poison which occasions this smell, is said to be deadly; and if any unfortunate traveller, too far from shelter, meet the blast, he falls immediately; and, in a few minutes his flesh becomes almost black, while both it and his bones at once arrive at so extreme a state of corruption that the smallest movement of the body would separate the one from the other. When we listen to these accounts, we can easily understand how the Almighty, in whose hands are all the instruments of nature, to work even the most miraculous effects, might, by this natural agent of the Samiel, brought from afar, make it the brand of death by which the destroying angel wrought the destruction of the army of Sennacherib.—*Porter's Travels, Vol.* ii, *pp.* 229-30

SAMILZYE, see Khyber.

SAMISCH-LEDER, Ger. Chamois leather.

SAMI STONE or god stone, seems to be applied to two or three minerals: samada stone, or corundum: a variety of agalmatolite, or pagodalite: and potstone, or a variety of steatite in much demand in China and in some parts of India, for the manufacture of images and figures. It is much used, also, in putting a finishing polish on steel and other metals, and brightening sword blades, bridle bits, &c.—*Bl. A. Trans.*, 1845, *Vol.* xvi.

SAMI TREE, worshipped by hindoos at the festival of the Dasserah.

SAMKI, Rus. Socks.

SAMLA, Sans. Flacourtia sepiaria.

SAMMA, Hind. Schleichera trijuga.

SAMMA. There seem to have been two Samma dynasties, an earlier and a later, ruling in Sind. The earlier seem to have been the Sambus and Sambastæ of Alexander's Historians, the Abestani of Arrian and Sabarcæ of Quintus Curtius, whose capital was the Sindonalia, Sindimon or Sindomanna of authors. One Samma dynasty was a rajput race of Lunar origin, the opponents and successors of the Sumra. The Jharijah race in Cutch are of Samma extraction. After expelling the Sumra race from Sind, in A. D. 1351, the Samma retained power till they were, in their turn, expelled by the Arghun, A. D. 1521. The Samma were either of the buddhist or brahmanical faith. They form unquestionably a branch of the great stock of the Yadava Rajputs, and their pedigree is from Samba, the son of Krishna, who is himself known by the epithet of Syama, indicative of his dark complexion, and their first capital was Samma Nuggur on the Indus, probably the modern Sihwan, then it was Samni, and finally was established in Thatta. The Samma seem to have become proselytes to mahomedanism, about A. D. 1391, since which event, their name, though it still comprises several large erratic and pastoral communities, is less known than that of their brethren or descendants, the Sameja, and the half-hindoo Jhareja of Cutch who do honour to their extraction by their martial qualities, however notoriously they may be deficient in other virtues.—*Elliot*, 497. See Yadu.

SAMMARA, see Mesopotamia.

SAM-MARAM, Tam. A wood of Tinnevelly, of a red colour, used for furniture of any description perhaps the Soymeda febrifuga?)—*Colonel Frith.*

SAMMET, Ger. Velvet.

SAMMI, or Sammu, Hind Bignonia suaveolens, *Roxb.*

SAMMI, or Swami stone, or Agalmatolite.

SAMMIONG, Lep. Arctomys hemachalanus, *Hodg.*

SAM-MOON, or Samoun Islands, or Three Gates, in the Canton River, a group of three small islets of about 3½ miles in extent.

SAMNOS, the Samnite custom of marriage so lauded by Montesquieu as the reward of youthful virtue, was akin in sentiment to that of the ancient Rajput, except that the fair Rajpootni made herself the sole judge of merit in her choice. It was a practice more calculated for republican than aristocratic society: "On assembloit tous les jeunes gens, et on les jugeoit; celui qui était déclaré le meilleur de tout prenoit pour sa femme la fille qu'il vouloit: l'amour, la beauté, la chasteté, la vertu, la naissance, les richesses même, tout cela était, pour ainsi dire, la dot de la vertu." It would be difficult, adds Montesquieu, to imagine a more noble recompense, or one less expensive to a petty state, or more influential on the conduct of both sexes.—*L' Esprit des Lois, chap.* xvi; *Livie*, vii; *Tod's Rajasthan, Vol.* i, *p.* 632.

SAMOAN ISLANDS, in Polynesia. The men of Manua are remarkably fine-looking, several among them being above six feet high, with Herculean proportions. The arm of one measured above the elbow fifteen and a half inches. At Tau and Manua they are generally tattooed from the loins to the knees, which has the effect of trowsers.—*Capt. Elphinstone, Erskine Islands of the Western Pacific, p.* 41.

SAMOEIDE, see India, Mongol.

SAMOJA, Hind. A middling quality of rice.

SAMOKA, also Turbuz, Hind. Cucurbita citrullus, *Linn.*

SAMOOM, often called Samiel. See Samiel.

SAMP, Hind. A serpent, a snake.

SAMPA JANNA, Tel. Fish roe.

SAMPAL, Sumbat, Malay. Cork.

SAMPAN, a river near Sohagpoor in Baitool.

SAMPAN, a Chinese boat, well-known

at Singapore, and in the rivers of Burmah, and remarkable for its swiftness both with sails and oars. These boats, when skilfully managed are exceedingly safe, and are sometimes employed on rather distant coasting voyages, from Singapore to Penang for example. The passenger Sampan is employed at Singapore chiefly in conveying passengers between the shore and the shipping Captain Sherrard Osborn says the Singapore sampan approaches in sharpness of outline and chances of drowning the sitters, to one of the above-bridge racing wherries on the Thames. Two Malay rowers, each pulling a single broad-bladed oar, could in these sampans beat our fleetest gig. The Chinese rowers instead of sitting down to their oars, always stand up, abaft their oars, and face forward. The form of the sampan and junk is of the model of a good broad-toed, broad-heeled, broad-soled slipper,—a good old-fashioned list slipper, in short.—*Osborn's Quedah, pp.* 4-5.

SAMPAN-CHOU or Boat Islet, a small island of moderate height in the Canton river, about 1½ mile N. E. of Lamkeet hill.

SAMPANDER, one of the three most famous saiva poets and devotees.

SAMPANGI MARAM, Tam. Michelia rheedii, M. nilagirica, *W. Ic.*

SAMPENGA CHETTU, or Champakamu, Tel. Michelia champaca.

SAMPRADAYA, a sect of the vaishnava hindoos.

SAMPAYA-PAULAY, Tam. A wood of Tinnevelly, of a light brown colour, specific gravity 0·792, used for building purposes.—*Colonel Frith.*

SAMPGA, Can. Hocomlia montana.

SAMP KI KHUMB, Hind. Arum speciosum.

SAMP-MAR, Hind. Circaetus gallicus, *Gmel.*

SAMPNI, Hind. Colebrookia oppositifolia.

SAM-PO-HO, Chin. The Indus river.

SAMPSUN, Dukh. Aristolochia indica, *Linn.*; *Roxb.*

SAMRAT UL ASAL, Arab. Galls of Tamarix orientalis.

SAMRAT UL TURFA, Arab. Galls of Tamarix indica.

SAMSHU, Chin. A spirituous liquor prepared by fermentation and distillation, from rice.—*Simmond's Dict.*

SAMSTRAVADI, Maleal. Barringtonia racemosa, *Roxb.*

SAMTA, see Vidya.

SAMUDAR, Sans. Ocean.

SAMUDRA, see Inscriptions.

SAMUDRA-CHEDDI, Tam. Argyreia speciosa, *Swt.*

SAMUDRA-DRATTA, a dynasty of 25 buddhist kings from Mithila who reigned in Magadha.

SAMUDRA GUPTA, see Inscriptions.

SAMUDRAPALA or Chandrapoda, Argyreia speciosa, *Swt.* Lettsomia nervosa, *R.*, i, 488; *Rheede*, xi, 61.

SAMUDRA PALLAM, Maleal., Tam. Fruit of Barringtonia racemosa, *Roxb.*

SAMUDRA-PATRA, Tel. Argyreia speciosa, *Swt.*

SAMUDRAPU also Samstravadi, Maleal. Barringtonia racemosa, *Roxb.*

SAMUDDRAPU, also Samudrapu Nundra-kaia, Tel. Cancer, Crab, Pagurus.

SAMUDRAPU NURUGU, Tel. Cuttle Fish-bone.

SAMUDRA-PU-TENKAIA, Tel. Lodoicea seychellarum; Double cocoanut; Cocos maldivica.

SAMUDRA SHOKA, also Gugali, Hind. Argyreia speciosa.

SAMUDRA-STOGAM, Maleal. Argyreia speciosa.

SAMUGH B'IS SHARIN, Pers. Gum arabic.

SAMUKA, Hind. Oplismenus frumentaceus.

SAMU-KA-BIJ, Hind. Hibiscus cannabinus.

SAMULFAR, Hind. Arsenious acid. Arsenic.

SAMULKOTTA, a town in the Northern Circars, in lat. 17° 3′ 3″; long. 82° 13′ 7″, 8 miles inland from the Bay of Bengal. Mean height of the village is 84 feet above the sea-level.—*Cullen.*

SAMULU, Tel. See Save.

SAMUNDAR KHAG, Hind. Literally Sea foam, the dorsal plate of the sepia, or cuttle fish. It is used medicinally as an absorbent and ant-acid, and to rub down paintwork. It is now in Europe, only valued as a tooth-powder, and in the arts.

SAMUNDAR PHAL, Hind. Fruit of Barringtonia acutangula.

SAMUNDAR SOK, Hind. Salvia plebeia.

SA-MUNG-NEE, Burm. Lepidum sativum, *Linn.* Garden-cress.

SAMUTRA-CHEDDI, Tam. Samutra Patra, Tel. Argyreia speciosa.

SAMU RAMA, Semiramis. It is however supposed that the term Samarim, as used in India, did not relate to one person but to many; and it seems particularly to have been usurped by princes. The Cuthites settled about Cochin and Madura, in India; and the great kings of Calicut were styled the Samarim, and the titular prince of the vicinity of Cochin is still called Zamórin.—*An. Anc. Myth., Vol.* iii, *p.* 144.

SAMVARMA, the last ruler of the Bharata dynasty, who was driven westward by the Panchala. See Bharata.

SAMVAT or Sambat, a term especially applied to the era of Vikramaditya, commencing 57 years before the christian era. See Era, Inscriptions, Junagurh, Nepal, Pali, Vikramaditya.

SA-WAT, Burm. Anethum graveolens, *Linn.*, *Dill.*

SAMYA, Mal. Cæsalpinia sappan, *Linn.* Sapan wood.

SAMYDA CANZIALA, *Buch.*, syn. of Casearia canziala, *Wall.*

SAMYDACEÆ, *Lindl.* An order of plants, comprising 1 genus and 6 species of Casearia.

SA MYEIK, Burm. Anethum sowa, *Roxb.*

SAN, Ar., Hind., Pers. A year, the year of an era: San-i-jalus, the year of a king's reign.

SAN, Beng., Hind. Crotalaria juncea, also written Sun. This plant is often confused with the "sankokra," (called sanni in some parts), Hibiscus cannabinus, to which it is much superior in strength. The name is also applied to Cymbopogon iwarancusa.—*Powell's Hand-book, Vol.* i, *p.* 507.

SANA, Sans. Crotalaria juncea.

SANAA, one of the districts of Yemen, and includes the country round the city for half a day's journey north, south and east. The city of Sanaa is situated in a deep valley, surrounded by four mountains, about twenty or thirty miles in length and six or seven in breadth, and about four thousand feet above the level of the sea. It is called Uzal in Gen. x, 27, and exhibits a magnificent spectacle to the eye, has the loveliest of gardens, with pomegranates, grapes, and cherries. The houses are of stone, four stories high, with terraces to walk on in the cool of the day. A very ancient house in ruins, called Kaser Saum, the college of Shem, the son of Noah. The Imam or prince resides in a splendid palace, built of a Gothic style resembling a fortress. He has other palaces. Sanaa contains fifteen thousand Jews. In Yemen they amount to twenty thousand. Wolff conceived the total population of the Jews throughout the world amounted to ten millions. He baptized in Sanaa sixteen Jews, and left them all New Testaments.—*Dr. Wolff's Bokhara, Vol.* i, *pp.* 59-61.

SANAD, a grant, a diploma, a character, usually written sunnud.

SANAGA, (sing.) Sana-galu, (pl.) Tel. Cicer arietinum, *Linn.*

SANAGALU, or Senagalu, Tel. Cicer arietinum, *L.*

SANAIM, Arab. Idol worshippers.

SANAKADI SAMPRADAYI, a sect of vaishnava hindoos, founded by Nimbaditya alias Bhaskara Acharya, a vaishnava ascetic. The objects of their worship are Krishna and Radha conjointly.—*Wilson, Hindoo Sects.*

SANAKE, Hind. of Beas. Vitex negundo, *Linn.*

SANA LAVANGA PATTA, Tel. Laurus cinnamomum.

SANAM, Malay. Verdigris.

SANAM, Hind. Fraxinus floribunda, large ash.

SANA-PAT, Beng. Senna; Cassia lanceolata, *Royle.*

SANAR, a caste in the southern Tamil countries who draw toddy from the cocoanut palms.—*Wils.* See Shanar.

SANA SELLA, Tel. Muslin.

SANAT ? Calico.

SANATORIA. In British India, this term is applied to designate military stations on the mountains or tablelands with climates suited to the health of British soldiers. A range of hill stations, or sanatoria, extend from Murree, in the Punjab, to Almorah, in the Kumaon district. There are Murree and Abbotabad, near Hazareh, in the Sind Sagor Doab, Dalhousie on the Chamba Hills, at the head of the Baree Doab; Dharmsala, near Kangra; Simla, with its adjacent stations of Dugshaee, Subathoo, and Kussowlee; Mussoorie and Landour, overlooking the valley of the Dhoon; Almorah and Nynee Tal, in the province of Kumaon. In process of time, and with an influx of European settlers, many more such stations will be formed, and there are hundreds of eligible sites for their localities. In the Eastern Himalaya, in Sylhet, some sites are spoken of favourably. Mount Abu, is west of Rajputanah; the Mahabaleshwar Hills, south-east of Bombay; Ramandrug near Bellary. The Neilgherri and Pulney Hills in the south of the Peninsula, and Neuera Elia in Ceylon.

Chikuldah is situated on an undulating table-land near to, and somewhat higher than, the fort of Gawlighur, situated in about lat. 21° N., and long. 77° E. Gawilghur Fort is 2,300 feet above the plain, 3,600 feet above the level of the sea, this part of the Berar valley is 1,300 feet above the sea. Chikuldah is on the Vindhya, or as some call it the Gawilghur range of hills, and about 20 miles from the cantonment of Ellichpoor. The plateau of Chikuldah is not above three-quarers of a mile broad, and about a mile in length, but it has easy access to the surrounding table-land and valleys. A cool breeze prevails at the sanitorium during the hot months, and invalids bear testimony to the sudden relief they experience there from the heat usual at

Ellichpoor. During the hot months, ladies and children in particular derive much benefit from the place. The varied and extensive scenery commanded from this elevated spot is exhilarating to the mind by the grandeur of its precipitous ravines with their bluff fronts and bold projections. The more gentle scenery of a vast sylvan tract is seen trending away towards the north, covered with high grass and forest trees, in a series of undulating steppes, all connected one with another, and diminishing in altitude as they recede ; embosomed amidst which are innumerable verdant and secluded valleys. Good roads along the irregular plateau command fine views of the neighbouring most picturesque country, and give every facility for taking air and exercise, without the fatigue of wandering in the jungle or descending into the deep ravines near which the roads pass. As the slope of the mountain inclines towards the north, a more pleasing character presents itself in this direction, than towards the south, where the face of the mountain stands denuded as a bold, precipitous, and cliff-like barrier, admitting only at intervals, of winding pathways, up its craggy front steep and difficult of ascent. It was through some of these passes that the first mahomedans penetrated into the Deccan, led by Ala-ud-Din. Upon the south, the whole valley of Berar is seen to spread out beneath the gazer's feet. During the hot months, it is generally shrouded in a sullen-looking mist, that seems to hang oppressively over the valley, but when the air is clear and bright, as at other periods of the year, the extensive champaigne of Berar is seen across its entire breadth, and sometimes far beyond, the hill fort of Mahore being at times very distinctly visible. Ferns, maiden-hairs, air-plants, lichens, mosses and orchideous plants, indicate a milder and more humid atmosphere. Perhaps this inexplicable and most undefined adaptation of the laws of vegetation, is nowhere better exemplified than in the case of the clustering climbing rose, which in the plains is never seen to blow, running there luxuriously to stems and leaves, whilst on these heights, its tendrils bow down with the weight of its lovely mignon boutons. In such a climate, by a judicious adaptation of localities, several of the valuable productions of the East might be made to flourish. The only cereal grains cultivated are a small millet, called by the natives Koodaka (Paspalum scrobiculatum) and wheat, the former bearing very minute seeds, but affording a very agreeably tasted and nourishing diet, the latter looking very light, poor, and flinty. To see the beauty of these ravines and valleys they should be visited in the summer months, when stately forest trees, as well as lowly shrubs, are all bursting into flower, at once, mixing blossoms of every hue and tint in lovely contrast, with fresh green leaves, for nearly the whole forest sheds its foliage, and is then being renewed. In the cold months, the floral world reposes, little variety is then seen ; amongst its few gay flowers, are those of the downy Grislea, the sweetest of all being the Clematis gouriania, whose odour hangs on every hill, where it is seen entwining its leafy tendrils from bush to tree, in snowy wreaths. As the rains approach, the orchideous and polypodaceous tribes spring into life ; and after they have set in, the ravines become completely changed in character ; numberless creepers shoot forth, and scitamineous plants and lilies throw out a rank, and vigorous vegetation. Thus throughout the several changes of the seasons a completely new and altered character is given to vegetation, conferring the most pleasing variety to the aspect of these hills. Potatoes and peaches thrive well at Chikuldah, the former being planted at the beginning of the rains. For general gardening, however, there is a deficiency of water, but enough at all seasons for culinary purposes and for drinking, from some fine springs near the station, from November to the end of June, a total of eight months, the mean temperature was found to be 71°. The hottest months were April and May giving a mean of 83°. The coldest months were January and February, having a mean of 59°. Thus producing between the hottest and coldest months, a range of 24°. The coldest day observed, was the 9th February, at sun rise, being 47°. The hottest day noticed, was on the 27th April, at 2 P. M., being 96°. Between the extremes of heat and cold, there was therefore a range of 49°. The greatest monthly range was 14° in November. The greatest diurnal range was 22° in April and May, the least diurnal range was 4° in February and 5° in June. The wet bulb thermometer during the hot months, had an average depression of 10°. The thermometer averaged a general range of about 10° below the temperature of Ellichpore. The rains cease about the middle of September, heavy dews then occur until the cold weather begins, and also from February to the rains. At this period the moist atmosphere is bright and transparent, but becomes hazy as it gets less dense towards the hot weather.

Gawilghur fort, to which officers formerly used to resort as they do now to Chikuldâh, is situated in a direct route fourteen miles from Ellichpoor, and is ascended by two ghats, the shorter ghat commences on the south side at an old garden at the foot of the hill called Imloo Bagh, the ascent is steep and travellers can only ascend up the face of it, on foot. The longer ghaut more circuitous and from three to four miles in length passes round by the west and enters through the lower fort. By this road, elephants and guns can pass. The fort is said to be 2,300 feet above the plain, and 3,600 above the level of the sea, Chikuldah possesses advantages from its locality over Gawilghur; being better supplied with water, picturesque, and beautifully wooded. Gawilghur fort is quite in a dilapidated state, and the only interesting object now remaining is the old mosque completely in ruins, many of its twenty-one domes having fallen in, and the surrounding walls given way, a table over the gateway records that this building alone cost within a few pice, that of the whole fort. Although the temperature of the hills is exceedingly mild, yet the thermometer indicates higher than one would infer from personal feelings. The morning air throughout the whole season is delightfully elastic and invigorating, and walking exercise was the favourite amusement at that time of the day, with ladies, who seemed to suffer no inconvenience from remaining in the open air till 8 o'clock; a light gentle breeze continues to blow during the day; and the nights are really so cool, that generally speaking, a sheet is by no means an unpleasant covering in the month of May. April is considered the most unpleasant month, the atmosphere becoming occasionally close and sultry about noon, but towards the afternoon large clouds regularly form, which fall in gentle showers, restoring the temperature to its usual mildness. On the commencement of the rains, about the 8th or 10th of June, thick fogs set in which render the place gloomy and disagreeable, but after a heavy fall of rain they completely disappear, and the climate is then said to be very delightful. Hitherto, however, from the want of accommodation for the public followers, all have been obliged to quit the station at the beginning of this season. The average fall of rain during the monsoons is said to be about 36 inches. From September, the temperature is so equitable, cool, and bracing, that without any exaggeration, it may be styled a European spring. On the 26th January 1840 the thermometer suspended in the open air under a tree, stood at noon, at 62°. As a convalescent station and therapeutical agent in the treatment of disease, it has already been found of advantage. The people of Nagpore may take advantage of this station, which presents a change of air at a moderate distance, the supply of water for culinary purposes is very scanty for drinking; several natural springs occur in the ravines close to the bungalows. Nowhere is there the slightest appearance of a swamp or marsh, nor is there any epidemic disease peculiar to the hills, and their salubrity is established by the fact, that with the exception of two severe visitations of cholera, accompanied or rather proceeded by famine in the years 1834 and 1838, out of a population of upwards of 3,000 inhabitants, there had been only 40 deaths in a period of 40 years; they are extremely addicted to drunkenness. Gonds seldom assemble in villages of any size, but are dispersed in huts, three or four together, generally on the slope and along the northern exposure of the hills; they are singularly migratory, the inhabitants this year of a village in the western extremity may next year be found at the farthest opposite point of the range. Chikuldah is said to be quite equal to the Mahabaleshwar hills, and a person on horseback is able to ride wherever he pleases over the plains, which he cannot do on the Mahabaleshwar on account of the bushes. Supplies are procurable from all the villages en route, from the side of the Wurdah. Colonel Stevenson in 1803 brought his guns up via Dhamungaon and Amjurah, when the army under the command of General Wellesley took Gawilghur.

Kussowlee, in lat. 30° 56′ N. L. 77 East, 45 miles distant from Umballah, and 32 from Simla, is about 6,400 feet, above the sea: there is no table land, and the peaks are rather steep, and pretty densely clothed with fir trees: there is a plentiful supply of excellent spring water, 700 feet below the barracks; the meat and vegetables are plentiful. The climate may be pronounced to be temperate and agreeable, unless during the rainy season, when dense fogs make it gloomy and depressing. The barracks during the early years of occupation were very inferior, having flat mud roofs, and rooms only 10 feet high, with clay flooring; lately, however, the rooms have been raised to 15½ feet, the floors have been boarded and the roofs made to slope so that they do not leak.

Subathoo lies nine miles from Kussowlie on the road to Simla, at an elevation of only 4,000 feet; the hills are bare of wood, the climate differs from that of Kussowlie in being hotter in summer, and warmer in winter; it is altogether more dry and sheltered, and has an advantage in being seldom visited by fogs.

Dugshai, is distant 18 miles from Kalka, and is 8 miles east of Kussowlie, and 10 miles south of Subathoo; its height ranges from 5,000 to 6,000 feet; the hills have a bleak and barren look, being completely bare of trees, and covered only by a long coarse grass.

There is free exposure to the prevailing winds; water is abundant and good at the distance of a mile from the barracks which are new, substantial and excellent, both in point of accommodation and ventilation. The rations are good and occasionally varied, and six acres of ground are laid out as a soldier's garden. The climate is said to be 'unexceptionable, although the heat of the summer is sometimes oppressive, and the cold of winter rather piercing. In 1851, August was the most rainy month, and in January there were two feet of snow on the ground.

Simla is 77 miles from Umballah, in lat. 30·6 north, long. 77·11 east, the houses are scattered over an extent of about 7 miles, on a series of heights varying from 6,500 to 8,000 feet, which is the highest elevation; it is in most places densely wooded with fir and rhododendron, and there is much rank jungle which keeps the surface soil constantly damp; both here and at Kussowlee the heat of summer is somewhat tempered by the exhalations from, and the shelter of, so much rich foliage. The climate of the two stations is also very similar, and it has been compared with that of the Cape of Good Hope. The rains commence early in July, heavy dense clouds and fogs then load the air, and with this increase of humidity, disease becomes very prevalent. Water is scarce during the hot months, many persons take the precaution to boil and filter it; supplies are abundant enough, but in general high-priced. The fall of rain at the several stations, has been variously estimated at 60, 80 and 100 inches: at Kussowlee and Simla 70 inches may be estimated as a fair annual average. The deep ravines and water courses, which intersect all the hills, are dry during the greater part of the year; the heated air ascends from these confined gorges, bringing, in the rainy season, dense clouds of mist, which are doubtless excellent media for the transmission of the miasmal exhalations that are generated in such places by moist warmth acting upon an abundant vegetation. The following table exhibits the mean temperature of each month:

STATIONS.	Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sep.	Oct.	Nov.	Dec.	Ht.	Rainfall.
Kussowlie	42·	47·4	58·5	64·4	77·2	73·9	70·5	70·6	72·1	66·2	...	...	64·00	About 70 inches.

The prevalence of diarrhœa and dysentery at these stations and the loss sustained had been so considerable as to lead to a very general belief that as sanatoria they had proved failures. In 1843-44, H. M.'s 9th Foot had 350 admissions from bowel complaint, and 57 deaths; while in 1844-45, its second year of residence, there were only 231 admissions and 17 deaths. The 1st Bengal Fusiliers stationed at Subathoo in 1845, also suffered much, but both regiments came to the hills in a very sickly state, the one having been decimated by fever and dysentery in Affghanistan, the other by a similar epidemic at Kurnaul during two years. The same may be said of H. M.'s 29th Foot, and the 2nd Bengal Fusiliers, the former having been in a sickly condition with a taint of scurvy for years before, and the latter having been very sickly in Sind. In 1847–48, the 29th had 33 deaths out of 382 cases of diseases of the stomach and bowels, and out of 25 deaths in the 2nd Fusiliers, 13 were from this class of diseases.

Since then regiments in a less unhealthy state were sent to the hills, and there has been very great improvement in the barrack accommodation as well as in the conservancy department. In 1850–51, H. M.'s 60th Rifles were stationed, the right wing at Kussowlie, the left at Subathoo, the average strength of the regiment was 1,002, and the deaths within the year only 14, of which, however, 13 were from bowel affections. At Kussowlie there were 220 cases, or 334 per cent. of average strength, with 9 deaths, and at Subathoo 74 admissions, or only 214 per cent., with 4 deaths, showing what had hitherto been rare in the history of these two stations, that the balance of salubrity was in favour of Subathoo. The admissions from diarrhœa were 221 with two deaths, but many more men were attacked, although not admitted into hospital. There were 82 admissions from chronic dysentery, of which 16 with 2 deaths occurred in the last quarter of the year, and chiefly in men who had suffered from repeated attacks of diarrhœa. In 1851–52, the same regiment, with an average strength of 910⅔, had of total admissions 892 ; deaths 36, of which 27 were from bowel complaints, out of 252 admissions divided as follows ; dysentery 35 cases and 9 deaths, diarrhœa 215 cases and 17 deaths against 221 cases with only 2 deaths in the previous year. On arrival at Jhullundur there were in hospital 57 cases of bowel complaints, and out of the 36 deaths, 9 occurred there, but all from disease contracted on the hills. It will be observed that the actual admissions were less, but the mortality which in the first year had been only 1·39 per cent. to strength, rose to 3·95 per cent., the disease from repeated relapses or from concealment of it, becoming much more intractable.

Dugshai.—In 1850-51, H. M.'s 22nd Regt. occupied Dugshai ; average strength 1,049, deaths 27, of which 7 were from dysentery, and 1 from diarrhœa : the total admissions from this class of diseases were under 200, and the diarrhœa was peculiarly mild. In 1851–52, the second year of residence, the average strength is stated to be 1,045, and the deaths at head-quarters 20, of which 3 were from dysentery out of 47 admissions, nearly all preceded by frequent attacks of diarrhœa, and 3 from diarrhœa out of 199 admissions. During this year the regiment had fewer casualties, and fewer admissions into hospital than in any year since its arrival in India. In 1851, during the cold season, it marched to Rawal Pindee, and for months after it had been there, it continued in a high state of health and efficiency, and without any excess of bowel complaints among the admissions in to hospital.

At Simla few persons escape one or more attacks of diarrhœa in the course of the season. The attacks are not confined to persons in broken-down health, who have suffered from periodic fever, or other tropical diseases ; residents in the prime of life and of sound constitution, have been very generally affected, and examples of its proving fatal are not rare. In one fatal case the diarrhœa was aggravated by the fatigue of a dawk journey, and proved fatal in Calcutta by terminating in malignant scorbutic dysentery ; in another case, there was only the wasting painless form of disease, and death took place on the passage to England.

Of the various causes assigned, the first and most popular was the bad quality of the water: this, however, has been disproved. The water from the springs on the north side of Kussowlie is very pure, while that on the south side is only impregnated with a trace of lime, but to a less degree than is found at many healthy stations in the plains. At Simla, in the hot season, the supply of water is scanty, and not of the best quality, but that is the time when diarrhœa is least common. During the rains, the running streams are as pure as could be desired after the first few showers have washed out the water courses ; besides, persons who were careful to use only boiled and filtered water did not escape the diarrhœa. Both at Simla and Kussowlie, the trees have gained the repute of producing the disease, by reason of their promoting damp exhalation, and preventing the free circulation of air. But Subathoo and Dugshai are bare of trees and yet experience no immunity from the prevailing endemic, shows. In places the trees require thinning, in order to admit light and air, and to keep down th[illegible] thick jungle which, at Simla especially, is, [illegible] believe, a source of noxious influence : [illegible] may be added that the results of experie[illegible] are in favor of selecting sites, like that [illegible] Dugshai, clear of trees and jungle which [illegible]mote humidity and afford materials for de[illegible]position. The best founded and most in[illegible]tial exciting causes are the cold moist a[illegible]phere, and the great and sudden vicis[illegible] of temperature by which perspiratio[illegible] checked, leading to internal congestion, languid and impeded circulation in the liver and functional derangement of that [illegible] But these ungenial influences of tem[illegible] and moisture must have something superadded to them, to account satisfactorily for the inherent and peculiar liability of these localities to produce diarrhœa; the climate of Mussoorie is equally humid, but without the same tendency to diarrhœa, and this may be also said of Nainee Tal, Murree and Darjeeling, the last being remarkably cold and cloudy, and the air long supersaturated with moisture. Other mountain ranges all possess a similar immunity, such as the Neilgherries and Mahableshwar. There must, therefore, to account for its prevalence from year to year, be some cause other than the ordinary or essential climate agencies, some limited morbific influence of a specific nature, and this appears to be partly malarious, partly scorbutic. We know that primary cases of intermittent fever are by no means uncommon at Simla and the neighbouring stations, and we meet with occasional cases of the worst form of typhoid remittent. In the season of 1850, at Simla, two cases occurred of malignant typhoid remittent fever; in one of these an officer on the general staff of the army, the disease proved fatal; in the order, and A. D. C. on the staff of the Commander-in-Chief, recovery took place after a protracted and dangerous illness; both these officers must have contracted the fever at Simla, or in its immediate neighbourhood, probably in crossing some low foul ravine. But notwithstanding these proofs of malaria, experience teaches us that in general it is not here powerful enough to excite periodic fever: it seems to ascend from the numerous deep ravines and water-courses which intersect these stations, but to be so diluted, or changed by the effect of elevation, cold and moisture, as to cause bowel complaints instead, and this is exactly what occurs in some mountain ranges in other parts of the world, where we observe bad remittent fevers at the level of the sea. Intermittents at the higher level, bowel complaints higher still, and at the highest ulcers which appear as the feeblest result of malarious [illegible]isoning in depressing the vital powers. [illegible]e cognate character of these diseases were [illegible] remarked in China, and is noticed by Mr. [illegible]son in his "Medical Notes." In ships [illegible]h lay at anchor at some distance from [illegible]hore, the miasma was received in a dilut[illegible]m, and the seamen suffered from an in[illegible]te species of ulcer obviously dependant [illegible]arious taint in the blood. An opinion [illegible]n gaining ground among medical offi[illegible]hat the epidemic ophthalmia, which had of late years been the source of so much inefficiency and loss in European regiments had it[illegible] in the presence of a scorbutic diath[illegible]g the men.

Mussoorie or Masuri, adjoins Landour on the west and consists of a series of ridges about 5 miles in extent, remaining almost east and west with frequent peaks and with spurs or shoulders issuing irregularly down to the valley of Deyrah Dhoon on the south, and to the river Uglar or Uggulwar on the north with deep wooded gorges between.

Hazareebagh.—In times gone by, European soldiers were either located in hot and unhealthy situations, contracting the diseases peculiar to such positions, or else they were in the restricted Hill stations, with but limited space for exercise and evolutions and also not without tendencies to create, or to aggravate, particular diseases. H. M.'s 37th regiment had, during its service on the low grounds bordering the Ganges, become so inefficient from sickness that its immediate embarkation for England was urged by the medical authorities as the only remedy; but the Commander-in-Chief determined to try the station of Hazareebagh; and the result was that, after being some time stationed there, the 37th returned rapidly to health, strength, and efficiency, and left for England, at the commencement of this year, entirely reinstated. To the 37th succeeded H. M.'s 77th at Hazareebagh, in quite as sickly a condition as the former regiment, and with the same rapid results as regards a thorough and complete recovery; and there can be no doubt that Hazareebagh, although considered to be in the plains of India, has many of the most valuable attributes of a hill sanatarium of the first class, whilst it presents few of the drawbacks of the mountain stations. Hazareebagh itself is about 2,000 feet above the sea level; whilst there is a small sanatorium within easy distance of the station, at an elevation of 4,000 feet.

Lohooghat.—A sanatarium was established at Lohooghat, in the Almorah hills, a position unsurpassed in India for salubrity of climate and picturesque scenery, and known to be highly congenial to the European constitution.

Roorkee, a most healthy station, has been turned to larger account than it has hitherto been for the location of European troops. The problem which has hitherto interfered with efficient military occupation of the country has been how to keep the European troops in healthy stations, and yet available at the shortest notice in case of alarm or disturbance. When the mutiny broke out in 1857 many of the European regiments were stationed in the Hills. Nothing can overrate the value of such a distribution of the military resources as will, whilst locating British soldiers in healthy stations, keep them ready on the slip to move and concentrate, or act in independent bodies, at the first whisper of necessity.

Mahendragiri mountain, in the Parla Kimidi district, is distant about 20 miles from the Sea coast, N. lat. 18-57, long. E. 84-24. From the eastern side of the mountain the approach is by a somewhat circuitous path which winds for several miles between the lower spurs of the range, then follow about six miles of very easy and gradual ascent until the path faces the steep side of the higher portion of the mountain, from this point to the summit a distance of perhaps 1½ or 2 miles the way is extremely toilsome. After surmounting this difficulty is a saddle of about 4 miles in length at an altitude ranging from 4,000 to 4,900 feet, varying in width and slope and, in parts, narrow but affording ample ground for numerous houses and gardens. The surface is covered with grass for a considerable space with here and there small woods, in which are to be found the wild raspberry and violet and the ferns and orchids common to the hill ranges of the Peninsula. In parts, however, the saddle is bare and rocky, springs of pure water are to be found in several places. In October the thermometer ranged from 58 to 73, and in November from 45 to 61. On the very highest point of the hill is a small stone pagoda formed of stones of such bulk that the mode of its construction is not easy to be conjectured. The height of the building, which is four-sided, may be about 22 feet ; the basement occupies an area of about 13 feet square and is formed of four blocks of stone of about 10 feet in length by 3 feet in breadth and of the same thickness, three layers each consisting of four blocks surmount the basement, and on top of them is laid a single block 8 feet square by 4 feet thick, finished by a circular stone carved like a coronet and of about 5 feet in diameter. The entrance barely admits a man, and in the interior is the stone symbol held sacred by the Lingayet ; close by this pagoda is a station of the Trigonometrical Survey, and from this point the coast may be traced from Ganjam on the north, to Calingapatam on the south. The view to the south-west ranges over the greater part of Parla Kimidi ; behind the range or rather on its western side runs a deep valley, on the opposite side of which rise the numerous and extensive hill ranges occupied by the independent Saurah tribes ; some of these hills are but little inferior in height to the Mahendragiri. To the north and north-east are distinctly traceable the Jarada, Jalantra, Bodarsingee, Soorungee and Chikati hill zemindaries and the talooks of Itchapore, Moherry and part of Poobaconda. The Mundasa zemindary extends from the east face of the range to the sea shore. Besides the small pagoda already described on the summit of the mountain, there are two others rather lower down of more elaborate carving and greater size, they differ in outline but both are of forms common in Orissa ; three or four other similar structures are to be found in the neighbouring woods in various stages of ruin. The remains of an inscription in the Tamul character, were seen. There are inscriptions in Oriya, Tamul and Telugu and some other character resembling the Mahratta. The natives ascribe them to the Paudava. The ascent from the long valley on the western side of the hill is comparatively easy. There are numerous and extensive valleys of fertile soil suitable for the growth of coffee and a plateau where the chinchona tree would probably thrive. The valley which divides the Mahendragiri range from the hill tracts of the independent Sourah to the west extends from the Jarada zemindary completely into the Parla Kimidi country, a line of communication along this part of the Sourah border might be very easily secured by clearing a wide road trace along the western side of the valley for the entire distance.

Other hill stations and sanitaria, under the Madras Government are :—

Gallikonda in the Vizagapatam District,
The Pulney Hills in Madura,
The Shervaroy in Salem,
Ramandroog in Bellary,
Neilgherries in Coimbatore,

and, in some degree, Chindwarra in the Nagpore territory.

118171

Gallikonda and Harris valley in Vizagapatam have not been found to answer. In 1859-60, a few temporary buildings for European soldiers and two officers were built at a cost of rupees 1,291. The expense of constructing a road of 14 miles to the range amounted to rupees 2,298, and was borne by the rajah of Vizianagrum, within whose zemindary the station is situated. A sanitarium on the higher range of the Gallikonda hills, called " Grant's range," was thought of.

Pulney Hills in Madura.—The settlement consisted of ten bungalows without any bazar or native village, and was occupied by the missionaries of the district during the hot weather. It is resorted to occasionally by the civil servants of the district as a relief, and by families from Trichinopoly. An annual expense of rupees 787 is incurred for the repair of an incomplete road of nine miles, which was commenced for the benefit and convenience of the hill villages. A few constables are kept on the hills, but they also are required for general purposes and not specially for the sanitarium.

Shervaroy Hills in Salem have never been used by Government as a sanitarium, and no regular expenditure has been incurred there for the benefit of any class of invalids. The settlement is about 840 square miles in extent, and contains 32 tiled and terraced buildings, and 1,388 thatched houses. According to the census of 1856-57, there was a population on the hills of 79 Europeans and East Indians and 5,027 natives. The annual revenue derived from coffee and other cultivation amounted to rupees 7,705, including the cost of collection, rupees 498. The outlay, including repairs, on two roads, 7 and 18 miles in length, constructed from Salem and Mullapooram within the last five years, has been rupees 31,864, and an annual allowance of rupees 1,370 has been sanctioned for their maintenance. The government also granted a sum of rupees 3,500 towards the cost of a dwelling-house for the clergyman, maintained on the hills by the Additional Clergy Society aided by local subscriptions. A body of 15 native constables at a cost of rupees 1,350 per annum are stationed at Yercaud. There are no special or local funds for the support of the Police, nor are there any government buildings of any kind on the Shervaroy hills. A Deputy Collector in addition to his general duties in the plains, visits the hills in question once a fortnight, in the double capacity of District Moonsiff and Deputy Magistrate for the disposal of Civil and Criminal cases. The full monthly cost of this officer and of his establishment is rupees 700-4-0.

Ramandroog is a military sanitarium, 34 miles from the town of Bellary. It is not above a mile square; is within the territory of the rajah of Soondoor, to whom belongs the revenue of the place, derived from the land, quit-rent and abkarry to the extent of rupees 757 per annum. Ramandroog is the convalescent depôt for the European Troops at Bellary and Hyderabad. It is also resorted to by officers and the few other European residents in the neighbourhood. The native population is poor and not numerous. Monthly average of invalids, 58 men, 4 women, 8 children. Persons unconnected with the invalids do not exceed 2 or 3. The military buildings at the depôt cost rupees 62,730, and the non-military government buildings about rupees 3,000. There are Barracks for 80 men, quarters for 2 Staff Serjeants and 8 married men, hospital for 16 patients, guard-room, Apothecary's quarters, reading room. The per-centage of deaths to recoveries is so small on the Droog out of the number of invalids sent there that the saving effected in this way must long since have repaid the small outlay which has been made on the station. During the hot season some 80 men are sent to it. In two years, only one death per annum occurred, and these cases were hopeless before they came up to the hills. The establishment maintained at Ramandroog in the Quarter Master General's Department are 2 tent lascars and 8 dooly bearers, costing annually rupees 777, but the same expense would have had to be incurred, if the invalids had been kept with their regiments on the plains. The monthly disbursements in the Pay Department are rupees 247-0-9, for an Assistant Surgeon, Assistant Apothecary, Serjeant Major with family allowances, Quarter Master Serjeant, Hospital Serjeant, Pay Serjeant, Head money, water for washing, temporary promotion according to the monthly strength of detachments, average for repair of roads, writer and stationery. The Commandant has been vested with the powers of a Joint Magistrate, and is allowed an establishment, costing rupees 44 a month. A European constable on rupees 420 a year, and a Police party of 15 men costing annually rupees 1,350 will be maintained at Ramandroog. The expense of the Post Office at this station is per mensem rupees 29. Ramandroog has been occupied since 1849. Forty miles of roads as approaches to it, have been constructed at a total cost of rupees 23,578. The expense of maintaining these approaches to rupees 780 per annum on the average for six years. Rupees 250 have been expended on the roads within the station, and an annual allowance of rupees 180 has been sanctioned for keeping them in repair. The annual collections at Ramandroog credited to the government are from the Regular Post Office, Postage Stamps, Cattle fines Magisterial fines, rupees 1,487-4-0.

Neilgherries in Coimbatore.—There are four stations on the Neilgherries, viz., Ootacamund, Wellington or Jackatalla, Coonoor and Kotagherry. Ootacamund is the Cusbah or principal station of the Neilgherry talook. It has no accommodation for troops or Invalids, but is largely resorted to, in common with Coonoor and Kotagherry, by officers, civilians, and the non-official classes. The Neilgherries which have been occupied since 1826, are in fact the only range on which European settlers are established in any numbers, and the revenue accruing to government, rupees 83,985, far more than meets all the Revenue and Magisterial charges connected with the stations. Wellington is almost exclusively a Military Station and Cantonment, and must of necessity be supported by the government. The total cost of military buildings at Wellington, being mainly barracks for an European regiment, is rupees 15,29,955, and that of the eleven miles of road within the station rupees 91,002. The annual expense of keeping these roads in repair is Rupees 1,896—and that for repairing the roads leading to Wellington is rupees 2,800. The expenditure in the Pay and Quarter Master General's Departments are for an Assistant Apothecary, Hospital Serjeant with family allowances, Pay Serjeant with family allowances, Head money, Cleaning Arms, Writers and Stationery, Tindal and 21 Tent Lascars, 2 Maistries and 44 Bearers, 8 Elephants, 48 Camels, 32 Draught Bullocks, 1 Barrack Serjeant. Wellington, or, as it was then called Jackatalla, was formed in 1852. The military residents during the year 1864 numbered 1,008 men, 78 women and 70 children. Wellington is made an invalid depôt only. It has a range of marriage quarters, affording good accommodation for 150 men. The number of Invalid Soldiers and their families accommodated there within the last two years averages monthly 54 men, 10 women and 22 children. The cost of the Military Joint Magistrate's Establishment including contingencies is rupees 804 per annum. The revenue derived from quit-rent on building sites and compounds, and Assessment on the Coffee plantations at the four stations on the Neilgherries amounted in 1860-61 to rupees 6,699—and that of the whole Neilgherry talook, from the above as well as all other sources, to Rupees 83,985, including rupees 12,700 of Income Tax.

Quit-rent on building sites and compounds;

Ootacamund....	3,105	7	0
Coonoor........	642	15	10
Kotagherry......	275	2	11
Wellington......	261	2	9
Quit-rent, commutation and sales of land under Freehold Rules..........	135	9	2
Coffee and other plantations held by Europeans, East Indians,&c.	2,278	13	4
Sale proceeds of land without upset price....	7	0	
Ryotwar Burgher cultivation.	8,919	7	4
Abkarry........	34,400	0	0
Moturfa........	1,775	13	10
Stamp..........	5,826	0	0
Extra..........	1,030	14	1
Forest..........	12,626	1	6
Income Tax.....	12,700	0	0

The revenue and magisterial charges for the same period amounted to rupees 27,347, inclusive of the pay and allowances of the Assistant Collector and of his establishment at Ootacamund. Forest charges are not included in the above, nor are those for the ecclesiastical and medical establishments, nor on account of the Ootacamund sub-court. The police force for Ootacamund and Wellington, consisting of two inspectors and three Europeans and seventy-five native constables cost annually rupees 11,266. The value of government buildings at the three civil stations exclusive of the European jail at Ootacamund, 30,771; Coonoor, 2,612; Kotagherry, 752, is rupees 34,135. About 183 miles of road have been made from time to time expressly for these stations and Wellington, but the exact amount of expenditure cannot now be ascertained. The Seeghoor and Coonoor ghauts leading up to the plateau, were originally made by the sappers and miners. In 1860-61, rupees 20,000 were expended in improving the Coonoor ghaut. The annual allowances for repairing the roads are :—

Ootacamund,	within the	station	600,	leading to it	6,800
Coonoor......	,,	,,	500,	,,	1,150
Kotagherry ..	,,	,,	0,	,,	600

The sum of rupees 1,500 per annum is allowed to the Collector for keeping in good order the bridle paths and cross roads on the Neilgherries.

Chindwarah.—At the sanitarium of Chindwarra in the Nagpore territory there is a barrack for 50 men, and a hospital for two patients. The monthly average of invalids is 55 men, and an establishment, which would be maintained even if the invalids were with their regiments in the plains, is kept up in the Quarter Master General's Department at a monthly cost of rupees 366-9-10, for 4 Tent Lascars, 12 Dooly Bearers and 32 Camels.—*Capt. Bond, MSS.*; *Dr. Mackenzie, Universal Rev., No.* 3, *p.* 352; *Col. Sykes' Report of the British Association for the Advancement of Science*; *Ind. Ann. Med. Sci., p.* 312.

SANATTA, or Santa, HIND., of Rawalpindi and Salt Range, Dodonæa burmanniana.

SANAYASI, a religious mendicant of the hindoos, chiefly a worshipper of Siva.

SANBAL-I-HINDI, also Sanbal-ul-taib, AR., PERS. Jatamansi.

SAN BUTI, HIND. Cassia obovata.

SANCARA ACHARYA, see Sankara Acharya.

SANCHI, a small village situated on a low ridge of a sandstone hill, on the left bank of the Betwa, twenty miles to the north-east of Bhopal, and about 5½ miles S. W. of Bhilsa. It contains the remains of numerous buddhist topes. About the beginning of the christian era, it was the capital of a kingdom called Sanaka-nika, and is celebrated for the presence of a buddhist tope. The largest topes of the budd'hists, such as those of Sanchi, Satdhara, and Bhojpur, were consecrated to the Supreme Invisible Adi-Buddha. Of the memorial topes, little is at present known. It seems nearly certain, however, that the great Manikyala tope was of this kind; an inscription was extracted from it, which begins with Gomaugasa, "of the abandoned body" and undoubtedly refers to

Sakya's abandonment of his body to a hungry lion. This tope, therefore, dates earlier than the period of Fa Hian's Indian pilgrimage in A. D. 100. The funeral topes were of course the most numerous, as they were built of all sizes and kinds of material, according to the rank of the deceased and the means of his fraternity. At Bhojpur, the topes occupy four distinct stages or platforms of the hill. The largest topes, six in number, occupy the uppermost stage, and were, it is believed, dedicated to Buddha; that is, either to the celestial Buddha, Adinath, or to the relics of the mortal Buddha, Sakya. This view is borne out by the fact that the largest tope contained no deposit, and that the second and third-sized topes yielded crystal boxes, one of which, shaped like a tope, contained only a minute portion of human bone smaller than a pea. The gateways of the Sanchi Tope belong to the first half of the first century of our era. The Amravati sculptures are 300 years later than those at Sanchi, but the frescoes in the Ajunta caves are 300 years later than Amravati and belong to the time immediately preceding the decline of buddhism in India. Of the inscriptions at Sanchi, one is in Pali, of date, B. C. 40? but the Samvat 18 may not be of the era of Vicramaditya. The character used in inscriptions is between Allahabad, No. 2, or Kanouj Nagari and Delhi Lat, or old Pali. The buddhist religion is mentioned as also king Chandagutto, in Pali; Chandragupta in Sanskrit. Very numerous inscriptions are upon the basement of a prodigious chaitya, or relic temple, of a hemispherical form, built without cement, whose circumference is 554 feet, and, fallen as it is, its height is still 112 feet. There are three gateways, each 40 feet high. Capt. Fell thought the date to be Samvat 18, or B. C. The splendid bas reliefs represent the dedication of a chaitya. The emperor Chandagutto buys land for the buddhist temple, and pays for it in dinars; and killing a brahmin is not so great a crime by five-fold as the taking away the land from the temple. It is to be observed of the figures making offerings to the chaitya that their appearance is exactly that of most modern hindoos: dressed in a dhotee round the loins and thighs, and naked from the waist upward, with a turband upon the head.

On the buddhist temple gateway at Sanchi, near Bhilsa, in Bhopal is an inscription in Sanscrit prose, of date, Samvat 403, or 1009 or 18? The same, Samvat 18, is mentioned in the inscription at Brahmeswara, but the character is of the tenth century. The character used in the inscription is evidently later than Allahabad, No 2. The buddhist religion is mentioned. The inscription is addressed to the sramana, or buddhist priests, and salutation is offered to the eternal gods and goddesses. The great emperor Chandragupta is mentioned, called by his subjects Deva Raja Indra. Possibly Chandragupta 2nd, of the Bhitari column inscription. But, if so, he must have deserted the religion of his family. The inscription records a money contribution, the coin being called "Dinar," and a grant of land by the great emperor Chandragupta, for embellishing the chaitya and the support of five buddhist priests for ever, and it records the remarkable fact of the purchase of the ground by the emperor for the purpose at the legal rate. It is uncertain whether the Samvat in the inscription is that of Vikramditya; it is much more likely to be a buddhist family era. It is said, "Whoso shall destroy the structure, his sin shall be as great, yea five times as great, as that of the murder of a Brahman." So that the Brahman was at a discount of five hundred per cent. compared with the buddhist chaitya! From the corruption indicated by the salutation to the eternal gods and goddesses and the alphabet used, the inscription is probably not older than the eighth century. A second inscription, on the buddhist temple at Sanchi, is in the Sanscrit, and the character used in the inscription, is the same as the other. The religion mentioned is buddhist: it mentions the holy monastry of Kakunada Sphola; and the four Buddha are thrice named; and images of four buddha are in niches. There are no kings or princes mentioned. This inscription records that a female devotee, Hariswamini, to prevent begging, caused an almshouse to be erected, and money was given for the lamps of the four Buddha; so that, at this period, as Fa-hian states, more than one Buddha was worshipped. The numerals of the date are not understood.

Inscriptions 3 to 25, on the buddhist temple at Sanchi, are in old Pali, of date before the fifth century. The character used in inscriptions, vary from Lat to Allahabad, No. 2, or Gaya. Gifts to the charity are recorded, but no kings or princes are mentioned. All the inscriptions are in the character of Allahabad, No. 2, or Gaya, therefore before the eighth century, and they are of different ages: they record small gifts by buddhists to the chaitya, particularly by different communities of buddhists from Ougein; and there is a regular progression in the form of the letters, from the simple outline to the more embellished type of the second alphabet of Allahabad. Three forms pervade all the monuments of Sanchi and Amravati; (1) the topes or Sumpa, mound-like buildings erected for the preservation of relics; (2) the Chaitya, which both in form and purpose, resemble early Christian Churches; (3) the Vihara, residences of priests and monks.

The topes of Kabul and Jellalabad were opened by Messrs. Honigberger and Masson in 1835, and those between the Indus and the Jhelum by Generals Ventura and Court in 1833 and 1834. The topes near Benares were opened by Major Cunningham in 1835, and those at Sanchi and other places around Bhilsa, were also opened by him and Lieut. Maisey in January and February of 1857. The topes of Tirhut and Bahar still remain to be examined. The Bhilsa topes have been described by Major Cunningham excepting the largest of the Sanchi group near Bhilsa. An accurate plan and section of this building, with a short account of the various subjects represented in the sculptured bas-reliefs of the gateways, was published by Captain J. D. Cunningham, in the Journal of the Asiatic Society of Bengal. In the topes dedicated to the celestial buddha, the invisible being who pervades all space, no deposit was made, but the Divine Spirit, who is "Light," was supposed to occupy the interior, and was typified on the outside by a pair of eyes, placed on each of the four sides either of the base, or of the crown of the edifice. Such is the great Chaitya or Tope near Kathmandu, in Nepal, dedicated to Swayambhunath the "Self-Existent," in which the eyes are placed on the upper portion of the building. A specimen of the regular Chaitya is represented in the third compartment (inner face) of the left-hand pillar of the eastern gate at Sanchi, in which the two eyes are placed one above the other. Such also are the numerous Chod-ten in Thibet, which are dedicated to the celestial buddha, in contradistinction to the Dung-ten, which are built in honour of the mortal Buddhas, and which ought to contain some portions of their relics either real or supposed. Chod-ten, means simply an "offering" to the Deity, Dung-ten, is emphatically a "bone," or relic receptacle. The same distinction is preserved in the Sanskrit term Chaitya and Dhatugarbha or Dhagoba. The former is properly a religious edifice, dedicated to Adi-Buddha, while the latter is only a "relic-shrine," or repository of ashes. The word Chaitya, however, means any sacred object—as a tree, an altar, a temple—as well as any monument raised on the site of a funeral pile, as a mound or a pillar. Chaitya may therefore, perhaps, be only a general term for both kinds of mound; while Dhatugarbha or Dhagoba is particularly restricted to the "relic" shrine. The word Tope is derived from Affghanistan, where it is used to designate all the solid mounds of masonry which were opened by Messrs. Honigberger and Masson. The same term also is applied to the massive tower of Manikyala in the Punjab, as well as to all the smaller towers in its neigbourhood. There can be no doubt therefore that the term Tope is the same as the Pali "Sthupo," and the Sanskrit "Stupa," a "mound" or "tumulus," both of which terms are of constant use in the buddhist books. Stupa, or Tope, is therefore a name common to each kind of tumulus; whether it be the solid temple dedicated to the Supreme Being, or the massive mound erected over the relics of Sakya, or of one of his more eminent followers. From several passages in the Pali buddhistical annals, it would appear that topes were in existence prior to Sakya's advent, and that they were objects of much reverence to the people. Sakya himself especially inculcated the maintenance of these ancient chaitya, and the continuance of the accustomed offerings and worship. In the sixth of his precepts, to the people of Vaisali, he enjoins them to maintain, respect, reverence, and make offerings to the Chaitya; and to keep up the ancient offerings without diminution. But this may have been only an adherence in his own doctrines to the existing belief of the people. Mahomed similarly recognised the prophetic missions of Moses and Elias, and the divinity of our Saviour Christ, and Sakya Muni acknowledged the holy muni Karkutsanda, or Karkuchanda, Kanaka, and Kasyapa, as his immediate predecessors. They were probably, heroes or saints, who had obtained the respect of their fellow-countrymen during life, and their reverence after death. Stupas had been erected over the relics in the neighbourhood of Kapila and of Benares. Sakya therefore accepted them in his own teaching on his own system as the Buddhas of a former age. It appears also that stupas had been erected over supreme monarchs prior to Sakya's advent, for Sakya particularly informs his disciple Ananda that, over the remains of a chakravarti raja, an imperial ruler, they build the Sthupo at a spot where four principal roads meet. It is clear, therefore, that the tope, or "tumulus," was a common form of tombs at that period. In fact, the tope, as its name implies, is nothing more than a regularly-built cairn or pile of stones, which was undoubtedly the oldest form of funeral momento. The topes were, therefore, of three distinct kinds; 1st, the Dedicatory, which were consecrated to the Supreme Buddha; 2nd, the strictly Funereal, which contained the ashes of the dead: and

3rd, the Memorial, which were built upon celebrated spots. As to the Dedicatory Topes, it is improbable that any deposit would be placed in them.—*Cunningham, in Bengal Asiatic Society translation, Vols.* iii, *p.* 488; vi, *pp.* 454–461; vii, *p.* 459; *Fraser's Magazine*; *Cunningham's Bhilsa Topes.* See Bhojpur, Buddha, Inscriptions, Sonari Topes.

SANCHI-BETA, Beng. Calamus rotang. Ratan.

SANCHYA, see Sankhya, Vedas, Vidya.

SANCHYA, Hind. White oxide of Arsenic.

SANCTUARY, a place of refuge, or safety. These have been established in most countries, to allow of alleged criminals and debtors escaping from immediate punishment, and admit of leisurely examination into the merits of their case. In one of these, in Rajputanah, whatever life, whether man or animal, passed their abode for the purpose of being killed, was saved (amra). Traitors to the state, robbers, felons escaped confinement, who may fly for sanctuary (sirna) to the dwellings (upasra) of the Yati, shall not there be seized by the servants of the court. See Băst.

SANCU, Sans. A gnomon for astronomical purposes. The pillars which are erected in front of every pagoda are real gnomons.

SAND, properly, is granular quartz, silica, or flint, the chief ingredient in the sands of the deserts, sea-shores, river banks and soil. Sand is produced by the disintegration of rocks, and its colour, which is generally imparted by oxide of iron, may be red, white, grey, or black. The pure colourless sands are much in request for the manufacture of glass, also for making mortars, for filters, in the operation of casting and founding, in sawing and smoothing building stones and marbles, and in many grinding and polishing operations. River and pit sand are usually sharper than sea sand, for this has been rounded by attrition. The washed scrapings of roads which have been repaired with flints furnish the sand used by stone masons. Grindstone dust, formed during the turning of the grindstone into form, cuts deeper than Flanders brick, which is another form in which sand is used. Showers of sand fell in China, on the 26th March 1850, and lasted several days,—about ten grains to the square foot collected in one day, or about eighteen tons per square mile. Such showers are frequent—three occurred in 1850; the natives believe that the dust comes from the desert of Gobi.—*Chinese Repository*, 1850; *Bl. As. Trans.*, 1851, *p.* 193; *Dr. Buist*; *Tomlinson*, See Dust-storms.

SANDA, a sort of lizard in Ajmir. It is distilled and the product applied by mohammedans to the penis: the reptile is also eaten as an aphrodisiac.—*Gen. Med. Top., p.* 151.

SANDACRES, Districts in Ceylon which differ from those called Patuna, in being studded with groups of timber trees of majestic dimensions.—*Tennant.*

SANDAL, Hind. Fraxinus xanthoxylloides.

SANDALE, Fr. Sandalwood.

SANDAL-HOLZ, Ger. Sandalwood, also Saunder's wood.

SANDAL-I-SURKH-RANG, Hind. A reddish brown colour.

SANDALO, It. Sandalwood ?

SANDALO ROSO, It. Sandalwood, also Saunder's wood ?

Many of the synonyms for this wood have been derived from the Sanscrit the letters *ch* of that tongue being converted into *s*, and *ts*. One kind is the produce of a small tree (Santalum album) growing in India and Ceylon, which gives its title to the natural order of plants called Santalaceæ or Sandalworts. The sandalwood of the Sandwich islands is from two other species of the same family, S. freycinetianum and S. paniculatum. By the Chinese it is ground into powder and used as a cosmetic. The tree grows freely among the mountains of Malabar, near the sea coast, whence Calcutta obtains her supply of sandalwood, and in Timor and the Fiji islands, from which China derives her chief supply. The tree is cut down when about 9 inches in diameter at the root; it is then cleared of its bark and cut into logs, which are buried for six weeks or two months in order that the white ants may clear off the outer wood; this they do most effectually, without touching the heart of the tree, which is the only valuable part. Sandalwood should be of a fine deep yellow-brown, and highly perfumed.

The average importation of this wood into Calcutta is 200 tons per annum. The Chinese imported an amount of sandalwood in 1838 worth about one hundred and fifty thousand dollars, but this is said to be doubled in some years. The supply to Europe is very small and chiefly derived from that which has been brought over by individuals without a view to commerce. It is much used in India and China for burning in temples, is extensively employed as a perfume in the funeral ceremonies of the hindoos, for cabinet-work, toys, fans and perfumes. Sandalwood is imported into Bombay from the Malabar Coast, and is re-exported to China, England and Calcutta. A description of white sandalwood, termed Lava or Lawa, is imported into Bombay from Zanzibar, and is applied to the same purposes as Malabar sandalwood. The deeper the colour, which is of a yellow-brown, and the nearer the root, the better is the perfume. Malabar produces the finest sandalwood, but it is also found in Ceylon and the South Sea islands. It is imported into England in trimmed logs from 3 to 8 and rarely 14 inches in diameter, the wood is in general softer than box-wood and easy to cut. The bark gives a most beautiful red or light claret-coloured dye, but it fades almost immediately when used as a simple infusion : in the hands of the experienced dyer, it might, it is supposed, be very useful. Two kinds of this wood are however known in commerce—the white and the yellow ; both are from the same tree, the former being the outer layers of the wood. The white sandalwood is coated with thick, compact bark, having a grey and brownish epidermis ; the wood is very hard, heavy, susceptible of a fine polish. It occurs in billets of middling size, is nearly inodorous, its taste being slightly bitter. The yellow, or citron sandalwood, is straight or twisted, lighter than water when taken from the trunk, heavier if from the roots, in yellow, fawn-coloured, or reddish billets, slightly shining, of middling hardness, taking a fine polish, and being very easily cleft. The odour of sandalwood is very strong, rose-like, and enduring, its taste slightly bitter. The wood of the Plumiera alba is occasionally substituted for the true sandal. The odour is due to the presence of an essential oil, heavier than water, readily congealed, and having a peculiar sweet smell. Sandalwood is extensively used by cabinet-makers for the fabrication of various articles of ornamental furniture. The oil is employed by the European perfumers, and in India is very extensively used for the adulteration of attar of roses. The wood in powder is given by the native physicians in ardent remitting fevers, and is supposed to be sedative and cooling ; with milk it is also prescribed in gonorrhœa. The powder is rubbed on the skin to allay the irritation of musquito bites, of prickly heat, and other cutaneous disorders. The Chinese consume it largely as a fancy wood and by them it is often elegantly carved. At the Madras Exhibition of 1855, a box exhibited by Mrs. Wilkieson, was a beautiful specimen of sandalwood carving. The figures and ornaments were taken from the sculptures in the celebrated temple of Hullabede in Mysore, they were boldly and deeply cut and well-finished. The work was executed under the direction of Captain Cunningham of the Mysore Commission and was carved by a native of Soorub, from careful drawings prepared expressly for the purpose. Some very creditable specimens of carved sandalwood were exhibited by the Bangalore Local Committee, of these the most deserving of notice were two large and two small boxes carefully finished and varied in the design ; but not so bold in relief as the box from Soorub. The Bangalore Local Committee also exhibited two rosewood carved boxes very similar in design to those made of sandalwood. The ornaments were all floriated, without figures, and clearly cut, but the general effect of the work was spoilt by the deep ground-work being dotted instead of being left flat. The Canara Local Committee contributed a well-carved sandalwood chess table, a model of a hindoo car, and some neatly finished boxes, one of which was inlaid with ivory and metal: Mrs. James Fraser exhibited two card cases and a work box carved at Ganjam, a district where the manufacture had been recently introduced. Well-carved sandalwood chowries were exhibited by Lady Montgomery and the Madras Local Committee. Mr. Meppen contributed sandalwood bracelets and crochet needle-holders made near Cuddoor in Mysore, and Mrs. Bourdillon, a box containing sandalwood knitting pins and silk-winders. The art of carving in sandalwood though creditable to the natives of India, as evincing care and laborious industry, owes its chief value to the quaintness of the designs and the elaborate nature of the work. As a branch of the fine arts it can hardly be ranked under the head of carving, as many of the specimens are little more than ornamental surface, showing much of the plain rectangle in the leading forms and little originality of invention. The chief markets for this manufacture, are Chicacole, Hyderabad, Vizagapatam and Travancore.

In any notice of sandalwood it is necessary to remember that three woods, designated white, yellow and red, are so called. The white and yellow is from the Santalum album. Pterocarpus santalinus, *Linn.*, or Santalum rubrum, *Konig.*, furnishes the red sandal or red saunder's wood of commerce, and S. freycinetianum and S. paniculatum, give the sandalwoods of the South Sea Islands. Santalum album is found in abundance in Mysore and Canara, is remarkable for its agreeable fragrance ; it is a preservative against insects : is much used in making work boxes, walking sticks, pen holders, and other small articles of fine ornament but cannot be procured of a large size. On different occasions, while Dr. Cleghorn was travelling down the Carur ghaut he met parties of Mapilla with fresh cut sandalwood on their backs. On enquiry, he ascertained that these men barter the wood to the Kurumbar for saltfish and cocoanuts. It sells in London at £5-15 to £6 the ton. Sells in China at £35 the ton. The natives of Yap, the Isle of Pines and Maree traffic with ships for the sandalwood. Timor is the only country in the Eastern Archipelago which produces it in any quantity, price £1 17*s.* 6*d.* per 133⅓ lbs. An inferior kind of sandalwood, the produce of Exocarpus latifolia was met with in several localities,—as the Percy Isles, Repulse Bay, Cape Upstart, Palm Islands, &c.—*Tomlinson* ; *Tredgold* ; *Ainslie*; *O'Sh., p.* 532 ; *Crawfurd, p.* 375 ; *M. E. J. R.* ; *Macgillivray's Voyage, Vol.* i, *pp.* 97–8 ; *Bombay Forest Reports of* 1857-58-59-60, *p.* 57 ; *Report of Madras Conservative of Forests, pp.* 7, 44 ; *Poole, St. of Comm.*

SANDALWOOD ISLAND, S. of Java, called also Sumba and Sandelhout, and by the natives Jecndana, is of middling height. Its west end is in lat. 9° 42′ S., and long. 119° 3′ E. and Tapi point, its eastern extremity is in lat. 10° 0′ S., and long. 120° 53 E. See Papuans.

SANDALWOOD OIL.

Sundal-ka-tel,	HIND.	Chandana yennai,	TAM.

Sandalwood oil is highly valued as a perfume by the natives of India ; and is employed in the adulteration of otto of roses. It is chiefly made on the Malabar Coast, whence it is brought to Bombay, and re-exported to England, China, and the Arabian and Persian Gulfs. The exports from Madras, amount annually to about 100 cwt.—*M. E. J. R.*

SANDAN, HIND. Dalbergia ougeinensis, also Ougeinia dalbergioides.

SANDARACH.

Sundroos,	ARAB.	Sandrao,	ENG.
Zoos,	,,	Sandarac.	,,
Yun-hiang,	CHIN.		

A resinous substance met with in round or elongated tears, of a whitish or pale-citron yellow, brilliant, transparent and limpid, brittle under the teeth, burns with a clear flame, and emits a pleasant odour ; taste resinous, and slightly balsamic. It is used as an ingredient in varnishes and incense ; when reduced to a powder, it forms the article termed pounce. Sandarach is obtained from Morocco. This resin is said by some writers to exude in hot climates from the bark of the common juniper-tree (Juniperus communis). Others state it to be produced by another tree of the pine tribe called Thuja articulata, but according to Brongniart and Schousboe, it is tears of the Callitris quadrivalvis, also a coniferous tree. Dr. Lindley had seen a plank two feet wide of this sandarach tree, which in Barbary, is called the 'arar' tree. The wood is considered by the Turks indestructible, and they use it for the ceilings and floors of their mosques. The Citrus wood of the Romans, was extravagantly prized for tables : and is supposed to have been the Callitris quadrivalvis, *Vent.*, or jointed Arbor vitæ, the conifer which yields the gum sandarach. The wood was distinguished as striped "tigrinæ ;" spotted "pantherinæ," or speckled, apiatæ : Cicero gave £9,000 for a citrus wood table.—***Faulkner*** ; *Tomlinson* ; *O'Sh., p.* 621 ; *Poole St. of Commerce, p.* 72 ; *Hogg, Vegetable Kingd., p.* 713; *Smith, Mat. Med., Chin., p.* 193.

SANDARI, HIND. Mississsya hypoleuca.

SANDAWA, also Mesiumentah, MALAY. Saltpetre.

SAND-BINDING PLANTS, Spinifex squarrosus, *Linn.*, known to Europeans by the designation of "Ground Rattan" and "Sea Pink." The Tamil name, Ravan mise, *i. e.*, whiskers of Ravanah, is a descriptive epithet. It comes near to the Sand Carex of England, in its habit of growth, creeping along horizontally, sometimes above, sometimes below the surface of the earth, emitting roots and shoots at short intervals of a few inches. It likewise possesses the advantage of being extremely tenacious of life ; the shoot at every node is capable of renewing the existence of the individual as fast as destroyed, and the whole plant offers a resistance to the effects of a storm which is rarely overcome. This species would be nearly as indestructible from natural causes as Couch grass, and would speedily colonize the sand tracts spontaneously, if it were only left unmolested for a year or two.

Ipomœa pes-capræ, *Sweet.* Mosul taylie, TAM. Goat's foot leaved Ipmœa, or "Rabbit weed." Perennial, creeping to a very great extent. Stems rooting at distant intervals. Leaves smooth, long petioled, two-lobed, like

those of Bauhinia, tipped with a neacro. Flowers large, reddish purple, very handsome. Common on the sandy beach north and south of Madras, where it is of great use in binding the loose sand, and in time rendering it sufficiently stable to bear grass. This fine creeper is equally abundant in both peninsulas, is also a native of Mauritius, Macao, &c., occupying the place of C. soldanella of the British coast, and a more striking and beautiful species of the tropical bindweeds is rarely seen. Rabbits, goats, and horses eat it, so do cows, but their milk is tainted. Great difficulty occurs in raising this plant in the vicinity of houses—as the inhabitants tread it down, and cattle nibble the tender shoots. It naturally takes a higher position on the sand-bank than the Spinifex, and suffers less injury during a storm, but they often grow together and conjointly effect much benefit. The Spinifex arrests the drifting sand, and the Ipomœa secures what the former collects. Mr. Caddell planted it most extensively along the canal banks near Tranquebar.

Canavalia obtusifolia, *DC.* Koyli avaree, TAM. Common on the sea-shore, frequently entwined with the last named binder, is a very useful plant, very abundant at the Adyar, Ennore, the mouth of the Godavery, and between Quilon and Anjengo.

Hydrophylax maritima, *Linn.* Seaside Hydrophylax. A straggling herbaceous plant, native of the shore of Coromandel, where it shows its pale lilac blossoms great part of the year. The branches run over the sand, sometimes under the surface, and strike root at the joints. It answers well when the sand is moist.

Microrhynchus sarmentosus, *Wight.* A widely diffused humble plant, common along the sea beach, with long flagelliform runners; but may not possess sufficient strength to effect the object in view. It is well figured in Wight's Illustrations, Vol. 11, t. 113. Plate No. 5.

Pupalia orbiculata, *Wight.*

Achyranthes orbiculata, *Heyne*, *Wallich.*
Cyathula orbiculata, *Moquin.*
Adai yotti, TAM.

Grows on sandy soils near the sea beach, abundant at St. Thomé, and near the mouth of the Adyar river. It is an extensively spreading procumbent plant, the branches being often several feet long; bristles attaching themselves to the clothes of passengers, cling to them with tenacity.

Pandanus odoratissimus, *Linn.*, the Kaldera bush, the Taylie marm, TAM., is a large spreading ramous shrub, often planted in belts, but takes up much room, forms dense thickets, and harbours venomous reptiles. The lands in which Chay root is cultivated are often protected from drift sand by means of this shrub. It is a very strong binder, but is objectionable from its raising sand-hills.

Ehretia arenaria, Sand-Ehretia, ***Griffith,*** is found between 12° and 28° N. L., binds together loose sand, in a minor degree. It may be the same as Ehretia cuneata? ***Wight*** *Icon., Vol.* iv, t. 1385, which grows on sand banks in the beds of all the rivers of the Western Peninsula of India.

The above are the sand-binding plants most frequently noticed along the Coromandel beach. There are others as Pedalium murex, Ipomœa pes-tigridis and Sesamum prostratum, &c., which co-operate in the work of conservation to a minor extent, but are less widely diffused along the coast; also Fagrœa Coromandellia. Trees such as the Cashew (Anacardium occidentale) the Alexandrian Laurel (Calophyllum inophyllum) and the wild date (Phœnix sylvestris) grow well, and render a double service by preventing a further encroachment of sand, and rendering the land useful. In Ceylon, the glass worts, Salicornia indica, and salt worts, Salsola indica, are the first to appear among the newly raised banks. The goat's foot Ipomœa, Ipomœa pescapræ abounds on the shores, also species of beans, Canavalia obtusifolia and Dolichos luteus and the Hydrophylax maritima, the Mudugaeta kola of the Singhalese, literally jointed sea shore plant, with pink flowers and thick succulent leaves. Also the Spinifex squarrosus, a water pink, whose seeds are in a large circular head, and called Maha-Rawana rœwula "the great beard of Rawana." A little above high water-mark is, likewise, the Aristolochia bracteata, the Hedyotis umbellata, sayan, also Choya, SINGH. Gloriosa superba, Vistnu karandi, TAM., or Lippia nodiflora.—*Dr. Cleghorn*; *Sir J. E. Tennent.*

SAND BOX TREE OIL, see Oil.

SAND EHRETIA, Ehretia arenaria, see Sand-binding plants.

SANDEL-HOUT, DAN. Sandal wood, also Saunder's wood?

SANDERBAN, the islets at the delta of the Ganges, said to be derived from Sandari vana, a forest of Sundari trees. See Sunderbuns.

SANDER'S WOOD.

Chandan,	VERN.	Rakta-chandan,	VERN.
Red Sander's wood,	ENG.		

Red Sander's wood, from the Pterocarpus santalinus, hard and of a bright garnet-red colour, is employed to dye a lasting reddish brown on wool. It only yields its colour to ether or alcohol. The tree is lofty, common in India, Ceylon, and the islands of the

Eastern Archipelago. The exports of this wood from Madras in one year amounted to nearly 2,000 tons. The imports of red Sander's wood from Calcutta and Bombay chiefly into London, are to the extent of 600 or 700 tons a year, worth £4 to £6 per ton.—*Poole, St. of Commerce, p.* 263.

SAND-GEMS, or Ava gem sand comes from the neighbourhood of Ava, and is sometimes one of the Shan articles of merchandize. It consists of small fragments of nearly all the precious stones found in the country, but garnet, beryl and spinell are its principal constituents, more especially the last, which seems to constitute nearly three-fourths of the whole mass. A single handful will contain specimens of every shade, black, blue, violet, scarlet, rose, orange, amber-yellow, wine-yellow and white.—*Mason.*

SAND-GROUSE. The Tibetan sand-grouse, Syrrhaptes tibetanus, repairs in large flocks to drink at the fresh-water springs. The plumage of both sexes is much alike but the long tail of the male is distinctive. —*Adams.* See Birds, Tetraonidæ.

SANDHA PALA, see Inscriptions.

SANDHEADS, a maritime term applied to the islets of the delta of the Ganges, nearest the Bay of Bengal. See Sanderban, Sunderbuns.

SANDHI, a conjunction of words in Sanscrit, and in the words of the Telugu language derived from sanscrit, and is a systematic element in Grammar.

SANDHI, or Sandhya, SANS. The twilight or crepuscule. The Sandhy of Brahma consists of 1,728,000 Solar Sidereal years; the same duration as the Crita, or Satya-yug, which quantity is used in its double capacity for constructing the Calpa. Pratas sandhya, the morning twilight. · Sayam sandhya, the evening twilight. The twilight of each yug is equal to 1-6th part of the same.

SANDORICUM, a genus of plants of the Order Meliaceæ, one unnamed species called Santoor by the Malay, grows in Tenasserim and the Malay Archipelago. It is used for furniture.—*Dr. Wallich.*

SANDORICUM INDICUM, *Cav.*

Trichilia nervosa, *Vahl.*

Theit-to,	BURM.	False mangosteen,	ENG.
Indian sandalwood,	ENG.	Wild ,,	,,

This elegant timber tree grows to a large size in the south of India, Mysore, Penang, the Moluccas and Philippines. It is scarce in the forests of British Burmah, but is large and plentiful near all villages both in the Rangoon and Tounghoo districts, where it is cultivated by the Burmese for its fruit, which is of the size of an orange, and has a fleshy acid pulp. The wood is white-coloured and adapted to every purpose of house-building. The pulp of its fruit is eaten raw by the natives of Tenasserim who esteem it excellent. It is watery and cooling and makes a good jelly, but this has a peculiar odour. Its root is bitter and used in medicine in bowel complaints.—*Drs. Mason; McClelland; Voigt.; Roxb., Vol.* ii, *p.* 392.

SANDSTONE, a rock which occurs in most countries, an aggregation of sand by a sort of semifusion as in quartz rock, and in common gritstone, adjoining trap dykes or great faults. In many of the white sandstones the grains merely cohere together. In the sandstone of coal tracks the finer particles of carbonate of lime, clay, oxide of iron, &c., are interposed between the grains: in other cases, as in the Hastings' sandstones, an infiltration of carbonate of lime has taken place. Some sandstones are in the laminæ, plane, waved, or slightly concentric: these admit of being readily split. The freestones are not distinctly laminated, the grains being so arranged as to present equal resistance in every direction. They work freely under the stone saw and the ordinary picks and chisels. They can also be turned into balustrades, pedestals and vases. In the East Indies, sandstones occur of different qualities, from the coarsest soft grit, to the hardest freestone, the most compact snakestone, and the toughest chert. Indeed, sandstones appear to be the most universally diffused rocks in Southern India; occurring in sixteen different districts, and often in beds or strata of enormous extent, as in the South Arcot, Nellore, Cuddapah, Bellary, Mysore and Nagpore districts. The whole of the valley of the Kistnah and great parts of the vallies of its affluents, the Gutpurbah, Malpurba, Bheemah, Tunga, Bhoodra and Tumbadra, and much of the valley of the Godavery and of the valleys of its northern affluents, have limestone, clay slate and sand-stone rocks, and the houses and more extensive buildings are all built of these. The limestone of Kurnool, west to the Beemah, is an excellent building material. The whole of Kymore range in Shahabad is described as of limestone, which also shows itself in the valley of the river Sone as far at least as Mungeysur peak in Mirzapur, and it crops up at Rhotas forming a sloping base to the precipitous sandstone rock. Below the limestone is one of a plush grey colour mixed with occasional crystals of Calc spar. This, like the Kurnool stones, is admirably suited for lithography. Below the latter, in Kymore is a limestome of a hard tenacious almost indestructible composition admirably suited for building. Soft sandstones resembling bathstone, and Tripoli abound near Nellore, Bellary, Cuddapah and Hurryhur. Sandstones suited for grinding purposes are obtained in Cuddapah at Chellamacoor, a greyish brown schistose granular standstone, near Cuddapah, there is bluish grey compact magnesian limestone, suited for fine sharpening stones, from Woontimitta fine grained schistose, sandstone, suited for a ragstone. In Guntoor, at Palnaud, are purple and lilac slaty sandstones fine in grain, honestones, black limestones, and lithographic marbles. From Gootemookoola and Dyda, hones from Koopokoonda, 8 miles west of Vinacondah, below the signal pond ; rough sandstone glistening with mica. From Matoor Hill, schistose ragstone.

The sandstones of the Kymore range in the Vyndhya have a high commercial value at Chunar and Mirzapore, being used as flagstones, and for ornamental purposes. The stones at those places owe their advantage to the proximity of the Ganges, which affords an easy river carriage ; otherwise they are the worst and most destructible description of stone in the range. The millstones of Chynepore, Sasseram, and Tilowlhoo, perhaps also Ackbarpore, are famous, but must always be dear in a distant market for want of river carriage. The Sone causeway and the Koylwan railway bridge are built of the dense sandstone of Sasseram, while even little quantities are found in the higher portions of the range towards Rohtas. The best stone, while easily workable, is almost as hard as granite, and may be had of any colour, viz., white, crystalline, blue, grey, and all shades to a dark red. Flexible sandstone is found in Ulwar, at Dadri in Jhend, and at Jubbulpore. It is called "Sang-i larzan," *i, e.*, shaking stone, and is obtained from the Kalyana hill in the pergunnah Dadri, it is used for roofing and for ornamental pillars. Sandstones also occur at Sahi Balabgarh, in the hills to the southwest of Delhi.—*Powell, Hand-book Econ. Prod., Punjab, pp.* 35–56 ; *Mad. Ex. Jur. Report*; *Reports and Catalogues of the Govt. Central Museum, Madras* ; *Tomlinson.*

SANDUDA, see Singhalese.

SANDULAY KA PHAL, DUK. Fruit of Elate sylvestris, *Linn.*

SANDUN, SINGH. Sandalwood.

SANDWICH ISLANDS, population about 75,000 or 80,000, from having been wild and uncivilized, are now all nominally christians. The male population are a good height, athletic, and well-proportioned ; but neither men nor women are prepossessing in appearance although they have the reputation of being good-tempered and not easily aroused into anger. The ruins of an old temple are still to be seen about six miles from Honolulu, near Diamond Hill. It is said to have been built by Ka-me-ha-meha the first, after the conquest of the island. It is called Heiau. Here, in the days of heathenism, were offered human sacrifices. The victim was chosen either by the priest or king. The messenger of death entered his abode while he slept, and he met his end by strangling. He was then dragged off as an offering to the sanguinary god. In Vate, the people, although differing a good deal among themselves, have, except the black colour of their skins, few points of resemblance to the Sanese. They are of larger stature and more regular features, some having straight or almost aquiline noses, good foreheads, and beards of moderate size, their manners more composed, their dress much more decent, consisting of a broad belt of matting, seven or eight inches wide, very neatly worked in a diamond pattern of red, white and black colours, with a species of maro suspended in front. Many of them had their skins tattooed, or rather covered with raised figures, the arms and chest being the parts generally operated upon ; the cartilage of the nose was frequently pierced, and filled with a circular piece of stone, and the lobes of the ears always so, large ornaments of white shells, or of tortoiseshell, being hung from them, so as often to extend the orifice to a great size. Round their arms, and, in some cases, round their ankles, they wore handsome bracelets, made of small rings ground out of shells. In the island of Vate the passion for collecting every kind of bone is so great, that a traffic in them is carried on, not only among the tribes, but with the neighbouring islands. It did not appear that jealousy of their women was the cause of their fear of the intrusion of foreigners, as many as well as a fair proportion of children were seen. The women were generally tall and thin, their hair cropped close to the head, and the skin occasionally marked with figures, as on the men's bodies. Their dress did not differ much from that of the males, consisting of a somewhat broader waist-belt, and a square mat in front, resembling an enlarged maro. To this must be added however the singular appendage of a tail, made of grass or matting, the ends being a loose fringe of a foot and a half long, and the whole suspended from the waist-belt, and reaching nearly to the calf of the leg. On all sides are evidences of plenty of articles of food. Numerous pigs run about, and all the trees near the houses are covered with yams attached to the boughs.—*William's*

The Cruise of the Pearl, pp. 34-41 ; *Capt. Elphinstone Erskine, Islands of the Western Pacific, pp.* 324-332.

SAN-FA-SHI, the name applied by the Chinese pilgrim Hwen Thsang to the Vrij'h country which he also calls Fo-lo-shi. San-fa-shi or Samvaji, is the Pali form of Samvriji, or the "United Vriji," from which General Cunningham infers that the Vriji were a large tribe which was divided into several branches, namely, the Lichhavi of Vaisali, the Vaidehi of Mithila, the Tirabhukti of Tirhut, &c. Either of these divisions separately might therefore be called Vriji, or any two together might be called Vriji, as well as Samvriji, or the "United Vrijis," as is the case with the warlike tribe of the Bagri or Sambagri of the Sutlej, which consisted of three separate divisions. He is of opinion that Vaisali was a single district in the territories of the United Vriji, or Wajji. Kesariya is an old ruined town, 30 miles to the north-north-west of Vaisali. The place possesses a mound of ruins with a lofty stupa on the top, which the people attribute to Raja Vena Chakravarti. In the Puranas also, Raja Vena is called a Chakravarti, or supreme monarch; General Cunningham found his name as widely spread through northern India as that of Rama, or the five Pandu.—*Cunningham's Ancient Geog. of India, p.* 446.

SANG, PERS. A stone, but used as a prefix to designate several substances, mineral earths, stones, minerals, gems, fossils, compounds used in the arts, or in medicine. Of these may be enumerated:—

Sang-i-abri, HIND., a mottled brown and yellow stone.

Sang-i-akik, cornelian.

Sang-i-asshar, a form of silica.

Sang-i-assyum, millstone grit.

Sang-i-basri, "bassorah stone," a slag or dross of copper in tubular pieces ; said to come from Basorah (Basrah), where it is collected at the mouths of the chimneys of copper furnaces.

Sang-i-birinj, the Dizful, is an important stream in Khuzistan. The bed of an occasional torrent in ancient Susiana, called Ab-i-bald, falls into the Dizful, is covered with a peculiar kind of pebble, which, being filled with little fossil shells resembling grains of rice, is called Sang-i-birinj, or the rice stone. These stones are also found in the river at Shuster, but of an inferior quality, and they are in much request throughout Persia for the head of the Nargil pipe, which is almost invariably composed of this material set in silver.

Sang-i-chamak, massive magnetic iron ore.

Sanj-i-dullam, PERS., HIND. Fuller's earth? In the peninsula of India, it is fire clay, procuraable at Streepermatoor, Tripasoor, Chingleput, Metapolliam and Cuddapah, and in many parts of India, and bricks can be made that resist the action of great heat. A clay is found at Beypore 20 to 30 feet below the surface, and is used for fire-bricks and for lining furnaces.

Sang-i-irmali, a fossil.

Sang-i-jarahat, Sulphate of lime, steatite and other minerals.

Sang-i-jahanam, Lunar caustic ?

Sang-i-kara, Hornblende rock.

Sang-i-kharus, Fossil encrinite.

Sang-i-larzan, Flexible sandstone.

Sang-i-mehtab, also tambra, garnet.

Sang-i-marmar, Marble.

Sang-i-musa, Hard clay slate, syenite, granite.

Sang-i-palan, French chalk, or steatite, used for making crucibles, qu. ? sang-i-dalan.

Sang-i-marjan, Coral.

Sang-i-pathani, Bloodstone.

Sang-i-rasak, Copper-dross, a mixture of metallic copper with organic matter ; obtained during the process of melting copper and brass.

Sang-i-sabz, Green earth.

Sang-i-safed, White quartz.

Sang-i-sar-i-mahi, Small fossil shells.

Sang-i-shadnaj, Fossil nummulite.

Sang-i-sitara, Avanturine.

Sang-i-sulaiman, Onyx.

Sang-i-tabak, a variegated stone.

Sang-i-yamani, Bloodstone.

Sang-i-yashm, Jade.

—*Chesney, Euphrates and Tigris, Powell's Hand-book.*

SANG, a reciprocal contract or promise. In the wedding ceremonies a few days after the conclusion of the Sang, a prepared entertainment is made sufficiently large to include the whole kheil, provided the young man's condition in life will admit of his going to that expense. It happens not unfrequently, that the Sang is entered into before the girl is marriageable. So soon as the girl arrives at proper age to take upon herself the duties of a wife, the Uroos or marriage ceremony is performed by a Moollah.—*Pottinger's Travels, Beloochistan and Sind, p.* 68.

SANG, a spear or javelin, formed wholly of iron, carried by faqeers ; also a war-lance, ten feet long, covered with plates of iron, about four feet above the spike. A sirohi is a sword made at the town of that name, famous for its temper.—*Tod's Rajasthan, Vol.* ii, *p.* 118.

SANGA, HIND. A wooden bridge in the Himalaya.

SANGA, see Inscriptions, Karli, Kiu-siu.

SANGAL, HIND., of Kashmir. Taxus baccata, Common yew.

SANGALA, a hill fortress in the central Panjab, captured by Alexander. It is the city to which Alexander marched after passing the Hydraotes (now the Ravi), and is supposed by Rennell to have been on the East side of the Beas. The Arashtra, or the kingless, were the republican defenders of Sangala or Sakala. They are the Adraistæ of Arrian, who places them on the Ravi. They were known by the several names of Bahika, Jartikka and Takka, from which last is the name of their old capital of Taxila or Takka-sila as known to the Greeks. The people still exist in considerable numbers in the Panjab Hills, and their alphabetical writing characters under the name of Takri or Takni are now used by all the hindoos of Kashmir and the northern mountains from Simla and Sabathu to Kabul and Bamian.—*Elliot.* See Chandragupta, Haripa, Khetri.

SANGAM, SANS. The fork of two rivers, also, a union, wedding or marriage. See Sutti.

SANGAN KUPI, TAM. Clerodendron inerme, *Gærtn.*, *Roxb.*, *Rheede.*

SANGANA, see Inscriptions.

SANGAR, HIND. Prosopis spicigera.

SANGARA, the occupants of the island of Beyt, in the time of Alexander. They were even then daring, reckless, pirates.

SANGAT, see Sikh.

SANGBOYS, in lat. 6° 48½' N., are two high islands of the Philippines.

SANG BARDAR, HIND. Spearsmen.

SANGCHA, HIND. Nummulites, obtained on the Mazari hills, at Dera Ghazi Khan and at Imam Baksh Khan. They are priced at 32 seers per rupee. See Sang.

SANG-DRAGON, FR. Dragon's blood.

SANGGYE, HIND. Senecio laciniosus.

SANGIR, or Sanguey, an island on the N. E. of Celebes, extending from lat. 3° 21' N. to lat. 3° 16' N. It is said to possess a harbour on its east side. Sangir and the numerous islands of its group in the Celebes occupy a superficies of 13 square leagues, the Tolaut and the Meangis islands united are 18 square leagues ; these archipelagoes, formerly subject to the authority of the sultans of Ternate, now make part of the Dutch residency of Menado. Several extinct volcanoes, and some still in full action, are found in the Sangir group ; the devastations which they commit from time to time, have often been fatal to the inhabitants. The eruption of Duwana, in 1808, completely annihilated the village of Tegalando, destroyed all the surrounding forests, and suddenly deprived the inhabitants of all means of livelihood, by the destruction of their fields. The Gunong-api or fire mountain, causes numerous ravages in the island of Siau ; its peak, 6,000 feet above the level of the sea, forms the culminating point of this group. Gunong-api covers with its base all the northern part of Sangir-besar, this volcano has not been active since 1812 when the torrents of lava which it poured out destroyed the extensive forests of cocoanut trees with which this part of the island was covered, and caused the death of many of the inhabitants. These islands furnish more than twenty-five kinds of wood suited for building and furniture. Two harbours, sheltered from all winds, exist in the larger Sangir, one in the Bay of Taruna, the other, called Midelu, on the eastern side.—*Jour. Ind. Arch. for Dec.*, *p.* 764.

SANGI, HIND. A pitch fork.

SANG-I-SULIMANI, HIND. Onyx.

SANG-KING, LEPCH. Mustela sub-hemachalana, *Hod.*, *Blyth.*

SANG KOI, see India.

SANG-KUPI, DUK. Clerodendron inerme, *Gært.*

SANGLA, HIND. A plank bridge in the hills.

SANGNAI, HIND. Panolia acuticornis, *Gray.*

SANG-NILA-UTAMA, see Johore.

SANGOW, see India, Kyau.

SANGPO, see Yak.

SANG-PWAN-HIA, CHIN. Midsummer root.

SANGRAI, HIND. Panolia acuticornis, *Gray.*

SANGRI, or Shangri, HIND. Seed pods of Prosopis spicigera.

SANGSAL, or Rangsal, the name of the larger of the idols at Bamian.

SANGSAPURBA, see Johore.

SANGS-GYAS, see Buddha.

SANGSUE, FR. Leeches.

SANGTARAH, HIND. Citrus aurantium, the Lime. Citrus bergamia.

SANGU, TAM. Chank shells.

SANGUINOLARIA, a genus of molluscs.

SANGUIS DRACONIS, LAT. Dragon's blood.

SANGUISUGA, Hirudo, the leech.

SANGUISUGA ÆGYPTIACA, the leech of Prov. xxx, v. 15, the Olukeh, or Aluka, or Aluk of the Arabs.

SANG-YAHUDI, " Jew's stone," a fossil encrinite.

SANG-YEN, CHIN. Tobacco. This is the name in some parts of China, but the ordinary names are Yen-t'sau ; Jin-t'sau and Tan-pa-ku.

SANHITA, see Arians, Vedas.

SANI, the planet Saturn, whose influence is supposed by hindoos to be malignant : also a deity of the hindoos. Yama is the regent of Hell ; Sani is the Planet Saturn ; and Brihaspati, is Jupiter. Saturn's ring was known to the ancients. In Maurice's Indian Antiquities is an engraving of Sani, the Saturn of the hindoos, taken from an image in a very ancient pagoda, which represents the deity encompassed by a ring formed of two serpents. Hence it is inferred that the ancients were acquainted with the existence of the ring of Saturn.—*Curiosities of Science, p.* 81.

SANI, a light camel or dromedary, trained especially for the riding of native chiefs. See Graha, Vara or Vasara.

SANI, see Khutri.

SANIGALU, or Senagalu, TEL. Cicer arietinum, *Linn.* Bengal gram.

SAN-I-JALUS, the year of a king's accession. See Jalus.

SANJAB, HIND. The sable.

SANJAD, or Sanjat, HIND. In Peshawur, in Pushtu, the berries of Eleagnus orientalis, also of Pyrus variolosa, wild pear.

SANJID, see Jugdalik.

SANJLI, or Ban-sangli, HIND. Cratægus oxyacantha.

SANJNA, HIND. Moringa pterygosperma.

SANKA, HIND. A chank, a shell. The chanks are made into trumpets, rings, beads, armlets, bracelets, and the Sankasari of Dacca are famed for their skill in the chank or sank work. The skill is remarkable with which the unyielding substance of a hard thick shell is converted into necklaces for men and into bracelets for women. The manufacture of shell bracelets is one of the indigenous arts of Bengal, in which the " Sankari" caste, at Dacca excel. The chanks of which they are made are large species of Turbinella, from six to seven inches long, and of a pure white colour. They are imported into Calcutta from Ramnad and South India, opposite to Ceylon, and from the Maldive Islands. See Sankasura.

SANKÆUR GOND, Acacia odoratissima, *Roxb.*, *Willd.*

SANKALPA, see Sati.

SANKARA CHAR. In Kashmir, are two eminences which bear the name of Takht-i-Suliman ; one near Kashmir is called Sir-i-Shu, or Siva's head by the hindoos, but also Sankara char : and the hill on the opposite side of the city is called Hari Purbat, or the hill of Vishnu or Hari. On the latter hill is the fort of Kashmir. The heat on the plains under the Sulimani range is excessive. The Kayser mountain seems a collection of inaccessible precipices—*Vigne.* See Kaysar, Khyber.

SANKARA ACHARYA, who lived about the 8th or 9th century, was a religious teacher of the hindoos, in the South of India, a commentator on the Veda, and the alleged author of the Sankara Cheritra, Sankara Katha, S. Vijaya and S. Dignijaya. He was a Namburi brahman, and a native of Kerala or Malabar. He lead an erratic life through India and Kashmir, and engaged in controversies, and finally died at Kedarnath in the Himalaya ; he founded a dominant Saiva sect. From Benares have emanated and still emanate almost all new opinions on questions of hindoo theology, hindoo philosophy and hindoo jurisprudence. The verdict of the Benares authorities is final in the hindoo world ; there, Sankara Acharya won a great shivite controversial victory ; there, disguised as a hindoo boy, Feizi became initiated in the hindoo Shasters ; there, at the fountain head, did Aurungzebe try to diffuse the leaven of mahomedanism ; and there at last has the Benares College been erected by the British to enlighten and form the native population with new ideas in their heads and new institutions ; Hindoo theologists have entered into vain disputes on the question, which, among the attributes of God, shall be deemed characteristic and pre-eminent ? Sankara Acharya, contended for the attributes of Siva ; and founded, or confirmed, the sect of saiva who worship Siva as Mahadeva, the Supreme Being, and deny the independent existence of Vishnu and other deities. He was the most renowned master of the school of Vedanta philosophy ; he says,

A drop that trembles on the lotus leaf,
Such is this life, so soon dispelled, so brief.

* * * * * *

The eight great mountains and the seven Seas,
The Sun, the Gods who sit and rule over these,
Thou, I, the Universe, must pass away,
Time conquers all ; why care for what must pass away.

The term Dandi, means any one who bears a staff, but is applied especially to a numerous order of religious mendicants, founded by Sankara Acharya, many of whom have been eminent as writers on various subjects, especially on the Vedanta philosophy. They are divided into ten classes, each of which is distinguished by a peculiar name, as Tirtha, Asrama, Vana, Aranya, Saraswati, Puri, Bharati, Giri or Gir, Parvata, and Sagara, which is added to the proper name of the individual—as Purushottama Gir, or Badendhra Saraswati. They are hence known collectively as the Das-nami, or ten name Gosain. Of these, only the classes named Tirtha, Asrama, Saraswati, and part of Bharati, are now considered as pure Dandi ; the others are of a more secular character and are more usually termed Atit.—***Wils. Glos.*** ; ***Tr. of Hind.***, ***Vol.*** i, ***pp.*** 275-276 ; ***Bunsen, God in History***, ***Vol.*** i, ***p.*** 332. See Advaitam, Cow, Dandi, Hindoo, Kapila, Lakshmi, Samaveda, Veda.

SANKARI, see Sanka.

SANKASURA, means demon of the Sanka or Chank. Early continental travellers spell it Chanch, and in exotic words, a hard is usually substituted for a soft, initial, giving Kank, or Conch. Shells, as arousing implements of war, were as such used in former times among Indians, as trumpets are at present. In the terrible civil war between the Pandu and their kinsmen, the Kuru, as homerically described in the Mahabharat, Krishna used the shell Panchajanya, each chief also sounded a shell, to which, like the swords of the chivalrous knights of Europe, distinct and significant names were given.—*Moor, p.* 213. See Gita. Sanka

SANKAYA GAURISWARA, see Inscriptions.

SANKH, see Namam.

SANK'HA, Sans., Tam. A pearl shell, any shell. A Chank, or Conch shell, one of the principal weapons of Vishnu. Hence Sankhadwara, the Chank locality, the island of Beyt.

SANKHA-DWARA, is still renowned for its shells, and one bank uncovered at low water, whence they are obtained, is close to the landing-place ; but as the rinsank, or war-shell, with which he was wont to peal a blast, the onslaught to battle, no longer graces the hand of the Rajpoot ; its use is now restricted to the brahmin, wherewith " to awake the gods in the morning !" to let the world know when he dines ; or, to form churi or bracelets, for the arms of the hindoo fair. Bengal is the best customer for the shells of Sankha-dwara ; and at an early part of the 19th century an entire street was occupied in the city of Dacca by shell-cutters, all supplied from the island of Beyt. In Colonel Tod's time, the banks were farmed of the Guicowar government by a Parsee merchant of Bombay, who contracted with the Kharwar, at the rate of twenty koree (from five to six rupees) per hundred, and loaded them for Bombay, whence they are shipped for Bengal. Perpetual allusion is made, in the martial poetry of the Rajpoot, to the " blast of the shell," which is as common as the charge of the brazen trump of western chivalry. Pre-eminent mention is made in the " Great war" of two of these.—*Tod's Travels, pp.* 432–33. See Sanka.

SANKHIR, Hind. Celastrus paniculata.

SANKHRI, Hind. Prosopis spicigera.

SANKHU, Hind. Celastrus paniculata.

SANKHYA, Sans. A sect of hindoo philosophers, from Sankhya, clear knowledge.

SANKHYA, a hindoo system of philosophy, teaching the eternity of matter and spirit independent of God, founded by Kapila. The Sankhya system of philosophy was apparently the earliest of all the systems that preceded the really philosophic age of the hindoo schools. Its author is said to have been Kapila who is now fabled to have been a son of Brahma, and an incarnation of Vishnu ; he is numbered among the seven great saints, and many marvels are ascribed to him. While using vedic notions, he in the main departed from vedic theories, and in all important particulars comes to conclusions diametrically opposed to what the veda teach. The Sankhya system contains two grand divisions, which differ on the vital question of the existence of a God ; one is termed the 'Seswara Sankhya' that which owns a God ; the other is called 'Niriswara Sankhya' or that which denies the very existence of a God ; the latter was Kapila's system, a system at that time entirely new ; it taught that there were two primary agencies, 'nature' or 'matter' and 'souls;' but that there was no 'Supreme Being.' He asserts as follows ; 'souls' have existed in multitudes from eternity ; by their side 'stands nature or matter ;' for eternal ages the two remained separate ; at length they became united, and the universe in all 'its forms was developed from their union.' The object of the Sankhya as well as of the other branches of the hindoo philosophy, is the removal of human pain by the final and complete liberation of the individual soul. The Sankhya system has twenty-five principles to which the soul must apply itself as objects of knowledge, and in respect to which true wisdom is to be acquired ; they are :

1st.—Nature, termed 'Pradhan' or chief, from being the universal material cause, the prime cause of all things.

2nd.—Intelligence, the first product of nature, increate, prolific, itself productive of others.

3rd.— Self-consciousness, its peculiar function is the recognition of the soul in its various states, it is the product of intelligence, and itself produces.

4th to 8th.—Five principles, subtle particles or atoms of things. These are imperceptible to the gross senses of human beings, but may be known by superior intelligence ; then follow—

9th to 19th.—The organs of sense and action, of which ten are external and one is internal. The organs of sense are five ; the organs of action are five. The mind serves both for sense and action.

20th to 24th are five elements produced from the five subtle particles.

1st.—Ether ; this has the property of audibleness, being the instrument of sound.

2nd.—Air ; which has two properties ; it is audible, and it can also be touched.

3rd.—Fire ; this has three properties ; audibility, tangibility, and colour.

4th.—Water ; possessed of four properties ; audibility, tangibility, colour and taste.

5th.—Earth ; possessed of five properties ; audibility, tangibility, colour, taste and smell.

25th.—The last principle is soul : like nature it is not produced but is eternal, but unlike nature it produces nothing from itself ; it is multitudinous, individual, sensitive, eternal, immaterial.

The great error that lies at the root of the Sankhya system is, that the products of matter and mind are blended and confounded together.

The next hindoo system of philosophy is that attributed to Gautama, namely, the Nyaya system, which considers by means of subtle and logical argument, the true mode of inquiring after Truth ; and has surveyed the whole field of this argument more exactly and completely than any other of the hindoo systems. The first inquiry of this system is what is the way to attain perfect beatitude ? And the answer given is 'That deliverance is only to be secured by a knowledge of the Truth.' It then proceeds to examine what instruments are best adapted for the acquisition of that deliverance, and comes to the conclusion that they are four in number, namely, perception, inference, comparison and testimony. It then minutely examines the various objects of knowledge, which are required to be proved and known ; which objects are twelve in number : soul, body, sense, object, knowledge, the mind, activity, fault, transmigration, fruit, pain and beatitude.

The Vedantic system, thereafter made its appearance, in three stages of development. The germs of this philosophy and even its principal doctrines are contained in the Brahmana books of the Vedas ; then it is seen in a more complete form in the Sutras of Vyasa ; and lastly, this philosophy is recorded in the great commentaries which eminent scholars have written upon the original authorities.

The voice of hindoo antiquity ascribes the origin of the Vedantic system to the sage Badarayan, otherwise named Veda-Vyasa. The manner of his birth is thus described in one of the works attributed to him,

> 'Of birth and death, a multiplicity
> Of souls is to be inferred.'

The fact of transmigration none of the hindoo philosophical systems dispute, it is allowed by all ; as a man casts off his old garments, and puts on new ones, so that soul having left its 'old mortal frame, enters into another which is new.' 'One soul, and not another. These philosophies are subjects for the learned of the hindoo people. Brahmanism is, at present, synonimous with hinduism, and the brahmanical religionists are of three classes, the worshippers of Vishnu, of Siva and the Sakta, or those who worship the female energies of gods. But their views seem to have been gradually brought to the present condition and, as with the hindoo, is in some places a nature-worship, in others an idolatry, in others a hero-worship, in others a physiology or a philosophy, perhaps, in all, a spirit-worship. Bunsen says (iii, 516,) the forms of worship followed by the Arian immigrants and the institution of castes seem to have commenced after they crossed the Sutlej river, and the original seat of this worship extended from the Indus to the Ganges and to Bengal (Behar). He adds that brahmans, after crossing the Sutlej, introduced Siva and other deities and threw those of the Vedic period into the shade. According to Bunsen, it was about the year 3000 B. C. that the schism took place amongst the East and West Arians, when all India, east of the Sutlej, adopted brahminism, and the religious views, forms and habits of Bactria were for ever abandoned. According to Manu (the first book of which he thinks was composed but little antecedent to the christian era) the world had passed through four yoga, when brahmanism was introduced ; and the brahmanism of the Sanscrit books is the mythico-pantheistic form of Vedic naturalism. Brahmanism is usually understood to be the later development and corruption of the ancient Vedic faith. Bunsen, however, expresses the opinion that the region of the Indus still retains the nature-worship of Vedism, while southern India and the banks of the Ganges have long fallen into brahmanism ; but such is not the case, the worship of the bulk of the Aryan races is divided between the physiological views entertained by those who believe in Siva, and the hero-worshipping followers of Vishnu. Brahmanism is accommodating to any thing that partakes of idol-worship. Similarly as a Roman would worship Isis and Osiris, so a hindoo makes offerings to apotheosized mahomedans, such as Shaikh Sadu, Ghazi Mian and Shaik Madar in northern India and Bawa Adam in the peninsula. Brahmanism is at present divided into several branches, each of which has many sub-divisions ; the three principal branches are ; *1st, Vedantism*, so named after the Vedanta of Vyasa. It has few adherents, consisting of some philosophical brahmans. Of the thousands of temples in India consecrated to various deities, only one is consecrated to this doctrine, in which Brahma is worshipped alone. 2nd, *Vishnuism.*—This doctrine raises the second person of the Hindu Triad (Vishnu to the highest place, and adores his differen avatars, together with a multitude of other deities, powers of nature, and mythical persons. Its professors are styled Vaishnava. 3rd, *Sivaism.*—This doctrine places the third person of the Hindu Triad (Siva) highest in the rank of the gods. The professors of this doctrine call themselves Saiva and their number amounts to many millions more than the professors of Vishnuism. Although Siva is the god of destruction, he is also the god of production, considered with respect to the idea, which ever pervades the doctrine of Brahma, namely, that death is but the recommencement of a new life.—*Elphinstone's History of India* ; *Bunsen's Egypt's place* ; *Tod's Rajasthan, Vol.* i, *p.* 26 ; *Tennent's Christianity in Ceylon, p.* 199 ; *Hind. Th., Vol.* ii, *p.* 13.

SANKHYA, also Saukhya safed, HIND. Arsenious acid.

Saukhya bilauri, vitreous arsenic.

Saukhya pili, yellow arsenic.

Saukhya siya, impure bisulphide of arsenic.

Saukhya surkh, bisulphide of arsenic.

SANKHYA KARIKA, a book containing the system of the Saukhya philosophy taug by Kapila. It consists of sixty-eight Aphorisms. See Hindoo.

SANKRANTI. The winter solstice, the sun's entry into Capricorn, is called the Maha-sankranti, or great Sankranti, and at this season, in the South of India, the Pongal festival is held.

The *Makar Sankranti* festival is held about the 12th January on the occasion of the sun entering the tropic of Capricorn or Makar. On this day, the hindoo people bathe, and anoint the body with sesamum oil, listen to the prayers of brahmans to whom they give presents. The prayers on this day are only to the sun. They have friends to dinner at night and put on new clothes.—*Wils. Glos.*

SANPOO, tributary of the Brahmapootra. It rises on the north face of Himalaya, in lat. 30° 25′, long. 82° 5′ E., winding its way through Tibet, and washing the borders of the territory of Lassa. It then turns suddenly south and falls into the Brahmapootra, under the name of Dihong. Length, about 100 miles. It receives as affluents, the Sanki-sanpoo, Niamtsion, Zzangtsion, Lallee Nuddee.

SANPU, see Indus.

SAN-SABZ, HIND. Green earth, silicate of the protoxide of iron.

SANSAPHAUR, HIND. Asparagus racemosus.

SANSARU, HIND. Missiessya hypoleuca.

SANSCRIT, according to Professor Müller, is not the mother of Greek and Latin, as Latin is of French and Italian, but Sanscrit, Greek and Latin are sister tongues, varieties of one and the same type, though Sanscrit is the older sister. It was also Mr. Colebrooke's opinion that Sanscrit draws its origin from a primeval tongue, which was gradually refined in different climates and became Sanscrit in India, Pelavi in Persia and Greek on the shores of the Mediterranean. The Iranian family of language seems to be called Arian, by Mr. Farrar, it is the Indo-European and Indo-Germanic of some phylologists : Pictet and Burnous called it Arian from the Sanscrit word Arya meaning noble ; Rask called it Japhetic ; according to Mr. Farrar, it has 8 divisions,

Hindoo,
Persian,
Greek,
Latin,
Lithuanian,
Sclavonic,
Teutonic,
Celtic.

Of these, it is uncertain whether Celtic or Sanscrit represents the older phase. But it is known that all of them are the daughters of a primeval form of language which has now ceased to exist, but which was spoken by a yet undivided race at a time when Sanscrit and Greek as yet had only implicit existence. The Sanscrit language and its modifications in Hindi and Mahrati are written in the Nagari character. The Sanscrit S, is represented in Zend by *h*. Thus Sapta Sindhu or the seven rivers, which is the old Vedic name of India itself, and is derived from the five rivers of the Panjab, together with the Indus and the Sarasvati, becomes in the Zend, Hapta Hindhu. In the Aryan family of languages, the numerals up to 100 are the same.

The ancient Persian language east of the Euphrates was a near dialect of the Sanscrit. We are ignorant of the date of the introduction of the Arian branch of the Semitic tree into the regions south of the Hindoo Kush and its extension into the sub-Himalayan belt towards Hastinapur. For, as in the case of the Southern Alphabet, its earliest appearance within our ken, is in the counterpart edict of Asoka or Pyadasi, grandson of Chandragupta at Kapurdegiri in the Peshawar valley. And the greater amount of pure Sanscrit which the Kapur de Gir inscription carries in its text, illustrates the descending course of that language ; and the ultimate and not very long delayed extinction of all trace of the once extensively prevalent Arian character, and its supersession by the more exact and appropriate system of writing indigenous to the south. The chief Sanscrit authorities of the buddhists, still in our possession, were written, at the latest, from a century and a half before, to as much after, the era of christianity. We may be satisfied therefore that the principal Sanscrit authorities which we still possess were composed by the beginning of the christian era at least, how much earlier is less easily determined. The principal Pali authorities of the south are of a period considerably subsequent to the Sanscrit buddhistical writings of India proper, and date only from the fifth century after Christ. Professor Max Müller seems to concur in these deductions from his remarking that after buddhism had been introduced into China, the first care of its teachers was to translate the sacred works from the Sanscrit, in which they were originally written, into Chinese. Colonel Sykes, however, still considers, from his examination of Gutzlaff's catalogue of Chinese buddhistical works, that the books taken from India to China, by the Chinese travellers between the fourth and seventh centuries were equally in Pali. The great body of the buddhist writings consists avowedly of translations. The Tibetan, Mongolian, Chinese, Singhalese, Burman and Siamese books, are all declaredly translations of works written in the language of India,—and that which is commonly called Fan or more correctly Fan-lan-mo—or the language of the brahmans. This, in India proper, was undeniably the Sanscrit language, though the buddhist authorities of Ceylon may have been Pali. The Sanscrit works, as they have come into our hands, have been found almost exclusively in Nepaul ; those in Pali being obtained chiefly in Nepaul and Ava. Pali is the language of the buddhists of Ava, Siam and Ceylon ; therefore it is concluded it was the language of the buddhists of Upper India, when the inscriptions on the several Lat were engraved ; and consequently that they are of buddhist origin. This however is questioned ; it being asserted that the doctrines of Buddha were long taught orally only, and were not committed to writing for four centuries after his death, or until B. C. 153, a date no doubt subsequent to that of the inscriptions. Buddha died 543 years before Christ. According to Mr. Burnouf and Mr. Hodgson, however, the earliest buddhist writings were not Pali but Sanscrit, and they were translated by the northern buddhists, into their own languages, Mongol and Tibetan. The buddhist authorities assert that Sakya Sinha and his successors taught in Pali, and that a Pali grammar was completed in his day. It is not likely that the edicts of Asoka, intended to regulate the moral conduct of the people at large should have been intelligible only to buddhist priests, or should have been perpetuated only on pillars for their edification. We may therefore recognise it as an actually existent form of speech in some part of India, and might admit the testimony of its origin given by the buddhists themselves, by whom it is always identified with the language of Magadha or Behar, the scene of Sakya Sinha's first teaching, but that there are several differences between it and the Magadhi, as laid down in Prakrit grammars, and as it occurs in Jain writings. It seems therefore to have been a form of speech peculiar to the people of Upper India. Of Pali alphabets, may be mentioned that of the Girnar rocks. The Asoka alphabet (the Sanscrit one,) Tibetan, is acknowledged to be of the seventh century, and the Kuteli alphabet of Bareli. The ancient Pali or Maghadi alphabet had once a very extended currency, and for a lengthened period retained its separate identity. It occurs in Asoka's edicts at Delhi, Allahabad, Matia, Bakra, Dhauli and Girnar : its appearance in these several localities, would primâ facie imply that it was intelligible to the people at large, throughout the circle embraced by these geographical boundaries, or that it was the recognised sacred alphabet of buddhism. Opposed to the latter supposition is the departure from its use in the Kapur-di-giri text of the edict itself and the modification to which the language is seen to have been subjected in some of the Pali transcripts, to meet apparently the local dialects of each site. The available medallic testimonies of coins contributes largely to the inference that these characters formed the ordinary medium of record in the majority of the states included within the limits above alluded to. In this alphabet exclusively are expressed the legends of innumerable series of coins of purely local type ; its characters are found associated on the one part with the Greek of Agathocles and Pantaleon and its phonetic signs are conjoined with counterpart Arian legends on certain classses of the Behat coins. Dr. Stevenson remarks, in speaking of the Nasik cave inscriptions, that on the whole, we find that brahmans and buddhists, in these early days of our era, lived in peace with one another, that both were favoured and protected by the reigning sovereigns, and that among the former, the Sanscrit language was used in writing and the Prakrit by the latter, the two languages probably holding the same place to one another that the Sanscrit and the vernaculars do at present.

Mr. Caldwell believes that theDravidian languages are to be affiliated not with the Indo-European but with the Scythian group of tongues and the Scythian family to which they appear to be most allied is the Finnish or Ugrian. The idioms which he includes under the general term Dravidian constitute the vernacular speech of the great majority of the inhabitants of Southern India. With the exception of Orissa and those districts of Western India and the Dekhan, in which the Guzerathi and the Marathi are spoken, the whole of the peninsular portion of India, from the Vindhya mountains and the river Nerbudda, (Narmadu) to Cape Comorin, is peopled, and from the earliest period appears to have been peopled, by different branches of one and the same race, speaking different dialects of one and the same language, the language to which Dr. Caldwell's term Dravidian is applied, and scattered off-shoots from the same stem may be traced *still further* north as far as the Rajmahal hills, and even as far as the mountain fastnesses of Beluchistan. The Guzerathi, the Marathi, (with its off-shoot the Konkani) and the Uriya, or the language of Orissa, are idioms which are derived in the main from the decomposition of the Sanskrit, the vernacular speech of the hindoo population within these respective limits : besides which, and besides the Dravidian languages, various idioms which cannot be termed indigenous or vernacular are spoken or occasionally used by particular classes resident in Peninsular India. The idioms which Mr. Caldwell designates as "Dravidian" are nine in number, exclusive of the Rajmahal, Uraon and the Brahui. They are as follows :—

1. Tamil,
2. Telugu,
3. Canarese,
4. Malayalam,
5. Tulu,
6. Toda or Tudara,
7. Kota.
8. Gond or Goand,
9. Khund or Kund, or Ku.

The last four languages are entirely uncultivated. The proportionable numbers of the several races by whom the languages and dialects mentioned above are spoken appear to be 32,150,000 as follows :—

1. Tamil spoken by	10,000,000
2. Telugu	14,000,000
3. Canarese	5,000,000
4. Malayalam	2,500,000
5, Tulu	150,000
6. to 9. Toda, Kota, Gond and Khund...	500,000

Whilst Dr. Caldwell regards the grammatical structure and prevailing characteristics of the Dravidian idioms as Scythian, he claims for them a position in the Scythian group independent of its other members, as a distinct family or genus, or at least, as a distinct sub-genus of tongues. They belong not to the Turkish family, or to the Ugrian, or to the Mongolian or to the Tungusian,—but to the group or class in which all these families are comprised. On the whole the Dravidian languages may be regarded as most nearly allied to the Finnish or Ugrian family, with special affinities, as it appears, to the Ostiak.

The conclusions arrived at by Dr. Caldwell with regard to the northern languages are that before the arrival of the Aryans, or Sanscrit-speaking colony of Brahmans, Kshatriyas, and Vaisyas, the greater part of Northern India was peopled by rude aboriginal tribes, called by Sanscrit writers Mlechcha, Daya, Nishada, &c., and it is the received opinion that those aboriginal tribes were of Scythian or, at least, of non-Aryan origin. On the irruption of the Aryans, it would naturally happen that the copious and expressive Sanscrit of the conquering race would almost overwhelm the vocabulary of the rude Scythian tongue, which was spoken by the aboriginal tribes. Nevertheless, as the grammatical structure of the Scythian tongues possesses peculiar stability and persistency; and as the pre-Aryan tribes, who were probably more numerous than the Aryans, were not annihilated, but only reduced to a dependent position and eventually in most instances incorporated, in the Aryan community, the large Sanscrit addition which the Scythian vernaculars received, would not necessarily alter their essential structure or deprive them of the power of influencing and assimilating the speech of the conquering race. According to this theory, the grammatical structure of the spoken idioms of Northern India, was from the first, and always continued to be, in the main Scythian. And the change which took place when Sanscrit acquired the predominance, as the Aryans gradually extended their conquests and their colonies, was rather a change of vocabulary than of grammar,—a change not so much in the arrangement and vital spirit of Dravida as in the material of the language. This hypothesis seems to have the merit of according better than any other with existing phenomena. Seeing that the Northern vernaculars possess, with the words of the Sanscrit, a grammatical structure which in the main appears to be Scythian, it seems more correct to represent those languages as having a Scythian basis with a large and most overwhelming Sanscrit addition than as having a Sanscrit basis with a small admixture of a Scythian element. The Scythian substratum of the North-India idioms presents a greater number of points of agreement with the Oriental Turkish or with that Scythian tongue or family of tongues of which the new Persian has been modified, than with any of the Dravidian languages.

The locality of the Andhra dominion has hitherto been as uncertain as the period of its sway. Wilford says at one place that the Andhra princes made a most conspicuous figure on the banks of the Ganges for above 800 years. Again, that Andhra and Koshala (near Kalinga) are used synonimously by some Hindoo authors: again, that Sricarnadeva took the title of king of Tri-Kalinga, or of the three shores, to the east and west and south of India. The general term of Dakshinapetha (Dekhan) agrees well with the latter definition, and we may rest content with denoting the Sata Karni as kings of the Peninsula. There were Andhra kings at the beginning of the christian era, when, says Pliny, the Andaræ kings were very powerful in India, having no less than thirty fortified cities, an army of 100,000 men and 1,000 elephants.

The history of the lands adjacent to Kabul, during the centuries immediately preceding and following the present era, is but little indicated in books, but has been, to a considerable extent, traced out by Mr. James Prinsep, Mr. H. T. Prinsep, Professors Wilson and Lassen, from coins of Greek, Arian, Bactrian, Scythian, Partho-Scythian, Ario-Parthian and Indo-Scythian, kings and dynasties, which the researches of Sir Alexander Burnes, Mr. Masson, Generals Court and Ventura had brought to light, as also from the engravings on rocks and on relics found in topes in all the region around Kabul. The characters in which these legends are engraved are Arian or Bactrian, Greek and Sanscrit. On coins, these are sometimes single, but many dynasties adopted bilingual legends, Arian and Greek, or Greek and Sanscrit, the Greek becoming gradually more barbarous towards the present era, until at length, it becomes unintelligible. As Mr. Prinsep tells us, it seems established that the Arian or Bactrian language was long the vernacular of the Paropamisan range, of Kabul, and perhaps of Herat and Kandahar, up to the Indus, for it has been found in the topes of Manikhyala, in the Panjab and on the rock at Bamian. Unlike the Greek and Sanscrit, it is written like the Semitic tongues from right to left, but the letters being always separate, they could at pleasure be written from right to left. The earliest Greek was written alternately, as a plough is drawn, and tombs of Tuscan kings opened some years since contain inscriptions in Greek characters, written from right to left. The Mongolians who adopted the Syrian characters write it in lines downwards like the Chinese. The Arian character was adopted first on the coins of the Greek kings from Eucratides down to Hermæus. It was then taken up by the Scythians, who crossed the Paropamisus, Imaus or Hindoo Kush, and also by Parthians who asserted their independence in Affghanistan. The Aryan alphabet character, in the course of years, seems to have undergone a change, and the same forms are not to be recognised in later coins, nor the same epithets and titles, and the inscriptions discovered in topes are all in the less simple late character. Mr. James Prinsep, Mr. H. T. Prinsep and Prof. Wilson have considered this Aryan language to have a close affinity with Sanscrit, but Dr. Moore about A. D. 1858, put forth the opinion that it is Hebrew. It seems to have superseded the ancient Sanscrit of the days of

Asoka, which was adopted by Agathocles and Pantaleon, the first of whom we know, from the pure Greek style of his other coins, to have been one of the earliest of the Grecian kings. After them, however, Sanscrit characters were entirely disused. Menander, the known Indian conqueror, never seems to have coined with the language of Asoka, from which circumstance Mr. H. T. Prinsep infers that the characters on the coins of Agathocles and Pantaleon were not vernacular, and had been introduced by the Indian sovereigns, who, following the first Chandra Gupta, retained dominion over the provinces ceded by the first Seleucus, until they were restored by Asoka to the Great Antiochus. At Manikhyala, a tope solidly built of quarried stones and lime cement, a great cupola, 80 feet high and 310 to 320 feet in circumference was opened by General Ventura, but there are fifteen other and smaller cupolas there, which were opened by General Court. Monuments of the same kind are met with at Rawalpindi (in the Panjab) in the Hazara country, west of Kabul, at Jellalabad, Lagman, Kabul, Bamian and in the Khyber pass. Many of those west of Kabul have been opened by Mr. Masson. In one, N. N. E. of the village which was opened by General Court, a sculptured stone was found in Arian characters, along with Roman coins and coins of Kadphises and Kanerkes, a fact alone sufficient to indicate that the territories around had been under the sway of rulers of varied races. The inscriptions on the pillars at Delhi and Allahabad, and on the Tirhut pillars at Mathiya and Radhiya were deciphered and translated about the year 1830, by the remarkable ingenuity of the late James Prinsep. The inscriptions on the rocks at Junagiri in Gujrat, and at Dhauli in Cuttack, were also interpreted by him. A third version of the rock inscriptions (but in the Ariano-Pali character), which was found at Kapur-digiri, near Peshawur, has been carefully collated with the others by Professor Wilson. Many short inscriptions from Gaya, Sanchi, and Birat, as well as from the cave temples of southern India, have also been published at different times, but with the single exception of the edicts in the rock inscriptions, which contain the names of Antiochus, Ptolemy, Antigonus, and Magas, the inscriptions in the able work of Major Cunningham are of greater interest, and of much higher importance than all that had before been published. The Kapurdigiri inscription is on a rock on the side of a rocky and abrupt hill near a village of that name in the district inhabited by the Yuzufzye. The mode of reading it was discovered by Mr. E. Norris. It reads from right to left, is in the Arian or Bactrian character, and is nearly a transliteration of that of Girnar ; and the language, he says, was in use for several centuries throughout that extensive line of country over which the Seleucidæ and their successors held dominion, —that is to say, from the Parapamisus or Caucasus to the upper part of the Panjab, including all Bactria, Hindoo Kush and Affghanistan.

Dr. Moore remarks that at least two classes of people employed the language expressed in this character, the one using the Arian or Bactrian, or Bamian, Kapurdigiri, &c., the other using the Budh or Lat character, found on the Girnar rock and on the pillar and in the cave temple inscriptions : and that these two classes of people seem to be the Getæ and Sakæ, the so-called Arian character being that used by the Getæ, while the so-called Lat character was that of the Sakæ. The Lat character occurs rarely in the southern part of the peninsula ; still it is the only one used on the sculptures at Amravati, which have been described by the Rev. W. Taylor, and while in charge of the Government Central Museum at Madras, the Editor despatched a large collection of its marbles to England, which have since been described. Inscriptions in the Arian and Lat characters are engraved on rocks at Kapurdigiri in Affghanistan, and at Cuttack, at Delhi on a pillar, also on pillars at Allahabad, Betiah, Muttiah and Radhia, and show that Sanskrit was the spoken language of India at least some centuries before the time of Solomon. Sanscrit is the ancient language of the hindoos. It had ceased to be a spoken tongue at least 300 B. C. At that time the people of India spoke dialects standing to the ancient Vedic Sanskrit in the relation of Italian to Latin. Of these dialects, there were more than one in various parts of India, from the inscriptions which the famous king Asoka had engraved on the rocks of Dhauli, Girnar, and Kapur-digiri, and which have been deciphered by Prinsep, Norris, Wilson, and Burnouf. We can watch the further growth of these local dialects, in the Pali, the sacred language of buddhism in Ceylon, and once the popular language of the country where buddhism took its origin, the modern Bahar, the ancient Magadha. We meet the same local dialects again, in what are called the Prakrit idioms, used in the later plays, in the sacred literature of the Jaina, and in a few poetical compositions ; and we see at last how, through a mixture with the languages of the various conquerors of India, Arabic, Persian, Mongolic, and Turkish, and through a concomitant corruption of their grammatical system, they were changed into the modern Hindi, Hindustani, Mahrati, and Bengali. During all this time, however, Sanskrit continued as the literary language of the brahmans. Like Latin, it did not die in giving birth to its numerous offspring ; and even up to the middle of the 19th Century an educated brahman would write with greater fluency in Sanskrit than in Bengali. Sanskrit was what Greek was at Alexandria, what Latin was during the middle ages. It was the classical and at the same time the sacred language of the brahmans, and in it were written their sacred hymns, the Vedas, and the later works, such as the laws of Manu and the Puranas. Sanskrit, and its congeners are inflectional languages, after the manner of the languages of Europe ; while the Turk, Mongol, Tangus and Ugrian, in the north and west, and the Tamil in the south, are agglutinate tongues. The Tibetan, Burmese, and all the Nepalese dialects are monosyllabic tongues. The Sanscrit differs from the Tamil of the south, and much more so from the Tibetan, Nepalese and Burmese, on its north and west. It has no relations with the Arabic, Armenian, Iran or modern Persian. The nearest congeners to the Sanscrit are the Sarmatian languages of the Russian Empire, then the classical tongues of Rome and Greece, then those of Germany and the Keltic, this class of languages being called the Indo-Germanic. Of the Sclavonic and Lithuanian, the two branches of the Sarmatian, the affinities of the Sanscrit are closest, and closer with the Lithuanian than with any other known tongue. Sanscrit was a dead language in the time of Buddha. The alphabet of the oldest Sanscrit manuscript and oldest composition in Sanscrit is of Pali origin. Sanscrit, next to Lithuanian, is most like the Sclavonic. The Sanscrit and Pali are, both, dead languages. It will thus be observed that the Arian or Sanscrit-speaking races of India, seem to have been closely connected with the Zend-speaking, Greek-speaking, Latin-speaking, German-speaking, and Sclavonic-speaking races, and not at all with the Arabic, Phenician and Hebrew families. Sanscrit in all its perfection was at one time, probably between the eighth and fourth centuries B. C., the spoken language of that race which immigrated into India from Central Asia, and to which modern orientalists give the name of Arian. The Hindi, Tamil, Telugu, Bengali and others of the languages of India, have their own ancient literatures ; but even where these languages are in no way connected with the Arian stock, the subjects of their compositions are all referrable to those of the Sanscrit. The Sanscrita Vach, the "Perfect Language," is the vehicle of the older literature of almost every part of India. According to a reviewer of the works of Ernest Curtius, that author is of opinion that the ancestors of the peoples of India, of the Persians, Greeks, Italians, Germans, Slaves and Kelts, were originally one people dwelling in the uplands of Asia : and that the first to separate themselves from this united Arian or Indo-European family, and to push their way into Europe, was the Kelts, they were followed by the Germans, and these by the Slaves and Letts. The next great swarm that deserted the hive and left behind them the progenitors of the Medo-Persians and the Indians, was composed of the common ancestors of the Greeks and Romans. But Sanscrit, though the latest researches have exploded the theory that it was the actual parent of that large stock of languages, which goes by the name of Indo-European and extends from India to the Americas, comprising Zend, Persian, Affghan, Armenian, Greek, Latin and all their progeny—the Celtic, the Sclavonic, the Teutonic and Scandinavian families—the languages of the whole Japhetic branch of mankind, it is not denied, that while it is the actual parent of some, as the Teutonic and Sclavonic families, it is certainly the eldest brother of, and presents older and more original forms than, all the rest. Professor Max. Müller, however, who does not accept the ordinary chronology of the world's age, in his history of Ancient Sanscrit Literature, divides the interval in which it appeared, into four periods. The first of these, the Chhandas period, he computes to have lasted from 1,200 to 1,000 B. C., and during that time the most ancient of the Vedic hymns were composed. The second or mantra period lasted from 1,000 to 800 B. C., and its hymns bear traces of the growth of a sacerdotal spirit and system. The third or Brahmana period lasted from 800 to 600 B. C. In these ancient liturgical books, the ritual application of the hymns, is prescribed with painful minuteness, and often with a mixture of childish allegorical interpretation. The fourth period is that of the Sutras or aphorisms, in which the ceremonial prescriptions were reduced to a more compact form and to a more precise and scientific system. Sanskrit, the best dictionaries of the English language do not show the Sanscrit derivations, but mother, father, brother, sister, daughter, and the names of familiar beasts and things were almost the same in the mouths of men who dwelt on the Indus 4 or 5,000 years ago, as they are in England to-day.

Sarpa,	SANS.	Serpens,	LAT.
Herpeton,	GR.	Serpent, reptile,	ENG.

The declension of the verb sarptum, to creep, with the Latin and Greek equivalents, is also given by Dr. Muir. In Malay, the most familiar words for the head, the shoulder, the face, a limb, a hair or pile, brother, house, elephant, the sun, the day, to speak, and to talk, are all Sanskrit. In the language of Bali, the name for the sun in most familiar use is Sanskrit, and a word of the same language is the only one in use for the numeral ten. It is on the same principle that Mr. Crawfurd accounts for the existence of a similar class of Malayan words in the Tagala of the Philippines although the whole number of Malayan words does not exceed one-fiftieth part of the language. Head, brain, hand, finger, elbow, hair, feather, child, sea, moon, rain, to speak, to die, to give, to love, are examples. In Javanese, Sanskrit furnishes words for the head, the shoulders, the throat, the hand, the face, father, brother, son, daughter, woman, house, buffalo, elephant, with synonymes for the hog and dog, the sun, the moon, the sea, and a mountain. Sanskrita signifies, adorned, completed, perfect; in respect to language, classic. It is composed of the elements, sam, "with" and krita, "made." Sanskrit Philosophy, was greatly advanced by Sir W. Jones, Colebrooke, Wilson and Müller in England, Burnouf in France, the two Schlegels, W. von Humboldt, Bopp and Lassen in Germany.

The Sanscrit or Pali languages have ceased to be spoken in any part of India, but both of them are in use as the sacred languages of the brahminical hindoos and the buddhists. The characters which have been used for Sanscrit as seen inscribed on sculptures have been the Kutila as at Vijayamunder, in Udayapur and on a stone slab from a temple at Ranode and at Oojein. An old form of character is engraved on the Allahabad column, and that on one of two bronze tridants found at Gopendara in Garhwal was in this old character, others being in nearly modern Deva-Nagari. The latter has been largely employed in writing Sanscrit in somewhat differing forms and as it is now used, but another form of it is known as Kanouj-Nagari. The character on the Allahabad column is Deva-Nagari in transitu, identical with that of the Gaya inscription, and also, like Mr. Wathen's inscriptions from Gujarat and those of Mahabalipur. The character of the Gaya inscription, is known to be of the eleventh century. A seal was found at Aseerghar in Kandesh, engraved with a Deva-Nagari, resembling the Gaya or Gour, approaching the Allahabad. That on the Bhitari Lat or pillar at Ghazipur, is not pure Sanskrit, nor easily intelligible; but its character is the same as Allahabad, No. 2, or Kanouj-Nagari, with numerous mis-spellings. At the ancient village of Maguta, district of Bhushana, on a stone slab, is an inscription in Sanskrit verse, the language and poetry superior. The character used is called the Kulda, and is midway between the Deva-Nagari and the Gauri. Some of the vowel inflections wanting. The inscriptions at the Budda Gaya vaulted cavern, or Nagarjuni, are in old Pali, of date, B. C. 280 to B. C. 247, and the character used in the inscriptions, old Lat. Those at Mathiah near Bettiah, at Bahra, and at Rediah, are in Pali, of date, 315 B. C.; and the character used in the inscriptions is old Pali.—*Muller's Lectures, pp.* 139-189; *Buddhism and Buddhist Pilgrims, p.* 24, *London,* 1857; *Jour. Bomb. Royal. As. Soc.* 1*st July* 1853, *p.* 41; *Prim. Ind. Ant., Vol.* ii, *pp.* 31, 33, 34, 45, 46, 50, 51 and 67; *Wilson*; *Latham*; *Bopp's Comp. Bowstring Hemp,	ENG.		

This grows along all the coasts of Southern Asia; has smooth oblong-acute, flat, and linear lanceolate, channelled, glaucous leaves, which are shorter than the scape; the style as long as the stamens, the bracts equalling the peduncle in length. It resembles the Agave in some of its characters, but produces finer fibres, which are easily separated from the pulp, and have been long known as a useful material for cordage, being soft, silky and pliant when well prepared, about equal to the Agave fibre in point of strength, but as it is a finer material, it might be applied to a better description of manufactures. The plant is easily propagated, and yields a good crop under cultivation. It was tried against Russian hemp, on board the Thalia, East Indiaman, when commanded by Captain Biden, and was highly approved of; it has also been made into fine cloth, thread, twine, rope; and cords are made from *this fibre. The zonar, the sacred thread of* the hindoo, was ordered by Menu to be made of the fibre, and the fine necklace cord, on which hindoos string their neck ornaments is made of it ; the fibres are commonly used to make bowstrings, and the plaited-leaves form an excellent soft mat. The root is in a slight degree warm to the taste, is not of an unpleasant odour, and is prescribed by the native Practitioners, in the form of electuary, in consumptive cases, and coughs of long standing. The juice of the tender shoots of the plant (which is the Katukapel of the Hort. Mal.) is given to young children for the purpose of clearing their throats of viscid phlegm.—*Roxb. Fl. Ind.* ; *Voigt* ; *Eng. Cyc.* ; *M. E. J. R.* ; *Ains. Mat. Med., p.* 88 ; *Royle, Fib. Plants.*

SANSI, the sun, dominating the earth and heavens.

SANSIO, Jap. A middle-sized tree of Japan, with prickles. They make use of its bark and husks instead of pepper or ginger, and they eat the pleasant tasting aromatic leaves.—*Amœn. Ex., p.* 892 ; *Thunberg's History of Japan, Vol.* i, *p.* 115.

SANSKARA, Sans. In hinduism, essential rites of which the hindoo religionist has ten or twelve,

Garbhadhana, worship on a woman's evincing signs of pregnancy, sometimes on attaining maturity.

Punsavana, worship on quickening, to obtain a male child. The Mahrattas perform—this as their

Anavalobhana, to obviate mis-carriage.

Simantonnayana, parting the hair of the head of a pregnant woman, on the 4th, 6th or 8th month.

Vishnubali, amongst the Mahrattas, a sacrifice to Vishnu, on the 7th month.

Jata karma, ceremonies at birth, amongst others putting of ghi into the child's mouth, with a golden spoon, before cutting the navel string.

Nama karanam, naming the child on the 10th, 11th, 12th or 101st day after birth.

Nishkramanam, taking the child out of the house when three months old to see the moon in the third light fortnight.

Suryanilokanam, showing the sun to the child when four months old.

Annaprasana, feeding the child with its first rice, on 6th or 8th month.

Karnavedha, boring the ears.

Chudu or Chula karanam, on the 1st or 3rd year and not later than the 5th year, shaving all the head save one lock, called the Chuda or crest.

Upanayana, investiture with the sacrificial thread which *falls from the left shoulder to the right hip, for a brahmin on the 8th to the 16th year ; for a* Kshatrya on the 11th and not later than the 22nd, and for a Vesya on the 12th and not later than the 24th. This constitutes the *Dwija* or second birth of these three races.

Savitri maha namya, at the time of or four days after the Upanayana, when the Gayatri is taught and repeated.

Samavarrttana, the ceremony on the student's completion of his studies and return home.

Vivaha, marriage.

Swargarohana, ascending to heaven, funeral ceremonies. Of these, the 3rd, 9th, 11th, 14th and 15th, are either local or modifications of others. Women have also the Sanskara of marriage.—*Wils. Glos.* See Yugbyasa.

SANSPAUR, Hind. Asparagus racemosus.

SANSTHAVA, Sans. Monastery, a college.

SANTAL. The Santal, Mundah, Bhumi, and Horaces, speak languages nearly identical. They occupy most of the British districts of Chota Nagpore, Singbhoom, Maubhoom and the hilly part of Bhagulpur, (the Rajmahal hills excepted) now known as the Santal pergunnahs ; also, parts of West Burdwan, Midnapore and Cuttack, an extensive country west of Calcutta. The Santal are a simple, industrious, people, honest and truthful, tractable and free from caste prejudices. Their country is healthy, their numbers are increasing and they are much sought after and prized as labourers, by the Bengal Indigo planters, and on the railways, and other works of Western Bengal, and in the Assam tea plantations. These tribes live apart in detached houses or isolated hamlets, or homesteads. The Santal are a branch of the Mundah Kol. They seem to have separated when the Mundah fell back on Chota Nagpore from the Damudah river, which the Sontal call their sea, and they preserve the ashes of their dead until an opportunity occurs of throwing them into that stream or burying them on its banks. The Santal are now most numerous in the Sontal pergunnahs, but there are many in Mohurbung, and there are several colonies of them in the Singbhoom district. They are an erratic race ; but, Lieut. Col. Dalton thinks that they left their chief settlements on the Damudah river, from having been pressed by the Kurmi. The Sontal, Bhumij and Mundah tribes have long been known to be intimately connected, and they have affinities with the wild clan of the Korewah of Sirgujah and Juspur, the Kheriah tribe of Chota

Nagpore and the Juanga of the Cuttack tributary mahals. Since the beginning of the nineteenth century they have intruded themselves into some of the Rajmahal districts, which therefore now contain two populations, allied to each other, but speaking languages said to be mutually unintelligible. The Sontal and Bhumij races have suffered in esteem in consequence of the human sacrifices offered at the shrine of Kali, as Runkini, but these races personally do not much care for this goddess, at whose shrine the establishment and ritual are essentially brahminical. The Santal and Rajmahali are markedly different in habits, appearance, manners and national characteristics, and on the Chota Nagpore plateau, these differences are very marked. The Santal are a very ugly race, with flat broad nosed features. They are a more simple, mild and industrious race than the Rajmahali, Gond, or Khond. Though the Santal are geographically near the plains, the Santal seem to be more shy and more socially isolated than the Mundah, Bhumi and Ho. They have kept much to themselves, prefering locations surrounded by jungle and segregated from the world, and cultivate the lower lands of their country, but they have latterly taken to labour for hire.—*Dalton, pp.* 154, 155, 157 ; *Mr. Campbell, pp.* 33, 4, 5.

SANTA CRUZ ISLANDS, are two small islands on the western side of the Philippines.

SANTALACEÆ, *R. Br.* The Sanderswood tribe of 6 gen., 10 species, viz., 2 Thesium ; 2 Santalum ; 2 Osyris ; 2 Spærocarya ; 1 Scleropyrum ; 1 Octarillum.

SANTALE ROUGE, FR. Saunders wood.

The synonyms of this plant are also given under sandalwood, but arranged according to their derivation. This small, but very valuable tree, the white or true sandalwood tree, is found in abundance on the hills which separate the Coimbatore district from Mysore, also, in abundance in Coorg and Mysore, and sparingly in Canara. In the Dekhan, this tree grows both in gardens and the jungles. It is usually cut into billets, and disposed of by weight. The scent is believed to be much modified by peculiarities of soil and elevation. It is remarkable for its agreeable fragrance, is a preservative against insects, and is much used in making work boxes, walking sticks, penholders, and other small articles of fine ornament. Sandalwood is a favorite cosmetic with Burmese ladies. It bears a small black berry, which if planted grows without any trouble. The wood is generally brought for sale in small logs seldom exceeding eighteen inches in length. An inferior kind of sandalwood is produced by a tree in the southern part of Mergui province, and forms an article of commerce. The Rakta Chandana is the red sanders wood (Pterocarpus santalinus). The Santalum or Syrium mytrifolium, grows in the Northern Circars, and Dr. Roxburgh considered it a strongly marked variety of the Malabar sandal tree. The attractive nature of the sandal tree is described in the sloka, "Round the stem of the Chandana dwell serpents, on its top birds, on its branches monkeys, on its flowers bees,—so the riches of a good man are beneficial to all. There are three kinds of sandalwoods known in commerce, the white, the yellow, and the red. The latter is from the Pterocarpus santalinus, *Linn.*, also called saunder's wood, or red sander's wood, but the white and the yellow are both from the Santalum album, a small or moderate-sized tree which grows in both the Indian peninsulas, in Assam, Cochin-China, China and, as the various names will show, in some of the islands of the Eastern Archipelago in southern India, it grows in a wavy tract from S. Canara southwards into Mysore and Coimbatore ; its wood is cut into billets of 50 to 70 lbs., and sold by weight in that state. It is burnt as a perfume, in houses and temples, both in India and China, is used in the funeral ceremonies of the hindoos ; is employed for trunks, almirahs, &c., as a preservative against insects ; is much used in making work-boxes, walking sticks, pen-holders and other small articles of fine ornament ; its powder is a favourite cosmetic with hindoo, Chinese and Burmese ladies, and hindoos use it to form the sectarian marks on their foreheads ; it is much used among the Chinese in cabinet work, and in the manufacture of fans, and other ornamental articles, and a valuable oil, used as a perfume, is distilled from its wood. The sandalwood trees in Mysore, Canara, Coimbatore, Salem, and some in North Arcot, received much attention from Dr. Cleghorn, its spontaneous growth has increased to a considerable extent, and he thinks it certain that with the vigilant supervision of local officers and slight assistance to nature in clearing the heads of young plants, which are often matted down by strong creepers, an addition might accrue to the revenue of these provinces. In Ossoor and Denkinakotta are sandalwood jungles. In Mysore the Colkar are employed to destroy the strong creepers which tend to choke the young plants springing from seed dropped in hedgerows by birds. It is their duty also to cut, annually, all the ripe trees, 20 years old and no other, and to take care that the billets are properly prepared and sorted, and brought into the sandal godown. The sandal tree grows to perfection in Mysore, Denkinakotta, Andyar, Collegal, and Suttimungalum and yields a large annual revenue to the state. It also thrives well in some parts of Salem, Coimbatore and North Canara. Dr. Gibson (Report, p. 162) mentions that the sandalwood appears to grow freely without any cultivation in all parts of the Bombay Deccan and may be seen in quantities in waste gardens, and even in some of their grass preserves, and trees may be seen in numbers of the hedges along the water-courses in western Khandesh. But, the northern Bombay sandalwood has not the high qualities of that found in the more southern provinces. In the Dharwar collectorate there are about 153,000 trees, a number which much exceeds that found in the whole length and breadth of the more northern provinces. Sandalwood is very liable to the heart-shake which decreases its value twenty to thirty per cent. In North Canara, there are many stills for making sandalwood oil. There is a current belief that the fragrance of the wood, depends on the local circumstances of its growth and that it is much modified by peculiarities of soil and elevation. A Chinese merchant mentioned that the sandalwood growing on rocky mountains contains the greatest quantity of oil. That of North Canara is not of the first quality, and Dr. Gibson, when at Hungul, tried the fresh sandalwood by cutting into several of the ripe trees, and, he found the wood very deficient in fragrance as compared to that of Mysore. There is a depôt for this wood in the forests near Denkinakotta, which the poojalies, for a few months of the year, work very laboriously and cheaply, felling, cleaning, shaving and cutting the trees into billets of $2\frac{1}{2}$ to $3\frac{1}{2}$ maunds of 25 lbs. each for one Rupee and bringing the same to the nearest store. The sandalwood tree grows slowly and irregularly, in the Archipelago, where it generally attains a height of 8 feet without branches, and 30 feet with branches and 2 feet in diameter. The heart-wood of the tree, yields the oil and one pound of the wood will yield about 2 drams. The wood increases in fragrance in age. The sandalwood of the Sandwich group is from two other species of the same genus, S. freycinetianum and S. paniculatum ; but the name is also applied to the wood of the Exocarpus latifolia, which grows in the Percy Islands, Repulse Bay, Cape-Upstart, Palm Islands, &c. &c., though it is useless as a substitute. In 1847 nearly 1,000 tons of the true sandalwood, procured chiefly from New Caledonia, the New Hebrides, &c., were exported, from Sydney to China, where it is burnt with other incense in the temples. The sandalwood trade in these islands gives employment to about six small vessels belonging to Sydney. In China, it realizes about £30 per ton. The oil exports from Madras ports of the Chandana nuna, Tel. ; Chundana yennai, Tam., amount annually to about 100 cwt. Oil of the seed, or sandal seed oil from the seeds of the sandal-wood tree. They yield by expression a thick and viscid oil which is burnt by the poorer classes in lamps.—*Dr. Gibson, Conservator's Reports,* 1849 *to* 1856, *p.* 162, *and* 1857 *to* 1860, *p.* 58 ; *Dr. Cleghorn's Conservator's Report, p.* 41 ; *McGillivray's Voyage, Vol* i, *pp.* 97-8 ; *Dr. Wight* ; *Bennett's Wanderings in N. S. Wales* ; *M. A. J. R.* ; *M. E. J. R.* ; *Wight, No.* 94, *Travancore* 263, *Mysore* 1, *Coorg* 3, *Masulipatam, Madras, Hort. Garden* 75, *Cleghorn, Mysore* ; *Riddell* ; *Mason* ; *Flora Indica, Vol.* ii, *p.* 464 ; *Hind. Theat., Vol.* ii, *p.* 96.

SANTALUM FREYCINETIANUM, the sandalwood tree of the Sandwich Islands, is from two species S. freycinetianum and S. paniculatum. And, the name of sandalwood is also given to the wood of the Exocarpus latifolia, which grows in the Percy Islands, Repulse Bay, Cape-Upstart, Palm Islands, &c., &c., but it is useless as a substitute. These grow in the south Sea Islands, at Hawai, Fiji and New Hebrides, but has been nearly extirpated by the avidity of traders.—*Bennett's Gatherings, p.* 419.

SANTALUM MYRTIFOLIUM is a separate species, or a strongly marked variety of S. album, found by Dr. Roxburgh in the mountains of the Rajahmundry Circar, and figured by him in Plate 2 of his 'Coromandel Plants :' it is distinguished by its opposite lanceolate leaves. The wood is of little value, according to Dr. Roxburgh, but Dr. Wallich says it is 'certe odoratissimum.' About 200 tons of sandalwood are annually imported into Calcutta from the Malabar coast, and about twice as much into Canton from the islands of the Indian Archipelago. Dr. O'Shaughnessy says Santalum myrtifolium is synonymous with the S. album of Roxburgh's Coromandel plants, a native of the continent of India, Timor, &c. ; that it is a small tree, with yellow flowers, in stalked, trifid, axillary cymes, leaves narrow and oval, and affords the sandal wood of Malabar. He adds that Roxburgh makes the Santalum album and S. myrtifolium, two distinct species. S. album thrives luxuriantly in the Calcutta Garden, is in flower and seed nearly the whole year, and is easily grown from seed.—*Eng. Cyc.* ; *O'Shaughnessy, p.* 532.

SANTA MARIE, Port. See Poverasjite.

SANTANG, see Kyan.

SANTHA, Hind. Dodonæa burmanniana.

SANTIPORE, a town of Nuddea. In the Santipore women are observed, that light, female form, that slender and delicate make, that graceful shape and elegance of proportions, and that smooth, soft body, which constitute the native beauty of Bengal.—*Tr. of Hind., Vol.* i, *p.* 22.

SAN TOME, or Saint Thomé, a sea coast suburb of Madras, 4 miles to the south.

SANUK FATEEHA.

SANWAK, Hind. Oplismenus frumentaceus, Panicum colonum.

SANWAK, a class of slaves in Chota Nagpore, a hereditary slave ; the Bandha Sanwak is a slave for life, but whose children are not slaves, and the Chuta Sanwak is described as a slave for debt. Also in Chota Rangpur, Ramgurh, and Hazaribagh, there are Sanwak life-slaves, generally from the hill tribes.—*Wilson's Glossary.*

SANWAR, Hind. Rhazya diffusa, Rhazya stricta.

SANVITALIA PROCUMBENS, a pretty compact plant, adapted to cover a small patch or bed, in the flower garden, colour yellow, and raised from seed.—*Riddell.*

SANYAL PEN, or Saualk the spirits of the departed, amongst the Gond are worshipped or propitiated for a year after death ; but persons of note, headmen of villages or priests are treated as gods for years or generations, and sacrifices are usually offered at their Sthapana or shrines of earth.

SANYASI. Amongst the rules prescribed for a hindoo man, the brahman, the Kshatrya and the Vesya have to pass through four stages (asrama) in life, the Brahmachari or religious student ; the Grihashta or householder, the Vanaprastha or hermit, and the Bhikshuka or Sanyasi, religious mendicant. —*Wilson's' Glossary.*

SANYASI. Amongst the hindoos, a wandering religious mendicant, generally a follower of the Saiva sects. The Sanyasi is a professed ascetic, but some of them marry, an instance of which in, 1868, was the Sanyasi family at the temple of Mahadeo at Rainapur near Mominabad. Amongst the Vaishnava, the terms Sanayasi and Vairagi are in a great measure restricted to peculiar classes, but amongst the Saiva, all the sects, except the San-yogi Atit, are so far excluded from the world, as not to admit of married teachers, a circumstance not uncommon amongst the more refined followers of Vishnu. In general, the Bramachari or student, and the Avadhuta or Avdhauta and Alakhnami, express all the Saivi class of mendicants, except perhaps the Jogi. The Brahmachari or students are also regarded as Sanyasi, and where the term is used in a definite sense, the twelve classes, viz , the Dandi, Brahmachari and ten Dasnami orders are implied. Sanyasi and Viragi are terms applied generally to all the erratic mendicants of the hindoos, of all religious orders. The terms signify a man who has abandoned the world or overcome his passions. Occasionally, however, the people distinguish between a Sanyasi and a Viragi, in which case, the Sanyasis imply the mendicant followers of Siva, and the Viragis those of Vishnu. The distinction thus made requires a peculiar exception, for besides the indiscriminate application of the term Sanyasi to the Vaishnava, as well as other mendicants, there is a peculiar class of them to whom it really pertains, these are the Tridandi or Tridandi Sanyasi. These are such members of the Ramanuja or Sri Vaishnava sect as have passed through the two first states of the Brahmanical order and entered that of the Sanyasi or the ascetic life. Their practices are in some other respects peculiar : they never touch metals nor fire, and subsist upon food obtained as alms from the family of Brahmins of the Sri Vaishnava faith alone. They are of a less erratic disposition than most other mendicants, and are rarely met with in Upper India, but are found in considerable numbers, and of high character, in the south. In their general practices, their religious worship and philosophical tenets, they conform to the institutes and doctrines of Ramanuja.—*Wilson, Hindoo Sects.* See Dandi, Hindoo, Mendicants, Siva.

SANYOGI, a married mendicant ; Vivogi or Byogi, an ascetic mendicant.

SAN-YOGI ATIT, see Sanyasi.

SAOO-HULDEE, Hind., a ceremony.

SAORI, Guz. Hystrix leucura, *Sykes.*

SAOURI NUTS, see Suwarrow Nuts, Caryocar.

Sachang,	JAV.	Sibukas,	TAGALA.

The product of Cæsalpinia sapan, a thorny tree indigenous to Siam, Pegu, the Philippine Islands, Tenasserim, Bengal, Ceylon, throughout the Archipelago and the South of India. Sapan wood is imported into Bombay from Siam, and Singapore; and an inferior description, in' small quantities, from the Malabar Coast. The former kinds are occasionally re-exported to London. Sapan wood is an article of considerable commerce in the East. In 1842 as much as 78,000 cwts. were shipped from Ceylon, but the export from thence has decreased. This island, however, ships dye-woods annually to the amount of £2,000. A large quantity is exported from Siam and the Philippine Islands; as much as 200,000 piculs annually from the former, and 23,000 piculs from Manila. 3,524 piculs were shipped from Singapore in 1851, and 4,074 piculs in 1852. The picul is about one cwt. and a quarter. It forms a large export from Ceylon: the shipments from thence were, in 1842, 77,694 cwt.; in 1843, 1,692; in 1844, 2,592; in 1845, 2,854. In 1837, 23,695 piculs of sapan wood, and 2,266 piculs of roots of ditto were shipped, and in the first six months of 1843, 22,326 piculs were exported from Manila; a large portion of this comes to Europe, but some goes to China, the United States, Singapore, &c. 15,500 piculs were shipped from Manila in 1844, 5,250 ditto in 1845; and 1,210 tons in 1850. About 3,000 piculs of sapan wood and the same quantity of other dyestuffs are annually imported into Shanghae. The price of straight sappan wood at Shanghae was thirty dollars per picul. In Calcutta, in June 1850, 4,000 piculs of the root of Manila sapan wood sold freely at about 7*s*. 6*d*. per factory maund, Siam, ditto 6*s*. 75 tons were imported into Liverpool in 1849: and 120 tons in 1850, from Calcutta. The imports of sapan wood into the United Kingdom, in 1850 amounted to 3,670 tons, worth £8 to £12 the ton, and this continued the price in January 1853. One Liverpool house imported 600 tons of dye-woods in a single year, worth £9,000.

The annual consumption of heavy dye-woods in Britian in dyeing cotton, linen, woollen and silk goods, &c., exceeds in weight 51,000 tons. In 1850, Great Britain imported 3,670 tons of sapan wood valued at £7 to £12 per ton, duty free. Sapan wood, is imported in pieces like Brazil-wood, to which, for the purposes of dyeing, it is greatly inferior, it is generally too unsound to be useful for turning. At the Madras Exhibition of 1855, specimens were exhibited in billets and chips from Tanjore, Travancore, Goa and Cuddapah. A red dye is made from an aqueous extract of the chips of this wood, but it is not reported to be a fast colour, and is principally used for common and cheap cloths. It is precipitated dark brown with iron, and red with alum. A decoction of the wood is used by calico printers as a red dye; the wood contains much gallic and tannic acids and is an excellent substitute for logwood, though weaker. In the valley of the Tenasserim, between the latitudes of Tavoy city and the mouth of the Tavoy river, the hills that border the valley on the eastern side abound in sapan-wood. Considerable quantities are exported every year from Mergui, and that province is usually supposed to contain the tree, though it is really within the province of Tavoy; but the facility of water communication from the interior to Mergui, makes that the only port to which the wood is conveyed. This narrow locality is the only one in the Province in which the tree is found. The tree has a much wider range, the Karens say, on the Meinam side of the mountain in Siam. More than five hundred thousand pounds have been exported from Mergui during some years between 1830 and 1840; but latterly the forests have not been so productive. Sapan-wood, is abundant in the island of Sumbawa, and in the Provinces of Iloilo in Panay and Pangasinan in the great island of Luzon. In 1850, there were exported, chiefly to Europe and America, no less than 11,000 tons of this article from the port of Manilla. It has, like many indigenous products a distinct name in the different languages, the only agreement, and this not perfect, being between the Malay and the Javanese, in the first of which it is called sapang, the origin of the European commercial and scientific names, and in Javanese sachang. In one language of the true Moluccas we have it as samya, and in another as roro, while in

Amboynese it is lolan, and in the Tagala of the Philippines sibukas. It seems probable, however, that the Cæsalpinias which produce the dye-wood of countries which extend from the 9th degree of South to the 19th of North latitude, may be a distinct species. The sapan-wood of Luzon is by from 40 to 50 per cent. more valuable than that of Siam, that is, yields by so much more of colouring matter. In this respect all the Asiatic cæsalpinias rank far below those of Brazil. Sapan-wood, is largely exported from Madras to Calcutta. For many years past, a trade in sapan-wood from Mergui to Decca has been prosecuted by the native boats, the article being obtained from the sapan-wood forests lying near the frontier hills, from the eastern side of which large supplies are annually imported through Bangkok into Singapore. It is also found throughout the valley of the Great Tenasserim river, and is said by the Karens to be plentiful in the vicinity of the head waters of the 'Hoin bwai,' and 'Dagyne,' in isolated patches, but generally distributed throughout the whole provinces. In Siam it sells at 5*s*. 6*d*. per 133 lbs. In the Philippine islands at 9*s*. 5*d*. per 133½ lbs. The sapan-wood is the log-wood of the Archipelago, whence it is exported in large quantities to Europe, where it is employed as a red dye. In China its decoction is used as a dye, and as a staining material. The tree grows abundantly in the western, southern and central provinces of Ceylon. It is fit for cutting when about five years old, at which time it attains a height of ten or twelve feet. The exports from Ceylon have been for the last few years about 6,000 cwts. annually.—*Faulkner* ; *Simmond's Dict.* ; *Tredgold* ; *M. E. of* 1855 ; *Mason* ; *Crawfurd's Dictionary, p.* 376 ; *Poole, Statistics of Commerce.*

SAPANG, Malay. Sapan-wood, Cæsalpinia sapan, *Linn.* ; *Roxb.* ; *W. & A.*

SAPATA CHEDDY, Tam. Hibiscus rosa sinensis, *Linn.*, also pronounced Sapata cherri, Tam., Sapatapu, Tam., the flower, and Sapata cheri, Tam., the plant of Hibiscus rosa sinensis, *Linn.*

SAPEC, Jap. A cash, about the 5,200th of a dollar, *Hodgson's Nagasaki, p.* 132.

SAPEK, a Tartar money of account, equal to about 5*d*. sterling.—*Simmond's Dict.* See Sepeck.

SAPFALI, Hind. Delphinium brunonianum.

SAP-GREEN.

Luh-kiau,	Chin.	Luh-kau,	Chin.

This beautiful and permanent dye-stuff, is, in China, the product, in great part, of the Rhamnus infectorius. It is made in Shantung, Hu-peh, Cheh-kiang. That of Hankow is expensive and is sold in the form of thin, dry, bluish scales which when rubbed up produce a bluish green pigment, used to colour shark skin for covering spectacle cases. It has the purgative properties of the buckthorn in the crude state and makes excellent marking ink when mixed with lunar caustic. Lime is present in the sap-green of China, as it is added to neutralize the acetic acid which is apt to form in this as well as in the syrup of buckthorn.—*Smith, Mat. Med. of China.*

SAP'HARA, a palanquin carried on the shoulders of Nambi brahmans, *Taylor.*

SAPHIR, Fr. Sapphire.

SAPHURA KUMRA, Beng. Cucurbita maxima, *Duch.*

SAPHT, Egypt. Hyosciamus niger, *Linn.*

SAPI, Malay. A wild breed of the genus Bos. The Sapi has much the general appearance of the Bali cattle, but has not the white patch on the buttock ; the horns are small, curved inward, white, tipped with black ; the forehead is flat with a tuft of long hair on it, particularly on the bulls ; the back is curved, the highest point being about the centre ; the spines of the vertebra are usually long ; the total height of an animal killed, from foot to spines of dorsal vertebra, was six feet two inches ; the hair was smooth and silky, of a brown colour, except on the feet which were of a dirty white, a mane about two inches long runs the whole length of the spine. There is no dewlap. The fibre of the flesh is fine, well mixed with fat, a most delicious meet for flavour, tenderness and juiciness that ever could be tasted. The other species of wild cattle is the Saladang. A Malay guide Inchi Basow stated that the meat was coarser than the buffalo and not good eating, but that the animal was much larger than the Sapi, some of the bulls growing to seven "asta or cubits." This is the moderate height of 10½ feet.—*Journ. of the Indian Archip., Vol.* vi, *Nos.* v *and* vi, *May and June* 1850, *p.* 355.

SAPINDACEÆ, *Juss.*, the Soap tribe of plants or Soap-Worts, a natural order of plants belonging to the calycose group of Polypetalous exogens. It consists of trees or shrubs, rarely herbaceous plants, with erect or climbing stems, with alternate often compound leaves, rarely simple, with or without stipules, and often marked with lines or pellucid dots. Their inflorescence is racemose or paniculate, with small white or rose-coloured, rarely yellow, flowers, which are seldom barren or hermaphrodite. The calyx consists of 4-5 sepals, slightly cohering at the base. The petals are the same in number as the sepals, one being occasionally abortive. They are in general furnished with a petal-like scale, but are sometimes naked. They have a fleshy glandular disc occasionally occupying the base of the calyx. The stamens are definite, about twice the number of the sepals. The filaments are free or slightly connate, the anthers 2-celled, the ovary 3-celled, rarely 2-4-celled, the cells containing 1-2-3 ovules. Style undivided, or more or less deeply 2- or 3-cleft. The seeds have usually an aril, are without albumen, and have a curved or spirally twisted embryo. The order contains 43 genera, 150 species of which inhabit the West Indies, Mexico and South America, 1 in North America, 2 in Bengal, 4 in Guinea, 10 in South Africa ; 1 in Madagascar ; 9 in Bourbon and Mauritius ; 50 in the East Indies ; 2 in Japan ; 4 in China ; 2 in Timor ; and about 10 in New Holland. The East Indies genera and species may be thus shown :

Cardiospermum halicacabum, *L.*, all India.
canescens, *Wall.*, Burmah.
Sioja sanguinaria, *Buch.*, Goalpara, Sylhet, Ava.
Schmidelia serrata, *DC.*, Peninsula of India, Bengal.
aporetica, *Roxb.*, Sylhet.
glabra, *Roxb.*, Chittagong.
villosa, *Wight*, Chittagong.
dentata, *Wall.*, Assam.
Sapindus sapinaria, *L.*, West Indies.
laurifolius, *Vahl.*, Peninsula of India.
emarginatus, *Vahl.*, Peninsula of India.
detergens, *Roxb.*, Bengal.
rubiginosus, *Roxb.*, both peninsulas of India.
polyphyllus, *Roxb.*, Pegu.
undulatus, *Wall.*, ?
acuminatus, *Wall.*, Nepal, Himalayan valleys.
fruticosus, *Roxb.*, Moluccas.
danura, *Roxb.*, Sunderbuns.
angustifolius, *Wall.*, Khassya.
Cupania canescens, *Pers.*, Circars, Kandalla.
lœvis, *Pers.*, Bourbon, Mauritius.
roxburghii, *Wight*, Sylhet.
sapida, *Cambess*, Guinea, cultivated in India.
madagascarensis, *G. Don.*, cultivated.
alternifolia, *Willde*, Mauritius.
Harpulia cupanioides, *Roxb.*, Chittagong.
Baccaurea pierardi, *Buch.*, Tippera, Burmah, Cochin China.
dulcis, *Wall.*, Penang, Sumatra.
Nephelium lichi, *W. & A.*, China, cultivated in India.
ramosum, *W. & A.*, Sylhet.
lappaceum, *L.*, Rambutan, N. E. Archipelago.
longan, *Cambess*, China, Cochin-China, both Peninsulas of India, Khassya.
rubrum, *Wight*, Sylhet.
verticillatum, *Wall.*, Moluccas.
Schleichera trijuga, *Willde*, Peninsula of India.
Melicocca bijuga, *Linn.*, Jamaica, East Indies.
Kolreutera paniculata, *Laxm.*, China.
Cossignia bourbonica, *DC.*, Bourbon.
Dordonæa burmannia, *DC.*, Peninsula of India.
dioeca, *Roxb.*, Hindustan.

One genus is found in Australia, Dodonea. This order is closely allied to Aceraceæ, from which they only differ in their alternate leaves and petals. The number of their stamens 8, with 5 unequal sepals, point out a relation with Polygalaceæ. Their climbing habit and tendency to produce tendrils give them a remote relation to Vitaceæ. In this order, although the leaves, branches, and other organs act in a deleterious manner, yet their fruit and seeds are eatable and wholesome. The Litchi and the Longan, favourite fruits in China, are produced by the genus Euphoria ; these fruits are sweet, with a sub-acid flavour ; they are considered a great luxury in China, and are sent at a great expense from the provinces of Fokien and Quan-Tong, where they grow, to Peking, for the consumption of the emperor. Several other genera bear fruits which are very delicious, and are eaten in Japan and Brazil. Sapindus is remarkable for bearing pulpy fruit, the outer part of which has been used, on account of its detergent properties, as a soap. Some of the species of this genus also produce eatable fruits. Paulinia is another genus which has poisonous properties residing in the leaves and other parts of the plant, whilst the fruits are eatable. The whole of the order partakes more or less of these properties. In China, the seeds of a Sapindus, besides their value in cleansing, are worn as beads " because," say the budhists, "all demons are afraid of the wood," one native name means preventative of evil. Euphoria li-chi, is one of the most delicious and delicate-flavoured fruits of the east, and though a native of China, succeeds well in most parts of India, as it does so in Euphoria longan and Nephelium, the Rambootan of the Malayan Archipelago yield edible fruits ; as well as Euphoria rimosa and rubra, both inhabitants of the Sylhet district, which are eaten by the natives of that district ; so are those of Melicocca trijuga, called even in the distant parts of India where this tree is indigenous, kusoombha and gusum, and where, as in the Doon in April, it may be readily recognised at a distance by the red colour of its young leaves. All its parts of fructification are liable to considerable variation. The pulpy sub-acid aril, as Dr. Roxburgh remarks, forms a grateful fruit ; the wood is hard and used as timber. Schmidelia serrata, of which the root is said to be astringent, yields also an edible fruit. The wood of several species is close-grained and hard, and forms valuable timber, as of Sapindus rubiginous, and of Euphoria longan and li-chi ; the latter also one of the most ornamental of trees. The edible fruit of the Indian and Malayan species of Pierardia, (P. sativa and dulcis), a genus referred by M. Blume to Euphorbiaceæ, is known. The latter, Dr. Jack is of opinion, consists of two varieties ; the Rambeh, of which Mr. Marsden has given a figure in his history of Sumatra, (Pl. vi, p. 101,) belonging to the peninsula of

Malacca, but unknown at Bencoolen ; while the Choopa, from which Dr. Jack has described the species, is abundant at the latter place, but not found in the former. To this genus is nearly allied a Dr. Jack states, (Lin. Trans. xiv, p. 118) is Hydnocarpus, of which the only species H. malayanus, yields the Tampui, a fruit ranking in point of taste and flavour along with the Lanseh. This, belonging to the genus Lansium of Jack (l. c. p. 115) is closely allied to Milnea of Roxburgh, also yielding an edible fruit, and both belonging to the Meliaceæ, and in many respects resembling Pierardia, and showing the connection between the two families. Several species furnish useful timbers, and edible fruits.—*Royle, Roxb., Voigt.* ; *Eng. Cyc.* ; *Williams' Midd. Kingd. p.* 286.

SAPINDUS, a genus of plants of the natural order Sapindaceæ, names derived from Sapo indicus or Indian soap, the berries of several of the species being employed as a substitute for soap. In America, the S. saponaria, in Java, S. rarak, in India, S. acuminatus, S. laurifolius, and S. emarginatus, and S. detergens (the last, according to Dr. Roxburgh, nearly allied to S. saponaria), are all used for the purposes of soap ; owing, it is now ascertained, to the presence of the vegetable principle called saponine. This has been traced in many other vegetables, which have the property of forming a lather with water. Some of this genus, as Sapindus esculentus and S. senegalensis, yield edible fruit. Sapindus laurifolia, ***Roxb.***, is a stout, very shady tree, of various parts of India : S. squamosus, ***R.*** is a native of the Malay Archipelago and of the island of Nassaulaut. S. longifolia and S. fruticosus, ***R.***, and S. serratus, ***R.*** are trees of the Moluccas.—*Willde* ; *Royle, Ill. Him. Bot., p.* 138.

SAPINDUS, *Species.*

Koote legree,	CAN.	Khete,	MAHR.

This is common in Canara and Sunda, in the ravines below, but is not common on the high lands of Canara : its wood is not used in the arts, but for building purposes, is of average quality.—*Dr. Gibson.*

SAPINDUS, *Species.*

Tsheik khyee, BURM.

This species is found on the hills, and in the forest skirting them in British Burmah where the wood is prized for house posts, ploughs, &c. Its color is grey, with a beautifully mottled grain. A cubic foot weighs 66 lbs. In a full grown tree on good soil the average length of the trunk to the first branch, is 40 feet, and average girth measured at 6 feet from the ground, is 6 feet.—*Dr. Brandis, Cal. Cat. Ex.,* 1862.

SAPINDUS, *Species*

Chitra, HIND.

Not uncommon in Murree and Hazara.

SAPINDUS ACUMINATUS, ***Wallch, Royle.*** A tree of the valleys of the Himalaya, of Nepaul and the Khassya mountains, *Voigt.*

SAPINDUS ACUTA, ***Roxb.*** Syn. of Sapindus laurifolius, *Vahl.*

SAPINDUS DETERGENS, ***Roxb.***

Do dan,	HIND.	Soap nut tree,	ENG.
Ritha,	,,	,, berry ,,	,,
Aritha,	,,	Arishta,	SANS.
Haritha	,,		

A small but handsome tree ; berries used for washing woollens and silks, also for the hair of the head. It forms a soapy admixture with water. In medicine, applied externally to pimples and abscesses, internally in cases of headache, also in epilepsy, and as an expectorant ; if pounded and thrown into water it destroys fish. It is also recommended as an expectorant and for the cure of chlorosis, also to stop epileptic fits by placing its powder in the mouth.—*Roxb.* ii, 280 ; *Voigt, p.* 94 ; *Lt. Col. Lake* ; *Dr. J. L. Stewart* ; *Powell Hand-book, Vol.* 1, *p.* 330.

SAPINDUS EMARGINATUS, *Vahl. Roxb.* ; *W. and A.* ; *Ill. Graham.*

This handsome tree grows in the peninsula of India, and in Bengal ; it is met with in the villages, its fruit is sold in all bazars as a detergent, and in many cases yields a more profitable return than any other fruit tree. The wood is white, and Dr. Gibson had seen it used only for fuel, but Captain Beddome describes it as a yellowish, prettily grained wood and adds that it is tolerably hard. Its semi-solid oil, extracted from the kernel, is used medicinally. Its cost prevents its general use. When the soap nut is mixed with water it froths like soap, and is used instead of that substance for washing woollens, silks and hair. Dr. Sherwood has mentioned that the seeds pounded with water often put an end to the epileptic paroxysm, a small quantity being introduced into the patient's mouth. Another species, the S. saponaria, has been used in medicine in the treatment of chlorosis, in the form of the tincture or extract of the soapy matter of the capsule. The nuts themselves are exceedingly hard and tough, and as they take a fine polish are employed for necklaces and beads. The kernels of the small black nuts of the S. saponaria are eaten in the West Indies, and deemed as palatable as the hazel nut or almond. The roots as well as the capsules are used in washing, but it is stated that the fabric washed is rapidly corroded ; this however requires confirmation. Wight suspects the Poochay cottay marum, to be the same as S. detergens, *Roxb.* The fruit is used for the same purposes as indicated by the characteristic native name. His S. emaginatus may be a different plant as the fruit does not correspond. Mr. McIvor says, the wood is elastic, strong and durable, common in Wynaad.—*Drs. Roxb Wight, Gibson, Cleghorn* ; *O'Shaughnessy, p.* 241 ; *Captain Beddome* ; *Edye, Forests of Malabar and Canara* ; *M. E. J. R. McIvor, M. E. of* 1857.

SAPINDUS FRUTICOSUS, *Roxb.* A shrub, native of the Moluccas, with pretty, coloured, small, flowers, in racemes in March, and fruiting in May. Introduced into the Dekhan from the Moluccas.—*Voigt* ; *Riddell.*

SAPINDUS LAURIFOLIUS, *Vahl.*

Sapindus acuta, *Roxb.*	S. trifoliata, *Linn.,Rheede.*
Purinsji, MALEAL.	Urinji, MALEAL.

This tree grows in the Peninsula of India where its fruit and leaves are used in medicine. Its berries are saponaceous and used by all.

SAPINDUS RUBIGINOSUS, *Roxb. W. & A., Willde.*

S. fraxinifolia, *DC.*	Moulvisia rubiginosa, *G. Don.*

Hseik-kyi,	BURM.	Isakarasi manu,	TEL.
Rusty soap nut,	ENG.	Ishi-rashi,	
Rithi-ka-jhar,	HIND.	Undurugu manu,	
Mani pungum,	TAM.		

This tree grows in both the peninsulas of India, it is a large timber tree in the mountainous tracts of the Circars, it is found, though not very plentiful, in the Pegu district, where it attains a girth of three or four feet, growing tall in proportion and straight. Its wood is white coloured, large, straight, strong and durable, and useful for a great variety of purposes. When dry it has something the appearance of teak, but, towards the centre it is chocolate coloured. Its Tamil name is derived from the quantities of silex or sand it contains, particularly near the bark, and which injures tools used in working it.—*Voigt* ; *Hort. Cal. Cat.* ; *Mr. Rhode's MSS.* ; *Dr. McClelland, Flor. Andh.* ; *Roxb., Vol.* ii, *p.* 283 ; *Ains. Mat. Med , p.* 213.

SAPINDUS SAPONARIA. ?

Aritha ; Ritha, HIND.	Soap nut. ENG.

The dried berries are brought to Ajmere from Kotah, Malwa and Mewar, they are not used in medicine ; but are much employed in dyeing, and as a detergent : eight seers are sold for the rupee.—*Gen. Med. Top., p.* 122.

SAPINDUS TRIFOLIATA, *Linn., Rheede.* Syn of Sapindus laurifolius, *Vahl.*

SAPINDUS UNIJUGUS, *Thw.* A large tree, in the Hewahette district of Ceylon, at an elevation of 3,000 to 4,000 feet. Wood not known.—*Thw. En. pl. Zeyl., p.* 56.

SAPISTAN, HIND. Cordia myxa.

SAPIUM, a genus of plants belonging to the natural order Euphorbiaceæ. The flowers are monœcious, the calyx bifid and 3-toothed, the style trifid, and the capsule 3-coccous. Wight gives Sapium baccatum, S. Indicum. S. baccatum is a tree of Assam, with minute greenish flowers.—*Roxb.* ; *Eng. Cyc.* ; *W. Ic.* ; *Voigt.*

SAPIUM INDICUM, *Willd., Roxb., W. Ic.*

Huruga, BENG.	Kirri nakooloo Gass, SINGH.
Benjieri, MALEAL.	

A small tree of the warmer parts of Ceylon, the Coromandel coast, south Konkun, the Sunderbuns and Assam, with minute greenish flowers, and in fruit all the year round. Capsule or nut globular, size of a nutmeg, 3-celled, 6-valved, thick and exceedingly hard, seed solitary, fixed by apex, smooth, juice very poisonous, taste exceedingly nauseous, seeds used for intoxicating fish.—*Hort. Cal.* ; *Roxb.* ; *O'Shaughnessy, p.* 562 692 ; *Thw. En. pl. Zeyl., p.* 296.

SAP-MARIL, BENG. Circaetus gallicus, *Gm.*

SAPO, LAT. Soap.

SAPODILLA PLUM.

Achras sapota, *L.*	A. zapotilla, *Browne, Jr.*
Bully tree.	Common sapota.

This, a native of the West Indies, is largely cultivated in the East Indies, its fruit, when ripe, is luscious, its bark is used medicinally and its timber makes good shingles.

SAPONACEOUS PLANTS. Many tropical plants furnish useful substitutes for common soap. The aril which surrounds the seed and the roots of Sapindus saponaria, an evergreen tree, is used as soap in South America and the West Indies under the name of soap berries. The seed vessels are very acrid, they lather freely in water and will cleanse more linen than thirty times their weight of soap, but in time they corrode or burn the linen. Humboldt says that proceeding along the river Carenicuar, in the Gulf of Cariaco, he saw the Indian women washing their linen with the fruit of this tree, there called the parapara. Some other species of Sapindus and of Gypsophila have similar properties. The bruised leaves and roots of Saponaria officinalis, a British species, form a lather which much resembles that of soap, and is similarly efficacious in removing grease spots. The bark of many species of Quillaia, as Q. saponaria, when beaten between stones, makes a lather which can be used as a substitute for soap, in washing woollens and silk clothes, and to clean colors in dyeing, in Chili and Brazil, but it turns linen yellow. The fruit of Bromelia pinguin is equally useful. A vegetable soap was prepared 100 years ago in Jamaica from the leaves of the American aloe (Agave americana) which was found as detergent as Castile soap for washing linen, and had the superior quality of mixing and forming a lather with salt water as well as fresh. Dr. Robinson, a naturalist, thus describes the process he adopted in 1767, and for which he was awarded a grant by the House of Assembly :—"The lower leaves of the Curaca or Coratoe (Agave karatu) were passed between heavy rollers to express the juice, which, after being strained through a hair cloth, was merely inspissated by the action of the sun, or a slow fire, and cast into balls or casks. The only precaution necessary was to allow no mixture of any unctuous materials, which destroyed the efficacy of the soap. A vegetable soap, which has been found excellent for washing silk, &c., may be thus obtained ; to one part of the skin of the Ackee add one and a half part of the Agave karatu, macerated in one part of boiling water for twenty-four hours, and with the extract from this decoction mix four per cent. of rosin. In Brazil, soap is made from the ashes of the bassura or broom plant (Sida lanceolata) which abounds with alkali. There are also some soap barks and pods of native plants used in China as substitutes for soap. The bark of Quillaia saponaria renders water frothy, and is used as a detergent by wool dyers. Saponaria vaccana is common in India. The pericarp of Sapindus emarginatus mixed with water, froths like soap. Saponaceous berries are found in Java. The Sapindus is used as a substitute for soap, as Sapindus acuminata, Laurifolius emarginatus, and detergens, all of them. East Indian plants are similarly used.—*Simmonds, p. 575.*

SAPONARIA, a genus of very ornamental plants belonging to the order Silenaceæ, with pretty species of rose coloured, pink or yellow flowers ; S. procumbens from its trailing habit, suited for covering rock work. S. ocymoides is one of the most elegant, and is also well adapted for rock work. The properties of Saponaria vacçaria, well known in India, are identical in every respect with those of the S. officinalis, or soap wort, the Στρουθιον of Dioscorides. The taste of the entire plant is bitter, the roots are cylindrical, two or three feet long, the thickness of a swan quill, branching above, epidermis ruddy, thick, and easily separable ; parenchyma white and solid. The taste of the root is bitter and mucilaginous ; the infusion is blackened by salts of iron, and the decoction froths like a solution of soap. According to Bucholz' analysis, these properties are due to the presence of a mucilaginous extractive called saponine.—*Riddell* ; *Eng. Cyc.* ; *O'Shaughnessy, p.* 212.

SAPONE, IT. Soap.

SAPOO, SINGH., a soft, firm, but rather open though even grained, light, Ceylon wood.

SAPOOMIDILE, a soft, rather coarse, open grained, light, Ceylon wood.

SAPOR or Shapur, the second sovereign of the Sassanian dynasty of Persian kings. It was this sovereign who captured the Roman emperor Valerian. He succeeded the Artaxerxes, of the Greeks and Romans, that being their mode of pronouncing Ardeshir. Ardeshir Babegan, the son of Sassan, was an officer of the Parthian king, Arsaces Artobanus V, and assumed the Persian throne as the first of the Sassanian dynasty in A.D. 226 ; his successor was the Shapur or Sapor who captured the emperor Valerian. There were other Artaxerxes, the first in A.D. 381, and the second in A.D. 629, and the Sassanian dynasty ended in A.D., 641, when Yezdejird or Izdejird iii, was overthrown by the mahomedans. Artaxerxes Longimanus was the Kai Bahman or Adashir daraz-dast of the Kaianian dynasty of Persian kings. Artaxerxes Mnemon, a Persian king, B.C. 426, at whose court Ctesias resided for some years. After Scylax, Ctesias was the next historian in India, and in his Indica cap. iv., p. 190, he mentions that Artaxerxes Mnemon and his mother Parasatys presented him with two iron swords, which when planted in the earth, averted clouds, hail and strokes of lightning. This is the first notice of the lightning conductor.—*Prinsep by Thomas.* See Greeks of Asia, Kabul, Persian kings, Scylax, Lightning conductor.

SAPOTACEÆ, *Endl.* The Sappodilla tribe of plants, comprise 5 genera, 22 sp., viz., 2 Chrysophyllum ; 5 Mimusops ; 7 Bassia ; 6 Sideroxylon ; 2 Isonandra ; which may be thus shown :

Achras sapota, *Linn.*, East and West Indies.
  sessiliflora, *Poir.*, Mauritius.

Lucuma mammosa, *Juss.*, America, China, East and West Indies.
Chrysophyllum cainito, *L.*, E. and W. Indies, S. America.
  roxburghii, *G. Don.*, Assam, Khassya.
Imbricaria commersonii, *G. Don.*, Bourbon, Mauritius, Java.
Mimusops elengi, *Linn.*, Moluccas, Ceylon, both Peninsulas of India, Bengal, Sylhet.
  obtusifolius, *Lam.*, Mauritius.
  kauki, *L.*, Malabar, Gour, Malay Islands, New Holland, Moluccas.
  hexandrusus, *Roxb.*, Circar mountains, Bombay.
  erythroxylon, *Bojer*, Bourbon, Mauritius.
Bassia longifolia, *L.*, Ceylon, Malabar, Coromandel.
  sericea, *Bl.*, Java.
  latifolia, *Roxb.*, Peninsula of India, Malwa.
  cuneata, *Bl.*, Java.
  butyraceæ, *Roxb.*, Nepal, Almorah.
  parkii, *G. Don.*, West Africa.
Sideroxylon inerme, *L.*, ?
  regium, *Wall.*, Pegu.
  cinerium, *Lam.*, Mauritius.
  tomentosum, *Roxb.*, Ghauts.
  wallichianum, *Wall.*, Penang,
Isonandra lanceolata, *Wight*, Peninsula of India.
  villosa, *Wight Ic.*, Peninsula of India,
  gutta, Malay Peninsula, Java. Borneo.

This natural order of trees or shrubs, have simple and alternate leaves, flowers solitary, or in fascicles at the axillæ of the leaves, gorged with a milky white juice. No individual of this order is really dangerous, the juice being devoid of acrid or irritating properties. The barks of many species are astringent, the fruits pulpy, acidulous, and edible. The seeds contain an oil rich in stearine. The butter tree of India, and of Mungo Park, Bassia butyracea, is one of this family ; it also contains the Sideroxylon, or iron wood ; the Achras sapota, Sapodilla plum, has delicious fruit with very bitter seeds, believed in Martinique to be powerfully diuretic ; the bark is deemed a substitute for cinchona. The Indian Sapoteæ spread from the Islands of the Indian Archipelago along the Malayan peninsula to Sylhet, and from that to Nepal, where the Bassia butyracea is found, as well as in the neighbourhood of Almora. The most remarkable product is that of the Fulwa or Phulwara, Bassia butyracea, the butter or ghee tree of the Almora and Nepal Hills, which is of a delicate white colour, and of the consistence of fine lard, but without any disagreeable smell ; it is highly esteemed as a liniment in rheumatism, contraction of the limbs, &c., and when used by natives of rank is frequently impregnated with some fragrant atar ; the tree very much resembles B. latifolia but may be distinguished by its much less fleshy corols and more numerous stamens ; it grows on the southern aspect of the Almora Hills, flowering in January and ripening its fruit in August ; the kernels, about the size and shape of almonds, are easily extracted from the smooth chesnut-coloured pericarps, when they are bruised and rubbed up to the consistency of cream, and subjected to a moderate pressure in a cloth bag ; the oil concretes immediately it is expressed, and retains its consistency at a temperature of 95°.—*Lindley, Fl. Med.*, *p.* 388 ; *O'Shaughnessy, p.* 427 ; *Royle Ill. Him. Bot., pp.* 262-63 ; *Roxb., As. Res.*, viii.

SAPOTA, *Species.*

Lawoloo, SINGH.

A tree of the western province of Ceylon, the berries of which are eaten by the natives. The wood is little durable, lasting only 10 years, but it is used in common house building purposes. A cubic foot weighs 39 lbs.—*Mr. Mendis.*

SAPOTA, *Species ?*

Palaepean, BURM.

In Tavoy, a very large tree, used in buildng.—*Dr. Wallich.*

SAPOTA ELENGOIDES, *A. DC.*, ; *Prod.* A large tree of the hot, drier parts of the island of Ceylon, common on the Neilgherries, wood strong and elastic like the hawthorn, burns well when green.—*Thw., En. Pl. Zeyl., p.* 175 ; *McIvor, M. E.*

SAPPAN-WOOD. Wood of Cæsalpinia sappan, *L.* ; See Dyes, Bakam, Patang, Sapan,

Sapphirus,	LAT.	Zaffiro	IT., SP.
Nila : Manila,	MALAY.		

Corundum, if translucent, when red is the oriental ruby ; when blue a sapphire, when green it is the oriental emerald, and when yellow a topaz. Sapphire (sapphirus) with the ancients, was a generic term for all blue gems. It was on tablets of the sapphire, so often mentioned in holy writ, that the ten commandents were engraved. It was supposed to preserve the sight. It occurs in parts of India. In the arts, minerals with other colours are also styled sapphire, the names being dependent on their colours. White sapphire, is transparent or translucent ; the oriental amethyst is purple ; the oriental topaz, yellow ; the oriental emerald, green : and some other varieties occur, as the chatoyant and the opalescent sapphire. Chemically, sapphire is a pure alumina ; it occurs in six-sided prisms often with uneven surfaces ; it also occurs granular. When the surface is polished, a star of six rays corresponding with the hexagonal form, is in some specimens seen within the crystal. The sapphire ranks next to the diamond in hardness. The sapphire is used in the jewelling of watches ; the oriental ruby, of fine colour and free from flaws, is more valuable than a diamond of equal weight. In Mr. Hope's collection is a blue sapphire which cost £3,000. Sapphire occurs in Ceylon, in dolomite. A piece dug out of alluvium near Ratnapoora, in 1853, was valued at £4,000. In Burmah, sapphires are found in the same earth with the rubies, but are much more rare and are generally of a larger size. Sapphires of ten or fifteen rutti without a flaw are common, whereas a perfect ruby of that size is hardly ever seen. The value of the gems, rubies and sapphires, obtained in a year may be from 1¼ to 1½ lac, from £12,000 to £15,000. Dr. Helfer writing from Mergui says "a Karen informed him that precious blue stones are to be had, which the Shan people collect and carry to Bangkok. He described the place as eight days' distant, and did not know whether it was British or Siamese." The green sapphire, or oriental emerald gem, is often seen for sale among the Burmese. The red sapphire, or ruby, or oriental ruby, is brought from Burmah, where it is found with the common blue sapphire, probably in the valley of the Salwen. The Burmese call it by the same name that they do the precious garnet, and do not appear to be always able to distinguish them. The violet sapphire, or oriental amethyst, is found in the same localities as the common sapphire. Corundum sapphire, ruby, emerald and topaz are found in great abundance in the peninsula of India but not with sufficient translucence, to be valuable as precious stones. Some small fragments of sapphire and of spinel, with the matrix in which it occurs, were exhibited from Masulipatam. Sapphires, in colour, vary from white to the deepest blue and black, but stones are often of varied hues. If held in water, with forceps, these coloured and uncoloured stones will be seen. A very good blue sapphire of one carat weight would bring £20. The white sapphire is sometimes sold as a diamond. The adamant described by Pliny, in the opinion of Professor Tennant, was a sapphire, as proved by its form, and by the fact that when struck on an anvil by a hammer it would make an indentation in the metal. A true diamond, so treated, would fly into a thousand pieces. Sapphire (sapphirus) with the ancients, was a generic term for all blue gems. The sapphire of the Greeks and Romans is described as intermixed with gold but, according to Mr. Emmanuel, that of Scripture was a transparent blue stone.—*Emmanuel*; *Eng. Cyc.*, *p.* 451; *Tomlinson*; *Mason*.

SAPPHIRINE is calcedony tinged with pale blue.

SAPPHIRINE GURNARD. Cuvier mentions that, in India, there are species allied to Trigla hirundo the sapphirine gurnard.

SAPPHIRUS, Lat. Sapphire.

SAPPRAH MARAM, Tam. Bixa orellana.

SAPRIA GRIFFITHII, a plant closely allied to Rafflesia, which was discovered in the Assam mountains by Griffith, is the most remarkable form known to occur there.

SAPROTRI, Hind. Saxifraga ligulata.

SAPTHAPATHINAM, see Hindoo.

SAPULOBUA BANDER, see Johore.

SAPUN, a river of Baitool.

SAPUSUND, Beng. Amberboa moschata.

SAR, Hind., Pers., the head, often employed to form compound words, Sardar, a chief; Sar-kar, a government, a head servant; Sarhad, a boundary; sarrashtadar, the head of a department; Sar-band head-binder, is the source of the turban, the s being changed into t.

SAR, Hind., see Sarkara.

SAR, or Ser, Hind., a grass, Imperata koenigii.

SAR, also sara, Hind. Saccharum sara.

SARA, Sarah, wife of Abraham.

SARA, Hind. Picea webbiana.

SARABAITES, see Math.

SAR, Baluch, the northern Indus, from the junction of the Punjab rivers to the town of Sihwan. It is also a Slavonic word. Gatterer and Niebuhr mention that Sauromatæ means northern Medes, and north of the Caucasus were the province and tribe of Siracene.—*Elliot, Hist. of Hind.*

SARABAS, see Kyan.

SARACEN, see Acre, Kasr, Semitic races.

SARACEN CORN, Fagopyrum *sp.*

SARAF, Hind. A money changer or banker.

SARAHI, an affluent of the Beas river.

SARAI, the capital of the khans of Kapchak, founded by Batu: it stood on the left bank of the Achtuba or northern branch of the Wolga.—*Yule Cathay*, i, *p.* 281.

SARAI, Hind. A caravansery, a building for the shelter and accommodation of travellers.

SARAI, Tel. Arrack.

SARAIAM, Tam. Arrack.

SARAIN, see Burabur Caves.

SARAIRI, Hind. Amarantus anardana.

SARAKHS, an ancient city of Khurasan, situated about mid-way or six days' journey, between Merv and Naishapur.

SARAKONTAY, Tam. A wood of Tinnevelly, of a whitey brown colour, used in building in general.—*Col. Frith.*

SARAKOONNAY, Tam. Cathartocarpus fistula.

SARALA DEVADARU, Tel. ? Berrya ammonilla, *Roxb.*

SARA-KUPA, or the Arrow Fountain, has been identified with Sarwanpur.

SARAN, a revenue district of Bengal, formed out of the ancient Bahar.

SARANA STUPA, or Asylum Tope, at Chapra in Saran.

SARANG, Hind. Nymphœa pubescens.

SARANGA DEVA, see Orissa.

SARANGÆAN. These soldiers composed part of the army of Xerxes; they were dressed in splendid and varied coloured habits, and armed with bows and javelins. They were the Euergetæ of the Greeks, a title bestowed on them by Cyrus, in gratitude for the relief which they afforded him, on his return from an unsuccessful expedition into Scythia.—*Kinneir's Geographical Memoir, p.* 189.

SARANG-BURUNG, Malay. Edible bird-nests.

SARANGI, a stringed musical instrument of hindoos and mahomedans.

SAR-A-PA, Pers. A suit of garments presented by mahomedan princes to those whom they intend to honour; literally from head to foot.

SARAPH, see Serpent.

SARAPHAN, the dress of female peasants.

SARA-PAPPU, Tel. Buchanania latifolia, Sarapappu nuuai, its oil.

SARAR, Hind. Saccharum sara.

SARAS, Duk. Cupressus glauca, also Cupressus sempervirens, *Willde*, also Acacia sirissa.

SARAS, Hind., also Surhuns, Grus antigone, the tall Saras is found all over British India: they may be seen in pairs now plunging their bills into the shallow waters, now scattering pearly drops from their throats. The natives of India strongly object to shooting these birds, about which they have a multitude of curious stories. There is a prevalent idea that if one of a pair be killed, the survivor never fails to die of a "broken heart."—*Burton's Falconry, Valley of the Indus, p.* 58.

SARASHTRA. According to Hwen Thsang, the province of Su-la-cha, or Suratha was a dependency of Balabhi. Its capital was situated at 500 li or 83 miles, to the west of Balabhi, at the foot of Mount Yeu-chen-ta, or Ujjanta. This is the Pali form of the sanscrit, for Ujjayanta which is only another name for the Girinar hill that rises above the old city of Junagarh. The name of Ujjayanta is mentioned in both of the Girinar inscriptions of Rudra Dama and Skanda Gupta, although this important fact escaped the notice of the translators. The name of Surath is still known in this part of the peninsula, but it is confined to a comparatively small tract, which forms one of the ten divisions of Gujarat. In the time of Akbar, however, it was applied to the southern or larger half of the peninsula, which, according to Abul Fazl, extended from the port of Ghoga to the port of Aramroy, and from Sirdhar to the port of Diu. The name of the district is also preserved by Terry whose information was obtained at the Court of Jehanghir. According to his account the chief city of Soret was called Janagar, that is, Javanagarh, or Jonagarh.—*Cunningham's Ancient Geography of India, p.* 325.

SARASWATI, a branch of the Caggar river near Thanesur. The Saraswati mentioned in the Vedas (vol. 3, p. 504) as breaking down the precipices of the mountains, fierce, mighty, vast, impetuous, overflowing her banks, "having seven sisters" evidently points to one of the great confluents of the Indus river, and probably the Ravi, the ancient Iraotes, that is Ira, (or Arya-vati) and in the Vedas the people of the Punjab are invariably termed Saraswata. In the Vedas, heaven, earth, (Aditi and Pritivi) and ocean, are rarely invoked, and the sun has comparatively few sakta. Occasional laudations are given to rivers, especially to Saraswati; and this nature-worship extends so largely as to embrace the cow, the wood used in the oblations, and even the "yapa" or sacrificial post. On the banks of the Caggar Saraswati, the Arian race came into contact with others, caste became recognised, but their descendants on the banks of that river have never adopted the high hinduism of the brahmins of the Gangetic valley, and continue agricultural. The Saraswati branch of the Caggar, however, seems to have been at one time, a fine river flowing through a well watered and green country. There are traces of its former course all the way to the Indus, and ancient Hindoo history is corroborative of this view; it is now merely a dry bed which is filled by surface water at the rains, and the countries through which it flowed are for the most part desert and barren. The Triveni or three plaited locks, in hindoo mythology, is the mystical union of the three sacred rivers, the Ganges, Jumna and Saraswati, severally the consorts, or energies, of the three great powers, Siva, Vishnu, and Brahma. Triveni, or the three plaited locks, is a mythological junction—a female triad, similar to that of the Trimurti of male powers. The Gunga or Ganges, Yamuna or Jumna, join near Allahabad, and the Saraswati, now a dry bed, is also supposed to join the other two underground. A hindoo dying near the imagined confluence of these three streams, or even those of the Gunga and Yamuna, attains immediate beatitude, consequently self or self-permitted immolation, suttees, &c., are meritorious on this peculiarly holy spot. The junction of the three waters at Allahabad is a sacred prayag, and an annual mela is held in March for purposes of ablution. Junctions of any sort, especially of waters, are held sacred by hindoos, and above all, the union of the sacred rivers, Ganga and Yamuna or Jumna near Allahabad, the latter river having previously received the Saraswati below Delhi, so that, in fact, all three do unite at this famed sangam or confluence. But the hindoo poet, feigns a subterrene flow of the Saraswati, and a mystical union at the sacred point, where bathing is deemed peculiarly efficacious, and where zealots are persuaded that suicide is of a most meritorious description. Major Moor, once saw, at Poona, a well modelled group in clay, where Rad'ha's locks, tripartite, were plaited into the mystical Triveni by the amorous Krishna, who sat rapturously admiring the work of, and in, his hands. Other rivers are, however, held sacred by the hindoos, viz., the Godaveri, the Sindhu or Indus, the Krishna or Kistna and the Brahmaputra.—*Campbell, p.* 62-63 ; *Tr. of Hind., Vol.* i, *p.* 15 ; *Cole., Myth. Hind., pp.* 394, 398 ; *Moor, Hindoo Pantheon, p.* 429. See Brahma or Hiranyagharbha, Chandra, Inscriptions, Krishna, Lakshmi, Mahadevi, Osiris, Sacta, Satarupa, Triveni, Vahan, Vina.

SARASWATI, a hindoo goddess, the wife, or sakti, or female energy, of Brahma, is analogous in western mythology to Minerva, the patroness of learning, &c. The fifth day of the month Magha is called Sri-panjami, on which Saraswati or Sri, the goddess of arts and eloquence, is worshipped with offerings of perfumes, flowers, and dressed rice : even implements of writing, and books, are treated with respect, are not used on this holiday, and are presented to the image of this goddess. Saraswati is, among other deities, especially propitiated in the marriage ceremonies of the brahmans : the following hymn is chanted in her honour :—"Charming Saraswati ! swift as a mare, whom I celebrate in the face of this universe, protect this solemn rite. O thou ! in whom the elements were produced, in whom this universe was framed, I will now sing that hymn," (the nuptial text) "which constitutes the highest glory of women." Viswadeva, like Serva-deva, means the gods collectively : all the gods ; the Pantheon. "One oblation to the assembled gods, thence named Vaiswadeva, both for evening and morning." Saraswati is the goddess of learning, music, and poetry, is the wife of Brahma. Saraswati is also called Brahmi, or Brahmini, the goddess of the sciences ; and Bharadi, the goddess of history. She is sometimes seen as a white woman standing on a lotus, or water-lily, holding a lute (or vina) in her hand, to show that she is also the goddess of music ; at others, riding on a peacock, with the same emblem in her hand. Although the worship of Brahma has fallen into disuse, the annual festival of Saraswati, in the month Magha, is highly honoured. In the Pantheum Mythicum of Pomey, which formerly belonged to the late Sir William Jones, and is referred to by him in his dissertation on the gods of Greece, Italy, and India, he has, in various marginal and other notes, compared the deities of these several mythologies as follow :—

Siva Indra	Jupiter.	Rama	Bacchus.
Brahma	Saturnus.	Bala Rama	Do. as the inventor of the use of wine.
Yama	Minos.	Skanda	Mars.
Varuna	Neptunus.	Durga	Juno.
Surya	Sol.	Suraswati	Minerva.
Chandra	Lunus.	Remb'ha	Venus.
Vayu	Æolus.	Ushasa	Aurora.
Viswakarma	Vulcan.	Swaha	Vesta.
Aswinicamara	Castor and Pollux.	Prit'hivi	Cybele.
Ganesha	Janus.	Sri	Ceres.
Pavana	Pan.	Gopyah Vidyah	Musæ.
Viraja, or Vaitarini.	The River Styx.	Atavi Devi	Diana.
Kuvèra	Plutus.	Aswiculapa	Genii.
Krishna	Apollo.	Heracula	Hercules.
Nareda	Mercurius.

SARASWATI AKU, TEL. Clerodendron viscosum, *Vent.*

SARATNI, SANS. Ell.

SARAWAK, in Borneo, is situated in a bay to the eastward of Point Api, at the foot of a range of mountains from one thousand five hundred to three thousand feet high, extending towards the interior of the island. The Sarawak government have acquired the coast territory from Cape Datu to the river Barram. The banks of the river of Sarawak are everywhere covered with fruit trees, the mangosteen, lansat, rambutan, jambou and blimbing are all abundant, but the Durian is most so and most esteemed. A beautifully resplendent sand, the particles of which resemble amethysts and topazes, and which is used in the adulteration of gold dust, may perhaps be thought to indicate the vicinity of other gems : it is found at Lingah, a branch of the great Batang Lupar river, not far from its mouth. Sago is manufactured at Muka, and antimony at Basein in Borneo.—*Low's Sarawak, p.* 29 ; *Wallich, p.* 75. See Archipelago, Borneo, Kyans.

SARAWAN, HIND. Pistacia integerrima.

SARAWAN, a province in Beluchistan,

The great central mountain range or table land running north and south comprises the provinces of Sarawan, Jhalawan, and Lus. See Beluchistan, Kelat.

SARB, also Ghas, HIND., Bupleurum marginatum.

SARBASHTAI, HIND., PUSHTU. Spiræa lindleyana, S. hypoleuca, S. callosa.

SARCOCLINIUM HOOKERI, *Thw.*

Maha-bairoo-gass, SINGH.

A moderate sized tree near Eknalagodde, in the Ratnapoora District of Ceylon, at no great elevation.—*Thw., En. Pl. Zeyl., p.* 279.

SARCOCLINIUM LONGIFOLIUM, *W. Ic.*

Bairoo-gass, SINGH.

A tree of the Central Province of Ceylon, growing at an elevation of 4,000 to 6,000 feet. The leaves are of a firm consistence, do not rapidly decompose, and are used by the Singhalese for thatching.—*Thw., En. Pl. Zeyl., p.* 279.

SARCOCOCCA PRUNIFORMIS, *Lind.*

S. trinervia, *Wight Ic.*	Shial; Shila,	HIND.

A tree of the Central Province of Ceylon, very abundant at an elevation of 5,000 to 8,000 feet. It is extremely variable in the shape of the leaves, which differ from nearly orbicular to narrow-lanceolate acuminated.—*Thw., En. Pl. Zeyl., p.* 290.

SARCOCOCCA TRINERVIA, or Neilgerry Box-wood tree, very common on the Neilgherries; wood hard, durable, might be used as common box-wood in the Arts.—*McIvor, M. E. J. R.*, 1857.

SARCOCOLLA.

Anzarut,	AR.	Unjirut,	AR.
Unzirut,	,,	Runjudeb,	PERS.

A sub-acid, sweetish, and somewhat nauseous, gum resin, produced in North Africa, Persia and Arabia, by several shrubs, the Penæa sarcocolla, Penæa mucronata and other species. It is yellow, or reddish, like gum arabic, in oblong globules, the size of a pea or of grains of sand, friable, opaque or semi-transparent, softening but not melting by heat; sp. gr. 1268. Sarcocolline is half transparent, crystalline, brittle, like gum, soluble in 40 parts of cold water and 25 of boiling water, soluble also in alcohol. Odour weak and peculiar, taste saccharine and slightly bitter; composition, carb. 22, hyd. 19, oxy. 10, atoms. Sarcocolla was once deemed a powerful healer of wounds *σαρξ* flesh, and *κολλα* glue), but this idea has been long abandoned. It is rarely met with in India, and then only brought from Persia and Arabia. Mesure regarded it as cathartic.—*O'Shaughnessy, p.* 427; *Powell, p.* 408; *Faulkner.*

SARCOSTEMMA, a genus of plants of the order Asclepiaceæ of which S. acidum, S. brevistigma, S. brunonianum, S. intermedium and S. viminale, occur in India. The name is (from *σάρζ*, flesh, and *στέμμα*, a crown, in reference to the leaflets of the inner corolla being fleshy). The genus has a rotate corolla, a coronet of double stamens: the outer one cup-shaped or annular crenated, the inner one 5-leaved, higher than the outer one, with fleshy segments; the stigma is nearly blunt; the follicles slender and smooth and the seeds comose.

SARCOSTEMMA ACIDUM, *W. Contr.*

S. brevistigma, *W. Contr.*	Asclepias acida, *Roxb.*

Brami, Shomluta,	BENG.	Pullatige,	TEL.
Som,	DUK.	Soma luta,	,,
Soma,	HIND.	Tige jemudu.	,,
Muwa kiriya,	SINGH.		

This leafless plant grows in rocky sterile places, in the Peninsula of India, about Coromandel, Khandesh, Bombay, Perim, Loony, between Dowlatabad and the upper Godavery, throughout the Dekhan and in Bengal, Poona, Bolan Pass, Panjab, Rohilcund. The plant yields an abundance of a mildly acidulous milky juice, and travellers suck its tender shoots to allay thirst. A bundle of the twigs with a bag of hard compressed salt if put in the trough of a water course so that the waterflow may become impregnated, will destroy white ants. This is the Soma or Som of the Vedas, and it obtained this name from the ancient hindoos because they gathered it by moonlight, carried it to their homes in carts drawn by rams, and a fermented liquor was prepared by mixing its juice strained through a sieve of goat's hair, with barley and ghee. This wine was drunk at all their religious festivals, and was used by the Rishi as an intoxicant. The Rishi continued it at their meals with beef. The Rig Veda, ix, says, the purifying Soma like the sea rolling its waves, has poured forth songs, and hymns and thoughts.—*Roxb.*; *W. Ic.*; *Voigt*; *Birdwood.*

SARCOSTEMMA ANNULARE *Retz.*, Syn. of Holastemma rheedii, *Spr.*

SARCOSTEMMA GLAUCUM. Glacous-leaved Sarcostemma, is a lactescent, smooth twining, herbaceous plant.—*Eng. Cyc.*

SARCOSTEMMA VIMINALIS, *Wall.*

S. brevistigma, *Wight.*	Som,	DUK.

A leafless plant, resembling the Euphorbia tirucalli; flowers white in the rains, the natives tie the stems up in a bundle and place them in the watercourse of their wells for the purpose of preventing the attack of white ants.—*Riddell.*

SARCOSTIGMA KLEINII. Its oil, long known under the name of Poovana and Poovengah, is used largely on the western coast, of the peninsula of India, as an external applicant in rheumatism.—*M. E. J. R.*

SARD, a reddish coloured quartzose mineral supposed to be a kind of cornelian or chalcedony.

SARDA, HIND. Cucumis melo, *Linn.*, *W. & A.* A very superior kind of melon brought from Kabul, &c., to be met with in Peshawur.

SARDA, HIND. Cool.

SARD-AE, PERS., an underground room which the people of Baghdad occupy in the hot weather; except in British India most houses in the hot countries of the east are provided with subterranean chambers, called sardab (literally cold water) to which the family retire during the heat of the day. They are often furnished with the greatest luxury, and their refreshing coolness is increased by the play of fountains, and punkahs or large fans hung from the ceiling. This is the favourite place for the ladies afternoon siesta.—*Ed. Ferrier Journal, p.* 292.

SARDAI, HIND. In dyeing, a colour of ripe melons, made with tun flowers, yellow, and a faint shade of kussumba.

SARDINAPALUS, brother of Samoges; the dominion of the Ninyads of Babylon, ended with the death of Sardanapalus, who burned himself at Nineveh, in his palace, B. C. 662, in which year occurred an inroad of Scythians into the south of Asia. Sardanapalus had held his court at Nineveh, at his death, two of his late viceroys, Arbaces, governor of Media, and Belesis, governor of Babylon, partitioned the empire between them: Arbaces receiving Media, with its dependencies, and Nineveh, for his portion, removed from the seat of his late government to that great city of Assyria, and hence took the title of king of Assyria. Meanwhile, Belesis remained at Babylon, in the midst of the wide territories of Chaldea, &c., and began the race of Babylonish kings. Arbaces, king of Assyria and the Medes, was the Feridoon of the Persian writers, and the Tiglath-pileser of Holy Writ, who, in his war with Pekah, king of Israel, carried away the first captives of that nation, who were brought to the east. This event happened about 639 years before Christ. —***Porter's Travels, Vol.*** i, *p.* 95. See Babylon, Nabopolassar, Nineveh.

SARDINE, ENG., FR., IT.

Sardellen,	GER.	Sardinas,	SP.

The sardine fish of commerce is found in the Mediterranean where its fishery employs a great number of people. In the Asiatic seas there are fishes of the same or allied genera; on the Ceylon coasts, Sardinella neohowii, ***Val. and Cuv.*** of which great numbers are eaten and the S. leiogaster, ***Val. and Cuv.*** Engraulis meletta? is a small fish of the herring family at Tavoy and Mergui, which is nearly related to the common sardine. Sir J. E. Tennent mentions as Ceylon fish, Cybium (Scomber, *Linn.*) guttatum; mackerel, carp, whitings, mullet, both red and striped, perches and soles as abundant, Sardinella neohowii, *Val.* frequents the southern and eastern coast in such profusion that in one instance in 1839, four hundred thousand were taken in a haul of the nets in the little bay of Goyapanna, east of Point de Galle. As this vast shoal approached the shore, the broken water became as smooth as if a sheet of ice had been floating below the surface. S. lineolata, *Cuv. and Val.* and the S. leiogaster, *Cuv. and Val.* are found at Trincomallee, also off the coast of Java. Another Ceylon fish of the same group, a Clupea, is known as the "poisonous sprat." The sardine has the reputation of being poisonous at certain seasons, and accidents ascribed to eating it are recorded in all parts of Ceylon. Whole families of fishermen who have partaken of it have died. Twelve persons in the jail of Chilau were thus poisoned, about the year 1829; and the death of soldiers have repeatedly been ascribed to the same cause. An order passed by the Governor in Council in February, 1824, after reciting that "Whereas it appears by information conveyed to the government that at three several periods at Trincomallee, death has been the consequence to several persons from eating the fish called Sardinia during the months of January and December," enacts that it shall not be lawful in that district to catch sardines during these months, under pain of fine and imprisonment. This order is still in force, but the fishing continues notwithstanding. The poisonous fish of this family which occurs in the Asiatic seas, is however, the Meletta venenosa.—***Tennant's Sketches of the Nat. Hist. of Ceylon, pp.*** 234-235; ***Mason***; ***Journ., Ind. Arch.*** See Clupeonia.

SARDIUS, in the breast plate of the Jewish high priest; any precious stone of a red hue was supposed by the Jews to be a preservative against the plague, and amongst the Arabs, to be useful in stopping hæmorrhage.

SARDONYX, a quartzose mineral. The sardonyx is rarely seen in use in India.

SARD-SAIR, PERS., a term in use amongst the nomade races of Persia, to indicate the locality to which they drive their herds in summer; the garm-sair is the winter quarters. In the South of Persia, a huge wall of mountains separates the garm-sair, or low region, from the sard-sair. Sard-sair signifies the cold region, but it is also termed the Sarhada, a word literally signifying "boundary or frontier," but generally applied to any high land where the climate is cold as on the high table-land of Persia. One of the most conspicuous of these, is an abrupt lofty hill, named Hormooj, where coal occurs.

SARDULA VARMA, see Inscriptions.

SAREBAS DYAK, see Kyan.

SAREDA TILAKA, in a monologue of later date than the play of Mrichchakati, which was of the 1st century of the Christian era, but still of comparative antiquity, there is a curious and amusing description of the various women of India, distinguishing each by her nationality, if such a term be allowable ; but the author fails of expressing anything definitive.

1. There goes the maid of Gurjara (Guzerat,) blooming as with perpetual youth, having eyes like the chakōra, of the complexion of the yellow Rochana, and a voice musical as that of the parrot. She wears anklets of silver, large earrings set with pearls, and her bodice is buttoned below the hips with gems.

2. The matron of Maharashtra proceeds yonder, her forehead stained with saffron, and with silver chains upon her feet ; she wears a coloured veil, and a girdle round her loins.

3. A Chola female (South of India) approaches, whose cheeks are tinted with saffron, and whose dress is embroidered with the buds of the lotus.'

The bodice which buttons below the hips, is unknown at the present day, either in Guzerat or elsewhere in India ; and as no single cloth, as a scarf, or the present sar'hi could be buttoned, we can only presume that the garment was cut out and sown in the fashion of a long tight-fitting robe, as in use among Persian women of the present time.—*Dr. Forbes Watson.* See Tantra.

SAREE, HIND. See Sarhi, Cotton Manufactures.

SAREI, HIND. Abies smithiana.

SAREMA, see Khuzistan or Arabistan.

SARERA, HIND. Amarantus anardana.

SARGAL, HIND. Pangi fraxinus, P. xanthoxyloides, Crab ash.

SARGARRA, HIND. Cymbopogon iwarancusa.

SARGASSUM BACCIFERUM, or Gulf weed covers all the gulf stream from L. 22° to 36° N., and L. 35° to 65° W.

SARGASSO SEAS, from Sargasso Sp. weed, Midway in the Atlantic between the Azores, Canaries, and the Cape de Verde islands, are vast masses of the Fucus natans, Oviedo calls them Praderias de Yerva. Fucus natans or the Sargasso gulf-weed, is found in large masses between the parallels of 18° and 34 of north latitude, and its utmost eastern limit extends to 36° E. L. It is of a greenish yellow colour, is abundant on the Florida reefs, but continues to vegetate as it floats about in the circular currents after it has been torn from its attachment. The masses give shelter to a great number of fish, mollusks and crustacean animals. Fucus natans, is the common Gulf weed, which travellers, to and from India, meet with in the Atlantic.

SARGUJAH. The Gour race on the east of the Gond, extend into the borders of the Chota Nagpur agency in Udipur and Sargujah. They are the dominant tribe in Sargujah and the Sargujah rajah is supposed to be a Gour though claiming to be a rajpoot. They are much hinduised.

SARHAD is occupied by tribes of Koords. —*Pottinger's Travels, Beloochistan and Sinde, p.* 140.

SAR'HI, HIND.

Shiali,	CAN.	Pudawi,	TAM.
Lugra,	MAHR.	Chira,	TEL.

The sarhi is the lower garment worn by the hindoo and non-Aryan women in India. Viscountess Falkland describes a group of women, with their heavy anklets, 'making a tinkling with their feet, (Isaiah iii, 16), each with their sarhi folded over their heads and persons, and carrying little chubby children on their shoulders, or astride on their hips ; and now these are lost to sight, and a fresh group appears, consisting of hindoo women of various castes, clothed in jackets and the sarhis of divers colours, and wearing the 'chains and the bracelets,' 'the earrings, the rings and the nose jewels.' (Isaiah iii, 19 and 21.) One end of the sarhi forms a very voluminous kind of skirt or petticoat, the other end is drawn over the head and shoulders, somewhat in the style or form of a Maltese faldetta. This sarhi is, in fact, the national costume of almost all hindoo women. The mahomedans, in India, in Hyderabad in the Dekhan, Oudh and Rajpootana, the N. W. Provinces, and the Punjab wear the voluminous petticoat introduced by the mahomedans ; it is worn by all mahomedan women and by many hindoo women whether secluded or otherwise ; but this, practice is confined to those provinces of India, and is almost unknown from Rajpootana southwards to Cape Comorin : and Bengal and Orissa also adhere to the ancient national costume and this article of woman's dress only varies with local taste as to colour, length and breadth, and fineness or closeness of texture. There is no female costume more elegant than a sarhi. It is an entire cloth, in many cases eighteen yards long and about a yard broad ; and the texture varies from the finest and most open character of muslin in

Bengal and the south of India, to the still fine but closer texture of the Deccan, Central India, and Guzerat. Sarhis are of all qualities, to suit the very poorest as well as the very richest classes of society the ordinary labourer and the princess and are obtainable for two shillings each up to one hundred pounds of value. In the manner of tying and wearing this garment there is little differences anywhere. The cloth, which has one plain end, is passed round the loins, and the upper border tied in a strong knot ; the cloth is then passed two, three, or even four times round the waist, to form a petticoat, which, if the sarhi be a proper breadth, reaches to the ground. A portion is then plaited neatly into folds and tucked in before, so as to hang down in front to the instep, or even lower. The remainder of the cloth is passed across the bosom over the left shoulder and head, on which it rests, the ornamented ends falling partly over the right arm below the waist. In the south of India, however, the end does not pass over the head ; it is drawn tightly over the left shoulder and bosom, and tucked into the waist behind, or on the right hip. The ancient female costume of Egypt, a sarhi or single robe, appears to have been put on and worn in precisely the same manner without a boddice. Well-to-do women of the Deccan and the south frequently wear a gold or silver zone, according to their circumstances, which, passing over all, confines the drapery to the waist in graceful folds. This zone appears unknown to the northward, but in many cases it is beautifully wrought and extremely ornamental. The Sarhi are largely made of silk, in Benares ; but the multitude have them of cotton, some of cotton and silk, with borders of gold or silk. Each woman of a household usually gets a new sarhi once a year. The Mahratta women, and women engaged in labour often make the sarhi take a very ungraceful form by passing it between the legs, in which it assumes the appearance of tight trowsers.—*Viscountess Falkland, Chow-chow, p.* 7, *London* 1857 ; *Dr. Forbes Watson.*

SARHIND, an ancient Indian city.

SARI, Hind. Prunus armeniaca, or Armeniaca vulgaris, the Apricot.

SARI, also Sarri, Sind, a necklace of gold beads worn by hindoo mendicants.—*Richard F. Burton's Sindh, p.* 393.

SARI, an old city of Mazandaran, which is celebrated in the legends of Afrasiab. In the eighteenth century, there were still to be seen at Sari four ancient circular temples, each thirty feet in diameter and one hundred and twenty feet high. In the time of the kings of Persia, Sari had been the seat of an officer called the Great General of the East.—*Malcolm, p.* 42 ; *Yule, Cathay, Vol.* i, *p.* 88.

SARIARA, Hind. Amarantus anardana.

SAR-I-ARA, Hind. See Sil safed.

SAR-CHASHMA, the source of the Kabul river in lat. 68° 10′ E. and long. 34° 15′ N.

SARINDA, Hind., an Indian fiddle.

SARINDIGA, Hind. Cassia obovata.

SARINGHI, or lute, see Jogi or Yogi.

SARINGHIHA, see Jogi or Yogi.

SARIPUTRA : the new town of Rajagriha is said to have been built by king Srenik, otherwise called Bimbisara, the father of Ajatasatra, the contemporary of Buddha. Its foundation cannot therefore be placed later than 560 B.C. according to buddhist chronology. Fa-Hian makes Nalanda the birthplace of Sariputra, who was the right hand disciple of Buddha ; but this statement is not quite correct, as we learn from the more detailed account of Hwen Thsang that Sariputra was born at Kalapinaka, about half way between Nalanda and Indra-Sila-Guha, or about 4 miles to the south-east of the former place. The remains at Baragaon consist of numerous masses of brick ruins, amongst which the most conspicuous is a row of lofty conical mounds running north and south. These high mounds are the remains of gigantic temples attached to the famous monastery of Nalanda. The great monastery itself can be readily traced by the square patches of cultivation amongst a long mass of brick ruins, 1,600 feet by 400 feet.—*Cunningham's Ancient Geography of India, pp.* 467, 470. See Buddha.

SARIPHI, see Koh.

SARISHT, Hind. Glue.

SARJIKA, also Sarjikashara, Hind. Soda.

SARJU, see Hindoo.

SARKA, Sarkanda, Sarkara, Hind. Saccharum sara.

SARKANDA, Hind., a grass, a species of Saccharum, growing in moist places, the flower stalk of the moonj grass, S. munja.

SARKAR, Hind. ; A Government, the ruling power.

SARKARA, Hind. Saccharum spontaneum, a grass—the leaves or grass of Saccharum munja.

SARKARA, Sans. Sugar.

SARAKONNI MARAM, Tam. Cathartocarpus fistula, *Pers.*

SAR KACHU, Beng., water leaved caladium, Colocasia nymphaæfolia, *Roxb.*

SARL or Salla, Hind. in the Himalaya beyond Punjab, Pinus longifolia, long leaved pine.

SARLAKHTEI, Hind. Spiræa lindleyana, Andromeda ovalifolia.

SARMAL, TRANS-INDUS. Heteropogon contortus, *R. & S.*

SARMAN or Sraman, an ancient name of brahmins. See Shaman or Shamanism.

SARMATIA, name of wide range of country in N. W. Asia and N. Europe, from Mongolia through Siberia and the Crimea to Courland, Livonia and Prussia. Some of the Sarmatia races are now known as the Sclave. In ancient Sarmatia and modern Poland, trees and serpents were worshipped by the peasantry up to the limits of the nineteenth century. The last relic of the tree worship the Stock-am-Eisen, the apprentice tree, is still standing in the heart of Kenna. In Norse mythology, the Yggdrasil ash tree was represented with one of its roots over the well of knowledge and with a serpent, Nidhog, gnawing its stem. The tree in the centre of Eden, with the serpent, is amongst the oldest mentioned, of the tree and serpent together, and the Bo-tree of Ceylon was planted at least, B. C. 200. Abraham's terebinth at Mamre is mentioned by Eusebius, to have been worshipped down to the time of Constantine and is said to be still growing at Eshkol. Serpents are thrown into temporary catalepsy by pressure on the back of their necks. The figure of the serpent on the pole in Numbers xxi, 8 and 9, was the Caduceus of Æsculapius, and in Kings xviii, 4, the reformer king cut down the groves and broke the serpent, which Hezekiah mentioned, was preserved in the temple itself.—*Fergusson, Tree and Serpent Worship.* See India, Kartelania, Sanskrit, Saratha.

SARMON, HIND. of Spiti, a kind of barley.

SARMEI, HIND. Berthelotia lanceolata.

SARMUL, HIND. Astragalus multiceps.

SAR NAHANA, HIND. Bathing.

SARNAKASSARI MARA, CAN. Rottlera tinctoria.

SARNATH, a town in Hindustan: the Choukandi, or Luri-ka-kodan is so called from the leap, from its top, of an Ahir, by the name of Luri. It is in the town of Sarnath, and is a lofty mound of solid brick-work, surmounted with an octagonal building. Hwen Thsang describes this tower to have been no less than 300 feet in height. In 1835, Major Cunningham excavated numerous buddhist images at Sarnath, near Benares, all of which had evidently been purposely hidden under ground. He found quantities of ashes also, and there could be no doubt that the buildings had been destroyed by fire. Major Kittoe, who subsequently made further excavations was of the same opinion. The budd'hist religion had evidently assumed the form of the heresy of a weaker party, who were forced to hide their images under ground, and were ultimately expelled from their monasteries by fire.—*Travels of a Hind., Vol.* i, *p.* 295. See India, Inscriptions.

SAR-NAT'H, a temple at Benares. Inscriptions on images of Buddha from the temple at Sarnath, at Benares, and on an image from Bakhra, in Tirhut are in sanskrit, but not pure. The date is after A. D. 800, and that of Sarnath, probably of the eleventh century. The character used in the inscription is more modern than Kanouj Nagari, approaching the modern character. The religion mentioned is buddhist, and the sages, Tathagata, Sramana Buddha. These inscriptions upon images of Buddha, are in a comparatively modern form of the Deva Nagari. They contain the quaint compendium of buddhist doctrines, commencing with Ye dharma hetuprabhava, &c.; but the Sanskrit text of the moral maxim has not been found in the Tibetan Pragna Paramita. These buddhist inscriptions in Sanskrit are most remarkable, showing at their late date that Sanskrit was still imperfect! The mounds and remains near Bakhra testify to a former buddhist city. From copper-plate inscriptions found near Sarnath it is conjectured the buddhist temple was erected by the sons of Bhupala, a rajah of Gaur, in the eleventh century. The image and inscription would probably be of the same date; and the character of the inscription corresponds to that date.—*Bengal As. Soc. Trans.*; *Vol.* iv, *pp.* 135, 181, 211 *&* 713.

SARNGAR, HIND. Rhododendron campanulatum.

SARO, BENG. Saccharum sara, *Roxb.*

SARO also Sarobij, HIND. Cupressus sempervirens, *Willde.*

SARON, HIND. Brassica campestris.

SARONG, JAV., MALAY. A piece of cloth, wrapped round the lower part of the body as a petticoat, also a cotton garment for men. Javanese women draw figures on their sarong, to express their thoughts and emotions. The sarong is worn by men and women, only that of a woman is deeper. The sarong when united is called a slendang; a woven or printed fabric imported into the Dutch ports of the Eastern Archipelago. There are imitation Battik sarongs, and Turkey red sarongs.—*Bikmore*; *Simmond's Dict.*

Cleyara lasiopetala, *Wight Ill.* i, *p.* 99.

Eurya lasiopetala, *Gardner.*

A moderate sized tree, common in the forests of the Central Provinces of Ceylon at an elevation of 6,000 feet and upwards.—*Thw. Enum. Pl. Zeyl.*, i, *p.* 41.

SAROS, see Chronology.

SARPA, Sans. The serpent so called in Sanskrit because it was conceived under the general idea of creeping, an idea expressed by the word srip. But the serpent was also called ahi in Sanskrit, in Greek echis or echidna, in Latin anguis. This name is derived from quite a different root and idea. The root is ah in Sanskrit, or anh, which means to press together, to choke, to throttle. Here the distinguishing mark from which the serpent was named was his throttling, and ahi meant serpent, as expressing the general idea of throttler. It is a curious root this anh, and it still lives in several modern words. But in Sanskrit it was chosen with great truth as the proper name of sin. Evil no doubt presented itself under various aspects to the human mind, and its names are many, but none so expressive as those derived from the root, anh, to throttle. Anhas in Sanskrit means sin, but it does so only because it meant originally throttling,—the consciousness of sin being like the grasp of the assassin on the throat of his victim.—*Muller's Lectures, p.* 366.

SARPAKSHI CHETTU, Tel. Ophiorrhiza mungos, *O'Sh.*, 400. The Sans. syns. Naga suganda, *W.*, 459, and Nakuli, *W.*, 458—a plant—the ichneumon plant, a vegetable supposed to furnish the mungus with an antidote, when bitten in a conflict with a snake.

SARPAM, Tam., Tel., Serpent.

SARPAN, Hind. Calophyllum calaba.

SARPANKA, Hind. Calophyllum inophyllum, *Linn.*, also Tephrosia purpurea, also Celosia argentea.

SARPASHI CHETTU, Tel. Ophiorrhiza mungos.

SARPAT, Hind. Saccharum sara, also Saccharum procerum.

SARPATKA, or Sarphoka, also Sarphonka, Hind. Tephrosia purpurea.

SAR-PESH, Hind. A forehead jewel.

SARPUN, in Hundes, a Chinese officer, a captain of police. The Shib chid, is a Chinese official, in Hundes, residing in the province of Bood, a month's march from Gartok.

SARRA or Sarrah, Tel. A wood of the Nalla mallai, of a dark grey colour but appears to be readily attacked by the worm. —*Mr. Latham.*

SARRABAND considered the first of the Affghan tribes, they are termed by Mr. Elphinstone and Professor Dorn, Betnee, Botni, Baitni or Batini. See Sarriban.

SARRACENIA PURPUREA. This plant belongs to the natural order Sarraceniacæ, in which there are three genera, and eight species, of which six are confined to North America, one is peculiar to California and one is found in Guiana. There is no representative of the order in India. In the 'Lancet' for December 7th, 1861 appeared a paper by Assistant Surgeon Miles stating that during an epidemic of small-pox in Halifax, Nova Scotia, a squaw had administered an infusion of the root in numerous cases, the result in every instance being a perfect cure. Subsequent trials in London and Edinburgh Hospitals have not established the reputation of the drug as an ante-varioloid remedy. In an article on the Sarracenia purpurea in the January number of the 'Pharmaceutical Journal' Professor Bentley, says :—that hitherto when tried in this country Sarracenia has altogether failed to cure, or in any way modify, the progress of small-pox."

SARRAP, Hind., Pshtu. Taxus baccata ; common yew.

SARRI, also Sarria, Hind. Brassica campestris, also Cicer soongaricum.

SARRIBAN TRIBES are Abdali, Tarin, Barech, Mabanah, Gharshin, Sirani, Babar, Kansi, Jamand, Katani, Kaliani, Tarkani, Khalil, Muhmaud, Daud-Zoe and Yusufzoe.

SARRIS, Mahr., Dekh. Acacia odoratissima, *Roxb.*, *Willde.*

SARRU, Hind. Brassica campestris.

SARSAPARILLA, Eng., Lat.

Oshba, Muckwy,	Ar.	Sarza,	Lat.
Ku-ku: Chin-ah'po,	Burm	Shariva,	Sans.
Salsepareille,	Fr.	Erramasumul,	Singh.
Sarsaparille,	Ger.	Irimusa,	,,
Mugrabu,	Hind.	Zarzaprilla,	Sp.
Salsapariglia,	It.	Nunnarivayr,	Tam.

The word sarsaparilla is derived from the Spanish word zarza, a bramble, and parilla, a vine. The sarsaparilla in use in medicine is composed of the roots of various species of Smilax. S. officinalis, is a native of South America. Varieties of this root are also found in the South of Europe. East Indian Sarsaparilla belongs to the Hemidesmus indicus, it is abundant and cheap, partakes largely of the qualities of the true sarsaparilla, and is extensively employed as a substitute as also is S. China. Sarsaparilla is valued as a restorative to debilitated constitutions, but the medical qualities which it is said to possess are to be attributed rather to its general composition than to any distinct principles. S. aspera continues to be employed in medicine. S. officinalis, *H. B.* and *K.*, was discovered by Humboldt and Bonpland in New Granada, on the banks of the Magdalena, in Columbia and in Minas Geraes. Its roots are taken to Cartagena.

S. Sarsaparilla, *Linn.* is a native of the United States of America ; but it does not yield any of the sarsaparilla of commerce. S.

papyracea, *Poir.* (S. syphilitica, *Mart.* non *Humb.*) is a native of Brazil ; its roots are collected by the Indians on the Rio Negro and other places in the vicinity of the Amazon river and they form the Salsa, Salsaparilla, Sarza, or Zarza, which is named the Sarsa of Maranhao, of Para, and of Lisbon ; it abounds more than the other in Parigline. S. Syphilitica. *Willd.*, was found by H. and B. on the Rio Cassiquiare, in Brazilian Guiana. S. Medica, *Schlecht*, was found by Schiede on the eastern slope of the Mexican Andes. The roots are dried and exported from Vera Cruz. Dr. Hancock states that there is but one species which manifests to the taste any of the sensible properties of sarsaparilla ; and this grows chiefly on the elevated lands of the Rio Imiquem, at Unturana and Caraburi ; also that the Sarsa of the Rio Negro, which comes by way of Angostura or Para, is the best. This is probably yielded by the above S. papyracea. Several other species are, however, enumerated by Martius, as S. Japicanga, brasiliensis and also Herreria salsaparilha as employed for the same purposes. So S. Cumanensis the Azacoreto of the natives, S. Cardato-ovato of Poppig, S. Purkampuy, referred doubtfully to S. officinalis by Dr. Lindley, S. China yielding the China-root of the shops, long famed in the East Indies. S. China and S. sagittæfolia are said to come from the province of Onansi in China. Smilax pseudo-China, S. Sarsaparilla, S. rubens, and S. Watsoni, furnish the drug of North America. The sarsaparilla distinguished in commerce as the Lisbon or Brazilian is the root of S. papyracea of Poiret. Besides this species S. officinalis, grows in the province of Mina ; S. syphilitica, grows in the northern regions, and three new species, S. sapicanga, S. brasiliensis, and S. sarsaparilla of India. The roots of Hemidesmus Indicus were sent to the Madras Exhibition of 1855 from almost every district, but they varied considerably in aroma, also a syrup and extract from the indigenous plant, growing at the foot of Courtallum hills. Dr. A. J. Scott forwarded a crystallized principle called "Hemidesmine," which was found on examination to be an entirely new substance, exhibiting a remarkable indifference both to acids and alkalies, crystallizing in a peculiar manner in hexagonal plates, which are subject to rapid efflorescence. The only ascertained solvents are alcohol and ether ; it is perfectly insoluble in water, both cold and hot. These facts show that it is a substance of a very peculiar nature. The jury recommended that this preparation be fully tested in hospital practice, along with the extract and syrup prepared from the same plant. The Hemidesmus Indicus; and Ichnocarpus frutescens, both used as sarsaparilla, are common on the slope of the Neilgherries. When sarsaparilla is not obtainable, the China root, (S. China,) may be employed. An infusion of the Hemidesmus Indicus, (Ununtamul,) is a still better substitute for sarsaparilla. But as much of the virtues of the Ununtamul depend on a volatile principle, it should not be used in decoction, as the long boiling dissipates the active ingredient. Syrups of Hemidesmus and of China root are alterative and diuretic, and are used to sweeten the decoctions and infusions of the same articles. —*Tomlinson* ; *Royle, Himal. Bot. p.* 383 ; *Simmonds* ; *M. E. J. R* ; *Beng. Phar. pp.* 279, 409.

SARASPARILLE, Ger. Sarsaparilla.

SARSAVA, Tel. Sinapis species.

SARSHAF, Saron Pji, also Rai, Hind. Mustard, S. juncea, Sinapis sinensis. Brassica juncea ; B. campestris, &c.

SARSHAPA-TELAM, Sans. Mustard oil. Oil of Sinapis alba.

SARSON, Hind. Brassica campestris, rapeseed ; jangli sarson, is sisymbrium iris, Kala sarson, also Tara-mira is Brassica eruca.

SARSOTE, properly Sarasvati, are brahmins found in considerable numbers, who aver that they were masters of the country prior to the Jit colonists. They are a peaceable, industrious race, and without a single prejudice of the order ; they eat meat, smoke tobacco, cultivate the soil, and trade even in the sacred kine.

SART, Arabo-Hindi. A gig or buggy, corruption of Arabic "shart" a wager, a bargain, a horse race.

SART, the name applied by the Turks to the Tajik aborigines of Trans-oxiania. The Sart or Tajik from time immemorial have occupied the tract in Central Asia, which has as boundaries, Siberia, India, Persia and China. The Tajik is Iranian. He is met with in largest number in the khanat of Bokhara and in Badakhshan, but many have settled in the towns of Kokand, Khiva, Chinese Tartary and Affghanistan. The Tajik is of a good middle height, has a broad powerful frame of bones, and especially wide shoulder bones, but they diverge from the Iranian, they have the Turanian wider forehead, thick cheeks, thick nose and large mouth. The Tajik originally came from the sources of the Oxus in the steppe of Pamir. The term is from Taj, a crown, the fire worshippers head dress. But the Tajik does not so style himself and regards the term as derogatory. The Turks style the Tajik Sart. The Tajik is covetous, unwarlike, and given to agriculture and trade ; fond of literary pursuits and polished and it is owing to their preponderence in Bokhara that that city has been raised to the position of the head quarters of Central Asiatic civilization, for, there, from pre-Islamic times, they have continued their previous exertions in mental culture and, notwithstanding the oppressions which they have sustained from a foreign power, have civilized their conquerors. Most of the celebrities in the field of religious knowledge and belles letters, have been Tajiks, and at the present day the most conspicuous of the mullah and ishan are Tajiks, and the chief men of the Bokhara and Khiva court are Tajik or, as the Turks style the race, Sart. Vamberry considers the Tajik and Sart identical, but he recognizes that in their physiognomic peculiarities, the Sart differs greatly from the Tajik, being more slender, with a larger face, and a higher forehead; but these changes Vamberry attributes to frequent intermarriages between Sart men and Persian slaves.

SARU, or Sarv, Hind. Cupressus sempervirens, also Casuarina equisitifolia.

SARNESVARA, *lit.*, the lord over all, a name used for the true God by the Roman Catholics.

SARUG or Serug. The old name of Edessa, a district lying somewhat to the west of Rehi. It was the ancient Osroene. It was occupied by the race of Arphaxad, when they were no longer pastoral, after the Peleg. See Terah.

SARUNG, Malay. The under garment of the Malay women; written sarong.

SARULMARA, Can. Bauhinia purpurea, *Linn.*

SARUNGA, Hind. Phytolacca decandra.

SARURA, Hind. Butea frondosa.

SARUT, Hind. Saccharum sara.

SARV, Pers. Cupressus sempervirens, *Willde.* See Saru.

SARV KA JHAR, Dekhani. Casuarina equisetifolia.

SARWALI, Hind. Celosia argentea.

SARWAN, Hind. Camel driver.

SARWARI, Hind. Celosia argentea, *Lin.*, *Rheede*, *Roxb.*, *W.*, *Ic.*

SARWYA or Sariaspa. Of this Rajput race, tradition has left us only the knowledge that it once was famous; for although, in the catalogues of the bard, it is introduced as the "essence of the Khetri race," we have only a few legends regarding its present degradation. Its name, as well as this epithet of the bard, induces a belief that it is a branch of the Aswa, with the prefix of sar, denoting 'essence,' or priority, also perhaps, northern. Silar or Sular in all probability, originated the epithet Larike, by which the Saurashtra peninsula was known to Ptolemy and the geographers of early Europe. The tribe of Lar was once famous in Saurashtra, and in the annals of Anhulwarra mention is made of Sid Rae Jey Sing, having extirpated them throughout his dominions. Sular or Silar, would therefore be distinctively the Lar. Indeed, the author of the Komarpal Charitra styles it Raj-tilac, or 'regal prince;' but the name only now exists amongst the mercantile classes professing the faith of Budha: it is inserted as one of the eighty-four clans. The greater portion of these are of Rajpoot origin.

SARZA, Lat. Sarsaparilla.

SASAFRAS, Arab. A medicinal substance, the root of S. officinale, a shrub or tree of N. America, in its Southern parts. See Sassafras.

SASALADALA, Singh. Literally the shaking leaf; one of the names of the bo-tree, the Ficus religiosa. Its leaves are almost constantly tremulous.—*Forbes' eleven years in Ceylon, Vol.* ii, *p.* 161.

SASANAM, Hind., Sans. A royal grant, usually on copper, sometimes on paper or on stone.

SASARKUND, is a pool in the Mahur jungle where the Pain-ganga is said to be engulfed. The Naikude Gond repair, there, in pilgrimage, at the month Chaitra, to a huge stone that rises in a gorge, and goes by the name of Bhimsen, before which the Naikude Gond mingle with Raj Gond and Kolam in worship. Towards evening, the worshippers cook a little rice, and place it before the god, adding sugar. Then they smear the stone with vermilion and burn resin as incense, after which all offer their victims, sheep, hogs and fowls with the usual libations of arrack, the pujari appears to be inspired, rolls his head, leaps wildly about and finally falls down in a trance, when he declares whether the god has accepted the services or not. At night drinking, dancing and beating tomtoms goes on, and in the morning they return home after an early meal. Those unable to leave home perform similar rites beneath a Mahwa tree.

SASASVATI, a goddess of the hindoos in the S. of India.

SASAVI, Malay. Sinapis chinensis; Mustard seed.

SASIN, see Siva.

SASSAFRAS, Eng., Fr., Ger., Lat., Sp.

Sasafras,	Ar.	Sassafraso,	It.
Cay-vang-di,	Coch.		

This medicinal substance, true Sassafras wood, is the root of Sassafras officinalis, the Sassafras laurel of North America. But, at the Madras Exhibition of 1855, the Jury remarked two specimens of wood, like Sassafras, both from Mergui, very fragrant, and containing an essential oil of value in medicine. Dr. Mason, indeed, says that a species of sassafras abounds in the Tenasserim jungles, which seems to possess all the properties of the sassafras of America. But he had never met with the tree in fruit or flower, and the leaf, he adds, shows that it is not the Sassafras officinarum ; in another place, he mentions that a species of laurus with the odour of sassafras, is, in Tenasserim, often used in house carpentry. It is probably the Camphora glandulifera, and Dr. O'Shaughnessy tells us that the Sassafras of Assam, is perhaps the bark of the Camphora glandulifera, *q. v.* It is fully equal to the American kind, and may be introduced accordingly, although its source is as yet not perfectly ascertained ; the root of Sassafras officinalis is used in medicine. The small wood is of a light brown, the large is darker ; both are plain, soft, and close. Sassafras-wood measures from 4 to 12 in. diameter ; it is sometimes chosen for cabinet work and turning, on account of its scent.—*Beng. Phar., p.* 279 ; *Dr. Mason, Tenasserim* ; *M. E. J. Rep.*, 1855 ; *Tredgold.*

SASDELLEN, Ger. Sardines.

SASSAFRAS OFFICINARUM, *Nees.*

Laurus sassafras, *Linn.* | Persea sassafras, *Spreng.*

A tree of N. America which has been introduced into India : it produces the sassafras bark and root used in medicine— *Voigt, p.* 309.

SASSAIS, Hind. Ærua bovii.

SASSANAM, Karn., title deed.

SASSANIAN KINGS of Persia. The following are the dates given in Dr. Smith's Dictionary, with Dr. Mordtman's latest determinations of the genealogical history of this race.

Smith.	Mordtman.		
A. D.	A. D.		
226	226	(1)	Ardeshir Babegan bin Sasan, or Artaxerxes.
240	238	(2)	Shappuhr, Shahpur or Sapor, captured Valerian.
273	269	(3)	Hormuzd or Hormisdas.
274	271	(4)	Baharam or Varanes I.
277	274	(5)	„ „ II.
294	291	(6)	„ „ III, Segan Shah.
294	291	(7)	Narse or Narses, conquered Armenia and Galerius.
303	300	(8)	Hormuzd or Hormisdas II.
310	308	(9)	Shapuhr or Sapor II,
381	380	(10)	Ardeshir or Artaxerxes II.
385	383	(11)	Shapuhr or Sapor III.
390	389	(12)	Baharam or Varauus IV. Kerman Shah.
404	399	(13)	Yezdegird or Isdegirde I.
420	420	(14)	Bahram Gaur, or Varanes V. visited India.
448	440	(15)	Yezdegird or Isdegirde II.
458	457	(16)	Hormuzd or Hormisdas III.
458	458	(17)	Firuz or Perose, allied with Khakan of Huns.
484	485	(18)	Balas, Palash or Balasces.
488	491	(19)	Kobad or Caodes.
498	498	(20)	Jamasp (Kobad recovers Kingdom 502).
531	531	(21)	Khosru, Kesri (Nushirvan) or Chosroes.
579	571	(22)	Hormuzd or Hormisdas IV. deposed by his general Varanus VI. A. D. 590 : M. ; A.D. 591.
591	591	(23)	Khosru Parvez, Kesri or Chosroes II. put to death by
628	623	(24)	Kobad Shiruyieh or Siroes.
	629	(25)	Ardeshir III. Anarchy.
	629	(26)	Shariar or Sarbazas.
	629	(27)	Puran Dukht.
	631	(28)	Azermi Dukht.
	631	(29)	Ferokhzad Bukhtyar.
	632	(30)	Yezdegird or Izdegirde III. overthrown by Mahomedans 641.

This monarchy commenced in Persia, in the year 226 A.D. when Artaxerxes overthrew the Parthian dynasty, and it continued until itself overturned by the mahomedan khalifs in the year A.D. 632. The founder of the Sassanian dynasty died in 240. In his latter days a certain Arpog was king of China, one of whose sons, Mamkon by name, fled from home on account of a charge brought against him, and took refuge in Persia. The last race of the fire-worshipping monarchs of Persia was the Sassanian dynasty, commencing with Ardeshir Babegan, the descendant of Sassan, who expelled the Ashkawi, about A. D. 226. His son Shapoor obtained several important victories over the Romans, and at length captured the emperor Valerian.—*Prin. Ind. Ant. p.* 13 ; *Thomas' Prinsep, Vol.* 1, *p.* 302 ; *Yule Cathay, Vol.* i, *p.* 84. See Khiraj, Kadesia, Greeks of Asia, India, Kara-oghlan, Khoosroo Parwez.

SASTRA, Hind. An order, a command, a scripture, a religious work, Dharma Sastra the Code of Manu or any book on law or science, religious books of the hindoos in general, and more especially certain philosophical systems, six in number.

SAT, Set, a grain measure of Siam, weighing 3⅜lbs. and holding about 3½ pints.—*Simmond's Dictionary.*

SAT. See Gayatri.

SATA. Minnagar or Manhabari, is the city of Thatha situated in a low swampy valley, 3 miles from the western bank of the Indus, and 4 miles above the separation of the Bagar, or western branch, from the Sata or main stream of the river. The site of Thatha itself is admitted to be modern, but those of Saminagar and Kalyan-kot are said to be of great antiquity. Lieutenant Wood remarks that the site of Thatha is so advantageous for commercial purposes that it is probable that a mart has existed in its neighbourhood from the earliest times.—*Cunningham's Ancient Geog. of India, pp.* 288-289.

SATADEVA, the youngest Pandava.

SATADRU, in position, corresponds almost exactly with the large city of Sarhind. The present ruins of Sarhind consists almost entirely of mahomedan buildings of a late period ; but it must have been a place of some consequence in the time of the hindoos, as it was besieged and captured by Muhammad Gori, the first mahomedan king of Delhi. The name of Sarhind, or " frontier of Hind," or perhaps northern Hind, is popularly said to have been given to the city at an earlier period, when it was the boundary town between the hindoos and the later mahomedan kingdom of Ghazni and Lahore. But the name is probably much older, and seems to mean Northern India, as the astronomer Varaha Mihira mentions the Sairindha immediately after the Kuluta, or people of Kullu, and just before Brahmapura, which according to the Chinese pilgrim Hwen Thsang, was the capital of the hill country to the north of Hurdwar. But the geographical list of Varaha Mihira is copied almost verbatim from that of the still earlier astronomer Parasara, who is believed to have flourished not later than the first century after Christ. The town called Band, or Bando, was probably the contracted form of Bhatasthala, and General Cunningham is inclined to think that Sarhind must be the place indicated by the pilgrim as the capital of the ancient district of Satadru.—*Cunningham's Ancient Geog. of India, pp.* 145-147.

SATAN, an evil spirit, of the jews, christians and mahomedans. Shaitan, the Sathanos or Satan of Europe, was recognised by the Chaldees.

SATANI. A class of religious mendicants in Southern India, who worship Permalu, an incarnation of Vishnu. They perambulate the street morning and evening, and accept alms from all but the lowest castes, often exacting the same by threats of burning themselves with a lamp. They are a mendicant caste of Sudras, worshippers of Vishnu, practising music.

SATAPASPA, SANS. Aniseed, Pimpinella anisum.

SATARUPA is the wife of Brahma, (or the first Menu, or Swayambhuva,) and is declared to be the same with Prakriti, or Nature ; a title generally given, not to Saraswati, the consort or sacti of Brahma, but to Devi, sacti of Mahadeva.—*Moor, p.* 127.

SATAS, see India.

SATASANDA, SINGH. Aristolochia indica, *Linn., Roxb.*

SATAVARI, or Pillipichara, TEL. Asparagus racemosus, *Willd., R.* ii, *p.* 151.

SATA VIRYA, TEL. White dub-grass.

SATAWAR, HIND. Asparagus racemosus.

SATAWAR, HIND. Asparagus racemosus.—*Linn., Roxb.*

SAT BALON, HIND. Polygonum nepalense.

SAT BARGE, HIND. Cavagana tragacanthoides.

SAT BIROZA, HIND. Pinus longifolia.

SAT-DHARA, said to mean, literally " the hundred streams" is a group of buddhist topes on the left bank of the Besali river, just below the junction of the Ghora-pachar river. The topes are two miles W. S. W. of the small village of Ferozpur. See Bud'dha, Topes.

SATGARHA, an ancient city in the Panjab.

SATGHAR GROUP, see Karli.

SAT GILO, HIND. Tinospora cordifolia.

SATGURBA, see Burabur caves.

SATHAGATA, an appellation of Sakya. See Lama, Sakya muni.

SATHA-KUPPAI, TAM. Anethum sowa, *Roxb.*

SATHAM, TAM. Food.

SATHI, SANS. Curcuma zedoaria, *Roxb.*

SATHI, HIND., a variety of coarse rice having a red skin.

SATHI, HIND. Salvia plebeia.

SATHNAMI, a saiva sect who profess to adore the true name, the one God, but they nevertheless recognize the whole hindoo pantheon, and pay reverence to what they consider manifestations of his nature visible in the avatars, particularly Rama and Krishna. The Sad or Sadh, on the other hand, utterly reject all kinds of idolatry, are pure deists with a simple worship. Between these unitarian sects and such as adore every deity, there is the utmost diversity of theory and practice. The Sathnami of Raepore and Belaspur have been inclined to accept christianity.

SATHPURA, a range of mountains in Central India. Nothing can be a greater contrast than the desolate wilds and jungles of the western Sathpoora hills and parts of the country extending from them to the Vindhya with their savage inhabitants, the

Bheel tribes, who abhor field, or, indeed, any other manual labour, and the adjoining richly cultivated plains of Malwa, extending, with occasional intervening tracts of hill and jungle, from the Mhye on the west, to Bhilsa on the east, a stretch of close on 200 miles, and from the crest of the line of the Vindhya to Mundissore and Oomutwarra, a distance of from 100 to 120 miles, and populated by a thrifty, agricultural people. This is succeeded by the more hilly and jungly land of Oomutwarra, Seronje and Keechiwarra, with their scanty population. Northwards, towards Gwalior, the country becomes more open, except on the wild border tracts of Kotah of Bundlecund till we come to the carefully cultivated plain of Gwalior, stretching for a distance of 140 miles between the Chumbul, Pahooj and Sind rivers. A vast portion of Bundlecund is hilly and unproductive, forming the northern slope of the table-land of the Vindhya ; but the scenery is strikingly grand.—*Ann. Ind. Adm., Vol.* xi, *p.* 341. See Satpura.

SATHUNG of the Lepcha. Hystrix longicauda, *Marsden.*

SATI, SANS. Good, pure, hence Suttee, a good woman who immolates herself with the body of her deceased husband. The term is applied to a true and chaste wife. The ancient Aryan custom was to transfer a widow to the brother of the deceased. The Scythians killed the favourite wife in order that she might accompany her husband to the land of spirits. The Thracians slaughtered the widow—the next of kin destroying her at the grave of her dead husband. The burning or self-immolation of hindoo widows, with the bodies of their deceased husbands was generally done at the sangam or confluence of rivers. The Sankalpa, or declaration of the Sati, is as follows : Having first bathed, the widow dressed in new and clean garments, and holding some kusa grass, sips water from the palm of her hand : holding in her hands kusa and tila, she looks towards the east or north, whilst the brahmin utters the mystic word O'm. Bowing to Narayan, she next declares, on this month, (naming the time) I (naming herself and family), that I may meet Arundhate, the wife of the Rishi Vasistha and reside in Swerga —that the years of my stay may be numerous as the hairs on the human body : that I may enjoy with my husband the felicity of heaven, and sanctify my maternal and paternal progenitors, and the ancestors of my husband's family : that, lauded by the upsarasa, I may be happy through the regions of fourteen Indra : that expiation may be made for my husband's offences, whether he have killed a brahmin, broken the ties of gratitude or murdered his friend :—I ascend my husband's funeral pile. I call on you, ye guardians of the eight regions of the world, sun and moon, air, fire æther, earth, and water, my own soul ! Yama, day, night, and twilight, I call you to witness, I follow my husband's corpse to the funeral pile.

The Danish north-men of Europe retained the recollection of the Sati, in the story of Balder, one of the sons of Odin, who was slain by a branch of mistletoe, and Odin himself descended and obtained a promise from the guardians of the dead, that Balder should be restored if all created nature would weep for him. All wept but one old crone whom Loki had possessed, so Balder could not be made to live again, and his faithful Nanna, refusing to survive her beautiful lord, perished on his funeral pile. After much discussion, during which raja Ram-mohun Rai made great efforts in the cause of prevention, Sati was at last legally abolished in British India, by Lord William Bentinck, and though it is still occasionally performed, all who engage in it are severely punished. It is rare in Kashmir but still current in Bali. The first recorded Sati, in the Mahabharata, was performed by Madri, the second wife of Pandu, Kunti the elder wife contested the point, but the brahmans who were present gave it in favour of Madri, who accordingly perished on her husband's funeral pile. The idea of Sati, was connected with a future state ; when the ancient Scythians buried a king, they strangled one of his concubines and buried her with him, together with his cup bearer, cook, groom, waiting man, messenger and favourite horses, (Herod, iv, 71,) to serve their master in the next world. Amongst the Thracians with whom poligamy prevailed the wife decided to be the best beloved was slain, by her next of kin, over the grave of her husband (Herod, v, 5) and buried with him. On the occasion of burning the body of Kichaka, whom Bhima had slain to avenge an insult to Draupadi, the deceased's relations wished to burn her with the body, but she was saved by Bhima. Just before the town of Dwarka was overpowered by a storm wave, king Vasudeva died, and four of his wives burned themselves on his funeral pile. Krishna also was slain by a Bhil hunter, in the forest. Ayuna then conducted the flying multitude to Kurukshetra where four of Krishna's widows burned themselves, and [illegible] rest of the widows assumed the devotee [illegible] and retired to the jungle.—*Colebrook* in [illegible] *Res., on the duties of a faithful* [illegible] *in As. p.* 87 ; *Dr. Vaughan, p.* 192 ; [illegible] *ife, Vigne, Herod* iv, 71 ; v, 5. See Sat'hi, Suttee.

SATI, a hindoo goddess, Siva's first wife, a daughter of Daksha. "The gods whom

Sati contained in her womb, burst out; her limbs were scattered all over the world, and the places where they fell are become sacred. Her breasts fell near Jalandar in the Punjab; the yoni into Assam; and the guhya (podex) into Nepal, where they are most devoutly worshipped to this day: the last is a small cleft in a rock, with an intermitting spring; it is called Guhyast'han." The servants of Cuvera, the deformed deity of riches, are called Guhyaca; and into such beings the dark souls of men, addicted in this world to selfish gratifications, transmigrate.——*Wilford on Mount Caucasus, As. Res., Vol.* vi. *p.* 477; *Moor, p.* 108. See Inscriptions Hindoo Sati.

SATILLER, the half of a sooco in Bencoolen and some parts of the Eastern Archipelago.—*Simmond's Dictionary.*

SATIN, Eng., Fr.

Atlass,	Ger.	Atalas, Intalas,	Malay.
Raso,	It.	Setim,	Port.

A silken fabric manufactured in Europe.

SATIN SPAR, see Calcareous spar.

SATIN WOOD; the Swietenia chloroxylon furnishes this cabinet wood, well-known for its glossy yellow shades. It is hard and when polished, is very beautiful with a satiny lustre, it is much used for picture frames, rivalling the birds eye maple of America. It is occasionally used by cabinet makers for general furniture, but it is liable to split. Satin wood grows chiefly in mountainous districts of southern India and Ceylon. It is abundant in the hills of the Vizagapatam and Ganjam circars, though logs seldom exceed eight inches diameter, it is well adapted for naves of wheels, for mallets, &c., a superior description for furniture is occasionally imported from Ceylon. Very fine satin wood occurs at Kutapatti, in the Tengrikottah talook of Salem. It is used for the naves of gun carriage wheels and is the best suited of all the Indian woods for fuses. The price is nearly the same as that of teak and blackwood. Colonel Frith mentions a satin wood of Penang, of a straw colour and a beautiful wood for ornamental furniture, &c.: but, it is not known what satin wood tree grows there. The best variety is the West Indian, imported from St. Domingo, in square logs and planks from 9 to 20 inches wide; the next in quality is the East Indian, shipped from Singapore and Bombay in round logs from 9 to 30 in. diameter; and the most infer[illegible] is from New Providence, in sticks from 3½ to 10 in. square; the wood is close, not so hard [illegible] box-wood, but somewhat like it in colour or rather more orange; some pieces are very beautifully mottled and curled. It was much in fashion a few years back for internal [illegible] and furniture, it is now principally used for brushes, and somewhat for turning, the finest kinds are cut into veneers, which are then expensive; the Nassau wood is generally used for brushes. Satin wood of handsome figure was formerly imported in large quantities from the Island of Dominica. The wood has an agreeable scent, and is sometimes called Yellow Saunders wood.—*M. E. J. R.*; *Mr. Rohde MSS.*; *Dr. Cleghorn's Conservator's Report* 1859-60, *p.* 15; *Col. Frith*; *Tredgold.* See Swietenia chloroxylon.

SATISARAS, see Kashmir.

SATKARINI, see Inscriptions, Junagurh.

SATNAMI, literally, true name, a hindoo unitarian sect who profess to adore the true name alone, the one God, the cause and creation of all things, Nirgun, or void of sensible qualities, without beginning or end. Their notions are borrowed from the Vedanta philosophy. With them, worldly existence is illusion, or the work of Maya, the primitive character of Bhavani, the wife of Siva. See Sat'hnami.

SA-TOO, Duk. Hordeum hexastichon, *Linn, Roxb.*

SATPURA. This name is now generally applied to the great range or table-land which, commencing eastward at Amarkantak, runs nearly up to the western coast, though the appellation seems to have been formerly restricted to that portion of the range which divides the Narbada and Tapti valleys. The Satpura mountains are thus described by Mr. Blandford of the Geological Survey. "This range is well defined to the westward, and from Rajpipla to A'sirgarh consists of a belt of mountainous country, forty or fifty miles in breadth, and of an average height, at the crest of the chain, but little under 2,000 feet above the sea, while many peaks rise above 3,000, and some (and even some table-lands, as Turan Mal) are as high as 4,000 feet. Nearly the whole of this range, both hills and valleys, consist of trap; but towards the west, along the northern boundary of Khandesh, a series of craggy peaks are met with, such as are but rarely seen in the trap region. Elsewhere the summit of the range is more or less a table-land. Just east of A'sirgarh there is a break, through which the railway from Bombay and Khandesh to Jabalpur passes, the highest part of which is only 1,240 feet. It is worthy of notice that this break leads from close to the junction of the two alluvial plains in the Tapti and Purna to a flat tract lying between the two Narbada plains. East of this break the trap hills continue till south of Hoshangabad, where sandstone and metamorphic rocks emerge and form a great portion of the hills of the Pachmarhi and

Betul country. There is a table-land of considerable extent round Betul, which extends far to the eastward beyond Chindwara and Seoni, and joins the high plateau of Amarkantak. Upon this plateau trap still predominates and a great spur from it extends between the Tapti and the Purna, forming the northern boundary of Berar as far as the confluence of those rivers. This range is also of considerable height, in places nearly 4,000 feet. Like most other ranges, it has no definite name, and is generally looked upon as a portion of the Satpura. Accepting Amarkantak as the eastern boundary, the Satpura would have a range from east to west of about six hundred miles, and in their greatest depth would exceed one hundred miles from north to south. The shape of the range would be almost triangular. Satpura hills divide the valleys of, and form the water-shed between, the Tapti and Nerbudda. The Satpura plateau is the true barrier between Northern and Southern India and is the line on which the settlers from Hindustan met the emigrants from the Dekhan and Maharashtra, each of them pressing the prior races into the great natural fastnesses of Central India ; the Satpura mountain range, extending from Rajpiplah to Asirgarh, and forming a great belt of mountainous country, 40 or 50 miles in breadth with an average height of 2,000 feet. In Gondwana there are now only two millions of aborigines, out of a total population of nine millions. The remaining seven millions almost amount to a microcosm of the people in India, and justice is administered in the Central Provinces in five different languages, viz., Urdu, Hindi, Marathi, Uriya and Telugu. In round numbers the seven millions may be thus classified :—1½ millions speak Marathi, 1½ millions speak Uriya, and 5 millions speak Hindi. Dr. W. W. Hunter gives the following as the languages peculiar to Central India :—

Ho (Kol),
Kol (Singhbum),
Santali,
Bhumij,
Uraon,
Mundala,
Rajmahali,
Gondi,
Gayeti,
Rutluk,
Naikude,
Kolami,
Madi,
Madia,
Kuri,
Keikadi,
Khond,
Savara,
Gadaba,
Yerukala,
Chentsu.

He arranges the races and tribes speaking these into Kolarian and Dravidian, viz. :—

1. The Kolarian,
   Santal,
   Kol,
   Mundah,
   Korku,
   Bhil,
   Bhumia,
   Bhui,
   Mair.
   Mina,
2. The Dravidian or people of the Tamil tongue,
   Oraon,
   Gond,
   Khond and S. Peninsula aborigines.

The committee include as Kolarian,

Bhilalah,
Bygah,
Bhunjia,
Binjwar,
Bhumiah,
Korku,
Kol,
Bhil,
Dhangar,
Gudba,
Kawar,
Nahur.
Manji.

Kolarian tribes occupy the broad belt of hilly country that runs almost continuously across India from the Santal tracts to the Kurku settlements. The Santal in the east and the Kurku in the west, speak a language substantially the same.

The Kolarian tribes of the Central Provinces are :—

Kol,
Kurku,
Bhil,
Binjwar,
Bhonjiah,
Bhumiah,
Bygah,
Dhangar,
Gudba,
Kawar,
Napun,
Manji,
Mahto,
Soura,
Goli,
Aguriah, } doubtful..

The Dravidian tribes of the Central Provinces are :—

Gond.
Bhuttra Gond,
Maree-Gond,
Maria or Gotawar.
Durweh Gond,
Khutalwar ,,
Aguriah ,,
Hulbah,
Koy,
Khond,
Dhunwar,
Nahur,
Punkah, } doubtful.

The occupants of the Central Provinces are :—

Bhil,
Korku,
Gond,
Lodhi,
Byga,
Parwar,
Kachi,
Chamar,
Kunbi,
Keloe,
Ooryah,
Kond,
Tiling Komati,
Mahratta,
Mariah,
Jharia.

with a sprinkling of rajputs, brahmins and mahomedans, in almost every district.

In the extreme west, in Nimar ; are the Bhil.

From thence, going to the North East, we find along the Satpura range the Kurku and Gond,—the Kurku belonging to the Kolarian family, and the Gond to the Dravidian. The Kurku are not numerous, and are chiefly to be found in the hilly part of the Hushangabad, and the adjoining northern part of the Chindwara districts. In these localities, they meet with the Gond, and a few Kurku are also found in Baitool.

The Gond are numerous in the plateau district of Seone, and in the south of Jubbulpur, and they are found also in the hilly parts of Jubbulpur.

The Gond, Byga and Kol form a large section of the population of Mandla, and the Gond and Bygah are also in the hilly parts of Balaghat, south of Mandla.

The Ooriya occupy entirely the Sumbulpur district.

The Khond dwell in the country surrounding the Ooriya in Sumbulpur and to the south.

Gaoli or Goli people have been settled from time immemorial along the Satpurah range, and once ruled the hill country round Baitul. The Gaoli of Seoni have many sub-divisions. They are generally robust fair men. On a spur of this range near the Nerbuddah [illegible] colossial Jain figure cut in relief [illegible] is a feet high.—*Campbell, p.* 7 ; [illegible]early 80 [illegible]ter.

SATRAP also Kshatrapa[illegible]ns. Although wholly unknown as a [illegible]vereign title to modern hindoos and n[illegible] be found in their books, this term is f[illegible]r to the reader of the Grecian history of ancient Persia, with merely a softening of the initial letter, as Satrapa ΣΑΤΡΑΠΗΣ, the prefect of a province under the Persian system of Government. It is an obsolete Persian title for the governor of a province. In Sanscrit it signifies the ruler, feeder, or patron of the Kshatra or military class, and now that we know the ancient language of Persia east of the Euphrates to have been a new dialect of the Sanscrit, we may conclude that satrapa had the same signification in Arabia. The effeminate Persians, at a very early period were in the habit of governing their numerous tributary provinces by mercenary troops. The same system and the same denomination of satrap, was adopted and retained by the Macedonian conquerors, alike when Greek or native officers were employed. And instances are frequent enough of the satraps assuming to themselves independence and a regal title. The satrapies of the ancient Persian monarchy are not supposed to have extended across the Indus. It was in Alexander's time this limit was first transgressed, it was not long prior to the time when the Bactrian Greeks or the Parthians made themselves masters of Sindh, Kutch and Gujarat.—*Prin. Ind. Ant., Vol.* ii, *p.* 64. See Greeks Kabul.

SATRAWALA, Hind. Cuscuta reflexa.

SATRINGA. Palit'hana, see Kashbin.

SATROGHANA, see Rama.

SATR-SOWA. Myrtus communis the myrtle; its leaves are eaten with black pepper to cure emissions that occur from debility.—*Genl. Med. Top., p.* 152.

SATRUN, Hind. Quercus dilatata.

SATRUGHNA. Viswamitra, a kshatrya warrior, in the time of the maharaja Dasaratha, retired to a cave, and by the practice of austerities, became a brahmin sage: at his request, Dasaratha sent his sons Rama and Lakshmana, Bharata and Satrughna to conquer the South of India.

SAT-SUKI, see Japan.

SATTA-KUPPA, Singh. Anethum sowa, *Roxb.* Dill seed.

SATTAGUDAI of Herodotus, the same as Thatagush of Darius

SATTAMANSI, Sans. Spikenard.

SATTAN, a name of the hindoo god Ayenar, and not identical with Satan of the Bible.

SATTAPANNI, or Srotaparni, a cave at Rajagriha.

SATTARAH, a town south of Poonah, in the southern mahratta districts. It was, latterly the town in which the rajah of Sattarah dwelt. See India, Mahratta Governments in India, Peshwa, Sevaji.

SATTATHAVAN, a vaishnava sect of the south of India, who, according to Wilson, are said to be communists as to their wives and to have no caste distinctions.

SATTEE, a hindoo woman who immolates herself along with her husband's remains on his funeral pile. See Sati, Suttee.

SATTEL, Ger. Saddles.

SATTRANJI, Hind. A fibrous striped cotton carpet made in India.

SATTU, Tel. Zinc.

SATUREJA HORTENSIA, *Wight.* Summer savory.

SATUREJA MONTANA, *Wight.* Winter savory.

SATURI, Hind. Rue.

SATURN, in the sidereal theology, was represented by Bel. See Brahma, or Hiranyagharbha, Lead, Sani, Saraswati, Singalese, Vahan.

SATURNIA, *Schrank.* A genus of insects belonging to the order Lepidoptera and the family Bombycidæ. The antennæ are fringed in the male; the head is small; the wings are very broad and entire; the palpi and trunk are wanting. The genus Saturnia includes now the Pavonia of Hubner, the Phalæna attacus Linnæus, and part of the genus Bombyx of Fabricius. To this genus, also, some of the largest of the Lepidoptera belong, but S. Atlas, the Giant Atlas Moth, which has wings measuring 7 or 8 inches across is now named the Attacus atlas. This species also, with S. Cercropia and A. Lunula, have their wings produced into a tail. The cocoons of A. Cynthia and S. Mylitta are used in India for the production of silk. Latreille states that these are the wild species of silk-worm of China. A. Cynthia is the Arrindi Silk-Worm of India. S. Promethea, a North American species, forms its cocoon within the leaf of a sassafras-tree, having previously fastened the stalk of the leaf to the stem by a strong silken web, whereby it is prevented from falling with the other leaves, Westwood.—*Roxburgh, Linn. Trans., Vol.* vii; *Eng. Cyc.*

SATURNIA GROTEI, *Moore.* A moth of Darjeling, nearly three inches in expanse.

SATURNIA PYRETORUM, *Boisduval.* A moth of China.

SATURYUN, Yunani. Eulophia virens, *R. Br., V. Ic.*

SATWARI, gardeners of Guzerat.

SATWIN, Hind. Mar. Alstonia scholaris, *R. Br., Don.*

SATYA, see Vamana, Yug or yuga.

SATYABHAMA, or Satyavama, one of Krishna's mistresses.

SATYANASA, Hind. Argemone mexicana.

SATYAVAMA, and Lakshmi, wives of

Balaji, an incarnation of Vishnu. These two as his sacti are generally seen with him as well as in his avatara of Krishna. See Baljajee, Tripati, Vishnu.

SATYAVRATA, see Brahmadica, Yama, Dharmarajah.

SATYOMBA, a pergunnah on the edge of the plateau of Chota Nagpore overlooking the valley of the Damudah river.—*Dalton, p.* 153.

SATYR, of Isaiah, xiii, 21 ; xxxiv, 14 is a goat, see Rama.

SATYRA CORNUTA, see Tragopan.

SATYRIUM CUCULLATUM, *Thunb.*

S. bicorne, *Thunb.* | Orchis bicornis, *Linn.*

A plant of the Cape of Good Hope introduced into Bengal.

SAT ZARRA, HIND. Asphodelus fistulosus.

SAUBATA GUDDA, see Semetic races.

SAUBATA KENNA, see Semetic race.

SAUBWA, see Karen.

SAUCE. Out of eighteen red sauces submitted by Dr. Hassell to examination in 1852, no less than sixteen contained Bole Armenian, and this usually in immense quantities.—*Hassell.*

SAUDHO-DANI, see Buddha.

SAUD, or Sad'h, a hindoo sect whose chief seats are Delhi, Agra, Jayapur, and Farrakhabad, but there are several of the sect scattered over other parts of the country. The Sauds utterly reject and abhor all kinds of idolatry, and the Ganges is considered by them not to be a sacred object, although the converts are made chiefly, if not entirely, from among the hindoos, whom they resemble in outward appearance. Saud, the appellation of the sect, means, they say, "servant of God ;" its real meaning is pure, from sad'ha pure. They are pure deists, and their form of worship is most simple. The Sauds resemble the Quakers, or Society of Friends in England, in their customs in a remarkable degree. Ornaments and gay apparel of every kind are strictly prohibited. Their dress is always white. They never make any obeisance or salutation. They will not take an oath, and they are exempted in the courts of justice, their asseveration, like that of the Quakers, being considered equivalent. The Sauds profess to abstain from all luxuries, such as tobacco, betle, opium, and wine. They never have exhibitions of dancing. All violence to man or beast is forbidden ; but, in self-defence resistence is allowable. Industry is strongly enjoined. Their nuptial rite is simple, all unnecessary expenses being scrupulously avoided. Polygamy is never allowed, and even widows are forbidden to unite with a second husband.—*Cole. Myth., Hind.*

SAUDIKAI MARAM, TAM. Myristica cinerea.

SAUERK-LEESAURE, GER. Oxalic acid.

SAUGOR, a town, and province in Central India. The Central Provinces is a term by which, under a Resolution of the Government of India, during Lord Canning's rule, the provinces of Nagpore and the territories of Saugor and Nerbuddah were united under a Commissioner. The Central Provinces consist of perhaps the grandest plateau on the face of the globe, more than half of which is covered by the densest jungle, where the wild beast finds its lair and the Gond savage a precarious subsistence. The plateau is in the very centre of the peninsula. From it, as a focus, radiate the great rivers of the Deccan. To the north flow the Sone into the Ganges, the Cane, the Betwa, the Sind and the Chumbul into the Jumna. To the west are the Taptee and Nerbudda, and to the east the Wein Gunga, Wurda and Pein Gunga, which form the Godavery. What the Kuen-Lun mountains are to the river system of Central Asia, and the Himalaya to Northern India, that is the Mahadeo range to the Deccan. It is true that the Godavery and Nerbudda series of rivers are little more than mountain torrents, but engineering science could do much for their navigation, and railways with their feeders will supplement them. On this vast tableland there is soil of surpassing fertility, wood, whether useful like teak or ornamental like ebony, which, with proper conservation, is inexhaustible, and such mineral resources as coal, iron, precious stones and gold. Here, but for the want of population, all the emigrants of England for the next decade might settle and grow rich. The area is 111,238 sq. miles, of which 47,299 are unculturable, and in 1868, about half of the remainder was under cultivation ; in 1862, they yielded 80 lakhs a year, but, in 1867, the revenue had increased to 120 lakhs. The Satpura range runs 600 miles, with an average breadth of 45 miles. The Chouradadur plateau is 100 sq. miles and the Nowagaon lake is second only to the Deybur lake in Oodeypoor.

The Nagpore province and the Saugur and Nerbudda territories occupy almost the old territorial division of Gondwana and were re-united under the designation of the Central Provinces containing nineteen districts :—

Saugur and Dumoh are on the Vindhyan table land.

Mandla, Jabulpur, Narsinghpur, Hoshungabad and part of Newar are in the Nerbada valley.

Baitool, Chindwarah, Seoni and Balagahat are on the Satpura table land.

Nagpore, Warda, Bhandara and Chanda, are on the Nagpore plain, in the valleys of the Warda and Wain-Ganga.

Raipur and Bilaspore are on the Chatisgarh plain, and Sumbulpor is in the valley of the Mahanuddy.

Upper Godavery, on the left bank of that river.

The principal ranges in the Saugor and Nerbudda territories are the Mahadeo hills, and the Kymore and Bundair ranges ; between the Mahadeo and Kymore ranges are the plutonic and crystalline rocks to which Mr. Medlicott applied the name of Sub-Kymore. The hills form the northern base of the Nagpore territories, and far beyond the present limits of the Nagpore territory stretch between the inaccessible country between Baitool and Chindwarra to the Nerbudda river, with wild recesses. They extend in a direction from north to south between the parallels of 21° and 22° north latitude, presenting a bold and well defined outline. Between Chindwarra and Mooltye they attain a height of more than five thousand feet. Amongst their wild gorges, and deep glens, their precipitous waterfalls and abrupt sides, their steep acclivites and numerous fissures, much wild and picturesque scenery is to be found. The principal rock strata of this range are composed of sandstone shales. The sandstone is often seen striped with dark ferruginous bands, which give it an appearance not unlike that of the Kymore sandstone in the vicinity of Jukehi, or the sandstone in the Nagpore District. From the very few fossil remains that have yet been discovered, it has, as yet, been impossible to fix the age of these hills. Only a few vegetable fossil stems have as yet been discovered. There are few or no traces of any mollusca or crustaceæ. Like the Kymore, it has been usual to ascribe these rocks to the era of the formation of the new red sandstone. From the fossil indications that we possess, that era appears to be too ancient ; the upper sandstone which forms the mass of the Mahadeo hills, and of so many others of less elevation appears to be more recent. While the plant beds underlying are decidedly not more recent than jurassic, and are probably a transition between the lias and jura transitions ; the coarse arenaceous beds themselves that are frequently characterized by the ferruginous bands already mentioned, are to be classed among the upper members of the cretaceous series. There is some doubt as to the true position of some of the shales that are ranked as under the plant beds. Between the Mahadeo sandstone ranges and the Kymore and Bundair hills are to be seen the granitic and schistose hills of the Nerbudda basin. Still, it is not alone in the Nerbudda basin that the granitic, crystalline and schistose rocks are found between outlying ranges of sandstone and limestone. This peculiarity is also seen in the Nagpore districts. It adds another illustration to M. Pallas' theory. While examining the mountain chains of Siberia he laid it down as a general rule, that in the formation of mountain chains, granitic associated with schistose rocks will be found in the centre, while outlying them will be seen the great sandstone or limestone ranges. It is thus in the Saugor and Nerbudda country. To these ranges Mr. Medlicott gives the name of Sub-Kymore, and supposes that they may be a continuation, downward, of the Vindhyan group subsequently altered. Still, until further discoveries have been made ; until fresh links have been added ; and until more certain fossil indications have been found, no reasoning from mere analogy will enable us definitively to fix their era. When their age has once been definitively fixed, there will be a greater simplicity in the classification of the Indian rocks, a classification which as has been suggested would appear in the following order ;

1. Mahadeos with sub-group of Lemata beds.
2. Rajmehals.
3. Upper Damudas of Jubbulpore and Central India.
4. Lower Damudas.
5. Talchirs.

The Saugor and Nerbudda territories at present embrace the districts of Jubbulpore, Saugor, Dumoh, Mundla, Seonee, Baitool, Nursingpore and Hoshungabad. Mr. Blandford's synopsis of the Damuda, Talchir and Panchet, gives the following result:—

Names.	Description of beds.	Fossils.	Thickness in feet.
I. Upper Panchet ...	Coarse Sandstones and conglomerates.	Unfossiliferous.	500
II. Panchet Group.......	Coarse Sandstones, very false bedded, &c., red clays, greenish and grey shales.	Ferns distinct from Damuda forms. Tœniopteris, Sphenopteris, Schizoneura, Reptilian and fish remains...........	1,500
III. Damuda Groups.....	Coarse and fine sandstones mostly false bedded and felspathic, shales, coal seams. The latter continuous over considerable areas.	Vertebraria Trizygia, glossopteris, Pecopteris, Schizoneura, Phylotheca, all plants..........	5,000

Names.	Description of beds.	Fossils.	Thickness in feet.
b. Lower Damudas..	Coarse conglomerates; white Sandstones; mineral coal seams of very irregular character.	Glossopteris, Vertebraria, &c.	2,000
IV. Talchir Groups....	Coarse Sandstone, fine Sandstone composing; undecomposed felspar............	Very rare, a few stems and seeds................	800

—*Cal. Rev. No*. 73, *Sept*. 1861, *pp*. 132, 133

SAUGOR ISLAND, is in the entrance of the Hoogly river, the western mouth of the Ganges, and is one of the islands of the Sunderbuns. It extends north and south, from lat. 21° 35′ N., to 21° 56′ N., and bounds the great entrance of the Hoogly on its eastern side. It is 21 miles in length and 6 in breadth, and is low, but as it lies upon the extreme edge of the Deltaic basin, it is consequently higher than the centre of the Delta. The remains of tanks, temples and roads are still to be seen, showing that it was once more densely populated than it is now, and native history informs us that Saugor Island had been inhabited for centuries. During the operation of clearing Saugor Island in 1822 to 1833, and later when clearing away the jungle for the Electric Telegraph in 1855-56, remains of buildings, tanks, roads and other signs of man's former presence were brought to light. Again, upon the eastern portions of the Sunderbuns, where the country has been cleared of forest, mud forts are found in good numbers, erected most probably by the then occupiers of the soil, to ward off the attacks of the Mug, Malay, Arab, Portuguese, and other pirates who, in times gone by, that is, about A. D. 1581, depopulated this part of the country. The Mug pirates even advanced so far to the westward as to depopulate the whole country lying between the river Horinghatta and the Rabnabad Channel, but we know of no trace of the land having been occupied further to the westward of the Horinghatta. Saugor Island, is still largely resorted to by pilgrims. The Delta is intersected from north to south by many broad rivers, and by endless creeks running one into the other filled for the most part with salt water when near the sea. This tract of land, occupies approximately 28,080 square miles of superficial area, or double the area of the Delta of the Nile; measuring from west to east, or from the right bank of the Hooghly river opposite to the Saugor tripod on the South-west point of Saugor Island, to Chittagong, it is 270 miles in width; presenting to the Bay of Bengal a series of low, flat, mud banks, covered at high water and dry at low water; a few miles from low water mark commence mangrove swamps; a little further inland trees appear, and lastly cultivation; the nearest cultivation in the central portion of the Delta being forty-seven miles from the sea. In the sea front of the Delta there are nine principal openings having a head stream, that is having water flowing direct from the Ganges, or from the Megna or Brahmapootra, they are 1, the Ganges; 2, the Megna or Brahmapootra; 3, Horinghatta; 4, Pussur; 5, Murjatta or Kagga; 6, Barapunga; 7, Mollinchew; 8, Roymungul or Juboona; 9, Hooghly. Besides these large rivers there are numerous openings having no head stream, being mere salt water tidal estuaries; these openings or headless rivers are the deepest as no silt or deposit is poured into them from the higher lands. The tides in the Hooghly run with a rapidity in the springs of seven miles an hour, between Saugor and Calcutta. At Calcutta it is high water about 2h. 30m. on full and change of the moon. The bore is of not unfrequent occurrence in this branch of the river.—*Cal. Rev.* See Earthquakes.

SAUL, or Sal, HIND. Shorea robusta. Saul tree dammer, is obtained from Shorea robusta and other species. The Vatica tumbuggaia grows to a limited extent on the west coast, but yields little if any of the dammer collected there. The dammers of the northern and eastern districts of the Peninsula of India occur in sticks much resembling in shape the black dammer but differing widely in colour and consistency. In colour it varies from light yellow to a dark brown. The two colours being very frequently found in the same lump and giving it the appearance of having a regular "grain," it is friable and differs from the white dammer of the western coast in its inferior hardness, opacity and its peculiar form, and from the black dammer in its colour. There are extensive tracts of Saul jungles in the Goomsur and Cuttack provinces. The Khond and Woodia living in and near these jungles, wound trees in several places. The resin issues and is collected when sufficiently solid. The dammer collected from the decayed parts of the tree is of a dark colour: the tree is called Guggilam in Telugu and tala gotso in Urya. The Khond and Urya make the leaves into the plates from which they eat their food and also roll up tobacco in them to smoke like a cheroot. In time of famine the above tribes live on broth made from the fruit of this tree. See Dammer, Sal, Shorea robusta, Syn. of Vatica robusta.

SAULAVANGAPATTA, TEL. Cinnamon.

SAUL FOREST STAG. Cervus affinis.

SAUL TALLAREA, *Roxb*. Syn. of Vatica laccifera, *W. & A.*

SAUL TUMBAGAIA, Roxb. Syn. of Vatica tumbuggaia, *W. & A.*

SAUM, Ar. The hot wind known as the Simoom ; it prevails over a large portion of Asia, and of its fatal effects there are many accounts. It was Mr. Rich's opinion, the result of a long course of inquiries, that the hot wind kills by exhaustion, and not by any poisonous quality in itself.—*Ed. Rich's residence in Kurdistan, Vol.* ii.*p.* 195.

SAUMAR, a name of the Ahom race in Upper Assam.

SAUMAY, Tam. Panicum miliaceum ?

SAUMYA, one of the nine divisions of India.

SAUNDAUNG, a Burmese long-measure, of 22 inches, the 7th part of the bamboo.

SAUNDERS WOOD.

Undun,	Arab.	Sandal-holz,	Ger.
Sundul-Ahmir,	,,	Ruttunjee,	Guz., Hind.
Ralita chandana,	Beng.	Sandalo roso,	It.

Red wood,	Eng.	Rakta-chandana,	Sans.
Ruby wood,	,,	Ranjana,	,,
Red sanders wood,	,,	Sigapoo shandanum,	Tam.
Santale rouge,	Fr.	Ku-chandanum,	Tel.

The Sanders wood or Red Sanders wood of commerce is the product of a large useful timber tree, the Pterocarpus santalinus, found in Malabar, Mysore, Ceylon, near Madras in the Pulicat and Tripaty hills Timor and Malay Peninsula. The wood is extremely hard, of a fine grain, and a bright garnet red colour, which brightens on exposure to the air. It is employed to dye lasting reddish-brown colours ; the concentric circles being divided by dark lines. It communicates a deep-red to alcohol, but gives no tinge to cold water, it is principally shipped to England from Calcutta in logs from 2 to 10 inches diameter, generally without sap, and sometimes in roots and split pieces, it is very hard and heavy, it is very much used as a red dye wood, and often for turning. The logs are often notched at both ends, or cut with a hole as for a rope, and much worn externally from being dragged along the ground ; other woods, as also indeed ivory tusks, are sometimes thus perforated for the like purpose. With different mordants, it yields various shades of red, these are said to be little permanent. This wood is largely exported from, but little used in, Madras. The Madras exports for 1854 amounted to 47,431 cwts. value 59,570 Rupees.—*M. E. J. R.* ; *Tredgold.*

SAUOLA MARA, Can. Cedrela toona, *Roxb.*, *Cor.*, *W. & A.*

SAN-PU. The Tibetans do not recognize a continuous chain of mountains running parallel to the Himalaya ; nor are they acquainted with "Kouenlun" as the name of any mountain range. They are familiar with the Himalaya, on one hand, and call it "Kangri," which simply means Snowy region, and they know that the country of the Mongols, or Mongolia, lies parallel to it, on the other hand. A great distinguishing feature in the physical geography of Eastern Tibet is the Yaroo river or Sanpoo of English maps. Thus characterized, in popular estimation—which is not founded on the physical features of the country, on its natural productions, or on political divisions of territory, separately or jointly,—Eastern Tibet is bounded on the north-west by the Kangtisee range of mountains. The highest portion of the Kangtisee range is supposed to be the "Kylas," of Strachey and a greatly elevated tract of country extending from the base of this range ; on the north by Mongolia ; on the east by the Sifan and Sechuen provinces of China, and on the south by the Himalaya, from the point at which it is pierced by the Burhampootur on the east, to the meridian of the Mansarowar and Rawan Rud Lakes on the west. The general direction of the Kangtisee range is north and south, and it is said to connect the Himalaya and Mongolia, as by a cross-bar. It runs to the east of the Mansarowar and Rawan Rud Lakes, its highest point is said to exceed in elevation any portion of the Himalaya, and four large rivers have their sources in different parts of the range, viz., the Singh-ka-bab or Indus, the Langehoo ka-bab, &c.

SAUNF, Hind. Fœniculum vulgare.

SAUR, Duk. Bombax malabaricum.

SAURA, is supposed to be derived from Surya, identical with Sol, the sun.

SAURA. See Chameleons, Sauria.

SAURA. A drink in use in the Nicobars, obtained from one of the palms.

SAURA, see Saorah.

SAURAPATA or Saura ; Hindu worshippers of Suryapati, the sun god. A sect of limited extent and total insignificance.

SAURASHTRA, an ancient name of the peninsula of Guzerat. The name of Gurjjara in the time of Hwen Thsang, was confined to western Rajputana and it was still a distinct country from Saurashtra in A. D. 812, when Karka raja of Lateswara recorded a grant of land. Between this date and A. D. 1310, there is a gap of five centuries, during which period we have no mention of Gurjjara in any contemporary records. General Cunningham has a strong suspicion, however, that the movement of the Gujar race towards the peninsula must have been connected with the permanent conquest of Delhi, Kanoj and Ajmer by the mahomedans, which rejected the Chohan and Rathor tribes from northern Rajputana and the Upper Ganges, and thrust them towards the south. The Rathor occupied Pali to the east of Balmer in the Samvat year 1283, or A. D. 1226. This settlement of the Rathor must have driven the great body of the Gujar from their ancient seats and forced them to the south towards Anhalwara Pattan and Eder. This was actually the case of the Gohil, who being expelled from Marwar by the Rathor, settled in the eastern side of the peninsula, which was named after them Gohilwara. In the time of Akbar the Gujar had certainly not penetrated into the peninsula, as Abul Fazl does not name them in his notice of the different tribes which then occupied the Sirkar of Surat. But even at the present day there is no large community of the Gujar in the peninsula, so that we must look for some other cause for the imposition of their name on a large province which they have never completely occupied. From an old inscription of the kings of the Gurjjara tribe, we learn that in S. 380, or A. D. 458 the Gujar had pushed their conquests as far south as the banks of the Narbada. In that year, and subsequently in A. D. 463, their king Sri Datta Kusali made several grants of land to certain brahmans in the district of Akrureswara, near Jambusara which General Cunningham believes to be Aklesar, on the south bank of the Narbada, opposite Baroch. But before s. 394, or A. D. 472, the Gujar race must have been driven back to the north, as far at least as Kambay, because the Chalukya prince Vijaya made several grants of land to the same brahmans in the town of Jambusara which lies between Baroch and Kambay. It is certain, therefore, that the Gujar race had occupied the country to the north of the peninsula as early as the fifth century of the Christian era. But two centuries later they had already lost their power as Hwen Thsang found a Kshatriya prince on the throne of Gurjjara. They must still, however, have continued to form the bulk of the population of the countries to the west and south of Mount Abu; and as Alaf Khan, the first mahomedan conqueror, under Ala-ud-din, Khilji, fixed his head quarters at Nahrwara, or Anhalwara, in the very heart of the Gujar country, General Cunningham thinks it probable that the name of Gujarat was then first applied to this new province of the Delhi empire; and as the peninsula of Saurashtra formed a part of the province it was also included under the same general appellation. He therefore looks upon the extension of the name of Gujrat to the peninsula as a political convenience rather than an ethnographical application. Hamilton mentions that the greater part of Malwa and Khandes was formerly called Gujarat; and this is borne out by Marco Polo, who distinguishes between the peninsula, which he calls Sumenat (Somnath) and the kingdom of Gujarat, which he places on the coast to the north of Tana; that is, about Baroch and Surat. Even at the present day the name of Gujarat is not used by the natives of the peninsula itself, who continue to call their country Surath and Kathiawar, the latter name having been a recent adoption of the Mahrattas. As Karka Raja, was reigning in A. D. 812, his grandfather's accession must have taken place in the third quarter of the seventh century, that is, between A. D. 650 and 675, which agrees with the actual date of A. D. 658, assigned by the native historians for the destruction of Balabhi, and the extinction of the Balabhi sovereignty in the peninsula of Gujarat. An ancient capital of Saurashtra, (Surat and Guzerat) was Balabhipura, the dynasty being named the Balabhi, Balhara, or Bala-Rais dynasty. The Jain chronicles of Jai-Sinhi, consulted by Colonel Tod, trace the ancestry of Keneksen, the founder of the Mewar family, up to Sumitra, the 56th descendant from Rama B. C., 2029, Jones; 950 Buchanan, and 1100 Tod. Solar worship first prevailed, afterwards the Jain 252. In A. D. 523, Siladitya was slain, and Balabhi was destroyed by the Parthians in 524. In A. D. 727 Buph or Bappa, seized Chitor from the Mori tribe, and founded the Gohila or Gehlote dynasty of Newar. But the Persian historians name Noshizad, son of Noshirvan, or Maha Banu, daughter of Yesdejird, for the origin of the Sesodia race of Mewar, in A. D. 531. Saurashtra means the region of the Saura, an ancient tribe of sun-worshippers, whose origin is lost in the darkness of ages. At what epoch this peninsula was subjected by the Saura race, we are ignorant; but from Justian, Strabo, Ptolemy, and both the Arrians, we can trace their way to a period coeval with Alexander the Great. The conquests of Menander and Apollodotus in the land of the Συρον or Saura, have given rise to much disquisition by the learned Bayer, and the annotators on the French translation of Strabo, who finding Συρον coupled with Φωνικον, were for transferring the Syria of the Indian Sea to the Syria and Phœnicia of the Mediterranean. It was, however, an easier task for the kings of Bactria, even with the deteriorated remnants of the Phalanx, to which, no doubt, they drilled their Indo-Getic subjects, to pass from Aria and Arachosia, down the valley of the Indus, into Saurashtra, than to penetrate through the desert lands or hostile tribes which would intervene in their wide march to Syria. In the terms Surastrene and Syrastrene, employed by the ancient authorities to designate the Indian Syria, we have Saurashtra without any variation. Colonel Tod says that Balhara was the title assumed by the succesful sovereigns of Saurashtra. Saurashtra or Soreth, the peninsula of Guzerat, is almost cut off from the main land by two rivers. It is almost 150 miles long, the same in breadth and contains an area of 22,000 square miles. Its mountain features are the Burda Hills ending in the south in the Alich range and the Oshum. The lofty and holy mount of Girnar overlooks the ancient fortress of Junagarh (old fort) and a tract in the south, called the Geer, which stretches 50 miles east and west, and 30 miles north and south and consists of ridges and hills covered with dense forests, trees and jungles and full of almost inaccessable fastnesses which for ages have given shelter to robbers, out laws and the Aghora a sect of wild fanatics reputed to be cannibals. During the seventh century in A. D. 770, Wullubhipur, the present Wulleh which had the most brilliant court in India, fell before an eruption from the north, supposed by Mount Stuart Elphinstone to be Persians under Naosharwan the Great, by Colonel Tod to be Scythians, and by another authority to be Indo-Bactrians, and the inhabitants fled and founded new cities in Malwah. The old temple of Somnath is in the city of Deo-Pattan. Mahmood left Ghazni, on his expedition against it in Sept. A. D. 1024, his numerous army was accompanied by crowds of volunteers, the flower of the youth of Turkistan. Ajmir and Anhilwara fell before him. Advancing upon Somnath, for two days, his most devoted followers were beaten headlong back by the valour of the Rajpoots fighting for hearth and altar. On the 3rd day, Mahmood led a furious charge in person, five thousand hindoos lay dead and the day was won. When he entered the shrine of Som-Iswara, he beheld a superb edifice of hewn stone, its lofty roof supported by pillars curiously carved and set with precious stones. In the adytum to which no external light penetrated, and which was illuminated only by a lamp suspended from the centre by a golden chain, upreared the symbol of Som-Iswara— a stone cylinder which rose nine feet in height above the floor of the temple and penetrated six feet below it. Two fragments of this object of idolatrous worship were at the king's order broken off, that one might be thrown at the threshhold of the public mosque and the other at the court gate of his own palace of Ghazni. Other fragments were reserved to grace the holy cities of Mecca and Medina. While Mahmood was thus employed a crowd of brahmans offered an enormous ransom if the king would desist from further mutilation. Mahmud hesitated ; but after a moments pause, he exclaimed that he would be known by posterity not as the idol seller but as the " destroyer." The work of destruction then continued and was rewarded by the discovery in the vaults below the adytum of untold treasures. Thus fell Somnath. Its gates were taken to the mosque of Ghazni from which they were removed when the British Indian army retired from the occupation of that country in 1842, and Lord Ellenborough, Governor-General, issued a Procalmation, to the Princes and Chiefs, and People of India. "My Brothers and my Friends he said, our victorious army bears the gates of the temple of Somnauth in triumph from Affghanistan, and the despoiled tomb of sultan Mahmoud looks upon the ruins of Ghuznee. The insult of 800 years is at last avenged. The gates of the temple of Somnauth, so long the memorial of your humiliation, are become the proudest record of your national glory—the proof of your superiority in arms over the nations beyond the Indus. To you, Princes and Chiefs of Sirhind, of Rajwarra, of Malwa, and Guzerat, I shall commit this glorious trophy of successful war. You will, yourselves, with all honour, transmit the gates of sandal-wood through your respective territories, to the restored temple of Somnauth. The Chief of Sirhind shall be informed at what time our victorious army will first deliver the gates of the temple into their guardianship, at the foot of the bridge of the Sutlej. My Brothers and my Friends.—I have ever relied with confidence upon your attachment to the British Government. You see how worthy it proves itself of your love, when, regarding your honour as its own, it exerts the power of its arms to restore to you the gates of the temple of Somnauth, so long the memorial of your subjection to the Affghans. For myself, identified with you in interest and in feeling, I regard with all your own enthusiasm the high achievements of that heroic army, reflecting alike immortal honour upon my native and upon my adopted country. To preserve and to improve the happy union of our two countries, necessary as it is to the welfare of both, is the constant object of my thoughts. Upon that union depends the security of every ally, as well as of every subject, of the British Government, from the miseries whereby, in former times, India was afflicted ; through that alone has our army now waved its triumphant standards over the ruins of Ghuznee, and planted them upon the Bala Hissar of Cabul. May that good Providence, which has hitherto so manifestly protected me, still extend to me its favour, that I may so use the power now intrusted to my hands, as to advance your prosperity and secure your happiness by placing the union of our two countries upon foundations which may render it eternal."—

The mahomedans who had only gained a partial authority over the Peshwa, the Gaikwar, and the Rajputs of Kattiawar, were succeeded by the Mahrattas in 1755, who could only collect the revenue by means of troops, in mulkgiri or circuits. But, in 1808, Colonel Alexander Walker, then Resident at the Gaikwar's court, was able to arrange for payment to the Gaikwar from the Rajput Chiefs of a certain fixed sum as suzerainties. When the Peshwa was overthrown in 1817, the British succeeded that power in the chief control. The gross revenues are estimated at a million sterling, but out of that £100,000 is paid as annual tribute in the proportion of two-thirds to the British Government and one-third to the Gaikwar. The population is 1½ millions. The tributaries are called talukdars, of whom there are 224, and each of whom possesses exclusive jurisdiction in his own district, and only the Grassia and Mul Grassia are allowed to litigate with their ruling chiefs. These are sprung either from cadets of the ruling tribe are from proprietors of lands which they have originally seized and now defend with all the proverbial tenacity of the Rajput, who freely gives and takes life for acres. The principal talukdars are their Highnesses the Nawab of Junagarh,—the Jam of Navanaggar, and the Rawal of Bhownaggar, also the Rana of Porebandur, the Raj of Drangdra and the Thakur of Murvi. Junagarh, the most important is held by a descendant of Sher Khan, Babi, a soldier of fortune who seized it in the general anarchy which preceded the subversion of the Moghuls. See Inscriptions, Kattiyawar, Khengar, Krishna, Mewar, Stevenson.—*Cunningham's Ancient Geog. of India, pp.* 318-320-322 ; *Thomas' Prinsep, p.* 253 ; *Tod's Travels, pp.* 252-53.

SAUREE, the low castes of the Punjab, are the Sauree, Bouria and Hurni.

SAURIA, the Lizard Order of Reptiles, which naturalists arrange as under:

The Order of Lizards—Sauria.

I. Crocodiles—Crocodilidæ.
II. Water Lizards—Varanidæ.
III. Land Lizards—Lacertidæ.
IV. Cordyles—Zonuridæ.
V. Skinks—Scincidæ.
VI. Acontiads—Acontiadidæ.
VII. Sand Lizards—Sepsidæ.
VIII. Geckos—Geckotidæ.
IX. Agames—Agamidæ.
X. Chameleons—Chamæleonidæ.

FIRST SUB-CLASS, REPTILIA PROPER.

The order of Tortoises—Chelonia.

I. Land Tortoises-Testudinidæ.

Testudo elegans, *Schöpff*	Peninsula of India, Ceylon.
horsfieldii, *Gray*	Affghanistan.
elongata, *Blyth*	Gamboja, Arakan, Mergui.

II. Fresh-water Tortoises—Emydidæ.

Manouria emys, *M. & Schl.*	Pinang, Arakan, Tenasserim.
Cuora amboinensis, *Daud*	Eastern India.
flavomarginata, *Gray*	China, Formosa.
trifasciata, *Gray*	China
Cyclemys oldhami, *Gray*	Mergui, Gamboja.
Pyxidea mouhotii, *Gray*	Cochin-china.
Notochelys platynota, *Gray*	Singapore.
Geoemyda spinosa, *Gray*	Tenasserim, Pegu.
grandis, *Gray*	Gamboja.
Emys ocellata, *D. and B.*	Tenasserim, Pegu.
bealli, *Gray*	Southern China.
thurgi, *Gray*	Bengal, Penang.
mutica, *Cantor*	Chusan.
nigricans, *Gray*	Southern, China.
sinensis, *Gray*	Canton, Formosa.
crassicollis, *Gray*	Mergui, Malayan Peninsula Gamboja.
reevesii, *Gray*	Cochin-china, Southern China.
trijuga, *Schweigg*	Peninsula of India, Ceylon.
macrocephala, *Gray*	Siam, Gamboja.
hamiltonii, *Gray*	Lower Ganges.
Pangshura tecta, *Gray*	
tentoria, *Gray*	Deccan, Indus.
flaviventer, *Gthr*	Bengal?
smithii, *Gray*	Punjab?
Batagur baska, *Gray*	Ganges, Irawaddy. Penang.
lineatus, *Gray*	Nepaul, Moulmein.
ellioti, *Gray*	Kistna River.
affinis, *Cantor*	Malayan Peninsula.
dhongoka, *Gray*	Nepal, Assam.
Platysternum megacephalum, *Gray*	China, Pegu.

III. Fresh-water Turtles—Trionycidæ.

Emyda granosa, *Schöpff*	Hindostan, Sikkim, Bengal.
ceylonensis, *Gray*	Ceylon.
vittata, *Peters*	Goa.
Trionyx sinensis, *Weigm*	China, Chusan, Formosa.
gangeticus, *Cuv*	Ganges, Penang.
javanicus, *Schweigg*	Ganges, Deccan, Penang.
ornatus, *Gray*	Siam, Gamboja.
subplanus, *Schweigg*	Singapore, Penang.
guntheri, *Gray*	
Chitra indica, *Gray*	Ganges, Malayan Peninsula.

IV. Marine Turtles—Chelonidæ.

Caouana olivacea, *Eschsch*	Coasts of S. E. Asia.
Chelonia virgata, *Flem*	Coasts ,,
Caretta squamata, *L*	Coasts ,,
Dermatochelys coriacea, *L*	Coasts ,,

The Order of Lizards—Sauria.

I. Crocodiles—Crocodilidæ.

Crocodilus palustris, *Less*	Ganges, Peninsula of India, Ceylon.
siamensis, *Schneid*	Siam, Gamboja.
porosus, *Schneid*	All rivers.
pondicerianus, *Gray*	Pondicherry.
Gavialis gangeticus, *Gm*	Ganges.

II. Water Lizards—Varanidæ.

Varanus flavescens, *Gray*	Ganges, Indus, Penang.
dracæna, *L.*	From Bengal to Ceylon.
lunatus, *Gray*	
nebulosus, *Gray*	Bengal, Siam.
Hydrosaurus salvator, *Laur*	China, Siam, (Ceylon.)

III. Land Lizards—Lacertidæ.

Tachydromus sexlineatus, *D.*	Rangoon.
meridionalis, *Gthr*	Southern China.
septentrionalis, *Gthr*	Northern China.
Cabrita leschenaultii *Ewd*	Coromandel.
Ophiops jerdoni, *Blyth*	Mhow.
Acanthodactylus cantoris, *G.*	Ramnuggar.
nilgherrensis, *Jerd*	Coonoor.

IV. Cordyles—Zonuridæ.

Pacseudopusgracilis, *Gray*	Khasya.

V. Skinks—Scincidæ.

Tropidophorus microlepis, *G.*	Chartaboum.
cochin-chinensis, *Cuv*	Cochin-china.
aspris berdmori, *Bly*	Mergui.
Euprepes chinensis, *Gray*	China.
rufescens, *Shaw*	From Afghanistan to China.
monticola, *Gthr*	Sikkim.
olivaceus, *Gray*	Malayan Peninsula.
macularius, *Blyth*	Rungpore?
trilineatus, *Gray*	Carnatic.
Mabouiaquadrilineata, *Blyth*	Hongkong.
chinensis, *Gray*	China.
maculata, *Blyth*	Assam.

Eumeces bilineatus, *Gthr*	Neilgherries.
himalayanus, *Gthr*	Himalayas.
schlegelii, *Gthr*	Sikkim.
modestus, *Gthr*	Ningpo.
reevesii, *Gray*	China.
ladacensis, *Gthr*	Tibet.
formosus, *Blyth*	Mirzapore, Wuzeerabad.
indicus, *Gray*	Sikkim.
taprobanensis, *Kelaart*	Ceylon.
Eumece chalcides, *L.*	Penang, Siam, Hongkong.
siamensis, *Gthr*	Siam.
bowringii, *Gthr*	Hongkong.
albopunctatus, *Gray*	Nellore, Mergui.
hardwickii, *Gray*	Peninsula of India.
punctatus, *E.*	Peninsula of India.
isodactylus, *Gthr*	Gamboja.
Hagria vosmærii, *Gray*	Bengal.
Chiamela lineata, *Gray*	
anguisme lanosticta, *Merr.*	Coromandel.

VI. Acontiads—Acontiadidæ.

Acontias layardi, *Kelaart*	Colombo.
Nessia burtonii *Gray*	Ceylon.
monodactyla, *Gray*	Ceylon.

VII. Sand Lizards—Sepsidæ.

Sphenocephalus tridactylus, *B.*	Afghanistan.

VIII. Gecko—Geckotidæ.

Gecko guttatus, *Daud*	From Southern India to China.
stentor, *Cant*	Penang.
smithii, *Gray*	Prince of Wales' Island.
monarchus, *D. & B.*	Malayan Peninsula, Ceylon.
japonicus, *D. & B.*	China, Chusan.
swinhonis, *Gthr*	Northern China.
subpalmatus, *Gthr*	Chikiang.
Ptychozoon homalocephalum, *Creveldt*	Penang, Singapore.
Hemidactylus triedrus, *Daud.*	Ceylon, Peninsula of India.
maculatus, *D. & B.*	From Ceylon to China.
sykesii, *Gthr*	Deccan.
frenatus, *D. & B.*	From Ceylon to Siam.
leschenaultii, *D. & B.*	Madras.
punctatus, *Jerd*	Tellicherry.
coctæi, *D. & B.*	Penang, Bombay, Ceylon.
leiurus berdmorei, *Blyth*	Mergui.
Peripia peronii, *D. & B.*	Penang, Ceylon.
cantoris, *Gthr*	Penang.
Nycteridium schneideri, *Shaw.*	Ceylon, Bengal, Assam, Siam, Penang.
Phelsuma andamanense, *Bly.*	Andaman Islands.
Gymnodactylus triedrus, *Gr.*	Ceylon.
pulchellus, *Gray*	Penang, Singapore.
frænatus, *Gthr*	Ceylon.
kandianus, *Kelaart*	Ceylon.
mysoriensis, *Jerdon*	Bangalore.
indicus, *Gray*	Neilgherries.
malabaricus, *Jerdon*	Malabar.
littoralis, *Jerdon*	Malabar.
deccanensis *Gthr*	Deccan.
variegatus, *Blyth*	Moulmein.
naultinus fasciolatus, *Blyth.*	Subathoo.
Pentadactylus borneensis, *G.*	Borneo.
felinus, *Gthr*	Singapore.
duvaucelii, *D. & B.*	Bengal.
Puellula rubida, *Blyth*	Andaman Islands.
Eublepharis hardwickii, *Gray.*	Peninsula of India.

IX. Agames—Agamidæ.

Draco volans, *L.*	Penang, Singapore.
reticulatus, *Gthr*	Philippine Islands.
timorensis, *Kuhl*	Timor.
cornutus, *Gthr*	Borneo.
fimbriatus, *Kuhl*	Java.
maculatus, *Gray*	Siam, Penang, Tenasserim.
spilopterus, *Wiegm*	Manilla.
dussumieri, *D. & B.*	Peninsula of India.
quinquefasciatus, *Gray*	Penang.
tæniopterus, *Gthr*	Siam, Tenasserim.
hæmatopogon, *Boie*	Java.
bimaculatus, *Gthr*	Philippine Islands.
lineatus, *Daud*	Amboyna, Celebes.
rostratus, *Gthr*	Borneo.
Otocryptis bivittata, *Wiegm*	Ceylon.
Lyriocephalus scutatus, *L.*	Ceylon.
Ceratophora stoddartii, *Gray.*	Ceylon.
tennentii, *Gthr*	Ceylon.
aspera, *Gthr*	Ceylon.
Cophotis ceylanica, *Peters*	Ceylon.
Japalura variegata, *Gray*	Sikkim.
swinhonis, *Gr*	Formosa.
polygonata, *Hallowell*	Loochoo.
Sitana pondiceriana, *Cuv*	Western India.
minor, *Gthr*	Madras, Ceylon.
Dilophyrus grandis, *Gray*	Rangoon.
Bronchocela cristatella, *Kuhl.*	Malayan, Peninsula.
smaragdina, *Gthr*	Gamboja.
jubata, *D. & B.*	Pondicherry.
Calotes versicolor, *Daud*	Ceylon, Continent of India.
nemoricola, *Jerd*	Neilgherries.
mystaceus, *D. & B.*	Pegu, Siam, Mergui, Ceylon.
rouxii, *D. & B.*	
ophiomachus, *Merr*	Ceylon, Southern India.
platyceps, *Blyth*	Cherra, Punji.
nigrilabris, *Peters*	Ceylon.
emma, *Gray*	Mergui.
maria, *Gray*	Himalayas.
Salea horsfieldii, *Gray*	Neilgherries, Ceylon.
Oriocalotes minor, *Gray*	Himalayas.
Acanthosaura armata, *Gray*	Eastern India.
capra, *Gthr*	Chartaboum.
coronata, *Gthr*	Chartaboum.
Oriotiaris ellioti, *Gthr*	Sikkim.
Tiaris tiara subcristata, *Blyth.*	Port Blair.
Physignathus cochinchinensis, *Cuv*	Cochin-china.
mentager, *Gthr*	Chartaboum.
Liolepis guttatus, *Cuv*	Eastern India, China.
Uromastix hardwickii, *Gray.*	Hindostan.
Charasia dorsalis, *Gray*	Southern India.
Stellio tuberculatus, *Gray*	Upper Hindostan, Himalaya.
Trapelus megalonyx, *Gthr*	Afghanistan.
Phrynocephalus tickelii, *Gr.*	Afghanistan.
caudivolvulus, *Pall*	Tibet.
brachysaura ornata, *Blyth*	Saugor.

FAMILY OF CHAMELEONS—CHAMÆLEONIDÆ.

Chamæleo vulgaris, *Daud*	Penin. of India, Ceylon.

SAURURACEÆ, *Lindl.* an order of plants comprising, 1 Gen., 1 Sp., of Houttuynia.

SAUSSUREA GOSSYPINA. In East Nepaul, at the summit of the Wallan Choon pass, at an elevation of 16,748 feet, above the sea, the plants gathered by Dr. Hooker near the top of the pass were species of Compositæ, grass, and Arenaria ; the most curious was Saussurea gossypina, which forms great clubs of the softest white wool, six inches to a foot high, its flowers and leaves seeming uniformly clothed with the warmest fur that nature can devise. Generally speaking, the alpine plants of the Himalaya are quite unprovided with any special protection of this kind ; it is the prevalence and conspicuous nature of the exceptions that mislead, and induce the careless observer to generalise hastily from solitary instances ; for the prevailing alpine genera of the Himalaya, Arenarias, primroses, saxifrages, fumitories, Ranunculi, gentians, grasses, sedges, &c., have almost uniformly naked foliage.—*Hooker, Him. Journ. Vol.* i, *p.* 225.

SAUTPOORA MOUNTAINS, form a mountain range which divide the Nerbudda from the Taptee valleys, extending from 21° and 22°, and 73° 40' to 78°, when it becomes confounded with the Vindhya. The average elevation, supposed 2,500 feet : Aseerghur hill fort, 1,200 feet. They form the northern base of the Deccan table-land. The southern declivity towards Taptee, is abrupt ; N. towards Nerbudda, gentle. The mountains rise into peaks.

SAUVADY MARAM, TAM. A timber of Coimbatore, *Dr. Wight.*

SAUVIRA, SANS. Sulphuret of Antimony.

SAUVIRA, or Sophir a district in W. India.

SAVA, or Saveh, a town in Persia lying between the towns of Kazvin and Ispahan.

This is supposed to be the ancient Saba, whence the three magi took their departure when they proceeded to adore the infant Jesus at Bethlehem.

SAVA, eldest son of Rama, the ancestor of the Balla, a Surya Vansa race of Rajputs.

SAVAI, a fish of Lake Thalesap cured with the ashes of the palm tree.

SAVANORE, or Sanore, its chief is a pathan whose ancestor, in 1750, was one of the three pathan mahomedans who conspired against Nassir Jung.

SAVARA, see Inscriptions.

SAVARA, or Suar, the Suari of Pliny, and Sabaræ of Ptolemy.

SAVARA SAKA, according to Manu, one of the outcaste military tribes. The China is a race alluded to by ancient Sanscrit writers, as dwelling on the extreme east, but further into India than at present, and Mr. Hunter, (p. 28) considers that the aboriginal races of the eastern peninsula, Burmah and India north of the Vindhya range derived their speech from a source common to themselves and the Chinese.

SAVARY KEERAY, Tam. Greens, which grow in the southern parts of the peninsula and are eaten by the people.—*Ainslie's Mat. Med., p.* 256.

SAVE, Can. Samulu, Tel. There are two sorts of this grain, viz., Hari Save and Hejjane. Poor people use them in food.—*M. E. of* 1857.

SAVEL KURUNDU, Singh. Cinnamon.

SAVENDRUG, in lat. 12° 55′ ? N., long. 77° 16′ E. in Mysore, W. of Bangalore, a hill station 4,005 feet above the sea, *G. T. S.*

SAVI, Guz., Hind. Maccaroni, Vermicelli.

SAVI CHINA WARI, Hind. Panicum miliaceum.

SAVIRELA CHETTU, Tel. Pæderia fœtida, *L.*; *W. & A.*, 1,300; *R.*, i, 683. Sans., syn. of Prasarine.'

SAVITI MUNNU COPPU, Tel. Soda.

SAVITREE RIVER, rises in the western Ghauts, in lat. 18° 17′ long. 73° 27′ runs S. E., into Indian Ocean.—Length 70 m.

SAVITRI, wife of Satyavana.

SAVITRI a word in the Gaetri mantram meaning the sun. See Gayatri, Surya, Hindoo, Zonar, or Zennaar.

SAVITRI VRATA, a feast observed by hindoo women, about the 16th June. On this occasion they worship the Indian fig tree, to preserve them from widowhood.

SAVITTA MANNU UPPU. Tel. Soda.

SAVON, Fr. Soap.

SAVORRA, It. Ballast.

SAVORY. Satureja hortensis, and S. montana, aromatic herbs, now fallen into disuse, used to flavour soups, &c.

SAVU ISLAND, its S. E. point is in lat. 10° 37′ S. long., 122° 0′ E., and is 18 miles long.

Savu and Rotti, are small islands to the west of Timor, and very remarkable as possessing a handsome race, with good features, resembling in many characteristics, the race produced by mixture of the hindoo or Arab with the Malay. They are certainly distinct from the Timorese or Papuan race and must be classed in the western rather than the eastern division of the Archipelago.—*Wallace, Vol.* ii, *p.* 277. See Rotti, Sumba, Timor laut.

SAWA. The Kariang, the Sawa, the Ka, and the Chong, are wild and migratory races, the first and second being the same people but inhabit various portions of the Burman dominions. The Ka, a term which, in the Siamese language means slave, but who are called by the Kambojans, Pa-nong, inhabit the mountains of Lao, bordering upon Kamboja. The Chong, a more industrious and settled people than the rest of this class, inhabit the hilly country on the eastern side of the gulf of Siam, between the eleventh and twelfth degrees of North latitude. The Samang, are a diminutive race of savage negroes, dwelling in the mountainous regions of the Malayan Peninsula.—*Crawfurd. Embassy, p.* 449.

SAWA, Malay., artificially irrigated rice fields.

SAWAH, Pokka sawan and kacha sawan Hind of Multan, are terms used of indigo in certain stages of manufacture.

SAWAL, Hind. Potamogeton crispus, also Amarantus anardana.

SAWALI, Hind. Alnus *sp.* also Potamogeton gramineus.

SAWANK, Hind. Oplismenum frumentaceum; also the wild species of Panicum colonum, used on fast days by hindoos.

SAWAN MULL, made many canals in Mooltan.

SAWARA, see India.

SAWFISH, species of Pristis, see Fishes.

SAWIGHT, See Kyans.

SAWIL KODI, Tam. Rubia cordifolia. *Linn.*

SAWITE, see Kyan.

SAWNAN, Hind. Fraxinus floribunda.

SAWS.

Seies,	Fr.	Garaji, graji,	Malay.
Sagen,	Ger.	Gargaji,	„
Kurwuttee, Guz.,	Hind.	Serras,	Port.
Ara,	„	Pili,	Rus
Seghe,	It.	Sierras,	Sp.

Implements of various sizes, for cutting wood, iron, and other hard substances.—*Faulkner.*

SAW-LEAVED CENTAURY, Eng. Centaurea behen.—*Linn.*

SAWUH, Malay. Anchor.

SAWUL, a river near Purah or Peorah in Almorah.

SAWUR, Malay. A very beautiful and useful wood of Java : the colour resembles that of mahogany, but the grain is closer, and it is more ponderous : its chief use is for handles of tools for carpenters and other artificers, for machinery, especially for the teeth of the wheels of mills, and other purposes where a hard and durable wood is required. On account of its scarcity, it is uniformly cut down in Java before it arrives at the necessary size for cabinet work. Forests of it grow on the hills of Bali, opposite the Javan shore, whence it is brought over by boat-loads for sale.

SAXÆ, see Kelat.

SAXICAVA, a genus of molluscs.

SAXICOLA ŒNANTHE, the Wheatear of Europe, W. Asia, plains of Upper India, N. Africa, Arctic regions, Greenland! migratory. There are several other Indian Wheatears, all of which are different from those of Europe excepting S. leucomela ; but S. stapazina is replaced in India by S. atrogularis and S. leucura by S. leucuroides (opistholeuca of Strickland) which occurs likewise in N. E. Africa.—*Blyth* ; *Jerdon.*

SAXICOLA RUBICOLA, *Sykes.*

Pratincola índica, *Blyth.* | P. saturatior, *Hodgson.*

Indian-bush-chat,	Eng.	Steinshmatzer,	Ger.
Jungle bramble bird,	,,	Schwarz-kehliger,	,,
Stone-chatter,	,,	Saltabastone,	It.
,, -smith,	,,	Zompacardi,	,,
,, -clink,	,,	Saltiupolo,	,,
Moore-Titling,	,,	Adavikampanalinclu,	Tel.
Traquet Rubicole,	Fr.	Adani kampa jitta,	,,
Moteux Traquet,	,,		

It is found in Russia, Germany, France, Provence, Italy, Smyrna, Japan, the Deccan, the banks of the Ganges, the mountains of Upper Hindustan, Senegal, and South Africa (Cape), England, Ireland, and Scotland. Jerdon names also, of the genus Saxicola, S. lenuroides, S. picata, S. leucomela, and S. deserta.—*Jerdon, Vol.* ii, *p.* 124 ; *English Cyclopædia, p.* 687.

'SAXIFRAGACEÆ, *DC.* The Saxifrage tribe of plants comprising 8 Gen., 34 species, viz., 6 Hydrangia ; 1 Ciamitis ; 1 Adamia ; 21 Saxifraga ; 1 Chrysosplenium ; 1 Tiarella ; 1 Astilbe ; 2 Vahlia. These Saxifraga genus of flowering plants are mostly natives of Britain with white, yellow, or pink flowers, S. umbrosa, the London pride, is a pretty flower, the species are easily cultivated from seed in any garden soil.—*Riddell.*

SAXIFRAGA FLAGELLARIS, a plant of Melville Island. See Saxifraga stenopylla.

SAXIFRAGA LIGULATA, *Wall.*

Bat pia,	Jhelum.	Saprotri,	Ravi.
Popal wat'phula,	Kangra	Til kachalu,	,,
Shaprochi,	Chenab.	Shiblack.	
Kurgotar dharposh,	,,	Makhan,	Beas.
Banpatrak,	,,		

SAXIFRAGA STENOPHYLLA, *Royle.*

Mu i pari, Pers. | Fairy-hair, Eng.

So named from its numerous thread-like stolons, in which and its general appearance it closely resembles the Saxifraga flagellaris of Melville Island.

SAXIFRAGA CILIARIS, see Chamærops khasiana.

SAXIFRAGE.

Shih-hu-wei, Chin. | Ngo-puh-shih-ts'au, Chin.

This acrid plant grows near water ; it has small yellow flowers. It is recommended in all diseases of the senses and great orifices of the body ; it acts as an emetic and diaphoretic.

SAYA, Hind., Pers. Shade, a shadow. A shade, a ghost.

SAYA, Tam. Hedyotes umbellata.—*Lam.*, *R. Br.*

SAYA, Mahr. Tectona grandis.

SAYA DE MALHA, a group of Madreporic islands, S. E. of the Maldives, *Figuier.*

SAYA ELLE, Tam. Salvia Bengalensis.

SAYAN, or Sayammul, Singh. Hedyotes umbellata.—*Lam.*, *R. Br.*

SAYANA ACHARYA, a man of high station and a deservedly celebrated scholar, who wrote a commentary of the Vedas. He was brought up at the court of Vira Bukka Raya, raja of Vijianugger in the 14th century of our era. See Madhava, Veda.

SAYANAN, see Sayana, Vedas.

SAYAWER— ? Hedyotis umbellata.

SAYER, Arab. Literally, travelling : but in the fiscal system of India, applied to the transit duties levied on goods passing from one district or one territory to another. It was finally abolished in 1834, 1837 and 1844 in the three presidencies of Bengal, Bombay and Madras. The transit duties in Madras alone amounted to £310,000 sterling a year.

SAYJBUND, Hind. Silk cords, with gold or silver tassels, for fastening the bedding or mattrass to the bedstead.

SAYL, Duk. Tambara, Malay. Cyprinus, *species.*

SAYL KUNDE, Tam. Cyprinus, *species.*

SAYMBU KAZHANGU, Tam. The root of Caladium esculentum. Saymbu kire are the greens.

SAYMI-KI-PHALLI, Hind. Lablab vulgaris.

SAYND, Beng., Hind. Euphorbia nivulia. Ch'apal send is the prickly pear.

SAYNDI, Hind. The juice or toddy of the date tree : Tari is the sap of the Tar or palmyra tree, Borassus flabelliformis ; Narelli is from the narel or cocoanut tree, cocos nucifera.

SAYNDI KA JHAR, Duk. Elate sylvestris.

SAYND-KA DOODH, Duk. Nara shij, Hind. Euphorbium.

SAYUR KALADI, Malay. Sayur is the generic term for vegetables. Kaladi is the Arum colocasia of Roxburgh with a large leaf and an edible root. It grows in marshy ground and is much used by the Chinese for food for their pigs.—*Jour. Ind. Arch., No.* 11, *Vol.* v.

SAYWIAN, Hind. Vermicelli which the natives usually prepare between the hands instead of using a press. Sayweean-ka-tukhta, a board for making sayweean on. Vermicelli is also prepared by being run through sieve holes into hot water.

SAYYID MAJID, see Somal, Beer-us-somal.

SAZANKI, Hind., Pshtu. 'The stinger,' Urtica, *species*.

SAZPOSH, Hind. Lavatera cachemiriana.

SBANGJA, Hind., Tib. Moss tea, a substitute for real tea.

SCABBARD. For these, the people of the East Indies set a great value upon the skin of a fish which is rougher than a sealskin. Upon the back of the fish there are six little holes, and sometimes eight, somewhat elevated, with another in the middle, in the form of a rose. They make scabbards for swords of the skin ; and the more those holes grow in in the form of a rose, the higher value they put upon them ; Tavernier had seen ten thousand crowns given for a skin.—*Tavernier's Travels, pp.* 151-152.

SCABIOSA ELEGANS. This genus of flowering plants, with the scent of honey, are well adapted for ornamenting the flower garden, they are propagated by seed, and grow readily in any good soil, the seed may be sown in pots at the close of the rains, and the plants removed when a few inches high. —*Riddell.*

SCABRITA SCABRA, *Vahl.*, also Scabrita triflora, *L. Mant.* Syns. of Nyctanthes arbor-tristis.

SCABRIUSCULA, see Collinsia.

SCÆVOLA BELA-MUDAGUM, *Linn.*

SCÆVOLACEÆ, *Lindl.* An order of plants of 1 gen. and 3 species.

Bela mudagam, *Mal.*	Scævola taccada, *Roxb.*

A shrub, cultivated in gardens, with dark shining green leaves.

SCÆVOLA TACCADA, *Roxb.*

Scævola bela mudagum, *Linn.*

S. taccada and S. kœnigii grow in Ceylon and on the shores of the islands of the Eastern Archipelago.

SCALARIA, a genus of molluscs.

SCALIE, of Cuttack, the fibre of a gigantic twining plant, common throughout the forest jungles of the province. It is used for cordage, and is made into twine for mat-making and roofing purposes.

SCALLOP.

Jula,	Hind.	Kashkul,	Pers.

The fakir's dish, made of a half sea-cocoanut shell : speaking of a child of unknown parentage the phrase is, fakir-ke-jhulay may tukra kon dala, who threw the portion into the fakir's scallop.

SCALPING. Abbe Domenich relates a conversation between two warriors. Is it a chief who speaks to Mahto-totia? See the scalp which hangs from the bit of my horse, answered the Scheyenne. The scalp fastened to the extremity of a pole, is placed in the conqueror's cabin : and on days of parade or battle, in front of the cabin. The chiefs suspend it to their horse's bridles. Scalping is a practice that originated in High and North-eastern Asia. The words of the Father of History are as follows :—" Of the first enemy a Scythian sends down, he quaffs the blood ; he carries the heads of all that he has slain in battle to the king ; for when he has brought a head, he is entitled to a share of the booty that may be taken—not otherwise ; to skin the head, he makes a circular incision from ear to ear, and then ; laying hold of the crown shakes out the skull, after scraping off the flesh with an ox's rib, he rumples it between his hands, and having thus softened the skin, makes use of it as a napkin ; he appends it to the bridle of the horse he rides, and prides himself on this, for the Scythian that has most of these skin napkins is adjudged the best man, &c., &c. They also use the skulls for drinking cups." The under-lying ideas were doubtless the natural wish to preserve a memorial of a foeman done to death ; and at the same time to dishonour his hateful corpse by mutilation. Fashion and tradition regulate the portions of the human frame preferred. Scalping is generally but falsely supposed to be a peculiarly American practice. The Abbe Em. Domenech (Seven Year's Residence in the Great Deserts of North America, xxxix,) quotes the decalvare of the ancient Germans, the capillos et cutem detrahere of the code of the Visigoths, and the annals of Flude, which prove that the Anglo-Saxons and the Franks still scalped about A. D. 879.

SCALY ANT-EATER, Eng. Ant-eater.

SCAMMONEA, It.

SCAMMONEE, Fr. Scammony.

SCAMMONY.

Sukmoonia,	Arab.	Sakmoonia,	Guz., Hind.
Scammonee,	Fr.	Scammonea,	It.
Skammonien,	Ger.	Escamonea,	Sp.

This is found in the bazars of India; it is the product of Convolvulus scammonia, a native of Syria, the Levant, and Guzerat, and is juice of the plant when dried. The scammony of Aleppo occurs in fragments, voluminous, dry, light, spongy, friable, pulverulent, with dull fracture of blackish grey, but covered with grey powder resulting from the reciprocal friction of the pieces, slightly transparent in small flakes, which become white and rather adherent when rubbed with a wet finger; odour disagreeable, taste weak, acrid, bitter, and repulsive, powder greyish white. The species of scammony is often adulterated with concrete juices of a similar kind, with flour, chalk, sand and earth. Good scammony consists of resin 60, gum 3, extract 2, and earthy and vegetable impurities 25 per 100. The most abundant harvest of scammony is in Smyrna and Aleppo. There are several modes of collection, which give rise to corresponding commercial varieties. The neck of the root being laid bare is divided transversely, and shells are placed around the edges to receive the juice as it exudes. This subsequently thickens in the air. The drug collected in this mode is called shell scammony. This occurs in small porous masses, sometimes smooth, of reddish or whitish grey colour; of waxy fracture, yellowish and half-transparent, in thin layers, of disagreeable taste and smell; on drying it becomes adhesive. Instead of shells the leaves of the chesnut tree are sometimes used, and a flattened scammony of good quality collected. If the roots be cut in successive layers, the scammony is inferior, but still esteemed. It is dried either over a slow fire or before the sun, and then moulded into stamped pastiles, of a whitish colour. This variety is very rare in commerce. Lastly, an extract is prepared from the expressed juice of the roots and stalks, this is moulded into round masses, of black, vitreous and resinous fracture. The Arab name of this drug, Ul Sugmoonia, signifies the purgative. Several old preparations called "diagredium" (διακρηδιον,) are mixtures of scammony with sulphur and liquorice, and are now no longer used.—*O'Shaughnessy, pp.* 500, 501. See Convolvulus scammonia.

SCANDA, see Vedas.

SCANDENT LOMARIA, Lomaria scandens. See Ferns.

SCANDINAVIA. Amongst the Arian races who went to the north-west, there is no grounds for the belief that the Saxons continued to offer human sacrifices after their settlement in Great Britain, but in their own land the immolation of captives in honour of their gods was by no means uncommon. The great temple at Upsal, in Sweden, appears to have been especially dedicated to Odin, Thor and Frea. Its periodical festivals were accompanied by different degrees of conviviality and license, in which human sacrifices were rarely wanting, varied in their number and value by the supposed exigency. In some cases even royal blood was selected that the imagined anger of the gods might be appeased. In Scandinavia, the authority of the priest was much greater than it would appear to have been among the Anglo-Saxons. It was his word, often, which determined where the needed victims should be found. It was his hand that inflicted the wound, and his voice which said, "I send thee Odin," declaring the object of the sacrifice to be that the gods might be propitiated, that there might be a fruitful season or a successful war. In no point does resemblance more attach between the ancient German and Scandinavian tribes, and the martial Rajpoot or ancient Gete, than in their delicacy towards females. See India, Sacrifice, Sanscrit, Yug.

SCANSORES, an order of birds of the class, Aves comprising,

ORDER I.—Scansores.

Fam. Psittacidæ.

Sub-Fam. Cacatuinæ, 2 gen., 5 sp., viz., 1 Calyptorhyncus, 4 Cacatua.

Sub-Fam. Psittacinæ, Parrots, 3 gen., 13 sp., viz., 1 Coracopsis, 2 Tanygnathus, 10 Palæornis.

Sub-Fam. Platycercinæ, Ground Parakeets, 2 gen., 2 sp., viz., 1 Aprosmictus, 2 Platycercus.

Sub-Fam. Loriinæ, Lories, 4 gen., 1 sub-gen. and 13 sp., viz.,

Section i, *tongue not filamented.*

2 Eclectus, 3 Loriculus.

Section ii, *tongue filamented.*

3 Lorius, 4 Eos, 1 Trichoglossus.

SCARDO, the chief town of Balti, is 7,255 feet above the sea. See Iscardo, Shigar.

SCARIDÆ, a family of insects of the order Homoptera which may be shown as under:

ORDER Homoptera *Latr.*

Fam. Cicadidæ, *Weswt.*
Dundubia, *Am. & Serv.*
Cicada, *Linn.*
Fam. Fulgoridæ, *Schaum.*

Lecanium, *Illig.*
Coccus.

SCARITIDÆ, a family of coleopterous insects belonging to the section Geodephaga, which corresponds to the Carabus and Cicindela of Linnæus. Siagona atrata is met with in Nepal and various parts of India : a specimen from Egypt, if not the self-same, is so exceedingly alike in size and sculpture, that it is very difficult to distinguish. The Scaritideæ abound in both hemispheres. Sapterus of India is represented by Oxystomus in the Brazils, and in Africa by Acanthoscelis. Morio and Clivina will, perhaps, be found in both the Old and New World ; the latter, indeed, is common to all temperatures ; the former may eventually occur in Europe, perhaps in Sicily.—*Hope, M. L. J., July* 1840, *p.* 115.

SCARLET, is a colour forbidden to mahomedans, but many of them wear it.

SCARLET CLERODENDRON, Eng. Clerodendron squamatum.

SCARLET CLOVER, Eng. Trifolium incarnatum.

SCARLET IXORA, Eng. Ixoira coccinea, *Linn.*

SCARLET OLEANDER, Eng. Nerium coccineum.

SCAVENGER, the lowest class of menials in British India, are the scavengers. They profess mahomedanism and hinduism. They are styled Lal-Begi, Halal-khor, Mehtar ; the women are styled Latchee, or Lakshi from the hindoo goddess Lakshmee.

SCAVIOLA LOBELIA, a glaucous green plant of the Eastern Archipelago.

SCEPACEÆ, *Lindl.* A family of plants, comprising 3 genera and four species, viz., 1 Lepidostachys ; 2 Scepa and 1 Hymenocardia, of the Khassya and Burmah mountains.

SCEPTRE, the Ch'hari of the hindoo rulers, a long rod with an iron spike on it, often placed before the gadi, or throne. "Chhari muzboot t'ha," his rod was strong, is a familar phrase, which might be rendered his sceptre is firm.—*Tod's Rajasthan, Vol.* i, *p.* 410.

SCEURA MARINA, *Forst.* Syn. of Aviconnia tomentosa, *Linn.*

SCHADA-VELI, Maleal. Asparagus sarmentosus.

SCHADIDA-CALLI, Maleal. Euphorbia antiquorum.

SCHÆNUS ACUMINATUS and Schænus graminifolius, in making cordage. The generic name is derived from "schoinos," a cord, plants.

SCHAFRAN, Rus. Saffron.

SCHAGRIM, Rus. Schagrin, Ger. Shagreen.

SCHAKERI-SHORA, Hind. Cucurbita maxima.

SCHALEN, Ger. Shawls.

SCHANGA-CUSPI? Clitorea ternatea.

SCHARLACHBEEREN, Ger. Kermes.

SCHAVALOS, Sp. Shawls.

SCHEDUDII, Rus. Acorns.

SCHEEPS-BESCHUIT, Dut. Biscuit.

SCHELESO, Sans. Iron.

SCHELK, Rus. Silk.

SCHEMBRA-VALLI ? Maleal. Vitis indica.

SCHEM-PARITI? Maleal. Hibiscus rosa-sinensis.

SCHENA, or Karuna— ? Amorphophallus campanulatus.

SCHERNOWOI KAMEN, Rus. Millstones.

SCHERUBALA, Maleal. Ærua lanata.

SCHERUKATU - VALLICANIRAM ? Maleal. Strychnos colubrina.

SCHERU-PULA ? Maleal. Ærua lanata.

SCHERU-SCHUNDA ? Maleal. Solanum indicum.

SCHETTI ? Maleal. Ixora coccinea.

SCHETTI-CODIVELI ? Plumbago rosea.

SCHIEFER, Ger. Slate.

SCHILPAD, Ger. Tortoise shell.

SCHINKEN, Ger. Hams.

SCHINUS BENGALENSIS, *Herb., Buch.*, Syn. of Icica indica, *W. & A.*, also of Canarium sylvestre, *Gærtn.*

SCHINUS NIARA, *H. B.*, also S. saheria, *H. B.* Icica indica, *W. & A.*

SCHITELU, *Rheede.* Sesamum orientale.

SCHIZANDREÆ, *Bl.*, a family of plants comprising Kadsura japonica, *Dun.*, of Nepal, Khassya and Japan : also Sphærostema propinqium and S. grandiflorum of Nepal, *Voigt.*

SCHIZANTHUS GRAHAMI. This is one of the Scrophularineæ, a genus of pretty showy annuals, colours of the flowers are crimson, white and variegated, and should be grown and treated as the Scabius.—*Riddell.*

SCHIZOPETALON WALKERI. This is one of the Cruciferæ, a singular plant with curiously cut petals, and a strong tapering root, and should be grown and potted like the Eschscholtzia.—*Riddell.*

SCHLAGENTWEIT, three learned brothers, Herman, Robert and Adolphe, who were employed from the year 1855, to report on the physical geography of India. They collected and published a vast amount of information. Adolphe the youngest was murdered at Kashgar by its fanatic ruler, Wali-Khan. It was generally thought for some time, that he had been betrayed by his servants ; and that he had fallen in a battle between the Chinese and Tartars, under the walls of the city of Yarcand. Such however was not the case, the lamented philosopher was murdered suddenly and almost without excuse at

Kashgar. Mr. T. H. Thornton personally examined Murad, M. A. Schlagentweit's Jew servant, and reviewed the correspondence on the subject from the Panjab Secretariat, he has collated also, with great pains, the evidence of the three servants, Mahomed Amin, Abdulah and Murad, and got Dr. Smith to report on the skull which the latter asserted he received from a Toorkee barber as that of the murdered man, but which Dr. Smith decided belonged to a native of the country. A. Schlagentweit having arrived at Sageit, wished to proceed to Kokund viâ Yarcand, a city within the confines of Chinese Tartary, which had but lately been conquered from the celestials by the Kokandese. His servants dissuaded him from making the attempt, because of the disturbed state of the country. He however did not listen to them, although he appears to have been fully cognizant of the perils and dangers awaiting him if he proceeded. He alludes to the probability of his death in a promissory note which he gave to Murad, for 3,000 Rs. on account of 300 Siklow or "white fur skins," and which in the event of death was made payable from the treasury at Kangra. He also sent back his papers and his heavy baggage viâ Ladakh. These were received and forwarded to his family in Germany. One march from Sageit, all his horses were stolen. His servants managed to recover eleven, and the rest were afterwards obtained on application to a minor chief named Haji, in Kargalik. This man was one of Wali Khan's adherents, and was cured by the traveller of a rather severe sabre cut. His gratitude was fervent, under its influence he desired to manifest his friendship for the sahib, by putting the horse-thieves to death but pardoned them reluctantly on the entreaty of the man they had injured. At the time of M. Schlagentweit's journey, Yarcand was occupied in force by a Syud, chieftain of one of those predatory bands with whom the Chinese are continually at war, named Dil-Khan or Zullat-Khan. Soon after reaching the city, Dil-Khan met with a severe defeat from the Chinese forces, and was obliged to retire. A. Schlagentweit finding himself disappointed in this direction took the resolution of going to Kashgar, at that time occupied by another Syud chieftain, named Wali-Khan. This man was possessed of considerable power on the borders, and was honored by the title of Peer or Saint. On arrival near the camp of this redoubtable chief, our traveller pitched his tents at the distance of a coss and sent forward Mahomed Amin to notify his advent. In a little time a person came over who forthwith proceeded to take an inventory of the traveller's property. His arms were also demanded, and surrendered. He was then compelled to go to Wali-Khan's camp, and on remonstrating appears to have been summarily beheaded with a sword. This was about the 26th August 1857. The promissory note given to Murad, the Jew, has been sanctioned by the Panjab government. Murad, with the other servants, were seized, they were soon released, but he being a Jew had to turn mahomedan before he could accomplish his freedom. Mahomed Amin went to Kokand, where he is still residing.

SCHLEGEL, Fr. A Sanscrit scholar who, in 1808, published an essay on the language and wisdom of the Indians.

SCHLEGEL, A. W. von, a Sanscrit scholar, who in 1823 published an edition and Latin version of the Bagavad Gita, and in 1829–38 two volumes of the Ramayana, with a translation of the first.

SCHLEICHERA, *species.* In Tenasserim, the fruit of a species of this tree resembles the wild rambutan in everything except that it is covered with prickles half an inch long. It is rarely seen in market but would be a valuable addition to the desert. The tree grows among the hills of Tavoy. There are four species of Schleichera in Burmah, all undetermined, viz. :

Kyet mouk,	Burm.	Thaka peu sai ghau,	Burm.

Æmbul kon,	,,		

This tree grows in the warmer parts of Ceylon, up to an elevation of 2,000 feet ; it grows, also, in Coimbatore, is common in Canara and Sunda, though most so below the ghats where it reaches the size of a large tree ; it is not uncommon in the Dundele forest and in the forests of the South Konkan, and is common in those of the North Konkan ; it is said to be very abundant in the Godavery forests, two trees in the Ganjam district are termed Koosoomoo, the Kola koosoomo and Ghuntiah koosoomo, the former of which abounds and is larger and more useful than the latter which is not so common, (but that either of these are the S. trijuga requires confirmation.) It grows in all the valleys and outer ranges of Kumaon. It occurs rarely, wild, in the Siwalik tract up to the Beas, and on the eastern verge of the Punjab. It attains an extreme height of 50 feet with a circumference of 4½ feet. The height from the ground to the intersection of the first branch is 9 feet. It produces a red, strong, hard and heavy wood, which is used to make pestles, spokes for bandy wheels and other purposes where much strength in small space is required, and as crushers for sugar, rice and oil mills, screw rollers for sugar mills, cotton presses, &c., and the axletrees of bandies and ploughs ; the seeds yield an oil which is used for burning, and from the young branches a considerable quantity of lac is gathered, which, in Ganjam, is in request among native jewellers. It is one of the heaviest woods known in Burmah, where it is common in the plains as well as on the hills, and is there used for cart wheels, the teeth of harrows, the pestles of oil mills, &c., &c. A cubic foot there weighs lbs. 70. The trunk of a full-grown tree on good soil attains an average length to the first branch of 25 feet, and its average girth measured at 6 feet from the ground is 12 feet. O'Shaughnessy says the oil from the seeds is edible. The bark is astringent and is used rubbed up with oil by the natives to cure the itch.—*Drs. Roxb.*, *Voigt, Wight, Gibson & Brandis* ; *Thwaites, Captain Macdonald, p.* 58 ; *Major Pearson* ; *Mr. Thompson* ; *Cal. Cat. Ex.* 1862 ; *Mr. Rhode.*

SCHOLASTIKOS, the Thebœan, travelled in India, a few years before the Chinese missionary Fa Hian, and was detained a prisoner for six months in the pepper districts of Malabar. Some account of his journey is given by Palladius.

SCHOOL, ENG. A term employed in the south-sea whale fisheries for a shoal of whales.

SCHORIGENAM—? Tragia involucrata.

SCHORL, or black tourmaline, is found in Madura, in great abundance, also in quartz near the mouth of Tavoy river on the east side, and also at the foot of the eastern mountains, near the head-waters of the Dahgyaine, north-east of Maulmain. In both localities in Tenasserim, the crystals are numerous, and in Tavoy they are large, but not so handsome as seen in foreign specimens. Green Tourmaline, cannot be distinguished by the eye from beryl. Beryl scratches quartz, but tourmaline is scratched by quartz. White jewels of an inferior quality are often offered for sale in Maulmain under the name of Ceylon diamonds, but they are usually made from green tourmaline. White tourmaline, is a rare mineral, but the green variety being common, the jewellers by exposing it to heat expel its colour and it becomes white.—*Mason.*

SCHOTT and Endlicher, authors of Meletemata botanica.

SCHOVANNA ADAMBOE, Maleal. Ipomœa pes-capræ.

SCHWEFELSAURES EISENTOXYDUL, Ger. Sulphuret of Iron.

SCHWEFELSAURES KUPFER, Ger. Blue stone, Sulphate of Copper.

SCHWEFELSAURES ZINKOXYD, Gr. Zinci sulphas, White vitriol, Sulphate of Zinc.

SCHWEFELSAURES NATRON, Ger. Soda.

SCIADOPITYS VERTICILLATA, *S. and Z.* A tree of Japan.

SCIARAPPA, It. Jalap.

SCIÆNA, a genus of fishes: S. aquila (maigre of the French, and umbrina of the Romans), &c., is found in the Mediterranean. S. pama or Bola pama of Buchanan resembles the "maigres," but has a singular natatory bladder. When twelve or fifteen inches long, it is called whiting at Calcutta, and furnishes a light and salubrious diet. It is caught in great abundance at the mouths of the Ganges, but never ascends higher than the tide.

SCIENCE.

Ailm,	Ar., Hind., Per.
Science,	Fr.
Kunst, Kenntnisse,	Ger.
Scienza, Scienzia,	It.
Sciencia,	Lat.
Ciencia,	Span.

The sciences have been arranged as under:

Classificatory Sciences, Botany and Zoology.

Chemical Sciences, Chemistry, Mineralogy, Electro Chemistry.

Sciences which consider bodies according to the elements of which they are composed are chemistry which analyses them, and mineralogy which classifies them with a view to their analysis.

Sciences which attend to the structure, the symmetry and the functions of living beings are Anatomy; Comparative Anatomy; Morphology; Biology.

Palætiology is the past history of the world by studying the causes of change, amongst which we may especially notice Geology or the History of the material Earth; and Ethnography or Glossology, the History of Languages.

Palæontology is the history of creatures now found fossil.

Deduction obtains consequences from principles.

Induction is the inference of a true theory from phenomena by philosophical sagacity: Deduction of consequences from hypothesis by direct reasoning.

Logic defines the methods of strict reasoning.

At School, boys should learn Arithmetic and Mensuration, *i. e.*, the practical rules of finding, from the necessary data, the areas of triangles, pyramids, cylinders, spheres.

Mathematics are disciplinal studies: Mathematics are of two kinds, Analytic and Geometric. The portions of Mathematics that may most properly be added to Elementary Geology are Solid Geometry (in 11th and 12th books of Euclid) Conic Sections; Mechanics; Hydrostatics, Optics and Astronomy.

Geometry sets out from certain fixed principles, viz.: Axioms and Definitions. The 1st six books of Euclid contain the essential portion of Geometry, and is a portion of Mathematics.

Mechanics is a branch of Mathematics. Mechanics, Hydrostatics, apparent Astronomy, and optics are the four branches of philosophy.

Mensuration is the Rules for determining the magnitude, in numbers, of lines, spaces and solids, under given conditions.

Algebra is the calculation of numerical questions by symbols.

The Algebra of Curves, is the calculation of the properties of curves by the symbols of their co-ordinates.

The Differential Calculus, is the calculation of the properties of curves by the symbols of their changes of such quantities.

SCIGLE, Fr. Rye.

SCILLA, Lat., also Cipollo Marina, It. Squill.

SCILLA, a genus of plants of the family Liliaceæ, of the South of Europe, and North Africa, and two species, S. coromandeliana, *Roxb.*, and S. indica, *Roxb.*, are natives of India, the former on sand hills on the Coromandel Coast, and S. indica on the sandy shores of both Concans. Its root is bitter and nauseous like that of squill.—*Voigt.*

SCILLA INDICA, *Roxb.*

Iskil, ARAB.	Indian squill.	
Kanda, BENG.	Jungle Piaz.	
Koondree, ,,	Nurri vungajum,	TAM.
Pa-daing-khyet-thwon, BURM.	Adavi tella-gadda,	TEL

This plant occurs on the sea-shores of the Indian Peninsula ; leaves numerous, radical, sub-bifarious, ensiform, nearly flat, smooth on both sides, six to eighteen inches long. When in blossom, the plant is entirely destitute of leaves : the bulbs are round, white, the size of an orange ; inodorous, nearly tasteless, and devoid of any medicinal properties but possibly this may have proceeded from their having been collected from an unfavourable locality, or at the improper season, as few plants are so much influenced by climate and circumstances as the squill, instances being known on the Spanish coast of its being quite inert in one locality, while as active as usual at the distance of a few miles. It is already extensively used in place of the officinal squill.—*O'Shaughnessy, p.* 663.

SCILLA MARITIMA, *Linn.*

Urginea maritima, *Steinh.*	O. squilla, (*a*) *B. M.*
Ornitho-galum maritinum, *Tourne.*	Iskil, ARAB.

This European plant furnishes the squill used as medicine. It is used as a diuretic but there is every reason to suppose that the East Indian species, S. coromandeliana and S. indica possess the same medicinal qualities.

SCINCIDÆ, the Skinks, a family of reptiles of the order Sauria or lizards, and sub-class Reptilia; the family may be thus shown :

Skinks—Scincidæ.

Tropidophorus microlepis, *Gthr.*	Chartaboum.
,, cochin-chinensis, *Cuv.*	Cochin-china.
Aspris berdmorei, *Bly.*	Mergui.
Euprepes chinensis, *Gray.*	China.
,, rufescens, *Shaw.*	From Affghanistan to China.
,, monticola, *Gthr.*	Sikkim.
,, olivaceus, *Gray.*	Malayan Peninsula.
,, macularius, *Blyth.*	Rungpore ?
,, trilineatus, *Gray.*	Carnatic.
Mabouia quadrilineata, *Bly.*	Hongkong.
,, chinensis, *Gray.*	China.
,, maculata, *Blyth.*	Assam.
Eumeces bilineatus, *Gr.*	Neilgherries.

,, chalcides, *L.*	Penang, Siam, Hongkong.
,, siamensis, *Gthr.*	Siam.
,, bowringii, *Gthr.*	Hongkong.
,, albopunctatus, *Gray.*	Nellore, Mergui.
,, hardwickii, *Gray.*	Peninsula of India.
,, punctatus, *E.*	Peninsula of India.
,, isodactylus, *Gthr.*	Gamboja.
Hagria vosmærii, *Gray.*	Bengal.
Chiamela lineata, *Gray.*	
,, anguismelanosticta, *Merr.*	Coromandel.

See Adda, Eurylepis.

SCINDAPSUS OFFICINALIS, *Schott.*

Pothos officinalis, *Roxb.*	Guj peepul, BENG.

Grows in Calicut, Bengal, Burmah, Cochin-China. It is cultivated for its fruit, which is cut into transverse pieces and dried, and is used medicinally.—*Voigt.*

SCINDAPSUS, a genus of plants of the family Araceæ, section Calleæ.

giganteus, *Schott.*, Penang and Singapore.
decursivus, *Schott.*, Sylhet.
caudatus —— ? Penang.
glaucus, *Schott.*, Paras, Nepal, Khassya.
peepla, *Endl.*, Sylhet.
pertusus, *Schott.*, Coromandel, South Concan.
pinnatus, *Schott.*, Malayana.

SCINDAPSUS, *Schott.* A genus of plants of the order Araceæ, sect. Calleæ, Subsect. Callinæ. The following are East Indian species :

caudatus—? Penang.
decursivus, *Schott*, Sylhet.
giganteus, *Schott*, Penang.
glaucus, *Schott*, Khassya, Paras. Nepaul.
officinalis, *Schott*, all British India, Burmah.
peepla, *Endl*, Sylhet.
pertusus, *Schott*, Coromandel, South Concan.
pinnatifidus, *Roxb.*
pinnatus, *Schott*, Malayana.

SCINDAPSUS OFFICINALIS, *Schott.*

Pothos officinalis, *Roxb.*

Officinal scindapsus, ENG.	Ati tipili, TAM.
Gaj pipal, BENG., HIND.	Gaja pippali, TEL.
Ouna tipili, MALEAL.	

This perennial plant grows at Calicut, in Bengal, the Monghir mountains, Rangoon, Maulmein, Cochin-China, its dried fruit is used in these countries medicinally, and it is cultivated for this purpose at Midnapore.—*Roxb.*, *Voigt*, *Mason*, *W. Ic.*

SCINDAPSUS PERTUSUS, *Schott.*

Pothos pertusus, *Roxb.* | Iletadi maravara, MALEAL.

A climbing plant growing on the Coromandel mountains and on the Western coast of India, in the S. Concans. The pericarp is used in leprosy and scabies.—*Roxb.*, *Voigt.*

SCINDE, a country on the lower part of the Indus river. See Sind'h.

SCINDIAH, the regal title usually given to the Mahratta sovereign whose capital is Gwalior, and who has the title of Maharajah. Scindiah was defeated by General Goddard on the 5th April 1780. The territories over which the maharajah Scindiah rules form part of what the British term Central India. Their extent is 8,318 square miles, with a population of 576,000 and an annual revenue of £330,000. See Central India, Gwalior.

SCINDIAH, the ruling title of a hindoo family whose capital is Gwalior. A war was concluded with Scindiah on the 30th December 1803. The Contingent of Scindiah, of 5,000 cavalry, was arranged for by the treaty of Gwalior of November 1817.

SCIRPUS JUNCIFORMIS, *Nees.*

S. juncoides, *Roxb.*

One of the Cyperaceæ, grows in Bengal.

SCIRPUS KYSOOR, *Roxb.*

Keshar, BENG.

A plant of Bengal.

SCIRPUS, a genus of plants belonging to the order Cyperaceæ.

SCIRPUS CAPSULARIS.

Tang-sin-ts'au, CHIN.

This sedge is grown in Kiang-nan and Shen-si, in China, for making mats and lamp-wicks, for the latter purpose, the consumption is enormous, the Chinese watch the growth of the flower like snuff of lamps and candles, and draw ominous conclusions from the appearance. The stalks are steamed and the cuticle peeled off, leaving the central white pith which is used as a tent in surgery. It is used as a ptisan or menstruum for other drugs ; its ashes are given to children to prevent them crying at night.

SCIRPUS DUBIUS, ***Roxb.*** Its root is used by the Tiling people for food.

SCIRPUS JUNCIFORMIS, *Nees.* S. juncoides, *Roxb.* A plant of Bengal.

SCIRPUS KYSOOR, ***Roxb.*** Keshar, BENG. A plant of Bengal.

SCIRPUS TUBEROSUS.

Pi tsi, CHIN. | Water chesnut, ENG.

This sedge has an edible root, used as food by the Chinese.

SCITAMINEÆ, *R. Br.* An order of endogene plants, to which Rich and Lindley apply the name Zingiberaceæ. It comprises the East Indian genera,

Zingiber,
Curcuma,
Dischenia,
Kæmpfera,
Amomum,
Elettaria,
Hedychium,
Alpinia,
Gastrochilus,
Monolophus,
Phœomeria,
Costus,
Globba,
Roscoea,

The order formerly embraced the Marantaceæ, with 1 anther-valve, and the Zingiberaceæ with 2 anther-valves. The separation of these orders is now generally recognised. Scitamineæ are abundant on the Khassia hills and extremely beautiful ; Dr. Hooker collected thirty-seven kinds. The hat of the Lepcha in Sikkim is made of leaves of one of the Scitamineæ, placed between two thin plates of bamboo work.

. SCIURIDÆ, a family of mammals of which several genera and many species occur in the East Indies. The Sciuridæ, belong to the order Rodentia—Molar teeth simple, with tuberculous crowns ; five above, four below, on each side ; the lower incisors very much compressed. Toes long, armed with sharp claws, four on the anterior and five on the posterior feet : thumb very short. Tail long and tufted. Cheek-pouches in some. In others the skin of the sides extended between the anterior and posterior limbs. The geographic range of the sciuridæ is very wide both in the Old and New World. They have been divided by some authors into two principal groups :—

A.—Squirrels with free limbs, viz., Tamias, Sciurus, Macroxus and Anisonyx.

B.—Squirrels with their limbs invested in the skin of the sides, viz., Pteromys and Sciuropterus.

Tamias or Ground Squirrels are found in Europe, Asia, and North America. Tamias palmarum is the Mustela africana of Clusius, Sciurus palmarum of Linnæus, and Le palmiste of Buffon. The genus Sciurus or True Squirrels have a slight depression of the frontal bones, and a very slight posterior projection of the same ; profile of the face very nearly straight ; cranial cavity as long as two-thirds of the face. No cheek-pouches. Tail distichous. The East Indian genera and species are as under :—

Fam.—SCIURIDÆ, or Squirrels.

Sciurus malabaricus, *Schintz.*

S. maximus, *Blyth.*, *Horsf.* | Jangli gilbri, HIND.

Malabar Squirrel of Malabar, Wynaad, Neilgherries, Travancore.

Cho,	LEP.		

Tibet Marmot, White marmot of E. Europe, Central Asia, Snowy Himalaya, Kashmere to Sikkim at 12 to 16,000 feet.

Arctomys hemachalanus, *Hody.* Red Marmot.

A. tibetanus, *Hodg.*

Chipi,	BHOT.	Sammiong,	LEP.
Drun,	KASHM.		

Cashmere, N. W. Himalayas at 8 to 10,000 feet.

In Macroxus, the frontal bones very much depressed: nasal bones but little elongated ; a deep depression between the cranium and the face. Tail round. No cheek-pouches. The species are natives of Sumatra, India, Africa, and South America.

In Pteromys, the posterior part of the nasal bones a little convex ; the frontal bones strongly depressed in their middle and rising slightly afterwards ; the posterior parts of the head do not begin sensibly to curve downwards before the middle of the parietal bones ; cerebral cavity small, only half the length of the head. The species are natives of Asia, the Moluccas, the Philippine Islands and Java.

In Sciuropterus, the species differ from Pteromys in having the anterior part of the profile line of the head straight to the middle of the frontal bones, where it takes a curved direction, very much arched, without any intermediate depression. Occiput projecting ; frontal bones elongated ; and the capacity of the cranium comprising three-fifths of the length of the head. The species are found in Northern Asia and North America.

Sciuropterus alboniger, *Hodgson*, *J. A. S.*, v., 231, Sc. Turnbulli, *Gray*. P. Z. S. 1837, p. 68, M. N. H., *n. s.* J. 68. Inhabits Nepal, Sikkim, Bootan, and common at Darjeeling.

Scriuropterus baberi, *Blyth*. A species seemingly allied to Sciuropterus fimbriatus, but one-fourth larger was figured by Sir A. Burnes as the Moosh-i-bolder of the mountain districts of Nyrow, and identified by him as the flying-fox of the translation of Baber's Memoirs (p. 145.) A length of feet is assigned to it, whereas it is doubted (from examination of several specimens) if Sc. fimbriatus would ever exceed 19 inches at the most. The colour of the upper parts is represented as pale fulvescent ashy brown, darker on the limbs, tail broad and bushy, and tipped with blackish under parts, dull white with a ferruginous margin to the membrane underneath. If verified it might rank as Sc. baberi.

Sciuropterus caniceps, see Sciurus.

Sciuropterus fimbriatus, *Gray*, M. N. H. *n. s.*, vol. J., p. 84, from Simla. Inhabits the N. W. Himalaya. The colour of the upper parts of this species resembles that of an English wild rabbit.

Sciuropterus layardii, *Kelaart*, has parachute.

Sciuropterus sagitta, *Linn*.

Pteromys sagitta, *Geoff.* | Sciurus sagitta, *Linn.*
Sciurus maximus volans, seu Felis volans, *Brisson.*
Le Taguan—Fr., Grand Ecureuil volant, *Buffon.*

This squirrel has a small rounded head ; cloven upper lip ; small blunt ears ; two warts at the utmost corner of each eye, with hairs growing out of them ; neck short. Length, from nose to tail, 18 inches ; tail, 15 inches, (*Pennant.*) It inhabits Java and others of the Indian islands. It leaps from tree to tree as if it flew ; and will catch hold of the boughs with its tail. It differs in size. Nieuhoff describes it under the name of the flying-cat, and says the back is black. Dr. Horsfield, in his 'Zoological Researches in Java,' describes two flying-squirrels (Pteromys genibarbis and P. lepidus), both nocturnal in their habits, nearly approaching to S. sagitta. He describes the first as living on fruits ; the second as found in the closest Javanese forests, where the height of the trees and the luxuriance of the foliage effectually conceal it. He enumerates 16 species of Sciuri, 4 of which were first described by himself. These do not include the flying-squirrels.

Sciuropterus turnbulli, see Sciurus.

Sciuropterus villosus, *Blyth*, *n. s.* referred to Sc. sagitta in Mr. Walker's Catalogue of Assamese mammalia.

Sciurus, the squirrel, of which several species inhabit India Proper, Ceylon, Assam, and the whole eastern coast of the Bay of Bengal down to the Straits of Malacca. (*J. A. L.*, xvi, 868, *et seq.*) There are no Sciuri more difficult to undertand than the group exemplified by Sc. modestus, *Muller*. Sc. lokriah and Sc. lokroides, *Hodgs.* Sc. griseopectus, *Blyth*, (xvi, 873), and of which Sc. chrysonotus is one of the species best distinguished from the rest. Three specimens from Darjeeling differ from all other examples of Sc. lokroides previously seen by Mr. Blyth, from that and other localities, in having the thighs externally of a bright ferruginous colour : in other respects they are quite similar to ordinary individuals of the species. Five species inhabit Ceylon.

Sciurus atrodorsalis, *Gray*. Mr. Blyth has no doubt now that this Tenasserim species was rightly identified, and that Mr. Gray's habitat of Bootan is erroneous. A third specimen is intermediate in its colouring to the two formerly described, having the under parts much lighter ferruginous than in the one, and considerably darker than in the other.

Sciurus barbei, *Blyth*. A small striped squirrel of Burmah, common in Mergui.

Sciurus berdmorei, *Blyth*. A small striped squirrel of Burmah and Tenasserim, nearly one-half larger than Sc. palmarum : the prevalent colour grizzled black and golden fulvous, with an obscure pale central dorsal streak, flanked by a blackish band: this again by a conspicuous yellowish-white line from the shoulder to the croup; then blackish again, with a second lateral whitish band; below again dusky; and the underparts yellowish-white, passing to ferruginous towards the vent and underneath the tail. Head tinged with ferruginous: and from what remains of the base of the tail in the specimen, this would seem to resemble in colouring that of Sc. layardi. Length of hind-foot from heel to tip of claws 1⅝ inch. Rodential tusks, deep orange-brown. This species inhabits the Thoungyeen district.

Sciurus bicolor, *Sparrman*, *Blyth*. Sc. Tennenti, *Layard*. (J. A. S., xvi, 870) Mr. Blyth mentions six species from the Tenasserim provinces, common; but the pale Malayan variety does not appear to have been hitherto observed, though the pale Malayan variety of Hylobates lar is there common. Resembles in size and colouring the common large species of the whole eastern coast of the Bay of Bengal, except that the caudal hairs are always largely tipped with white, save at the base and the extreme tip of the tail, there is no black moustachial mark nor black border beneath the eye, but a large triangular patch of black behind it and reaching upwards to the ear, also a rusty spot at the base of the ear posteriorly, and the auricle is well-fringed with hair, though less copiously than in Sc. purpureus,—finally there is much more fulvous white upon the limbs, leaving only the toes of the fore and hind limbs black. In the common Sc. bicolor, the posterior limbs are wholly black externally, and the anterior are wholly black behind, and more or less externally. In the Ceylon squirrel both fore and hind limbs are fulvous-white all round for the lower half, the extremities or toes alone black. This race has accordingly quite as good a claim to be distinguished by a separate name as either of the other large races of S. E. Asia; and it is interesting to know that it co-exists in Ceylon with Sc. macrourus, though in a different region, the two never infringing on each other's territory. It also attains a much larger size than Sc. macrourus, being that of Sc. purpureus and Sc. bicolor: and it is wholly confined in its range to the Kandian country and the more elevated districts generally of the island.

Sciurus brodiei, *Blyth*. Distinguished by its having a very long pencil tuft (3½ inches) at the extremity of the tail, quite different from what is ever seen in Sc. tristriatus: beneath the tail, to near its tip, ferruginous. According to Mr. Layard, " this species is confined to the Palmyra-tree district, from Putlam to Jaffna. How much further round the coast is not known."

Sciurus chrysonotus, *Blyth*, common in Tenasserim.

Sciurus ephippium, *Muller*. Sc. javensis, *Schreber*, var., from Borneo.

Sciurus griseopectus, see Sciurus.

Sciurus insignis, *Hors*. A small striped squirrel of the Malayan Peninsula.

Sciurus layardi, *Blyth*, *n. s.* Size of S. striatus and S. brodiei, but the colour very much darker, nearly as in Sc. trilineatus (vel. Delesserti,) but inclining more to ashy than to fulvous, except on the head and flanks: lower parts ferruginous, paler on the breast: middle of the back nigrescent with a strongly contrasting narrow bright light fulvous streak in the middle, reaching from between the shoulders to near the tail, and an obscure stripe on either side, barely reaching to the croup. Tail ferruginous along its centre, the hairs broadly marginal with black and finally with whitish, besides which is another and narrow black band on each hair towards its base, chiefly seen as the tail is viewed from above; tip black, forming a pencil-tuft 3 inches long. This handsome species is believed to be peculiar to the upland districts of Ceylon.

Sciurus lokriah, see Sciurus.

Sciurus lokroides, see Sciurus.

Sciurus macrouroides, *Hodgs*. A gigantic squirrel, abounds throughout the Burmese countries and Malayan peninsula, and northward to the Assam Hills and those of Sikkim and Nepal. It has a pale variety in the Malayan peninsula.

Sciurus macrourus, *Forster*, The common large squirrel of the western districts of Ceylon, also met with in Travancore and other neighbouring districts of continental India becomes extremely tame, chiefly perhaps remarkable for its singularly loud and harsh voice. Indeed, the voice would seem to be an excellent criterion of specifical distinction among the Sciuridæ. This animal carries its tail in the same peculiar manner, curled round on one side, as is observable in Sc. purpureus and Sc. bicolor, and doubtless all others of the same group.

Sciurus maximus, the Malabar Squirrel. Upper parts and external surface of the limbs bright chocolate-brown, which colour terminates abruptly, and is joined by the pale yellowish-brown on the under parts, fore-arms, and internal surface of the limbs. Front of the fore-legs, neck, throat, face, and head between the ears, lighter in colour: a broad darker patch on the rest of the upper part of the head extends from the forehead to the middle of the nose. Back and shoulders sometimes deepening into black. Ears short, covered with long tufted hairs, and brush-like; from the longer part of each ear a narrow line of deep-brown passes downwards and backwards in an oblique direction. Whiskers scanty, long and black. Claws incurved and strong, those of the anterior thumbs broad, short, and flattened. Tail distichous, the hairs expanding widely towards the extremity, bright chocolate-brown at the base, black in the middle, and chesnut in the extreme third part. Length about 33 inches, of which the tail measures rather more than one-half. It is a native of the Malabar coast. Sonnerat appears to have been the first zoologist who observed this richly coloured species, the largest of the true squirrels. It haunts among palm trees, and is stated to be very fond of the milky juice of the cocoa-nut, as well as of the solid part of the nut. In captivity, it is tame and familiar; but it tries its teeth upon most substances that come within its power and should be guarded against accordingly.

Sciurus phayrei, *Blyth*. A Burmese squirrel.

Sciurus pygerythrus (?) *Is. Geoffroy*, var.? Tenasserim. A Burmese squirrel: a supposed variety of Sc. lokroides.

Sciurus rafflesii, *Vig.* and *Hors.* Sc. prevostii, *Desmarest*, is a larger squirrel than Sc. hippurus. It inhabits the Malayan peninsula. It is black above, deep rufo-ferruginous below and on the feet: a very broad white lateral band from mouth to haunch, extending over the outside of the thigh, and more or less greyish from cheek to shoulder: tail of a somewhat duller black than the back, and a little rufescent at tip.

Sciurus redimitus, *Vander Boon*. Sc. rufogularis, *Gray*, a squirrel of Borneo.

Sciurus rufoniger, *Gray*, probably a variety of Sc. redimitus.

Sciurus tristriatus, *Waterhouse*. This would appear to be the most common species of Palmist squirrel in Ceylon; and there is no difference between Singhalese specimens and examples procured in the vicinity of Midnapore: one of the former is remarkable for having a strong ferruginous tinge on the upper part of the head. Mr. Layard mentions that "at Hambantotte he got a new Sciurus, like Sc. palmarum, only the head is much redder, the colour of the back and belly more blended, and the animal altogether smaller. This entirely replaces all the small Sciuri in that part of the country; they are first seen at Tangalle, and he supposed extend round to Trincomallee."—*Blyth, Journ. Beng. As. Soc.*, *Vol.* xvi, *pp.* 871, 873, 874, 1001, 1272; xvii, *p.* 345; *Cal. Journ. Nat. Hist.*, *Vol.* iii, *p.* 266.

SCLAVONIC, see Sanskrit.

SCLERANTHACEÆ, *Lindl.* An order of plants with 1 sp. of Scleranthus, of no importance.

SCLERIA LITHOSPERMA, *Willd.*

S. tenuis, *Retz.* | Scirpus lithospermus, *Linn.*

A sedge of Ceylon, the peninsula of India and Bengal.

SCLERIA TESSELATA, *Willd.*

S. biflora, *Roxb.*

A sedge of Ceylon, peninsula of India, Bengal and Nepal.

SCLERIEÆ, *Nees.* A section of the Cyperaceæ or sedges, two species of Scleria occur in British India, one a very long sedge, grows by the water in the river Soormah near Sylhet and is used for thatching: boat-loads of it are collected for the Calcutta market, also immense rafts of bamboo 100 feet long.—*Hooker's Him. Jour.*, *Vol.* ii, *p.* 327.

SCLERODERMA VERRUCOSUM, see Fungi.

SCLEROSTYLIS ATALANTIOIDES, *W. & A.*, *Blume.*

Limonia bilocularis, *Roxb.* | Arawi-nim, TEL.

This small tree or shrub one of the Citraceæ is found in the Circars. Its wood is yellow, and is always very small, but is very hard and might be used as a substitute for box.—*Roxb.*, *Voigt*, *Captain Beddome.*

SCLEROSTYLIS CEYLANICA, *W. Ill.*

Sclerostylis arnottiana, *Wight Ic.*
Rissoa ceylanica, *Arn. Pug.*, *p.* 6, (324,) *c. p.* 1196.
Yucca-naara-gass, SINGH.

A plant of the warmer parts of Ceylon, not uncommon.—*Thw. En. Pl. Zeyl.*, *p.* 46.

SCLEROSTYLIS ROTUNDIFOLIA, *Thw.* A small and not common tree, growing in Ceylon, at an elevation of 4,000 feet and upwards.—*Thw. En. Pl. Zeyl.*, *p.* 46.

SCLEROTIUM STIPITATUM, *Berk. et Curr.*

Puttu Kai or Putta Manga, TAM., from puttu, a white-ant hill, and manga, a mango; and Kai, fruits. Mail Manga, TAM., from mail, dry, like sticks, leaves, &c., and manga, a mango, neither the substance, nor its name is familiar to the natives of the Carnatic, to be accounted for by the great dryness of the climate and the absence of the moisture and heat so necessary for fungoid growths. On the western coast, where it rains for at least six months in the year, it is occasionally to be met with in dark crevices, and in the recesses of rocks and caves, also in old and deserted ant-hills, and frequently after the insects have become winged: they are found only in the peripheral and more superficial caverns, springing from their roof, occasionally from the floor, never from the cells occupied by the ants. Some grow with long stalks, others are sessile; in those having stalks, they can in a few be traced beneath the soil, while the sessile ones seem simply to lie over the soil. It attains its greatest perfection during, or immediately after, the rains. They take on a variety of forms, being oval, oblong, pyriform, irregularly round, &c. The external rind is black and slightly wrinkled ; on cutting into it, the interior is found to be white and pithy, and is compared by the natives to the kernel of a tender cocoanut. It is tasteless and inodorous. The Malayalum Vythians believe it to be manufactured by the insects themselves, by a kind of accretive process, and that snakes are very fond of it and devour it greedily. Snake-charmers collect the Puttu Maunga and take it round for sale, and they give out that they keep a supply always on hand with which to feed their snakes. The Vythians eagerly seek it, and use it as a remedy in cholera, syphilis, and a variety of other diseases. In cholera it is prescribed as a specific, by rubbing it up with a little water and fresh ginger-juice or country arrack ; and the dose is repeated after every motion or act of vomiting. It is not commonly found in white-ant hills, but is met with in one out of every twenty or thirty on the western coast and Coimbatore district.—*Dr. John Shortt.*

SCOLOPACIDÆ, a family of Birds of the order Grallatores or Waders, comprising 16 genera and 33 species as under :

1 Ibidorhyncus,
4 Totanus,
3 Actitis,
6 Tringa,
1 Terekia,
2 Limosa,
2 Numenius,
1 Eurinorhyncus,
1 Calidus,
1 Philomachus,
1 Strepsilas,
1 Phalaropus,
1 Scolopax,
1 Macrohamphus,
6 Gallinago,
1 Rhynchæa.

This family of birds is interesting to the Indian sportsmen, from the circumstance of its species being largely sought after for amusement. The Woodcock is everywhere very scarce on the plains of India, but has now and then been met with near Calcutta ; it is found on the Neilgherries, and occasionally on the plains of the peninsula. Some incline to the opinion that Woodcocks may not be so rare being commonly overlooked in their jungle-haunts. The Woodcocks seen at the dinner-table are generally Greenshanks (Totanus glottis) and occasionally the Black-tailed Godwit (Limosa ægocephala)—birds of very different Scolopaceous genera. Two distinct species in the Himalaya are commonly confounded under the name 'Solitary Snipe,' and both are very different from the Gallinago major of Europe and Northern Asia, which has not been observed in the East Indies. Of the other Indian kinds, one Gallinaga solitaria of Hodgson, is peculiar to the Himalaya, and to this species the designation 'Solitary Snipe' should be restricted. It is readily known by its white belly and yellowish legs—wings longer, straighter and more acuminated than in the other, and the upper plumage more minutely speckled, with the pale linear markings on the back narrower, and the tail also longer. Average measurement 12½ inches by 20 in expanse of wings ; closed wing 6⅓ inches ; and tail 3 inches. Weight 5 to 6 oz., or even more. The other, G. nemoricola of Hodgson, should be distinguished as the Wood Snipe, and is more of a Woodcock in appearance and habits, though keeping to the outskirts of the jungle. Though principally a Himalayan species, it is not rare in the Nilgiris, and it has been met with in various parts of the country, and once in the Calcutta provision-bazar. This species has blue legs, and the under-parts are uniformly barred throughout ; the general colouring dark, and the markings bold ; the wings more bowed and rounded than in the other, and the tail shorter. It is only found, remarks Mr. Hodgson, in the haunts of the Woodcock, with this difference in its manners, that it is averse to the interior of woods. Length 12½ inches by 18 in expanse of wings ; closed wing 5½ inches ; and tail 2¼ inches. Weight 5¼ to 6½ oz. and upwards.

The 'Grass Snipe' also known as the Pin-tailed Snipe (G. stenura), is distinguished by a duller plumage than the common British snipe, and especially by the curious series of pin-feathers on either side of its tail ; whereas the other has a fan-shaped tail, altogether different in form. The pin-tailed is the common Snipe of the Malay countries, but not of Australia, as has been stated ; the Australian (G. australis) being a much larger bird, with intermediate form of tail, as in the Solitary and Wood Snipes of British India. In Bengal it is the more abundant species, early and late in the season, as the common or British Snipe is during the height of the cold weather ; but so early as on the 30th August, one came from the bazar in a bundle of pin-tailed snipes, and subsequently the pin-tailed only, in considerable abundance. Nothing is more easy than to distinguish the two species by the shape of the tail, and a practised eye will generally tell them at the first glance ; yet very few sportsmen in India are aware of the difference.

The little Jack Snipe, G. gallinula, is much later in its arrival, though numerous species of small Waders arrive from their breeding-haunts before the end of August. The Jack Snipe has a tail quite different from that of any of the others ; in brilliancy of plumage it excels all the rest.

There is a small and distinct species of Woodcock in the Malayan Archipelago, the Scolopax saturata of Horsfield.

The Woodcock, identical with the British, has been obtained in the Tenasserim provinces ; it abounds in the Himalaya, is less common in the Neilgherries, and is considered a rare bird in the mountains of Ceylon. On the Bombay side it is said to be far from common in the Mahabaleshwar.

SCOLOPAX, a genus of birds of the family Scolopacidæ and sub-family Scolopacinæ or snipes : the East Indian genera and species of which are as under :

Gallinago gallinula, *Linn.*, *Sykes*, *Jerdon*, *Blyth*, *Gould.*

The Jack Snipe : it breeds in the Northern regions : it is found in most parts of India, in the cold weather coming later and departing earlier than the common snipe : it prefers thicker coverts, lying very close and is difficult to flush.

Rhynchæa bengalensis, *Linn.*, *Sykes*, *Jerd.*, *Blyth.*

R. capensis, *Linn.*
„ orientalis, *Horsf.*, *Hardw.*
R. picta, *Gray.*

The Painted Snipe, is a permanent resident in some parts of India, breeding in June and July in thick marshy ground, but is found throughout Africa, British India, Ceylon, Burmah and Southern China.

Scolopax rusticola, *Linn*, *Jerd.*, *Blyth.*

S. indicus, *Hodgs*, *Gould.*
The Woodcock.

The common snipe, breeds in the northern regions but is a winter visitant to India, arriving, in small numbers, in the N. of India early in August, and in numbers by the end of September and through October : they are occasionally seen in the Calcutta market early in August, and in that of Madras by the 25th of that month. In Upper Burmah, Dr. Jerdon noticed them towards the middle or end of July. Dr. Adams says it breeds there, which Dr. Jerdon doubts. They frequent marshes, rise with a hissing call, fly against the wind and occasionally alight in a ploughed field.

Gallinago solitaria, *Hodgson*, *Blyth.*

The Himalaya Solitary Snipe,

Found as yet only in the Himalaya, in winter up to 3,000 to 6,000 feet, but probably belongs to Tibet.

Galinago stenura, *Temm.*

S. gallinago, *Jerd.*
S. heterura, *Hodgs.*

S. horsfieldii, *Gray.*

The Pin-tailed Snipe.

This so closely resembles the common snipe that sportsmen and even naturalists often mistake it.—*Jerdon on Birds of India* ; *Horsfield & Moore Cat.* ; *The Indian Field.*

SCOLOPENDRIUM. Many of the Filices or Ferns are still used in medicine in India. The rhizomes, or dried leaves of Scolopendrium, are sold under the altered name, Iskoolikundrioon. Those of Polypodium are called bulookunboon. The Asplenium radiatum, mohrpunkhee, or peacock's fan, is employed by the natives probably as an anthelmintic.—*O'Shaughnessy.* See Ferns.

SCOLYMUS MACULATUS, *Linn.*

S. pectinatus, *Cass.*
S. angiospermos, *Gærtn.*

A plant of Europe, cultivated in the East Indies.

SCOMBER PELAMYS, *Linn.* The Bonito, one of the mackerel tribe, inhabits the southern seas, and is often caught by hook and line. Its flesh resembles raw beef and when cooked is not inviting.

SCOMBER THYNNUS, *Linn.* The Albicore is in length from 3 to 6 feet, is an inhabitant of the southern seas, the back is bright purple with a golden tint : eyes large and silvery, belly silvery, with a play of iridescent colours.—*Voigt*, 427 ; *Bennett*, *p. 22.*

SCOMBRIDÆ, a family of fishes of the section Acanthopterygii, of which the common mackerel may be regarded as a type : the Tunny, Sword-fish, Dory, Boar-fish, Pilot-fishes and the King-fish, also belong to this group. The body is generally covered with small scales ; the tail is usually very powerful and deeply cleft : in most of the species the pectoral fins are long, narrow, and pointed ; the dorsal fins are two in number, the foremost of them being composed of bony rays ; the hinder dorsal is chiefly supported by soft rays, and is often divided into numerous small false fins. They are provided with numerous cœca, and these are often united in clusters. The Sword-fish, Xiphias gladius, *Linnæus*, is an inhabitant of the Mediterranean and Atlantic, occasionally visiting the British coast. It measures from 10 to 15 feet in length. Its body is lengthy and covered with minute scales, the sword forming three-tenths of its length. On its back it bears a single long elevated dorsal fin; there are no central fins. The tail is keeled. The lower jaw is sharp ; the mouth without teeth. The upper part of the fish is bluish-black merging into silver below. The sword-fish is said to attack the whale, wounding it with its beak. There are many well-authenticated instances of the planks of ships being perforated by the upper jaw of this powerful creature, which, it has been supposed, occasionally attacks the hulls of ships by mistake for the whale. Specimens of ships' timber penetrated by its sword are preserved in many museums. The Xiphias is mentioned by Aristotle ('Hist Anim,' viii, 19), who notices the fact of its striking vessels. The young fish is said to be good eating. When very young the body is covered with small tubercles, which disappear before it attains the length of three feet. Naturalists arrange the family Scombridæ as under :

FIRST GROUP.—Scombrina.		
12 Scomber,	13 Thynnus,	5 Pelamys,
12 Auxis,	9 Cybium,	1 Naucrates,
1 Elacate,	10 Echeneis,	1 Hypsiptera.
SECOND GROUP.—Nomeina.		
1 Gasterochisma,	2 Nomeus,	2 Cubiceps,
1 Neptomenus,	1 Platystethus,	1 Ditrema.
THIRD GROUP.—Cyttina.		
6 Zeus,	2 Cyttus,	? Oroeosma.
FOURTH GROUP.—Stromateina.		
9 Stromateus,	3 Centrolophus.	
FIFTH GROUP.—Coryphænina.		
6 Coryphæna,	4 Brama,	1 Taractes,
4 Pteraclis,	3 Schedophilus,	1 Diana,
1 Ausonia,	1 Men	1 Lampris.

—*Eng. Cyc.*

SCOPARIA DULCIS, *Linn.* Native of every part of the world within the tropics, common in India, particularly near the sea.—*Voigt, p.* 507.

SCOPE, IT. Brooms.

SCOPIMERA GLOBOSA, a crab of Korea, quickly hides itself in the moist sand.—*Adams.*

SCOPOLIA ACULEATA, *Ser.*

Toddalia aculeata, *Pers.*		Molakarunnay,	TAM.

This has a small white root, about the third part of an inch in diameter, the bark of which is bitter and sub-aromatic and is considered as stomachic and tonic. It is given in a weak infusion to the quantity of half a tea cupful in the course of the day.—*Ains. Mat. Med., p.* 89.

SCOPOLIA PREALTA, *Dun.*

Belenia prealta, *Dnc.*

Sholar Bajarbang,	CHENAB.	Lang, Tang,	LAD.
Nandru,		Khardag,	TRANS-INDUS.
Dandarwa,	,,		

Common in waste ground in parts of the Chenab basin from 6,800 ; to 9,500 feet, in Zanskar and Spiti, and to 16,000 feet in Thibet, and apparently found sparingly in Trans-Indus, in the plains, and perhaps the same plant in one place near Lahore. In the hills the leaves are applied to boils, and are also said to be poison, the mouth swelling from their touch, and the head and throat being affected when they are eaten. A man was poisonously affected by eating the plant gathered in the Lahore habitat, and the Negi of Lahoul, when at Le in 1867, suffered from its narcotic effects for two or three days, some of its leaves having been gathered by mistake with his sag or greens. At the same time they can hardly be very poisonous to all animals, for in Lahoul they are browsed by cattle. Dr. Christison states that this has the same property of dilating the pupils as Belladonna.—*Dr. Stewart, Powell's Hand-book.*

SCOPS ALDROVANDI, 'Scops-eared Owl' of Europe, Asia Minor, N. Africa : migratory. In India replaced by affined species ; more especially Sc. bakkamœna (the Scops sunia et pennata of Hodgson) which seems to be generally diffused all over the country. Sc. Aldrovandi is said to be from Nepal and Tibet refers doubtless to a grey specimen of the bakkamœna.

SCORPION, ENG., FR.

Kuzhdam,	ARAB.	Bichu,	HIND.
Aqraba, Am-aryat,	AR., PERS.	Scorpio,	IT., TAT.
		Escorpion,	SP.
T'siuen-hieh,	CHIN.	Teru,	TAM.
Okrab,	HEB.	Telu,	TEL.

The scorpion is one of the Arachnida, eight-legged, air-breathing, articulate animals, comprising nutes, spiders, scorpions. The scorpion has a curved sting at the end of a tail. If the sharp point of the sting be cut off, the animal cannot wound or hurt. Scorpions inhabit the hot countries of both hemispheres, live on the ground, conceal themselves under stones and other substances, most commonly in ruins, dark and cool places, and often in houses. They run with considerable swiftness, curving the tail over the back—this they can turn in every direction, and use for the purposes of attack and defence. With their forceps they seize various insects, on which they feed after having pierced them with their sting. They are particularly fond of the eggs of spiders and insects. The wound occasioned by the species found in the southern parts of Europe (Scorpio europæus), is not usually dangerous ; but according to the experiments of Dr. Maccary, made upon himself, the sting of some other and larger species produces serious and alarming symptoms, and the older the animal the more active seems to be the poison. The remedies employed are the volatile alkali, chloroform used externally and internally, and, externally, ipecacuan in form of a paste. The young scorpions are produced at various intervals, and are carried by the parent for several days upon her back, during which time she never leaves her retreat. The pain suffered from the scorpion's sting seems to depend more upon the temperament of the sufferer than any other cause ; some suffering much agony, occasionally terminating in death, while others become only slightly agitated. The favourite remedy now in the United States is the "whiskey cure," which, under the form of arrack, combined in the case of a scorpion sting with a poultice of chewed tobacco, was known for the last fifty years to the British soldier in India. Buthus afer, *Linn.*, the great black scorpion of Ceylon, is as large as a little cray-fish, its sting occasions a little inflammation. In some parts of the Dekhan scorpions are very numerous in open plains, living in holes about nine lines in diameter. On one occasion, the plain at the Gor-Nuddi, used as a parade ground for the Poona Horse, was found pierced in every direction with scorpion holes ; perhaps not a foot of ground but had one of these, and in every one was a scorpion. It was a very curious sight, perhaps not rare in India, though unseen or unnoticed. The boys tapped the ground near, to cause a few particles of sand to fall down on the scorpion, on which it would appear at its opening, and the sharp end of a deer horn was thrust below to prevent its retreat : they were then tied together and made to fight. It is said that a scorpion if surrounded by fire so as to be prevented escaping, stings itself to death. Infested spots seem to have been common in Palestine and Mesopotamia, as in Numbers, xxxiv, 4 : Joshua, xv, 3 : Judges, i, 36 : I, Maccabees, v, 3.—*Eng. Cyc.* ; *Burton, the City of the Saints, p.* 193.

SCORPION SPIDER. Species of the genus Galeodes or scorpion spiders, occur in Central Asia, Tartary and in the Himalaya. The Lycosa or Tarantuloides singoriensis (or Aranea tarantula of Pallas), and the Scorpion-spiders common on the steppes, are the Galeodes aranoides (Phalangium aranoides of Pallas). The latter—or a congener common in Affghanistan, was there mistaken for the 'Tarantula' by Elphinstone. Both, but more especially the Galeodes (or Solpuga), are celebrated for their bites, reputed to be envomed ; but this is now denied by naturalists. This very formidable and most voracious 'Tiger of the Spider class,' is a terrible pest in some parts, as especially on the Astrakan steppe, where its bite is much dreaded by the Kalmuks, who call it the 'black widow' (belbussan charra). They harbour chiefly under the tufts of wormwood, and about the bones which are always to be found near a Kalmuk habitation, and also at the mouth of the deserted nests of the Spermophilus citillus, where they collect a sort of bed of leaves. A Kalmuk had been bitten on the back in his bed, by one of these creatures. The back was swollen to a considerable distance round the part, and water trickled from his mouth. A camel's body becomes exceedingly swollen by the bite of one of these poisonous spiders. Camels seem to suffer most from these spiders, because they are most addicted to lying on the ground.

Galeodes vorax, *Hutton*, an extremely voracious spider of Northern India, which feeds at night on beetles, flies, and even large lizards, sometimes gorging itself to such a degree as to become almost unable to move and remaining torpid and motionless for about a fortnight. A sparrow, as also a musk-rat (Sorex indicus) put along with it were killed by it. This Galeodes vorax was seen to attack a young sparrow half-grown, and seize it by the thigh, which it sawed through, then caught the bird by the throat, and put an end to its sufferings by cutting off its head. Dr. Baddeley confined one of these spiders under a glass wall-shade with two young musk-rats (Sorex indicus), both of which it destroyed. Neither in the instance of the bird, of the lizard, or the rats, did the galeodes devour its prey after killing it. Capt. T. Hutton, in the eleventh volume of the Asiatic Society's Journal, makes mention of a lizard bitten by one being allowed to escape, with only a severe wound on the side ; and as it lived for some days before being permitted to run off, the bite of the Galeodes would not appear to be poisonous.—*Gosse, pp.* 237-8. ; *Tenn. Sketches of Nat. Hist., Ceylon, p.* 470 ; *Capt. Hutton, in Jour. As. Soc. of Ben., Vol.* xi, *Part* ii, *p.* 860.

SCORPION, TAILLESS, three species of the tailless scorpions have been noticed in Ceylon, all with the common characteristics of being nocturnal, very active, very minute, of a pale-chesnut colour, and each armed with a crab-like claw. They are

Chelifer librorum, *Temp.*
„ oblongus,
Ch. acaroides, *Herm.*

The latter species has certainly been introduced from Europe, in Dutch or Portuguese books.—*Tennant's Sketches of the Nat. Hist. of Ceylon, p.* 476.

SCORZE DE LIMONE, IT. Rind of Citrus limonum, *Risso.* Lemon Peel.

SCORZONERA HISPANICA, *Linn.*, it is an annual from the South of Europe, it should be sown either in beds, broad-cast, or planted out in rows at a distance of a foot apart, has a long milky-juiced root, grows without any difficulty after the rains. The root when boiled and dressed is rather a delicate vegetable. It comes to perfection in three or four months. Salsafy—is the black Scorzonera, and requires the same treatment. In China, the Meh-men-tung, is a species of Scorzonera, called vipers-grass, its root is eaten as a vegetable.—*Jaffrey* ; *Smith.*

SCOTOPHILUS COROMANDELIANUS, *Fr. Cuv.* This very small bat occurs in Ceylon, not much larger than the humble bee, and of a glossy black colour, it is sometimes to be seen about Colombo.—*Tennent's Sketches of the Natural History of Ceylon, p.* 20.

SCOURING-LEAVES of the Actæa aspera of China, are used for cleaning pewter vessels.

SCOURING RUSH of China, Actæa spicata.

SCREW PINE.

Kaldera-bush,	ENG.	Sithay nar,	TAM.
Umbrella tree,	,,	Thaium,	
Vacoa of Mauritius,	FR.	Thalay	
Keora,	HIND.	Mazali,	,,

The screw pine, the Pandanus odoratissimus of botanists, grows in Madagascar, Bourbon, the Mauritius, Ceylon, in the Peninsula of India, Burmah and Malayana, being very common along the sea coast. The leaves are used for making mats, baskets and hats ; there are extensive manufactories of these articles at Pulicat, Cuddalore and several other localities. The fibre of the leaf is white, soft, and pulpy, but possessed of little strength. It appears to be a good material for the preparation of paper but ill suited for cordage. The aerial roots are much used as coarse brushes for white-washing houses, when beaten with a mallet they open out like a soft brush.—*M. E. J. R.*

SCREW PLANT or Screw-Tree, Helicteres isora.

SCRIPTURE, a term in use in the English language to designate the sacred books of the christian religion. It is from the Latin scriptura, writing, and is also applied to the holy books of the hindoos, the Vedas, and the Puranas, the names of the sacred books of the hindoo religion. Veda is derived from vedali contracted vetti, he knows, one of the verbs most commonly used in Sanscrit and from which several words are derived of equally frequent occurrence, as vidya, learning ; vidivan, a learned man, &c. This verb, also, has been preserved in Greek, Latin, and Anglo-Saxon, as SANS., vidanti ; GREEK, eidonta, LAT., vident ; ANGLO-SAXON, witon ; and ENGLISH, wit. The sacred books of the christian religion are designated the Old and New Testament, or, collectively, the Bible ; the Old Testament inculcates monotheism and gives a history of the Hebrews for about two thousand years, to B. C. 500. The New Testament gives a history of John and of Jesus, the Christ, the Messiah or anointed, of his teachings, his doctrines and those of his disciples. In British India, the followers of Jesus Christ are a comparatively small number, the bulk of the people having accepted hinduism ; there are few buddhists, a small number of Jains, and about seventeen millions of mahomedans. The prevailing religion among Aryan and non-Aryan hindoos, and Chinese at present, is a spirit-worship of the most varied kind. It is laid down in the Gurooda Poorana and other hindoo scriptures, that, on the occurrence of a death, the son or other heir of the deceased must offer lump-offerings, and that if he neglect to do so the spirit passes into the state of goblin. If, after the fourth lump has been offered, the obsequies proceed no further, for example, if any cause occur to prevent cremation —the spirit, it is believed, remains a bhoot. Similarly, if six lumps only be offered, the spirit remains a pret. For twelve days the soul, it is supposed, is seated on the eaves of the house in which it had parted from the human body. At sunset, therefore, the compassionate relatives place upon the roof for its substance a vessel of water and another of milk. Other accounts fix the residence of the soul, during this calamitous period, at the place of the funeral pile ; or at cross-roads ; and some admit that it dwells alternately in the elements of fire, air, and water, and in the house which was its home. One lump-offering should be made daily, until the fourth day from the day of decease, for the construction of a new body for the pret. The body, at the end of that time, attains to the size of the upper joint of a man's thumb. On the tenth day a lump should be offered for the purpose of satisfying the hunger and thirst which the pret now begins to feel. The common practice in Goozerat, at the present time, is to make the lump-offering ten times on the tenth day. Sradha must be performed on the tenth, eleventh, twelfth, or thirteenth day succeeding the decease, and afterwards monthly on the day of the month on which the death occurred, and yearly on its anniversary. Sradha must be performed beside a reservoir or on the banks of a river. The sacrificer shaves his face, and, holding in his hand a copper cup containing water, with sesamum and sacrificial grass, he repeats the name of his progenitors, both paternal and maternal, sprinkling water as he repeats each name. The heir now forms an image of the deceased with sacrificial grass, washes it, and strews it with flowers. A similar representation of a Viswa Dev, is also made to witness the performance of the rite. The sacrificer sprinkles these, muttering a charm which has been taught him by his family priest, and which is supposed to call the Dev and the soul of the deceased into the figures. A salagrama stone is placed beside them to represent Vishnoo, and the three are worshipped with the usual ceremonies. Food is then set before the grass figures and the salagrama, and the heir, sprinkling them once more, repeats the charm which is supposed to dismiss their inhabitants. The grass is thrown before a cow to be eaten. The rites performed, the relations and neighbours of the deceased are entertained, and brahmins feasted according to the means of the sacrificer.—*Kennedy on the origin of Languages, p.* 210 ; *Ras Mala, Hindoo Annals, Vol.* ii, *pp.* 374-75.

SCROPHULARIACEÆ, *Lind.* The figworts, a natural order of plants belonging to the dicarpous group of monopetalous exogens. The Scrophulariaceæ are very widely diffused over the surface of the earth, being found in the whole range of climate between the poles and tropics. Achimenes cochinchinensis when pickled, is much esteemed, as an article of diet. The figwort tribe of plants have 36 E. Indian gen., 166 sp., viz. :—

1 Vebascus,
1 Celcia,
8 Scrophularia,
3 Mazus,
3 Mimulus,
5 Herpestis,
3 Dopatrium,
2 Peplidium,
12 Linaria,
1 Antirrhinum,
5 Pterostigma,
3 Bonnaya,
9 Vendellia,
6 Torenia,
2 Artanema,
8 Striga,
5 Linderbergia,
12 Stemodia,
7 Linnophila,
3 Buchnera,
1 Sutera,
7 Buddlea,
1 Hemiphragma.

SCULPTURES. Notes on the sculptures of British India are given under the headings Architecture, Antiquities, Caves and Inscriptions. The sculptures are innumerable : monuments, decorated buildings and sculptured texts have been the principal modes by which the various rulers of the territories now styled British India and their wealthy subjects have adopted to perpetuate their edicts, their names and fame. With the Egyptians of old, and with the hindoo and buddhist religionists now, the art of sculpture is the very pillar of their religion ; the priests in every temple first made (and still make) their god and then worshipped it ; as in Exodus, ch. xx, 4, the Egyptians worshipped figures of the sun as Ra, and of the stars as the other gods, as also statues of men, beasts, birds and fishes ; but the Jews were forbidden to make the likeness of anything in the heavens above or on the earth beneath, in order to bow down and worship it. (Herodotus, lib. ii, 36.) The history of the ancient races in the south of Asia is to be read in their sculptures.

The sculptures in Kashmere, at Sanchi, Benares, Amraoti, Madura, Trichinopoly, Tanjore, and Mahabalipuram have attracted much notice, as also have those in the cave temples at Ellora, Adjunta, Elephanta and the edicts of Asoka at Girnar and other places. The Amraoti sculptures belong to a period of three hundred years later than those of Sanchi, and the topes illustrate the faith at their date. In the Amraoti sculptures are thousands of priests and other signs of a clerical order segregated from the laity and of an established ritual. Sanchi is illustrative of the Hinayana buddhist philosophy, 300 years before the oldest buddhist book, and Amraoti illustrates the Mahayana philosophy, 800 years after its promulgation.—*Porter's Travels, Vol.* ii, *pp.* 159-60-61.

SCUTELLARIA, a genus of plants of the family Lamiaceæ, section Scutellarieæ. The Scutellaria, handsome plants when in flower, are adapted for the front of borders; the colours are purple, yellow, red or blue, the flowers resembling the Antirrhinum, and may be grown from seed in any good garden soil. Wight gives Scutellaria rivularis and S. violacea. S. viscidula is the Hwang-k'in of China ; its roots and seed are used medicinally.—*W. Ic., Riddell.*

S. colebrookiana, *Wall*, Peninsula of India.
S. discolor, *Coleb.*, Khassya and Nepal.
S. indica, *Linn* , Mahabaleshwar, China, Japan, Moluccas.
S. rivularis, *Wall.*, Nepal and China.
S. scandens, *Buch.*, Nepal and Kamaon.

SCUTIA INDICA, *Brogn,, W. & A. Ill.*

Rhamnus circumscissus, *Roxb., Rh.*
„ myrtinus, *Burm.*
Ceanothus circumcissa, *Gærtn.*
„ zeylanica, *Heyne.*
Celastrus „ *Rott.*
Gadda goru, Tel.

A small struggling shrub, with small greenish yellow flowers, a native of the Peninsula of India.

SCUTIA PANICULATA, *Don.*, syn. of Celastrus paniculata, *Willde, Roxb.*

SCYLAX. India was visited by Scylax, Ctesias, Megasthenes to Chandragupta, Diamachus to Mitragupta. Scylax, B. C. 51 was the first European who is known have visited India. He was sent by Darius to explore the Indus and wrote an account of his journey. The next historian of India was Ctesias, who lived for some years at the Persian court of Artaxerxes Mnemon B. C. 427. Herodotus, however, followed Scylax as an authority, but it was not until the expedition of Alexander, B. C. 327, that a body of able observers, trained in the school of Aristotle, were able to give accurate ideas to Europe of the condition of India, and of these writers, Megasthenes is far the most important. He lived at the court of Chandragupta, at Palibrotha, as an envoy from Seleucus I. According to him, the military force of Chandragupta consisted of 600,000 infantry, 30,000 cavalry and 9,000 elephants. India seems to have been known to the Greeks only as a country, that, by sea, was to be reached by the way of the Euphrates, and the Persian Gulf; and though Scylax had, by the order of Darius, dropped down the river Indus, coasted Arabia, and thence reached the Red Sea, this voyage was either forgotten or disbelieved, and in the time of the Ptolemies it seems probable that nobody thought that India could be reached by sea from Egypt, and Eudoxus of Cyzicus in Asia Minor came to Alexandria to persuade Euergetes to give him the command of a vessel for this voyage of discovery. A vessel was given him ; and though he was but badly fitted out he reached by sea, a country, which he called India, and brought back a cargo of spices and precious stones. He wrote an account of the coasts which he visited, and it was made use of by Pliny. But it is possible that the unknown country, called India, which Eudoxus visited, was on the west coast of Africa, and Abyssinia was often called India by the ancients, and all east of the Euphrates was also known as Hind or India.—*Perry's Bird's Eye View of India, p.* 52.

SCYLLARUS, a genus of Crustaceans. S. rugosus, *Edwards*, occurs at Pondicherry, and S. squammosus, *Edwards*, at the Mauritius.

SCYPHANTHUS, pretty little yellow flowers, which require the same treatment as the Loasa.—*Riddell.*

SCYTHIA, Saca-dwipa, also Sakatai, the country of the Sakæ. According to Strabo (*lib.* xi) all the tribes east of the Caspian were called Scythic. The Dahæ were next the sea; the Massagetæ and Sacæ more eastward ; and every tribe had a particular name. All were nomadic ; but, of these nomades, the best known are the Asi, the Pasiani, Tachari and Saccarandi, who took Bactria from the Greeks. The Sacæ made irruptions in Asia, similar to those of the Cimmerians, and possessed themselves of Bactria and the best district of Armenia called after them Sacasenæ. Of the first migrations into India of the Indu-Scythic Gete, Tahshak and Asi, that of Sehesnag from Sehesnagdes (Takshac from Tacharisthan) six centuries before Christ, is the first noticed by the Pooranas. About the same period a grand irruption of the same races conquered Asia Minor and eventually Scandinavia, and not long after the Asi and Tachari overturned the Greek kingdom of Bactria. The Romans felt the power of the Asi, the Catti and Cimbri from the Baltic shore. Colonel Tod supposes the Asi and Tachari to be the Aswa and Takshac or Toorshka races of the Pooranas of Saca-dwipa ; the Dahæ to be the Dahya, one of the 36 royal Rajput tribes, now extinct, and he supposes these to be the descendants of Baldeva and Yudishtra, returned under different appellations. The country on the east is still occupied by the Turkoman race. Scythians had their first abodes on the Araxes. According to Deodorus, (Book ii) their origin was from a virgin born of the earth, (Ella) of the shape of a woman from the waist upwards and below a serpent, (symbol of Buddha or Ella.) Jupiter had a son by her, named Scythes, who gave his name to the nation. Scythes had two sons, Palas and Nagas (the shepherd and snake-races of the Tartar genealogy), who were celebrated for their great actions, and divided the countries, the nations being called after them the Palians (Pali) and Nagians. They led their forces as far as the Nile in Egypt and subdued many nations. They enlarged the empire of the Scythians and as far as the eastern ocean and to the Caspian and lake Mœotis. They overran Assyria and Media, overturning the empire and transplanting the inhabitants to the Araxes under the name of Sauromatians. The Scythians had many kings, from whom sprung the Sacans (Sacæ), the Massagetæ (Gete or Jit) the Ari-aspians (Aswa of Aria) and many other races. They overran Assyria and Media, overturning the empire, and transplanting the inhabitants to the Araxes under the name of Sauro-Matians. Those tribes who inhabited, at a later period, that great tract of country which lies between the Oxus and Jaxartes, received from the ancients the general name of Scythians, and are now known to Europeans under that of Tartars. Though this country has been subject to a succession of warlike tribes, these have probably all been derived from one stock : for though known under many names, their habits and character have always been the same. The Scythians of the Greeks differ in no essential degree from the Tartars of modern history. Before the time of Alexander, Transoxania was inhabited by a nation known by the generic name of Saca : and the Geta and Massageta were powerful tribes of that nation. The appellation given in the history of ancient Persia to the country between the Oxus and Jaxartes is Turan ; but oriental authors give us no names of particular tribes at this period of their history : and all those who dwelt beyond the limits of Turan, to the east and north-east, were considered as belonging to Chin and Khatai : which countries may be generally understood to designate that large tract which is known in modern geography as Chinese Tartary. We learn from every history, that from the most early ages to the present, the nomades or pastoral tribes of this region have been continually changing : they have, in their turn, subdued others, and been conquered themselves. We find them sometimes improving and extending their dominions : and at others, compelled to leave their pasture lands to the occupation of fiercer and more numerous hordes of barbarians ; and forming as they proceeded into the fertile plains of Southern Asia, or of Europe, part of a great tide of violence and of rapine. The progress of the Tartar hordes is finely described in Scripture. Ezekiel, when prophesying of Gog and his people, says :—"Thou shalt ascend, and come like a storm ; thou shalt be like a cloud to cover the land ; thou, and all thy bands, and many people, with thee. And thou shalt say, I will go up to the land of unwalled villages ; I will go to them that are at rest, that dwell safely, all of them dwelling without walls, and having neither bars nor gates. And thou shalt come from thy place, out of the north parts, thou, and many people with thee, all of them riding upon horses, a great company, and a mighty army."

Scythia was a term in use by the ancients of a very indefinite character, but it was generally understood to mean the territories occupied by the resident, but generally the nomadic tribes who roamed over the regions from the north of the Black and Caspian Seas, eastwards into the countries now known as Mongolia and Tartary. Ancient European literature further distinguishes Scythians into those of Europe and those of Asia ; the former are supposed to have occupied the country from the Danube to the sources of the Dniester and the Dnieper in the neighbourhood of the Don and along the northern shores of the Black Sea. The portion between the Danube and the city of Carcinitis was called Old Scythia ; and the peninsula (Taurida) to the Borysthenes was called Little Scythia : and in the time of Strabo, Little Scythia included the country as far as the Danube previously occupied by the Thracians. These European Scythi seem to have been colonists from Asia. The Asiatic Scythæ are supposed to have been the progenitors of the Turkoman, Tartar and Mongol races now occupying the regions in Central Asia extending from the Caspian and Aral Seas, eastwards into China. The Scythian races repeatedly emerged from their Asiatic plains in great masses, conquering to the east the west and south, and the Mantchu Tartar now rules in China, the Turk from Constantinople to the shores of the Persian Gulf and to the sources of the Nile and, after repeated inroads into the East Indies, along the Indus and Ganges rivers, the descendants of Timur, a Scythian, until the middle of the 19th century held nearly all the countries now known as British India. For about 1,000 years, from B. C. 700 to A. D. 300, a succession of Scythian tribes, belonging apparently to the same family as the Uralian tribes of Russia, and Fins, Laps and Hungarians of Europe, burst in from the Jaxartes and swept over all the western portion of the Continent of Asia, extending to India in one direction, and to Syria and Asia Minor in another. No doubt these left their impress, but except perhaps among the Brahui Baluch no traces of them in India can be seen. Farghana, the native territory of the father of Baber, lies on both sides of the Jaxartes, and is a portion of ancient Scythia. The manners of the Scythæ described by Herodotus are found still to exist amongst their descendants : a pair of slippers at the wife's door is a signal well understood by all Eimak husbands. The Scythian kings of Bactria followed the Greek kings, in adopting their forms of money. They coined similar pieces with superscriptions similar, and in the same languages, but inscribed on them their own names and titles, and varied the emblems and devices. Manes, B. C. 135, is supposed to have been a Scythian, the head of one of the tribes that broke into Bactria between 150 to 140 B. C., and he seems to have held communication with Azes. On the obverse, his coin contains the king with a trident, a Tartar war weapon, setting his foot on a prostrate enemy.

Azes, B. C. 130, the greatest of Scythian kings, on whose coins are bilingual inscriptions, with plain, distinct Greek characters, ΒΑΣΙΛΕΩΣ ΒΑΣΙΛΕΩΝ ΜΕΓΑΛΟΥ ΑΖΟΥ, in Arian, Maharajasa Raja Rajasa Madatasa Ayasa. The figures on the coins are various. Professor Wilson thinks he was an Indian buddhist king, about 50 B. C. Professor Lassen regards him as a Sacian Scythian, who conquered the Kabul valley in the time of the second Mithridates, and finally destroyed the kingdom of Menander and Hermæus in about 120 B. C. He considers he was succeeded by Azilises.

Sir H. Elliot states (p. 408) that Scythian barbarians from Sind expelled the Gehlotes from Balabhipura in the beginning of the sixth century. The Yuetchi established themselves on the Indus at the same time. The Abtelete or Ephthalites or White Huns, according to Cosmas, ruled on the banks of the Indus in his time, and the Sah dynasty were ruling in Saurashtra.

Among the many swarms that came from the cold regions of Scythia, the Turks, says Tindal, (p. vi,) were not the least noted, as the Persian annalists abundantly testify, as well as the famous author of the Othman Annals, Taj-ut-tuarich Saadi effendi, and what seems to be inserted from him in the Lexicon-Persico-Turcicum Niamatullah to explain the word Turk, where it is said, " by this name are called the inhabitants of Chata or Chuten, (Kitahia or Great Tartary) who inhabit the Kapchac plains. And because all of them have fair faces and black eyes and eyebrows, therefore the Persian poets call Lovers and Gallants, by comparison, Turks." But this name of Kapchac, peculiar to a tribe of the Tartars, was, after Jenghiz-khan's expedition, given by the Persians to the whole nation of Scythians, their conquerors, as appears by the testimonies of the Persian writers. Thus, the poet Saadi, in the preface of his Gulistan or Rosary, ascribes the cause of his leaving his country Chorasan to this effect. Since, therefore, it is manifest, the name of the Turks was known to all Asia long before Othman, and chiefly attributed to the Scythian tribes that followed Jenghiz-khan, and were dispersed over Persia and Asia Minor, it remains to show how this name came to be appropriated to the Othmanidæ. Soliman, father of the Othman race, prince of Nera, treading in the steps of the great Jenghiz-khan, came forth from his country with fifty thousand followers, the flower of the Scythian youth, and overran not only the neighbouring regions, but all Azerbejan and Syria, as far as Aleppo. When the news of these conquests was brought to the Persian Court, immediately the name Turk common to the Jenghiz-khan Scythians, was given also to this army. Soliman, prince of Nera, is by all the historians of his nation, and also by the more accurate christian writers, affirmed to be forefather of the Turkish emperors. Soliman was of the noblest Oguzian family among the Scythians, and head of a horde or tribe of Tartars near the Caspian Sea. By these, as well as by the neighbouring people, Soliman was proclaimed by the title of shah. The admission of a body of Scythians into the Kshetrya class, is asserted by Colonel Tod, and in part acceded to by a very able writer in the " Oriental Magazine." The union must have taken place within a century or two before the christian era, or at some later period. This is the supposition on which Colonel Tod has gone in some places. That there were Scythian irruptions into India before those of the Moguls under Chengiz Khan, is so probable, that the slightest evidence would induce us to believe them to have occurred ; and we may be satisfied with the proofs afforded us that some of the Rajputs certainly did come from the west of the Indus. In support of this, it may be mentioned that the religion and manners of the Rajputs resemble those of the Scythians. The names of the Rajput tribes are Scythian. There were, by ancient authorities, Indo-Scythians on the Lower Indus in the second century. There were White Huns in Upper India in the sixth century, in the time of Cosmas Indico Pleustes. De Guignes mentions, on Chinese authorities, the conquest of the country on the Indus by a body of Yu-chi or Getæ, and there are still Jit on both sides of that river. On the other hand, the great tribe of Yadu, which is the principal, perhaps the only one, which came from beyond the Indus, is the tribe of Crishna, and of the purest hindoo descent. There is a story of their having crossed to the west of the Indus after the death of Crishna. If the religion and manners of the Rajputs resemble those of the Scythians, they incomparably more closely resemble those of the hindoo. Their language also is hindoo, without a Scythian word (as far as has yet been ascertained). The Scythian is short, square-built, and sinewy, with a broad face, high cheek bones, and long narrow eyes, the outer angles of which point upwards. His home is a tent, his occupation, pasturage, his food, flesh, cheese, and other productions of his flocks, his dress is of skins or wool ; his habits are active, hardy, roving, and restless. The Rajput, again, is tall, comely, loosely-built, when not excited, languid and lazy. He is lodged in a house, and clad in thin, showy, fluttering garments, he lives on grain, is devoted to the possession of land, never moves but from necessity, and, though often in or near the desert, he never engages in the care of flocks and herds, which is left to inferior classes. According to Herodotus, the Scythic

Sacæ enumerated eight races with the epithet of royal, and Strabo mentions one of the tribes of the Thyssageta as boasting the title of Basilii. The Rajputs assert that in ancient times they only enumerated eight royal sac'ham or branches, viz., surya, soma, hya or aswa (qu. Asi ?) nima, and the four tribes of Agnivansa, viz., pramara, purihara, solanki, and chohan. Abulgazi states that the Tartars or Scythians were divided into six grand families. The Rajputs have maintained these ideas originally brought from the Oxus. The contrasted physical appearance of the respective races will decide this question. The aborigines of Rajputanah are dark, diminutive, and ill-favoured ; the Agniculas are of good stature, and fair, with prominent features, like those of the Parthian kings. The ideas which pervade their martial poetry are such as were held by the Scythian in distant ages, and which even brahminism has failed to eradicate ; while the tumuli, containing ashes and arms, discovered throughout India, especially in the south about Gowalcoond, where the Chohans held sway, indicate the nomadic warrior of the north as the proselyte of mount Aboo. Colonel Tod derives Scythes from Sacatai, 'Saca-dwipa,' and 'es' 'Lord' : Lord of Sacatia or Scythia. Affinities in persons, customs and languages, connect ancient India with the Scythic races and, the southern boundary of the latter has immemorially approached the upper basin of the Indus, and has crossed it more than once since India was Arianized : it may be further assumed as probable that the latest great Indian formation, prior to the ultra-Indian and Arian, was Scythic, that the Scythic area included India, although the race was then modified by others, and that the eastern migration of the Arians broke the continuity of the Scythic range and isolated the southern section before it had completely transformed the olden Indian race. The Rajputs, according to Colonel Tod, are Scythians, having a common origin with the tribes of early Europe.

The Scythians worshipped an iron scimitar as a symbol of Mars ; to this scimitar they offered more sacrifices than to the rest of their gods, and brought yearly sacrifices of cattle and horses. In the Saga many of the swords have special names, and are treated with the greatest respect. The North American Indians are supposed to be derived from Scythians. The earliest existing accounts of the Scythian people describe them as rude and unlettered, living in various independent tribes, as not united into one nation, and perfectly unacquainted with the learning and arts of civilized society. Herodotus characterises the Scythians as the most ignorant of men, and every subsequent description of them fully confirms this.

It is generally supposed that the original seat of the Finnic tribes was in the Ural mountains, and their languages have been therefore called Uralic. From this centre they spread east and west ; and southward in ancient times, even to the Black Sea, where Finnic tribes, together with Mongolic and Turkic, were probably known to the Greeks under the comprehensive and convenient name of Scythians. As we possess no literary documents of nomadic nations, it is impossible to say, even where Greek writers have preserved their barbarous names, to what branch of the vast Turanian family they belonged. On the evidence of language, the Finnic stock is divided into four branches, the Chudic, Bulgaric, Permic, and Ugric.

The Chudic branch comprises the Finnic of the Baltic coasts. The name is derived from Chud (Tchud) originally applied by the Russians to the Finnic nations in the northwest of Russia. Afterwards it took a more general sense, and was used almost synonymously with Scythian for all the tribes of Central and Northern Asia. The Finns, properly so called, or as they call themselves Suomalainen, *i. e.*, inhabitants of fens, are settled in the provinces of Finland (formerly belonging to Sweden, but since 1809 annexed to Russia), and in parts of the governments of Archangel and Olonetz. Their number is stated at 1,521,515. The Finns are the most advanced of their whole family, and are, the Magyars excepted, the only Finnic race that can claim a station among the civilised and civilising nations of the world. Karelian and Tavastian are dialectical varieties of Finnish. The Esth or Esthonians, neighbours to the Finn, speak a language closely allied to the Finnish. It is divided into the dialects of Dorpat (in Livonia) and Reval. Except some popular songs it is almost without literature. Esthonia, together with Livonia and Kurland, forms the three Baltic provinces of Russia. The population on the islands of the Gulf of Finland is mostly Esthonian. In the higher ranks of society Esthonian is hardly understood and never spoken. Besides the Finn and Esthonian, the Livonian and the Lapp must be reckoned also amongst the same family. Their number, however, is small. The population of Livonia consists chiefly of Esths, Letts, Russians, and Germans. The number of Livonians speaking their own dialect is not more than 5,000. The Lapp, or Laplanders, inhabit the most northern part of Europe. They belong to Sweden and Russia. Their number is estimated at 28,000

Their language has lately attracted much attention, and Castren's travels give a description of their manners most interesting from its simplicity and faithfulness. The Bulgaric branch comprises the Tcheremissians and Mordvinians, scattered in disconnected colonies along the Volga, and surrounded by Russian and Tartaric dialects. The general name given to these tribes, Bulgaric, is not borrowed from Bulgaria, on the Danube; Bulgaria, on the contrary, received its name (replacing Moesia) from the Finnic armies by whom it was conquered in the seventh century. Bulgarian tribes advanced from the Volga to the Don, and after remaining for a time under the sovereignty of the Avars on the Don and Dneiper, they advanced to the Danube in 635, and founded the Bulgarian kingdom. The third, or Permic branch, comprises the idioms of the Votiakes, the Sirianes, and the Permians, three dialects of one language. Perm was the ancient name for the country between 61° 76′ E. long., and 55° 55′ N. lat. The Permic tribes were driven westward by their eastern neighbours, the Voguls, and thus pressed upon their western neighbours, the Bulgar of the Volga. The Vostiakes are found between the rivers Vyatka and Kama. Northwards follow the Sirianes, inhabiting the country on the Upper Kama, while the eastern portion is held by the Permians. These are surrounded on the south by the Tartars of Orenburg and the Bashkir; on the north by the Samoyedes, and on the east by Voguls, who pressed on them from the Ural. These Voguls, together with Hungarians and Ostiakes, form the fourth and last branch of the Finnic family, the Ugric. It was in 462, after the dismemberment of Attila's Hunnic empire that these Ugric tribes approached Europe. They were then called Onagur, Saragur, and Urog; and in later times they occur in Russian chronicles as Ugry. They are the ancestors of the Hungarians, and should not be confounded with the Uigur, an ancient Turkic tribe mentioned before. There have now been mentioned the four chief classes of the Turanian family, the Tungusic, Mongolic, Turkic, and Finnic. The Tungusic branch stands the lowest. These four classes, together with the Samoyedic, constitute the northern or Ural-Altaic division of the Turanian family. The southern division consists of the Tamulic, the Gangetic (Trans-Himalayan and Sub-Himalayan), the Lohitic, the Taic, and the Malaic classes. These two divisions comprehend very nearly all the languages of Asia, with the exception of Chinese, which, together with its neighbouring dialects, forms the only representative of radical or monosyllabic speech. A few, such as Japanese, the language of Korea, of the Koriakes, the Kamchadales, and the numerous dialects of the Caucasus, &c., remain unclassed; but in them also some traces of a common origin with the Turanian languages have, it is probable, survived, and await the discovery of philological research. Scythians made a great inroad into Southern Asia, B. C. 633, and signs of their dominion in the valley of the Indus are still to be seen. General Cunningham (p. 37) mentions that Asoka dispatched missionaries to the most distant parts of his empire for the propagation of buddhism. Alasadda, or Alexandria ad Caucasum, the capital of the Yona, or Greek country, is recorded as one of these distant places; and as the Chinese pilgrim Hwen Thsang notices several stupas in that neighbourhood as the work of Asoka, we have the most satisfactory proofs of the Indian occupation of the Kabul valley in the third and fourth centuries before Christ. The completeness of this occupation is well shown by the use of the Indian language on the coins of the Bactrian Greeks and Indo-Scythians, down to A. D. 100, or perhaps even later; and although it is lost for the next two or three centuries, it again makes its appearance on the coins of the Abtelite, or White Hun of the sixth century. During the whole of the tenth century the Kabul valley was held by a dynasty of brahmans, whose power was not finally extinguished until towards the close of the reign of Mahmud of Ghazni. Kophes is a name as old as the time of the Vedas, in which the Kubha river is mentioned as an affluent of the Indus; and as it is not an Arian word, General Cunningham infers that the name must have been applied to the Kabul river before the Arian occupation, or, at least, as early as B. C. 2500. In the classical writers we find the Khoes, Kophes, and Khoaspes rivers, to the west of the Indus, and at the present day we have the Kunar, the Kurah and the Gomal rivers to the west, and the Kunihar river to the east of the Indus, all of which are derived from the Scythian ku, "water." Ku is the guttural form of the Assyrian hu in Euphrates and Eulæus, and of the Turki su and the Tibetan chu, all of which mean water or river. The district of Kophene must, therefore, have received its name from the river which flowed through it, like as Sindh from the Sindhu or Indus; Margiana from the Margus, Aria from the Arius, Arachosia from the Arachotus, and others. It is not mentioned by Alexander's historians, although the river Kophes is noticed by all of them.

Chatfield says (p. 183) the Scythians,

known more particularly by the name of Sacæ, infected the Persians with their opinions concerning an immortality to be procured from vegetables. All the eastern nations eagerly adopted it, and thence it travelled into Europe. The ingenuity of the Greeks displayed it in the ambrosia of their gods. The Magi in the shrub, called Hom ; the Arabians in their elixir's magical studies, and their talismans ; the modern nations of Europe, in their frivolous researches after grand specifics, alchemy, and the efficacy of plants and minerals.

Ouseley remarks (pp. 86-88) that the Scythians often sacrificed men to their deity, and the sword, on which they threw the victim's blood ; and with blood also they profusely sprinkled or completely varnished the trunks of their sacred trees.

According to Eolus, the Scythians dwelt 1,000 years in the country of their origin. They then emigrated towards the south, and having peopled the regions comprised between the Sgeind (Indus) and the ocean, and the Teth-gris (the Tigris) in 293 rings, or years, they crossed the Teth-gris, arrived at the Affreidg-ris (Euphrates), occupied the Tath-do-cai (the Jews Hiddekel), and spread beyond the Affreidg-ris all over the earth, maintaining under their sway the several nations of the globe during the space of 1809 years.

The Chronicles of Eolus, written in a Scythian dialect (Phœnician according to O'Connor) gives historical descriptions of the events that occurred during the 1,304 years which preceded the establishing of the Scythian empire.

The tribes that lived on the banks of the Indus were called Indo-Scythians, and those from the confines of Europe, Celto-Scythians. Mr. Hodgson was of opinion that all the aborigines of India are Northmen of the Scythic stem, and he considers this view to be justly inferable from their physical characteristics. He thinks, however, that very careful investigation will alone enable us to decide whether they owe their confessedly scythic physiognomy to the Tangus, the Mongol or the Turk branch of the Tartars or Scythians, and whether they immigrated from beyond the Himalayas at one period and at one point or at several periods and at as many points. Members of that stock, he continues are found from their original seats on the north of the Himalaya southwards to the seas, and between Gilgit and Chittagong there are a hundred passes over the Himalaya and its south eastern continuation to the Bay of Bengal, through which they may have migrated ages upon ages before the dawn of legend and of chronicle. In every extensive jungly or hilly tract throughout the vast continent of India there exist hundreds of thousands of human beings in a state not materially different from that of the Germans as described by Tacitus, and he adds that these primitive races are the ancient heritors of the whole soil, from all the rich and open parts of which they were expelled by the hindoos. It might be deemed folly, says Colonel Tod, (Vol. i, p. 592,) to trace the rites and superstitions of so remote an age and nation to Central Asia ; but when we find the superstitions of the Indo-Scythic Gete prevailing within the Indus, in Dacia, and on the shores of the Baltic, we may assume their common origin ; for although the worship of arms has prevailed among all warlike tribes, there is a peculiar respect paid to the sword amongst the Getic races. The Greeks and Romans paid devotion to their arms, and swore by them. The Greeks brought their habits from ancient Thrace, where the custom existed of presenting, as the greatest gift, that peculiar kind called acinaces, which we dare not doubt, comes from the Indo-Scythic or Sanscrit. When Xenophon, on his retreat, reached the country of Seuthes, he agreed to attach his corps to the service of the Thracian. His officers on introduction, in the true oriental style, presented their nuzzurs, or gifts of homage, excepting Xenophon, who, deeming himself too exalted to make the common offering, presented his sword, probably only to be touched in recognition of his services being accepted. Up to the present day, the soldier races of India, on their presentation to a superior, present to him their swords, and in being dismissed from the reception, a drop of essence of roses is allowed to fall on the half-drawn blade. The most powerful oath of the Rajput, next to his sovereign's throne (gadi ca an), is by his arms, ya sil ca an, 'by this weapon !' as, suiting the action to the sword, he puts his hand on his dagger, never absent from his girdle. Dhal, turwar ca an, 'by my sword and shield !' The shield is deemed the only fit vessel or salver on which to present gifts ; and, accordingly, at a Rajput court, shawls, brocades, scarfs, and jewels are always spread before the guest on bucklers. In the Runic "incantation of Hervor," daughter of Angantyr, at the tomb of her father, she invokes the dead to deliver the enchanted branch Tirsing, or 'Hialmar's bane,' which, according to Getic custom, was buried in his tomb ; she adjures him and his brothers "by all their arms, their shields, &c." It would deeply interest a Rajput, who might deem it the spell by which the Khanda or sword of Hamira, which he annually worships, was obtained. The Gothic invaders of Italy inaugurated their monarch by placing him upon a shield, and elevating him on their shoulders in the midst of his army. Eyvor-sail is the name of a celebrated Rajput hero of the Bhatti tribe, who were driven at an early period from the very heart of Scythia, and are of Yadu race. Tradition has hallowed the two-edged sword or khanda of Mewar, by investing it with an origin as mysterious as " the bane of Hialmar." It is supposed to be the enchanted weapon fabricated by Viswacarma, with which the hindoo Proserpine girded the founder of the race, and led him forth to the conquest of Chetore. It remained the great heir-loom of her princes till the sack of Chetore by the Tatar Alla, when rana Ursi and eleven of his brave sons devoted themselves at the command of the guardian goddess of their race, and their capital falling into the hands of the invader, the last scion of Bappa became a fugitive amidst the mountains of the west.

In Vedic times, along the western coast of Hindustan dwelt, also, other races, different alike from the Scythic tribes and from the Arians of the Vedas—earlier colonizers or emigrants, most probably from Assyria and the west—who had a civilization of their own and "iron-built cities," and with whom the Pharaohs and Solomon and Hiram and the Cushite Arabs of Yemen carried on a lucrative trade by sea. This people extended gradually down the coast to Cape Comorin, crossed over to Ceylon, and crept up to the Coromandel coast, till stopped by the Godaveri and Mahanadi. All the Bengal Presidency and Central India was at that time thinly inhabited by a Tartar, Sakyan, or Mongol race, coming down from Tibet and Nepal. But so sparse was the population whom the Arians encountered that in the Vedas, Agni is represented as "the general" of Nahusha, the first settler, that is, they cleared the ground by burning the forests, and some fine descriptions are given of the grandeur and terror of the sight.

The heir of Gengis Khan was chief huntsman, the highest office of the state amongst the Scythic Tatars ; as Ajanbahu, alike celebrated in either field, of war and sport, was chief huntsman to the Chohan, emperor of Delhi, whose bard enters minutely into the subject, describing all the variety of dogs of chase. In his delight for this diversion, the Rajpoot evinces his Scythic propensity. The grand hunts of the last Chohan emperor Prithi Raj often led him into warfare, and one of his battles with the Tatars was while engaged in field sports on the Ravi. The Indo-Scythic race of Grecian writers are the Yadu and Balica branches of the Indu race, and they are said to have ruled Khorassan after the great war.

Nagani-mata, or Nagnecha, half-woman, half-serpent, is represented as the mother of the Takshak or Scythic race, and the chief Mori, from whom Bappa took Chetore was of her descendants. There are many Scythic rites in the house of the rana of Mewar. Many of the Scythic tribes have entered India, mostly as conquerors, the Gete, the Takshak, the Asi, Katti, Rajpali, Hun, Kamari. They seem to have brought with them a worship, out of which ultimately the budd'hist religion was formed as promulgated by Sakya Muni. These Indo-Scythi also brought with them their northern custom of using tribal designations, taken from the names of animals, Varaha, the hog, Numri or Lumri the fox ; Takshak, the snake ; Langaha, the wolf ; Cutchwaha the tortoise ; Aswa or Asi the horse; Seesodya from Seesoo the hare &c., and several of them still hold large possessions in the western parts of Central India and in Beluchistan. Some of the Scythians even carried their names into Europe, Asi, was the term by which the Gete, Yeut or Jut were known, when they invaded Scandinavia and founded Yeutland or Jutland. The Asi nomades took Bactria from the Greeks, and Mr. Prinsep considers them to be Scythians of Azes, who overpowered the Greek dynasties in Soghdiana and northern Bactria, between 140 and 130 B. C.

Mr. Hodgson, writing on the northern races, remarks that the great Scythic stem of the human race is divided into three primary branches, the Tungus, the Mongol and the Turk. The first investigators of this subject urgently insisted on the radical diversity of these three races ; but the most recent inquirers are more inclined to unitise them. Certainly, he adds, there is a strong and obvious character of physical (if not also of lingual) sameness throughout the Scythic race ; and it is remarkable that this peculiar character belongs also to all the aborigines of India, who may be at once known, from the Cavery to the Alpine Cosi and Bhagarati by their quasi-scythic physiognomy, so decidedly opposed to the Caucasian countenance of the Arians of India. Mr. Hodgson also suggested, that there would be found among the aborigines of India a like lingual sameness, and that consequently very extended and very accurate investigation would alone suffice to test the real nature and import of the double sameness, physical and lingual. That all the aborigines of India are Northmen of the Scythic stem, seemed to him decidedly and justly inferrible from their physical characteristics. But, inasmuch as that prodigious stem is everywhere found beyond the whole northern and Eastern boundary of India, not merely from Attok to the Brahmaputra, where these rivers cut through the Himalaya, but also from that point of the latter river all the way to the sea ; and inasmuch as there are familiar ghats or passes over the Himalaya throughout its course along the entire confines of India from Kashmir to the Brahmakund, he thinks it follows of necessity that very careful and ample investigation will alone enable us to decide upon the question of the unity or diversity of the aborigines of India, in other words to decide upon the questions, whether they owe their confessed Scythic physiognomy to the Tungus, the Mongol or the Turk branch of the Tartars or Scythians, and whether they immigrated from beyond the Himalaya ("the hive of all nations") at one period and at one point, or at several periods and at as many points. Between Gilgit and Chittagong there are 100 passes over the Himalaya and its south-eastern continuation to the Bengal Bay ; and they can have issued through these passes, ages upon ages before the dawn of legend and of chronicle. Mr. Hodgson inclines to the opinion that the aborigines of the sub-Himalaya, as far east as the Dhansri of Assam, belong to the Tibetan stock, and east of that river to the Chinese stock—except the Garo and other tribes occupying that portion of the hills lying between Assam and Sylhet ; and that the aborigines of the Tarai and forest skirting the entire sub-Himalaya, inclusive of the greater part of the marginal circuit of the Assam valley, belong to the Tamulian stock of aborigines of the plains of India generally.—*Tod's Rajasthan, Vol.* i, *pp.* 58, 61, 565, 591, 592 ; ii, 233; *Lubbock's Origin of Civil., p.* 217 ; *Burton's the city of the Saints, p.* 137; *Ward's view of the Hindoos, Vol.* i, *pp.* 12, 30 *to* 34, 37 ; *Maurice, pp.* 19, 26, 27, 28 ; *Muller's Lectures, pp.* 33, 34, 305-310 ; *Chatfield's Hindoostan, p.* 183 ; *Asiatic Researches, Oct. ed., Vols.* iv, v, *pp,* 52, 55, 373 ; *Dr. Buchanan's Travels in Mysore, &c., Vol.* iii, *p.* 253 ; *Humboldt's Researches in America, Eng. ed., Vol.* i, *p.* 219 ; *Moor's Hindoo Pantheon, p.* 6 ; *Voyages des Indes, Liv.* iii ; *Ouseley's Travels, Vol.* i, *pp.* 86, 87, 88 ; *Cunningham's Ancient Geog. of India, pp.* 16, 37. Bahr,	AR.	Mare,	LAT.
Ping-le,	BURM.	Mar,	SP.
Mer,	FR.	Samandram,	TAM.
Darya,	HIND., PERS.	Samudra,	TEL.

Indian sea or Green sea, Bahr-ul-Hind, or Bahr-ul-akhzar.

Mediterranean Sea, or White Sea, Bahr-ur-Rum or Bahr-ul-baiz.

Black sea, or Euxine sea, bahr-us-Sud.

Persian sea or Blue sea, bahr-ul-fars, Bahr-ul-kabud ; Bahr-ul-akhzar.

Red sea, Bahr-ul-kulzum, Bahr-ul-ahmar.

Caspian sea, Bahr-ul-Khazr.

Dead Sea or sea of Lot, Bahr-i-Lut.

Sea flow and ebb, Madd-o-juzr.

Sea breeze, nasim-i-bahr.

Sea chart, kinar-namah.

Sea coast, kinar ; sahilah.

Sea compass, kiblah-nooma.

Sea ear, darya gosh.

Sea horse, faras-ul-bahar.

Sea port, bandar.

Sea shell, sadf.

As wavelets dash upon a reef, they are lit by what the Arabs call the "jewels of the deep." The Arab superstition is, that these flashes of light are jewels made to adorn the necks and hair of the mermaids and mermen. When removed from their native elements the gems fade and disappear. There is some idea similar to this among the Scotch, and other northern people. The colour of the sea greatly varies in different parts of the globe. It is white in the Gulf of Guinea, black around the Maldives, vermillion off California (caused by the red colour of the infusoria it contains) and green in the Persian Gulf. In the Arctic sea it undergoes rapid transitions from purity to opacity from ultramarine to olive-green, the green colour being caused by myriads of minute insects which prey on each other and are a prey to the whale. The East African and Arab races have, from the most ancient times, sailed across the seas that bound their countries on the east and south, and have largely colonized the southern parts of Asia, into the region of the Archipelago. The Arabian Sea, the Indian Ocean, the Bay of Bengal and the Pacific Ocean have been the great high-ways through which western civilization spread. The great sea basins have several subordinate ethnic regions through which successive foreign elements have been introduced into the Archipelago. The principal one in the North Pacific is that which is surrounded by the Japanese, Luchuan, Meiakoshima, Formosa, Philippine, Palos, Oluthy, Marianne, and

Bonin groups. On the S. E. it merges in the Muro-Polynesian band ; on the S. W. it constitutes a portion of the Indian Archipelago ; on the N. W. it forms the outer boundary of the China-Corean basin, on the N. it connects itself with the basins of the Japanese and Okhotsh seas, and is thus brought into direct ethnic union or close connection with the E. districts of M. and N. Asia. The China sea unites the Indian Archipelago primitively with the great ethnic region of S. E. Asia by the districts of the Hongkiang, Tonkin, Mekong and Menam basins, and the marginal Chinese and Anam districts,—the Malay Peninsula, which forms the western bounding district, being ethnically a common portion of the Archipelago and the continent. The inhabitants of the sea-shore in tropical countries wait every morning with impatience the coming of the sea-breeze. It usually sets in about ten o'clock. Then the sultry heat of the oppressive morning is dissipated, and there is a delightful freshness in the air which seems to give new life to all for their daily labours. After sunset there is again another calm. The sea-breeze is now done, and in a short time the land breeze sets in. This alternation of the land or sea-breeze, a wind from the sea by day and from the land by night is so regular in intertropical countries, that it is looked for by the people with as much confidence as the rising and setting of the sun. The oppressive heat of the sun and the climate of the sea-shore is mitigated and made both refreshing and healthful by the alternation of those winds which invariably come from the coolest place—the sea, which is the cooler by day, and the land, which is the cooler by night. About ten in the morning the heat of the sun has played upon the land with sufficient intensity to raise its temperature above that of the water. A portion of this heat, being imparted to the superincumbent air, causes it to rise, when the air, first from the beach, then from the sea, to the distance of several miles, begins to flow in with a most delightful and invigorating freshness.—*Burton's Pilgrimage to Meccah, Vol.* i, *p.* 323 ; *Dr. Forbes Winslow, M. D., on Light, London,* 1867 ; *Maury's Physical Geography, pp.* 136, 138. See Ocean.

SEA-COCOANUT.

Cocotier de Maldives,	Fr.	Zi-Calappers,	Singh.
Cocos-de-mer,	,,	Kuddal Tayngai,	Tam.
Darya-ka Naril,	Hind.	Samutrapu tainkaya,	Tel.
Ubdie Narikaylum,	Sans.		

This species of cocoanut is the fruit of the Lodoicea seychellarum. It resembles two cocoanuts fastened together ; it is convex on one side, and almost flat on the other, oblong, and somewhat pointed at both ends. The shell is dark-coloured, and contains a kernel, not unlike that of the ordinary cocoanut, but drier, harder and more insipid. They are often seen floating in the sea off the coasts of Arabia and Africa, whence they are brought to Bombay ; and also from the Laccadive and Maldive Islands. The shells are made into drinking cups and scallops, which are used by the Indian devotees. The kernel is used medicinally by native practitioners, in cases of typhus fever, &c.—*Faulkner.* See Cocoanut, double ; Lodoicea, Seychelle.

SEA-COCOANUT OF TENASSERIM, is not the famous Cocos de mer of the Seychelles, but is the fruit of a tree Xylocarpus granatum, very common in the mangrove swamps ; and growing near the shore, its fruit falls into the water and floats out upon the sea, which gives rise to its name. The fruit is not edible, but is exceedingly astringent, and is regarded by the natives as a specific in cholera.—*Mason.*

SEA-CUCUMBER, see Holothuriadæ, Trepang.

SEAFORTHIA SAPIDA, *R. Br.*, the Norfolk Island Cabbage tree, is a handsome palm, about twenty feet high and two feet in circumference, green and smooth, with annular scars left by the fallen leaves : the frondes form a magnificent crest at the top of the column ; they are pectinate, about nineteen feet long, and they vary from nine to fifteen in number. The apex of the trunk is enclosed in the sheathing bases of the leaf-stalks, along with the flower-buds and young leaves. When the leaves fall they discover double-compressed sheaths, pointed at the upper extremity, which split open indiscriminately on the upper or under-side, and fall off, leaving a branched spadix or flower-stem, which is the colour of ivory, and attached by a broad base to the trunk. The flowers are produced upon the spadix ; they are very small, and are succeeded by round seeds, red internally. As the seeds advance towards maturity, the spadix becomes green. The young unfolded leaves rise perpendicularly in the centre of the crest. In this state they are used for making hats ; those still unprotruded and remaining enclosed within the sheaths of the older leaves form a white mass, as thick as a man's arm : they are eaten raw, boiled, or pickled. In a raw state they taste like a nut, and boiled they resemble artichoke bottoms. —*Keppel's Ind. Arch., Vol.* ii, *p.* 283.

SEA DUST, see Trichodesmium, Red-sea.

SEA GYPSIES, a name by which sailors designate the Baju-laut a seafaring people of the Archipelago.

SEA-HAWK, or Frigate bird, the Tachypetes aquila, is also called the Man of War bird and the Boatswain. It has short feet and cannot swim or dive. It is intermediate between the predaceous sea and land birds. It attacks the smallest birds and makes other fishing birds abandon their prey. It is of immense endurance, takes great flights and rises to vast heights in the air. It ranges through all tropical seas and hovers over the tropical waters. It has been seen 400 leagues from land, and yet is said to return to land every night. Its expanded pinions measure 14 feet from end to end.—*Bennett.*

SEAHI or Siahi, HIND., PERS. Ink.

SEA-HORSE, a fish, one of the Syngnathidæ, the head of which, as the fish dries, assumes a bent position like the head and neck of a horse.

SEA-HORSE: their teeth are imported into China, chiefly through Macao; they are brought from California and other parts of western America, and are used by the Chinese in the same manner as ivory; they are the teeth and tusks of the walrus and other cetaceous animals,—*Morrison.* See Ivory, Carving.

SEA ISLAND COTTON or Long staple cotton. See Cotton.

SEA JELLY, a term applied to the molluscous acalephæ, *Colld.*

SEA KALE, Crambe maritima. A vegetable not of much value.—*Jaffrey.*

SEAL, the name of a family of amphibious animals, valued for the oil obtained from the fat or blubber, and also for their skin, which is used for a variety of purposes.—*Faulkner.*

SEAL.

Khatim,	AR.	Sigillum,	LAT.
Cachets,	FR.	Nagin,	PERS.
Petchafte,	GER.	Sellos,	PORT., SP.
Mahr, HIND. PERS.	TURK.	Mutra,	TAM.
Sigilli,	IT.	Muhurle,	TURK.

The seals of oriental nations are used for ornament and as signet rings. The Anguliya mudra, or finger-ring seal or signet, has, from the earliest periods been commonly used in the East. Ahasuerus takes his signet off his hand and gives it first to Haman and again to Mordecai; and Herodotus notices that each of the Babylonians wore a seal-ring. The Greeks and Romans had their rings curiously engraved with devices, and that cast by Polycrates into the sea was the work of an engraver whose name the historian has not thought unworthy of commemoration. The seal is alluded to, also in the Demagogues of Aristophanes.—*Hind. Theat., Vol. ii, p.* 162.

SEAL of Soloman, Mahr-i Suliman.

SEAL of Siva, see Inscriptions.

SEALING WAX.

Cire d' espagne,	FR.	Lak,	MALAY.
Cire d' cacheter,	„	Surgutsch,	RUS.
Seigellack,	GER.	Lacre,	SP.
Chap-ka mom,	HIND.	Arakku,	TAM.
Cera lacca,		Lakka,	TEL.
Cera dispagna,	IT.		

This is a composition of gum lac, melted and incorporated with resin, and afterwards coloured with some such pigment as vermillion, ivory-black, &c. It is used for sealing letters, legal instruments, &c. Several varieties of sealing-wax are made from lac, in different parts of India. Garcias ab Orta described it as made from lac in the year 1563. Tavernier mentions the same fact. The Spaniards have obtained credit for the invention; but they, no doubt, learned it from the Arabs. A Frenchman who travelled much in Persia and different parts of the East Indies is also thought to have been the discoverer; and by Beckmann it is considered to be a German invention. The sealing wax made at Guntoor is very good, and, for a hot climate, better than the English wax, as it does not soften with the heat of the atmosphere.—*Faulkner*; *Royle, Arts, &c., of India, p.* 486; *M. C. C.*; *McCulloch's Com. Dic., p.* 1011.

SEALKOTE, a district in a pleasant fertile strip under the Himalaya. It produces grain of kinds, goor, cotton and flax; its manufactures are country paper, cloth (coarse), soosee pushmina work, and koftgaree or work inlaid in gold.

SEA SLUG, ENG. Holothuria; Biche de Mar.

SEA-NETTLE. Ships often meet in with vast numbers of young sea-nettles (medusæ) drifting along with the Gulf stream. They are known to constitute the principal food for the whale; the habits of the right whale are averse to the warm waters of the Gulf stream. —*Maury, p.* 43.

SEARBETT or Shalbett Island, in lat. 20° 54′ N., long. 71° 31′ E., is 17 miles from Mowah point, on the Guzerat coast.

SEA SHELLS, are the hard outer coverings of the molluscous animals or shell-fish. The shores of the islands of the Indian ocean afford a great variety of beautiful and rare shells. They are brought to China in junks from the Archipelago, and from the islands along the coast. They are mostly salt water shells. Few or no fresh water shells are collected. Both sorts are sometimes injured by scraping and varnishing them. Besides shells, as objects of natural history, insects are also procurable at Canton, tolerably well preserved: they are mostly coleopterous insects, as beetles; butterflies and other classes are also gathered, especially those which are gay. The precious stones seen in the China market in small quantities, are rather inferior; chrysolite, malachite, cornelians, agates and jade, are the most common: limestone and quartz are cut into fantastic shapes, but being always lackered, are spoiled for natural objects. Birds or fishes are seldom seen preserved.—*Morrison.* See Mollusca, Nacre.

SEA-SIDE ALOE, or Small aloe, Aloe litoralis.

SEASONS. The horticultural division of the seasons in Madras, are:

Spring.	
August.	
September.	Sow seeds, plant trees and shrubs.
October.	
Summer.	
November.	
December.	Vegetables plentiful.
January.	
Autumn.	
February.	
March.	
April.	
Winter.	
May.	
June.	Protect tender plants from the hot winds.
July.	

The Indian seasons are, according to the shasters, six in number, each comprising two months. These divisions are more fanciful than real; and the common people are content to adopt the more definite division of three. Chou-masa, or Burk'ha, constitutes the four months of the rainy season. The rest of the year is comprised in Secala, Jara or Mohasa, the cold season; and Dhoob-kala, or Khursa, the hot season. The hindoos also divide the seasons into Ghrishma, or hot weather, Varsha or rains, Sarat or autumn, Hemanta or cold season, Sisira dewy or foggy. Amongst the hindoos, as amongst other races, many of the religious festival days or holidays relate to the changes in the seasons, at the new year, when the sun turns northwards, and at the vernal and autumnal equinox; in illustration may be mentioned the Ganesh Chaturthi or Chauth, which falls about the beginning of September. On this day was born Ganesh, called also Ganpati, made from the turmeric and oil off the body of Parvati. He is the god of wisdom who removes obstacles and is invoked at the commencement of all undertakings. Ganpati has a man's body with the head of an elephant. His head is said to have been cut off or destroyed by Siva, when Ganesh tried to prevent Siva entering the chamber of Parvati while bathing. Clay images are made and worshipped for from one to nine days and then thrown into water. The Chin Chor or Chinchwad who resides at a village of that name near Poona is believed to be an incarnation of Ganesh, who promised an ascetic, named Meroba, who lived in Sivaji's time that he would be incarnate for seven generations in his family. The earth image of Ganesh, is one of three forms in which the earth deity Mrittika, is worshipped by hindoos. The first, the Nagapanchami, on which feast a snake of clay is worshipped: the second is Gokul Ashtami, when a clay image of the infant Krishna is worshipped, and the third occasion is that on which Ganesh is worshipped, and this last day of the worship of Mrittika is observed with great pomp. The vahan or carriage of Ganesh is a rat. The feast in honour of his birth is held on the 4th of the month Bhadrapad, falling on the first days of September. Ganesh is brought to the house with much pomp.—*Jaffrey*; *Elliot.*

SEASON PIGEON, of Ceylon, Cornus puniceus, is migratory.

SEA WATER. Fresh water specific gravity taken at 1,000, sea water is 1,027. But the Dead Sea is equal to 1,028. The deep sea water is of a cœrulian blue; but it appears yellow on the coast of Japan: black round the Maldives; and the alleged redness of the Red Sea, Erythrium Mare, is said to owe its colour to a delicate microscopic algæ, Trichodesmium erythræum, though others allege shells and infusoria as the cause. The sea of California is often of a vermillion colour. The phosphorescence of the ocean is very frequent in the Indian Ocean and Arabian Gulf. The water assumes a white milky appearance. On one occasion, seen by Captain Kingman, the water was filled with phosphorescent animalcules. On other occasions a gelatinous translucent substance has been observed, and at others countless myriads of minute globular creatures called Noctilucæ, and the animalcules called Pyrosoma atlanticum, a mucous sac, an inch long, which on a ship's deck emits a light like that of iron at white heat.—*Collingwood.*

SEA WAVE, see Floods.

SEA WAX, see Maltha.

SEA WEED, Ulva reticulata, *Forsk.*, is a very beautiful reticulated sea-weed of the Eastern Archipelago. Dead Sea weed washed on shore is not used in Japan as food, nor for trade, but the whole coast is a dry salter's establishment. The Japanese go out in their small boats to the rocks, and with long sticks, to which is attached a piece of iron to serve as a knife, they sever the weed from the rock or bottom of the sea. The instrument may be twenty feet long, the blade about eighteen inches; the amount of sea weed is really incalculable; from Hakodate to Yenanai, following the shore, is twenty-two miles in a straight line, but quite sixty miles if we follow the curves of the bays and ups and downs of the land; and every available inch is covered with it. Each day it is placed out to dry if the weed is not humid; otherwise it is covered up against the rainy day. This weed is a valuable export from Japan and edible, and, with rice, constitutes the cuisine of the Chinese. It is exported to China, and then sent up to those countries where salt is dear, being lighter as merchandise, and well adapted for cooking.—*Hodgson's Nagasaki, p.* 63. See Algæ, Food, Japan.

SEA WRACK, Zostera.

SEB, also Seo or Palu, Hind. Pyrus malus, Apple tree, an apple.

SEB, a divinity of the ancient Egyptians, analogous to the Chronos of the Greeks and Latins, with them the egg of the goose was the emblem of Seb.—*Bunsen*. See Goose.

SEB, also Seo and Sev, a mode of pronouncing the name of the hindoo god Siva, whose emblem is the conical-formed lingam.

SEBA, Sans. Apple.

SEBA, see Balkees, Saba.

SEBE MARA, Can. Psidium pyriferum.

SEBESTAN, also Lobesten, Sebestena and Sebestens; Lesura, Hind. Buhooari, Beng., are dried fruits, distinguished as smaller and larger, of Cordia angustifolia, myxa and latifolia. The fruits are edible, but tasteless, and were once formerly famous in European medicine, but seen only to contain much mawkish mucilagenous pulp. These were formerly used in Europe, but now by the native practitioners of the East only. The dried fruits are very glutinous, and are esteemed expectorant. The seeds of Cordia myxa, are called Chakoon ki beenj, and deemed an infallible remedy in ringworm, the powder mixed with oil being applied to the eruption (Beng. Dis.)—*Ben. Ph., p.* 294; *Thirty-five years in the East, by Dr. Honig., p.* 343.

SEBESTANA DOMESTICA, *Lam., Commel., Pr. Alp.* Syn. of Cordia myxa, *Linn., Roxb.*

SEBESTANA MYXA, *Commel.* Syn. of Cordia myxa, *Linn., Roxb.*

SEBESTANA OFFICINALIS, *Gært.* Syn. of Cordia myxa, *Linn.*

SEBESTENS, Lindley's name for the order Cordiaceæ, *Eng. Cyc.*

SEBIFERA GLUTINOSA, see Tetranthera.

SEBO, Sp., Port. Tallow.

SECALE CEREALE, Rye, has the glumes 1-nerved and shorter than the spikelet; the rachis is very tough. This plant is extensively cultivated in Europe, and has nowhere been observed in a truly wild state, away from the possibility of escape from cultivation, being sown by the agency of man.—*Eng. Cyc.; Voigt, p.* 741.

SECAMONE ALPINI, Secamone, (*Prosper alpinus*). A drastic purgative. The Smyrna scammony has been attributed to this plant on very insufficient grounds.—*O'Sh., p.* 452.

SECAMONE EMETICA, *R. Br.*

Periploca emetica, *Retz.*	Asclepias angustifolia, *Roxb.*
Asclepias pseudosarsa.	Shada-Boori, Beng.

Grows common in the southern parts of the peninsula of India at the foot of mountains; is a smooth twining shrub, leaves short stalked, veinless, smooth, varying from elliptical to narrow lanceolate, cymes interaxillary, shorter than the leaves. Roots acrid and emetic.—*O'Shaughnessy, p.* 461; *Roxb., Vol.* ii, *p.* 39.

SECTS. Amongst hindoos, there are six principal sects. In addition, however, to these six sects it is to be observed, that the vaishnaiva are divided into two branches, the Goculast'ha and the Ramanuz; the first the worshippers of Krishna, the latter of Rama Chandra. These again are subdivided, one part of the Goculast'ha worshipping Krishna alone, a second worshipping him in conjunction with his mistress Radha, and a third (called Radha Ballabhi) who adore Radha only, considering her as the active power of Vishnu in the eighth avatar. The followers of the last-mentioned sects have adopted the singular practice of presenting to their own wives the oblations intended for the goddess; and those among them who follow the left-handed path require their wives to be naked when attending them at their devotions. Among the Ramanuz some worship Rama only, others Ramá and Sita. The Saiva sect worship Siva and Bhavani conjointly, and adore the Linga or compound type of their god and goddess. The exclusive worshippers of Siva are the Lingi or Gymnosophists. Those of Bhavani, or any other of the female energies, are the Sacta sect, whose emblem is the Yoni. The sectarial marks or symbols are made of ashes, cow-dung, earth of the Ganges, turmeric, sandal powder, chunam (a sort of lime,) &c., and are commonly of yellow, red, black, and straw colours. The sectarians of Siva and Vishnu are styled saiva or vaishnava, or Siva-bhakt and Vishnu-bhakt. The right-hand worshippers of the Sakti are also called Bhakta.—*Cole. Myth. Hind., pp.* 163, 395; *Wilson's Glos.* See Hindoo, Linga, Yoni.

SECRETARY OF STATE FOR INDIA, is one of the principal ministers of the Queen of Great Britain, he signs all communications to the Governors and Council for the Indian presidencies. He is aided by a Council of military, civil and mercantile men, and is by law compelled to seek their opinion, but is not bound to follow it.

SECUNDERABAD, a large military cantonment, 6 miles north of Hyderabad.

SECUNDRA, a town in Northern India; its name is probably from Secunder Lodi. In Secundra was laid the Great Akbar. The quadrangle of his mausoleum is enclosed by high embattled walls, to break the monotony of which there are four octagonal minarets at the four corners, and four colossal gateways on the four sides. The space within is laid out in walks, flower-beds, orangeries, and groves of mango.—*Tr. of Hind., Vol.* ii, *pp.* 9, 10.

SECUNNY, Anglo-Hind. A steersman, from sukhan, a helm.

SEDA, Port., Sp. Silk.

SEDAU, see Kashmir.

SEDD MAREB, see Mareb, Saba, Sail-ul-Areb

SEDDHYA, see Inscription.

SEDGE, plants of the natural order Cyperaceæ, the Sedge-tribe, comprising the following E. Indian genera and species :—

A. Cypereæ.
alopecuroides, *Rottler*, Himalaya.
angustifolius, *Buch.*, Bengal.
aristatus, *Rottler*, Peninsula of India, Bengal.
articulatus, *Linn.*, Peninsula of India, Bengal.
bulbosus, *Vahl.*, Coromandel.
canescens, *Vahl.*, Peninsula of India.
castaneus, *Willd.*, Peninsula of India, Bengal.
compressus, *Linn.*, W. & E. Indies, Penin., Beng.
difformis, *Linn.*, Greece, Egypt, S. Asia, the Behooa.
distans, *Linn.*, W. & E. Indies, P. of Ind., W. Africa.
dubius, *Rottler*, P. of Ind., Ben., ch'hoto gothoohee.
exaltatus, *Retz.*, Peninsula of India, Bengal.
haspan, *Rottler*, Peninsula of India.
hexastachyus, *Rottler*, Arabia, East Indies.
inundatus, *Roxb.*, P. of Ind., Bengal, patee.
iria, *Linn.*, P. of Ind., Beng., Nepal, China, Manilla.
niveus, *Retz.*, Bengal, Monghyr, Kamaon.
pectiniformis, *Rom*, Coromandel.
pertennus, *Roxb.*, Bengal, the nagur-moothi.
pleuranthus, *Nees*, Coromandel.
polystachyus, *Rottler*, Peninsula of India, Australia.
procerus, *Roxb.*, Peninsula of India.
pulvinatus, *Nees*, Peninsula of India, Bengal.
pumilus, *Linn.*, Peninsula of India, Bengal.
pygmæeus, *Vahl.*, P. of Ind., Beng., Ava, the jal-muti.
racemosus, *Retz.*, Penin. of India, Bengal, Penang.
roxburghii, *Nees*, Peninsula of India, Bengal.
sanguinolentus, *Vahl.*, Konkan, Bengal, Nepal.
seminudus, *Roxb.*, Bengal.
tenuiflorus, *Rottler*, Peninsula of India.
tortuosus, *Roxb.*, Circars.
venustus, *R. Brown*, Pen. of Ind., Australia, Java.
verticillatus, *Roxb.*, Pen. of Ind., Bengal, Nepal.
Papyrus dehiscens, *Nees*, P. of Ind., Beng., Chumatee-patee.
elatus, *Nees*, Ceylon.
pangorei, *Nees*, P. of Ind., Beng., Mador katee.
tegetiformis, *Arnott*. Bengal.
Mariscus cyperinus, *Vahl.*, Ascension, Mauritius, China, Bengal.
dilutus, *Nees*, Peninsula of India, Bengal.
Kyllingia monocephala, *Linn.*, E. Indies, China, Nepal, Archipelago, Australia.
triceps, *L.*, Pen. of India and Malacca, Bengal.
Courtoisia cyperoides, *Nees*, Peninsula of India.

B. Hypolytreæ, *Nees*.
Anosporum monocephalum, *Nees*, Beng., Gothoobee.

C. Scirpeæ, *Nees*.
Abildgaardia rottbolliana, *Nees*, P. of India, Bengal.
tristachya, *Vahl.*, Peninsula of India.
Fimbristylis æstivalis, *Vahl.*, Pen. of India, Bengal.
argentea, *Vahl.*, Peninsula of India.
ferruginea, *Vahl.*, Bengal.
pallescens, *Nees*, Bengal.
royleniana, *Nees*, Sunderbuns, Bengal, the tal nooroo is the variety microstachya.
schœnoides, *Vahl.*, P. of Ind., Beng., keshun-mulunga.
Trichelostylis autumnalis, var. Indica, *Roxb.* Bengal, the kuratiya-yuvanee.
complanata, *Nees*.
miliacea, *Nees*, Bengal, the buro-yuvanee.
quinquangularis, *Nees*, Bengal.
tenella, *Nees*, Peninsula of India. Bengal.
tetragona, *Nees*, Bengal.
Isolepis articulata, *Nees*, Bengal.
barbata, *R. Br.*, Peninsula of India.
incurvata, *Nees*, Bengal.
prolongata, *Nees*, Bengal.
setacea, *R. Br.*, Europe, Bengal, Australia.
squarrosa, *Vahl.*, Bengal, the chhoonchoo-moormoori.
supina, *R. Br.*, Bengal, Nepal, Australia.
Hymenochæte grossa, *Nees*, Bengal.
Scirpus junciformis, *Nees*, Bengal.
kysoor, *Roxb.*, Bengal.
Eleogenus capitatus, *Nees*, Rio Janeiro, Pen. of India, Bengal, New Holland.
Limnochloa acutangula, *Nees*, Peninsula of India.
plantaginea, *Nees*, Ceylon, Peninsula of India.
tumida, *Nees*, Bengal, Peninsula of India.

D. Sclerieæ, *Nees*.
Scleria lithosperma, *Willd.* Ceylon, Pen. of India.
tesselata, *Willd.*, Ceylon, Pen. of India, Nepal.

E. Cariceæ, *Nees*, several species of Carex have been introduced into India.
Carex indica, *Willd.*, Nepal.
Uncinia nepalensis, *Nees*, Himalaya.
Remirea wightiana, *Wall.*, Peninsula of India.
Hemicarpha isolepis, *Nees*, Peninsula of India.
Lipocarpha lœvigata, *Nees*, Peninsula of India.
triceps, *Nees*, Coromandel.
Hypolytrum giganteum, *Wall.*, both Pens. of India.
Fuirena ciliaris, *Roxb.*, Coromandel.
pentagona, *W. & A.*, Peninsula of India.
dichostylis micheliana, *Nees*, Nepal, Europe, Asia Minor.
Chætocyperus limnocharis, *Nees*, Coromandel.
Echinolytrum dipsaceum, *Desv.*, Peninsula of India.
Malacochæte pectinata, *Nees*, Peninsula of India.
Eriophorum arundinaceum, *Wall.*, Penang.
comosum, *Wall.*, Nepal.
Rhynchospora chinensis, *Nees*, China, Nepal.
Morisia wallichii, *Nees*, Nepal.
Haplostylis meyenii, *Nees*, China, Ceylon.
Cephaloschœnus articulatus, *Nees*, Pen. of India.
Hypoporum pergracile, *Nees*, Sylhet.
Corbesia laxa, *Nees*, Nepal.
Trilepis royleana, *Nees*, Himalaya.

Sedges are found on the sea shore, on the tops of mountains, in marshes, ditches and running streams, on meadows and in forests, and several of them furnish useful products. A few secrete fecula in their tuberous root-stocks, as the water chesnut of the Chinese, &c., others secrete a little volatile oil as Cyperus longus and rotundus. The creeping rhizomes of Carex arenaria, and of a few allied species, are sometimes used medicinally under the name of German Sarsaparilla. An Indian species of Cyperus tegetum, *Roxb*., called Papyrus pangorei by Nees von Esenbeck, the Madoorkati of the Bengalees, which is extremely common about Calcutta and in Bengal, is very extensively employed for making the elegant, shining and useful mats for which the capital of India is famous, and which are frequently imported into Europe. The culms or stalks of the plant when green are split into three or four pieces, which in drying, contract so much as to bring the margins in contact, in which state they are woven into mats, and thus show a nearly similar surface on both sides. The strips are tied up in bundles about four inches in diameter and four feet in length ; and seem, also, well adapted for making paper, ropes. The papyrus of the Egyptians belongs to this order, and is still called Babier in Syria. It is about 15 feet high ; the exterior tunic of the stems cut in bands, and pressed, formed the paper of ancient Egypt and Europe ; the leaves, which are several feet long, served for the same purpose, but were of inferior quality. This paper is but little liable to decay. Pliny, for instance, relates that the book of the laws of Numa Pompilius was found in Rome in a high state of preservation, after having been buried nearly six centuries in the earth.

The cotton-grass Eriophorum of Europe, is a conspicuous ornament of tuft-bogs and marshy moors, from having its seeds clothed at the base with a silky or cotton-like substance. With this, pillows are sometimes stuffed, and wicks of candles, as well as paper, made. There is a species of the genus very common in the Himalaya, both in low valleys and at considerable elevations. This, Dr. Royle named Eriophorum cannabinum, in consequence of his finding it everywhere employed in making ropes for all ordinary purposes by the mountaineers. Its name, bhabhur and bhabhuree, has a considerable resemblance to that of the papyrus, considering that the *b* and *p* are letters so frequently interchanged for each other. All who have scrambled up the steeps of the Himalaya will remember the great support they have received from the toughness of the tufts of the bhabhur. Specimens of the dried leaves are made up into bundles about three feet in length ; twine is made from it : this, though rough, is strong and well-fitted for ordinary purposes. In the Himalaya the Bhabhur holds a conspicuous place, from its extensive use and most abundant supply throughout the whole of the hills, affording a most economical substitute as an article of cordage, in lieu of others of a more costly and durable nature. All the jhoola or rope bridges, which are erected over the large rivers where the sangha or wooden planked bridges cannot be made, on all the principal thoroughfares of the Gurhwal district, are constructed of this silky species of grass, the cables of which are of a considerable thickness. These rope bridges are a very safe means of communication over the large and rapid rivers intersecting different parts of the country, both for travellers and men with loads ; and, where the footway and sides are properly laced with brushwood, afford an easy enough roadway for loaded sheep—but neither ponies nor cattle can travel over them. This grass grows abundantly in all the ravines of the sides of the mountains, and is to be had only for the cutting—but it is not of a very durable nature, though pretty strong when fresh made into ropes. It lasts about a twelvemonth only, or a little more, and the people in charge of the rope bridges are constantly employed in repairing and annually renewing the ropes and stays. The 'chinka,' or temporary bridges of a single cable, upon which traverses a seat in the shape of an ox-yoke, are also sometimes made of this grass. Sedges nearly resemble grasses in appearance, but are distinguished from them by their angular stems. There are few of them useful for any purpose—not even for fodder.—*O'Shaughnessy, p.* 628; *Royle's, Ind. Fib., p.* 85 ; *Trans. Agric. Soc. of India, Vol.* viii, *p.*272; *Cat. Ex.*, 1851 ; *Captain Hudleston on the fibres of Gurhwal.*

SEDI or Cherri, Tam. Tree.

SEDILENGAM, Maleal. Cinnabar.

SEDJI MITTI, also Saji-khar, Hind. Impure Carbonate of Soda, Papudkhar, Guz., Hind. Sub-carbonate of Soda.

SEDUARI, Hind. Vitex trifolia, *Linn.*

SEDUM CŒRULEUM, . a succulent plant with various coloured flowers, all of which should be grown separately in pots, in a light sandy soil mixed with brick rubbish, they are propagated by seed, these plants are well adapted for rock-work.—***Riddell.***

SEEAL, a tribe in the waste tracts between the Sutlej and the Indus.

SEEAL, see Jun.

SEEANA (lit. cunning, artful) a conjuror.

SEECURANEE, Tel. A Nalla mallai wood, white coloured, light and straight-grained, and would be useful for temporary purposes. Perhaps the Isakarasi, Tel. The Sapindus rubiginosus.—***Mr. Latham.***

SEED.

Binge,	Guz.	Tukhm,	Pers.
Binj,	Hind.	Veri,	Tam.
Semen,	Lat.	Vittu,	Tel.
Banih, Biji,	Malay.		

In commerce, the grains of several species of gramina. Those of most importance, in a

commercial point of view, are clover seed, flax or linseed, rape seed, mustard seed, hemp seed, and jingelly or sesamum seed. In China, in the packing of seeds, after gathering them from the plants, they put each kind, separately, into a small bottle, and then pack the whole into a little box, ready for being shipped to Europe or America. An Indian climate, is very inimical to the preservation of seeds; if properly dried in the first instance, the best mode for preserving most kinds of seeds is well-soldered tin cases. Seeds of sesamum are presented to deceased ancestors, and, among the gods to Yama, the regent of death.—*Faulkner: Fortune, p.* 131; *Ward's Hindoos, Vol.* ii, *p.* 63.

SEED PEARLS, see Pearls.

SEEDUM ACRE, Fuh-kiah-ts'au, Chin. The Stone-Crop plant.

SEEDY, also written Sidi, a corruption of the Arabic "my lord!" is the popular name in India for African blacks.—*Burton's Scinde, Vol.* i, *p.* 52. See Sidi, Negro.

SEEHOO, a lake of China, on its borders stands the wealthy and extensive city of Hang-choo-foo, the surrounding scenery, is accounted one of the grandest, as well as most beautiful in all China. The Lui-fung-ta, or tower of the thundering winds, standing on the point of a promontory jutting into the lake, forms a bold object. It is said to have been built in the time of the philosopher Confucius, who lived three centuries before the christian era. In the Vale of Tombs, the variety of monuments is almost infinite.—*Macartney's Embassy, Vol.* i, *p.* 28.

SEEKARTEN, Ger. Chart.

SEEKA-KAI, Tam. Mimosa abstergens.

SEEKANDAR, Alexander the Great.

SEEMI-AGHATI, Tam. Cassia alata.

SEEMANTONNAYANA, Sans. From simanta, the place on the head where the hair divides, and oonayana, a raising up. Amongst hindoos, during the marriage ceremony, the bridegroom first pulls the veil over the face of the bride and then, turning it up again draws a line with red lead down the centre of her forehead. To this ceremony this word alludes.

SEEMUL, Hind. Bombax heptaphyllum.

SEEN, or Shalee, a brass dish.

SEENA BUND, Hind. Lit. breastband, used in shrouding the dead.

SEENA ZANNEE, lit. breast-beaters, an appellation of the Shiah sect of mahomedans.

SEENAH, a river that rises near the Wetern Ghauts, runs past Ahmednuggur and joins the Bheemah river.

SEENGA, see Kunawar.

SEENKH, Hind. The culm of the khus-kus, Andropogon muricatus.

SEEOORSAT, in Persia, provisions supplied to travellers of rank, from the villages that they pass through: possibly from sair, a journey, rasad, provision.

SEEPAH, a native soldier, Sepoy.

SEER, Hind. Hedychium spicatum.—*Royle's Bot.*

SEER or Ser, a measure equal to about 2 lbs., it varies from eighty to eight-four Oojein rupees' weight.—*Malcolm's Central India, Vol.* ii, *p.* 15. See Weights.

SEERANO, an allowance given to the town shepherds of India. See Ballai.

SEER or Seir fish, Cybrium guttatum, the Scomber guttatum, *Linn.* Toramalu, Singh.

SEERAH, fortified islets opposite Aden.

SEESODA. The origin of this town's name is from the trivial occurrence of the expelled prince of Cheetore having erected a town to commemorate the spot, where after an extraordinarily hard chase he killed a hare (sussoo.) —*Tod's Rajasthan, Vol.* i, *p.* 216.

SEESTAN, a desert country north-west of Beluchistan, on the rivers Helmund and Furh-rud. It was a province of ancient Persia, but in the early part of the 19th century it was independent. Seestan means the region of cold. Both sides of the valley of the Indus were occupied in the earliest periods by another branch of the Yadu, for the Sind-Samma dynasty was descended from Samba (which like Yadu became a patronymic) of which the Greeks made Sambus—and one of whose descendants opposed Alexander in his progress down the Indus. The capital of this dynasty was Samma-ca-kote, or Samana-gari, yet existing on the lower Indus, and which was corrupted into Minagara by the Greeks. There is no country to which an admirer of Persian poetry and romance turns with more interest than to Seestan. Its numerous ruins testify it to have been a fertile country, once full of cities, which in extent and magnificence are scarcely surpassed by any in Asia. Except on the north, where it joins the south-western border of the Dauranee country, the province is now surrounded by wide and dismal deserts, whence every wind brings clouds of a light shifting sand, which destroys the fertility of the fields and gradually overwhelms the villages. The only parts which still retain their fertility, are those on the banks of the Helmund and Furra Rud, and of the lake which is formed by those rivers. This celebrated lake is termed by geographers the Sea or Durya or Zereng. In Persian books, it is said sometimes to be called the Sea of Loukh, and, by the people of the country, the Sea of Zoor or of Khaujek: in the neighbourhood, it is merely called the Lake, or the sea, and it is at least 150 miles round. The water is brackish and hardly drinkable. The edges of the lake, for a considerable breadth, are choked with long rushes and reeds, the shores also are overgrown with the same sort of vegetation ; and being liable to inundation, are full of miry places and pools of standing water. These marshes and thickets are frequented by herds of oxen, whose owners are men distinct from the other inhabitants of Seestan: they are said to be tall and stout, but black and ugly, with long faces and large black eyes : they go almost naked, and live in hovels of reeds. Besides their occupation of herdsmen, they fish and fowl on rafts among the rushes of the lake. The original inhabitants of Seestan are the Tajik, but they have now received some additions from other countries. There are said to be two considerable tribes, called Shahrukee and Surbundee, which have emigrated from Persian Irak to Seestan, and in much later times, a tribe of Beluch has fixed its residence in the east of the country. The Tajik and the two first-mentioned tribes exactly resemble the Persians, and have little remarkable in their character. The Cauker clan of Punnee, who inhabit Seewee in the plains of Seweestan are divided from the rest of the tribe by mountains and by Beluches, the inveterate enemies of the Cauker name. The people of Seistan dress like Persians, and have the same colloquial dialect ; they are all Sheea moosulmans, and on the very worst terms with the Affghans. Seistan was formerly called Nimroez, and comprehended part of Arriana and the country of the Sarangœans. It is bounded on the N. and N. W. by Khorassan, E. by Candahar and Zablestan, and S. and S. W. by Mekran and Kerman. The greater part of this province is flat, sandy and uninhabited. Seistan lies between Persia and Affghanistan, and is surrounded except on the north by wide deserts. It is a flat country, with low hills here and there. One-third of its surface is moving sand, and the other two-thirds are composed of compact sand and clay, covered with thickets of tamarisk, and abundant pasture. The Helmund, which is by far the finest river between the Tigris and the Indus, flows through Seistan, and falls into the lake of Zurrah. The river banks are clothed with luxurious vegetation, and the lake, which is about ninety miles long by sixty broad, is bordered by forests of reeds, beyond which there are pastures and tamarisk thickets. The original inhabitants of Seistan were Tajiks ; but the country has long been occupied by savage tribes of Beloochees. Seistan is well-known to the admirers of Ferdusi, as the country of Zal and Rustam. In the early part of the nineteenth century, the ruling family of this province had descended from the line of Kyanee, but lost its power. Kamran invaded Seistan, plundered it, and drove off 6,000 of its inhabitants captive, whom he sold into slavery, or exchanged to the Toorkmans for horses, he assigned to the Kyanee family the town of Jahanabad, south of the Helmund, where, in 1838, they were residing and fixed his own government at Chuknusoor, north of the river. Little regular revenue is derived from Seistan, except camels, cows nd sheep ; it is thinly peopled, and altogether a poor possession. The most remarkble feature of the province is the intersecion by the Helmund and its tributary rivers. In summer all these are greatly swollen, and t has been said that they form a lake called ' Zurrah ;" but the natives whom Burnes nterrogated were unacquainted with this name, and described the rivers to be lost in a vast swampy region, full of reeds, called Hameo." Many of the places on the map are also quite unknown, but ancient forts are ften laid bare by the blowing away of the sand, while modern ones are overwhelmed. This is to the people a constant source of wonder and castles of a former age are said to show themselves as if newly from the hands f the architect. The singular disappearance of the waters of the Helmund, and this changeable face of nature, would account for the many fabulous descriptions of Seistan. The ruins of an old city in the " Loote" or desert called Zaideen, yields many antiquities, rings, coins, &c., which are taken by the finders to Furro for sale. One curious property of the climate is, that the horse cannot live in it, and probably there are not one hundred of these in Seistan. Kamran lost nearly all his cavalry in his campaign, most of the horses dying from a disease of the digestive organs contracted in it, which makes it very unfavourable for military operations ; but the camels of Seistan are celebrated.—*Kinner's Geographical Memoir, p.* 182 ; *Ferrier*; *Mr. Elphinstone* ; *Markham's Embassy, p.* 23 ; *Burnes, in Par. Papers* ; *H. et Th.* ; *Tod's Rajasthan, Vol.* ii, *p.* 230 ; *Elphinstone's Kingdom of Caubul, pp.* 492, 493, 494 ; *Pottinger's Travels in Beloochistan and Sinde, pp.* 66, 89, 90.

SEGESTAN, the Vaekerata or Vekereta of the Vendidad, was the sixth settlement of the Arians. This country is the home of Rustum, Dushak is the capital of Segestan. To the south-east of it is the land of the Parikani, known to the ancients as a part of the Saken country (Sakastene). The greater part of it is now a desert, but it was once cultivated. The Record runs (vii, verse 10.) "Vekereta, in which Duzhaka is situate ; there Ahriman created the Pairiika Khnathaiti." Here there may be allusion to a schism, which, in that case, would be the second historical one. Recent travellers have also found nomadic tribes between Media and Gedrosia, who worshipped the Peri (Fairies), but were fire-worshippers also. The Jamshidi, a tribe of the Aimak, are the only tribe of Eastern Iranians who are exclusively nomades. They derive their descent from Jamshid, and moved out of Segestan to the shores of the Murghab, which they have occupied from pre-historic times. They live in the neighbourhood of the Salor and Sarik Turkoman and they use the round conical tent of the Tartars, surrounding it with felt and a reed matting, and their clothing and food are Turkoman as also their occupation, for, they are great man-stealers. They excel the other Aimak as horsemen, and, for a chapao, band themselves with men of Herat or with the Turkoman tribes. It was this cause that led Allah Kuli Khan to transport them from Khiva to the banks of the Oxus, after he had conquered them with the allied Sarik Turkoman. After a residence of 12 years, they fled and returned to the town of Murghab. The Jamshidi is polite in word and manner. They still retain parts of the zoroastrian faith, reverence fire, and pitch their tent door to the east.—*Herod.*, iii, 94 ; *Comp. Ritter*, viii, 59.

SEGHALIN, Seghalien, or Tarakai, long believed to be a peninsula, is an island lying between 54° 24′ and 45° 54′ 2″ N. L., and E. L. 141° 40′ and 144° 46′. It is about 600 miles in length and from 20 to 100 broad. It is well wooded and fertile, and coal is found in many places, especially about Jonquiere Bay. Two-thirds of the northern part belong to Russia, and is peopled by Ghilak. The aboriginal races of Yezo, whose severe treatment by the Japanese, led them to other countries, occupy the southern part of the island of Seghalin, which is in possession of the Japanese. The Aino are of short stature with broad faces of the Mongol type. They are a timid race, their limbs are hairy, they have bushy beards and long tangled hair, large heads and clumsy figures, the expression of their faces is that of good nature combined with stupidity. According to Ma-Rosney their language is dissi[illegible]galese. Dr. nese, and that spoken in [illegible]sele as affording a the island of Yesso, are also [illegible] the fishes Japanese.

SEH, HIND. Prosopis spicigera.

SEH, LEPCH. Abies smithiana, *Hooker, Wall.*

SEHARUNPORE, in North-Western India, the site of the Botanical Gardens of the Government of India. The Kandonur river near Hurowrah is in Seharunpore.

SEHESNAG. The Takshak race entered Hindusthan, led by a conqueror termed Sehesnag, from Sehesnagdesa. He ascended the Pandu throne, and his line terminated in ten descents with Mahananda, of spurious birth. This last prince, who was also named Bykyat, carried on an exterminating warfare against the ancient Rajpoot princes of pure blood, the Poorans declaring that since the dynasty of Sehesnag the princes were soodras. Three hundred and sixty years are allotted to these ten princes. A fourth dynasty commenced with Chandragoopta

Mori, of the same Takshak race. The Mori dynasty consisted of ten princes, who are stated to have passed away in one hundred and thirty-seven years. See Takshak.

SEHESRA ARJUNA, of the lunar race, called also Sehesra Bahu was of the Hi-hya tribe. He founded Mahesvati on the Nerbudda, still existing in Meheswar. In the Bhavishya Poorana this prince, Sehesra Arjoona, is termed a chakravarta, or paramount sovereign ; also that he conquered Kurkotaka of the Takshak, Toorshka, or Snake race, and brought with him the population of Mahesvati, and founded Hemanagara in the north of India, on his expulsion from his dominions on the Nerbudda. Traditionary legends yet remain of this prince on the Nerbudda where he is styled Sehesra Bahu, or 'with a thousand arms, figurative of his numerous progeny.' He was expelled from Mahesvati by the solar race.

SEHL, one of the princes of the Bharat, who founded Aror.

SEHO of Ternate, Arenga saccharifera.

SEHORE, a town on the bank of a stream [illegible] Bhopal.

hundred [illegible] mahomedan family from Sind, and all the comme[illegible]elat, until expelled by the had flowed int[illegible] subsequently were expelled by the Brahui. Sehrai, is from sahara, a desert, hence also Sarrazin, or Saracen, from sahara, desert, and zuddun, to strike, contracted. The Brahui appear to have been a nation of Tartar mountaineers, who settled, at a very early period, in the southern parts of Asia, where they lived an ambulatory life in khels, or societies, headed and governed by their own chief and laws, for many centuries ; and at length they became incorporated, and obtained their present footing at Kelat and throughout Beluchistan. It is impossible to form more than a supposition, what was the nature of the region from which they emigrated, but their pursuits and way of domestic life afforded the strongest reason for believing that they were originally mountaineers ; and some amongst them affirm that the very name demonstrates this by its signification being a compound of an affix boan and roh, a word said to mean a hill in the dialect still spoken in some parts of Thibet ; such reasoning, however, is not entitled to any great dependence, though supported by the collateral evidence of the Beluch being called in one quarter of the country Nharooi, which, if we admit the former derivation, means " low landers," *i. e.*, literally not hillmen, a name they received from the Brahui when they came amongst them, and evinced a preference for the champagne districts, low villages, and plains. The Brahui imagine themselves the aborigines of the country. In another place he states, that he considers the hindoos to have been the first colonisers of the upper part of the Brahui mountains, and that the Brahui gradually settled amongst them. That the last hindoo rajah was named Sehwa, who called in the aid of these mountain shepherds against a horde of depredators from the western parts of Mooltan, Shikarpoor, and Upper Sind ; and that the Brahui, having defeated and driven off these invaders, deposed the rajah Sehwa, and seized the government for themselves—a chief of the name of Kumbar becoming khan of Kelat, of whom the present khan is a lineal descendant. See Brahui, India, Kelat, Sind'h.

SEHWAN, the ancient Sindomana, is built on the extremity of a spur from the Biluchi range which here juts into the river. The pass of Sehwan has a picturesque appearance from the river, with its rocky mountains rising in terraces along the bank, and its old ruined castle, supposed to have belonged to the Alexandrian age. Beyond Sehwan is the large town of Larkhana, containing about 5,000 inhabitants, the capital of one of the most fertile districts in Sindh, being that watered by the Indus, and the large branch called the Narrah beforementioned.—*Postan's Personal Observations, pp.* 28 *and* 29 ; *Adams.* See Kelat.

SHE-WAN-PAN, CHIN. A wooden frame, with wires, resembling the abacus of the ancient Greeks, Romans and Arabians. By the help of this the Chinese work the most difficult and intricate calculations, but without it they are perfectly helpless.—*Frere Antipodes, p.* 218.

SEIDBURROOA, a Nepaul tree, the bark of which is manufactured into a strong useful paper ; it is also made into rope and black thread, but neither of them resist moisture well.—*Smith's Nepaul.*

SEIDE, GER. Silk.

SEIES, FR. Saws.

SEIFE, GER. Soap.

SEIFATALA, or the bitter apple, a little village. A priest or man of the law, set before Mr. Rich an ample meal of honey, fresh butter, yoghourt, cucumbers and buttermilk. The natives of this part of the East always eat honey and butter together, and it is likely to be a prevailing custom in other parts of the East, from the mention made of it in scripture—" Butter and honey shall he eat," Isaiah vii, 15.—*Rich's Residence in Koordistan, Vol.* i, *p.* 523.

SEIGUL, see Khutri.

SEILAN, a name of Ceylon. See Marco Polo.

SEIN, HIND. Pentaptera tomentosa.

SEIR, also Teg, MAHR. Euphorbia tirucalli, Milk-bush

SEIR ABONEID, in lat. 25° 14′ N., long. 54° 22′ E., an island 2½ miles long and 2 broad, on the south side of the Persian Gulf, contains large quantities of sulphur, and has some mineral springs.

SELDI, RUS. Herrings.

SELE, the Polynemus sele, a fish of the river Ganges and Bay of Bengal. The sele combines the advantages of fineness of flavour, with wholesomeness as food; while considerable in size, it is migratory in habit and in the cold weather enters the Bengal rivers, in great shoals. Its swimming bladder is of value as an article of commerce, and its flesh in a fresh state is esteemed as food, this would become still more valuable if it could be properly cured. The demand for dried fish, fish roe, salted fish, tamarind fish, exists in every part of Asia. Shark fins are largely used in China, and isinglass is in request both in Europe and China. It might perhaps become an article of consumption even in India as it is mentioned in their systems of Materia Medica by the name of ghurree-al-su-mak and sureshum mahee, that is, fish-glue, and is described as a good diet for patients in a decline. The species affording the isinglass is the Polynemus sele of Buchanan, Sele or Sulea of the Bengalese. Dr. Buchanan describes the [illegible] as affording a light nourishing food, like most of the fishes which he has called Bola, but as inferior to many of them in flavour. It is common in the estuaries of the Ganges, and is often found weighing from twenty to twenty-four pounds; and may perhaps be the emoi of Otahetti, the Polynemus lineatus of Lacepede, the P. plebeius of Broussonet. This, according to Block, is by the English called King-fish and is the Kalamin, TAM. of John from Tranquebar, and abundant in the Kistna and Godavery. Buchanan further states, that the sele has a strong resemblance to the abovenamed "maga boshee" of Dr. Russell. An anonymous author stated that from half a pound to three-quarters of a pound of isinglass may be obtained from each fish. Mr. McClelland supposed either that P. sele attains a much larger size than twenty-four pounds, the limit given to it by Buchanan, or that isinglass is also afforded by a far larger species, namely, P. tetradactylus, Telia, or Teriya bhangan. This is identical with the "maga-jellee" of the Coromandal Coast, and which Buchanan often saw six feet long in the Calcutta bazaar, and was informed, it sometimes equalled 320 pounds avoirdupois in weight. It is considered by the natives as a wholesome diet although seldom used by Europeans. Mr. McClelland says he has frequently seen them of a uniform size, that must have weighed from fifty to a hundred pounds, at least loading whole cavalcades of carts on their way to the Calcutta bazaar during the cold season. Both the sele and the "teria bhangan" must consequently be very common there from November to March. P. sele is supposed to be a variety of P. lineatus, which is said to be common on all the shores to the eastward; but if so, it seems strange that the Chinese should send for it to the Hooghly. The same might, however, be said of the cod, which, though caught in abundance on the coasts of Great Britain, is also diligently sought for on the banks of Newfoundland. He also inquires whether Polynemus emoi and P. plebeius, supposed by Buchanan to correspond with his Sele, contain the same valuable substance, and whether either of Russell's species, the abovenamed nagabooshee and maga-jellee (*Indian fishes* 183-184,) yield it.—*Royle on Isinglass, passim.*

SELENITE, see Elespah, Gypsum.

SELEONI-MIED, Rus. Brass.

SELEUCIA was built by SeleucusNicator, forty or forty-five miles north from Babylon, at a point of the confluence of the Euphrates with the Tigris, by a canal. There were six hundred thousand citizens here at one time, and all the commerce and wealth of Babylon had flowed into it. Seleucia was built by the Greeks out of the ruins of Babylon. The two cities of Ctesiphon (or Ul-madain), and Seleucia were built one on each side of the river, opposite each other, though flourishing at different periods. The ruins, or rather ruin, of Ctesiphon (for there is but one relic of that once rich and noble city), is calculated to excite wonder. There is no eastern palace which possesses such a facade as the Tak-i-Kasra or, if we suppose it to have been merely a gateway, such an entrance. The Ali Capi at Ispahan, or the gates of the palace at Dehli, magnificent structures in themselves sink into insignificance beside the Tak-e-Kesra; for none of them can boast of an archway more than one hundred feet high. Antiochus Epiphanes, one of the Seleucidæ died B. C. 164, in the year 143 of the era of the Seleucidæ. After the death of Seleucus Philopater, Antiochus Epiphanes assumed the reins of power in the empire that included Armenia and Parthia. Alexander was favorable to the Jews, but, Antiochus Epiphanes, the reverse. The first seven years of his reign were still endurable, but after that every confessor of Jehovah, who could not be bribed or seduced over was subjected to the most cruel forms of martyrdom. But relief came in the uprise in B. C. 167 of the valiant Mattathias and B. C. 165, the temple was purified and the worship of God restored. Seleucia was on the western banks of the Tigris. It was the capital of the Macedonian conquests in Upper Asia. Ctesiphon was on the eastern banks, at the distance of only three miles from Seleucia, and was the capital of the Parthian kings.—*Chatfield's Hindoostan, p.* 277; *Mignon's Travels, p.* 78; *J. B. Fraser, p.* 3; *Bunsen, God in Hist., Vol.* 1. See Kabul, Luristan, Tigris.

SELEUCIDÆ. There are two eras, the one reckoned from the date of Alexander's death A. A. C. 323, the second, has its epoch 311 years and four months B. C., and is used in the book of Maccabeus. These Seleucidæ eras were also called Syro-Macedonian. The people of the Levant and the Jews adopted it, the Jews calling it Tariq-Dilcarnaim, and it is still in use amongst the Arabs. The Alexandrian era was established commencing from the entrance of Seleucus Nicator into Babylon. Armandi notices the fact that the elephants figured on the coins of Alexander and the Seleucidæ, invariably exhibit the characteristics of the Indian type, whilst those on the Roman medals, can at once be pronounced African from the peculiarities of the convex forehead and expansive ears. Kurnah near Bussorah is one of the towns founded, and called Apamea, by Seleucus Nicator, after his wife Apama. After the death of Alexander, his lieutenant, Seleucus, succeeded to the sovereignty of Affghanistan and the other Asiatic conquests. Under his grandson, Affghanistan was taken from the Seleucidæ, by the aboriginal chiefs, and soon after formed with Bactria an independent state which existed during 150 years. Subsequently the Tartars made themselves masters of Affghanistan and appear to have held possession of it up to the death of Mansoor, when one of his officers, Sabaqtagin, established an independent dominion over all the southern parts of Affghanistan, making Ghizni his capital. His son Mahmood, who died A. D. 1028, enriched Affghanistan with the spoils of India. In the reign of the cruel Bahram, one of the Tartar's descendants, the Sabaqtagin dynasty, were deprived of all but the Punjab, and this too, in A. D. 1160, they lost. Seleucus Nicator, however founded thirty-five cities in greater and lesser Asia; sixteen of which he named Antioch, from Antiochus, his father; nine Seleucia from his own name; six Laodicea, from Laodice, his mother; three Apamea, from Apama, his first wife, (of which the city of Kurnah was the chief); and one Stratonicea, from Stratonice, his last wife. According to Dean Prideaux, he was a great protector of the Jains, and the first who gave them settlements in those provinces of Asia, which lie on this side of the river

Euphrates. As they had been faithful and serviceable to him in his wars, and in many other respects, he granted them great privileges in all the cities which he built. The expedition of Seleucus to the Panjab is related by Justin, (lib. xv, c. 4), and by Pliny, (Nat. Hist., lib. vi, c. 17). Seleucus Nicator is said to have penetrated to the mouth of the Ganges and it had been sailed up by the Romans as far as Palibrotha, before the time of Strabo.—*History of the Panjab, Vol.* i, *p.* 55 ; *Prideaux's connection of the Old and New Testament; Mignon's Travels, p.* 4. See Affghan, Affghanistan, Chaldea, Chandragupta, Greeks of Asia, Hindoo, Inscriptions, Kabul, Koorna, Khuzistan, Mesopotamia, Shaman, Tigris, Vindusara.

SELIKEH, or Selikha, ARAB. Bark of Cassia lignea.

SELIM, see Mameluk.

SELIM-GHUR, see Delhi.

SELINGHINSKY, near the Baikal lake, is 1,779 feet above the level of the sea. It is situated on the east bank of the noble river Selinga or Selingue in a deep, barren, sandy soil, that produces almost nothing. The Selingue river disembogues from the southwest, into the Baikal lake.—*Staunton's Narrative, p.* 44. See Kalkas.

SELJUK, a Tartar or Turkoman, whose name was handed down to his posterity through his son Togrul Beg. Dr. Latham supposes Seljuk to be the same word as Seleucus. The leader of the Seljuk tribe was Togrul Beg. The death of Mahmud which occurred A. D. 1228 was followed by a period of anarchy, during which Togrul Beg advanced and took Ghazni and was declared king. The Seljuk had long settled in Persia, where they naturally adopted the colloquial dialect, and brought it with them on their expulsion by the Kharazmian kings. The unremitting enmity of these kings forced vast hordes of them to fly from Persia after they had been colonised there for many years. The Seljukian branch of the Turks, from their traditionary patriarch Seljuk Khan, had acquired and consolidated a mighty empire, more than two centuries before the name of the Ottomans was heard. The Seljukian Turks were once masters of nearly all Asia Minor, of Syria, of Mesopotamia, Armenia, part of Persia and Western Turkestan ; and their great sultans, Toghrul Beg, Alp Arslan, and Malek Shah, are among the most renowned conquerors that stand forth in Oriental and in Byzantine history. But, by the middle of the thirteenth century of the christian era, when Ertoghrul appeared on the battle-field in Asia Minor, the great fabric of Seljukian dominion had been broken up by the assault of the conquering Mongols, aided by internal corruption. After long years of warfare carried on by Ertoghrul and his more renowned son, Othman, Œni became the settled possession of their house. Othman, or, according to the oriental orthography, Osman, is regarded as the founder of the Ottoman empire. The Seljuk, as well as the Moghul, are of Tartarian origin ; but to speak of them as the same nation would be as likely to confound, as a person writing on Europe, to include Spaniards and Frenchmen under the common term of Europeans. Dr. Latham classes the Belooch nation with the Persian, but considers them as a modified form. He says, E. and S. E. of the proper Persians of Kirman, come the Belooch of Beloochistan, the Belooch came from the westward, but whether they were Seljuk Tartars, or Arabs from Aleppo, is a matter of doubt. Dr. Cooke says, the original inhabitants of the country were hindoos, who fled from the conquering mussulmans, who invaded Sind, Lus and Mekran, A. H. 93 : and he is of opinion that the Brahui were Tartar mountaineers, who gained a footing in the country and ultimately supplanted the former, becoming the ruling race.—*Pottinger's Travels in Beloochistan and Sinde, p.* 269 ; *Creasy's Ottoman and Turks, p.* 7.

SELL-AMMA, one of the village goddesses of the peninsula of India. See Hindoo.

SELOOPAY MARAM, TAM. Elæodendron roxburghii.

SELOTTAH, see Kol, Koli.

SELU, SANS. Cordia obliqua.

SELUNG, or Salong a tribe who occupy the islands of the Mergui Archipelago, to the south of Tavoy. They are fishers, for the sea-slug. They reside in their boats, which are good : are decently clad and intelligent : and are inclined to settle in villages and cultivate. They dig up the slug at the low water of spring tides during the N. E. monsoon. They are supposed by some to be descendants of slaves from the Malay peninsula.

SELUPA MARAM, TAM. Elæodendron roxburghii.

SELYA, in the South of India, is a sheet or body covering in use amongst the poorer classes, cultivators, laborers, wrapped round their shoulders and body when employed in the fields. Their usual cost is about rupees one and a quarter to rupees one and three-quarters. In Dharwar one is always presented to the bridegroom by relations of the bride, together with a turban.

SEM, the ancestor of the semitic race, dwelt in Arpakhsad, the primeval land of the Kasdim or Chaldees, the frontier mountains of Armenia towards Assyria. Of the four branches of this semitic race, Elam, Assur, Lud and Aram, Helam or Elam, the Elymæi formed the stem of the Babylonian empire, east of the Tigris, in Susiana, (South Babylonia) ; Assur was the stem of the empire of Ninus on the upper Tigris ; Lud, the Lydi, were the original inhabitants of Asia Minor, Pontus and Cappidocia, as far as the Halys, where the Lydians of history were seated. Aram the original highlands S. W. of Armenia (Ar Minn) the country between the sources of the Euphrates and Tigris, Mesopotamia proper, is Aram-Nahrain, and Aram became the latest name for Syria. The Aram race branched into Uz or Huz, which is Nejid or North Arabia. It was to Ur of the Chaldees that Nahor went. His son Terah left it and went to Haran (Karra) a day's journey S. of Edessa. According to Bunsen, the semitic race invented theogony for other peoples and especially for the Hellenes, and the Hebrews abandoned all mythological religion in the time of the patriarch Abraham. —*Bunsen, Vols.* iii, v, *pp.* 71-2, 365. See Assur, Arpahaxad, Adam, Aram, Elam, Lud, Semitic races.

SEM, Hind. Canavalia gladiata.

SEMA BOGGU, Tel. Coal.

SEMADOONG, Abies brunoniana, *Sich.*

SEMAL or Sembal, Hind. Bombax malabaricum. Semal ka phool, flowers of the Bombax heptaphyllum, considered refrigerant. —*Genl. Med. Top., p.* 152.

SEMAN, see Kelat.

SEMANDI, Malay. Is a regular treaty between the parties on the footing of equality. The adat paid to the girl's friends has usually been twelve dollars.—*Lubbock's Origin of Civil., p.* 54 ; *Marsden's History of Sumatra, p.* 263.

SEMANG, a negrito race who occupy the Malay peninsula. Semang, is a Malay word applied by the mahomedans of Kedah, Perak, Tringanu and Salangore, to the pagan tribes of the interior, though the Semang Paya reside on the borders of the morasses, the Semang Bukit, are the occupants of hills, the Semang Bakow reside in the neighbourhood of the sea, in the creeks and districts where the mangrove grows, and the Semang Bila approach the Malay in civilization. According to Mr. Earl, the Semang are a woolly-haired race of the Malayan peninsula, and a mere remnant of tribes which, according to native tradition, occupied a considerable portion of the interior of the peninsula at a comparatively recent period. At the present time the race is only known to exist on the mountain Jerei, in the Kedah territory, a little to the north of Pinang ; in the neighbourhood of the mountain range which lies immediately opposite to the latter settlement ; and in the uplands of Tringanu, on the east coast of the peninsula ; but it seems probable that scattered remnants are to be found in several other spots, which have not yet been visited by Europeans. The Sakai and Allas tribes of Perak, which have hitherto been classed with the Semang, or woolly-haired race of the neighbourhood of Pinang, have curly but not woolly hair ; and although they retain the Papuan custom of boring the septum of the nose, and also mark their skins with cicatrices, they cannot be considered as Papuans ; indeed their language and leading characteristics show them to be wild tribes of the Malayan race. The Semang, however, who are identical in every particular with the Pangan of the interior of Tringanu, are Papuans in all their purity, with woolly and tufted hair in every respect similar to other unmixed tribes of the race. The Semang of Kedah have been very accurately described by Mr. Anderson, in the fourth number of the Journal of the Indian Archipelago. Of the origin of the Semang race the Malays possess no tradition. Certain it is, however, that the tribes of them which inhabited various parts on both sides of the peninsula, were much more numerous, before many of the present Malayan colonies were founded by emigrants from Sumatra. The Semang are designated by the Malays, Semang Paya, Semang Bukit, Semang Bakow, and Semang Bila. The Paya are those who reside on the plains or borders of morasses, the Semang Bukit, whose abode is on the hills, and the Semang Bakow are so called from their frequenting the sea-shore, and occasionally taking up their quarters in the mangrove jungles. The Semang Bila are those who have been somewhat reclaimed from their savage habits, and have had intercourse with the Malays. A similar race of people are said to have formerly inhabited all the islands of the Archipelago, and nations and remnants of them, under the names Aheta, Aeta, Negrito, and Papua occupy, or are still to be found on, many of them. On the east coast of the peninsula, the Semang are called Pangan. They are at present most numerous in the interior near Jan, a small river to the north of the Mirbow, near the lofty mountain Jerei, in the Kedah territory. There are small parties also in the mountains, inland of Juru and Krian, opposite Penang. Their huts or temporary dwellings, (for they have no fixed habitations, but rove about like the beasts of the forest), consist of two posts stuck into the ground, with a small cross-piece, and a few leaves or branches of trees laid over to secure them from the weather. Some of them, indeed, in the thicker parts of the forest, where the elephants, tigers, and other wild animals are most abundant, make their temporary dwellings upon the cliffs and branches of large trees. The Semang subsist on the birds and beasts of the forest, and roots. They eat elephants, rhinoceros, monkeys, and rats, and with the exception of the scanty supplies they obtain from the Malays, they have no rice or salt. They are very expert with the sumpit, a blow-pipe for projecting small darts, and poison the darts with ipoh, procured from the juice of various trees, which is deadly poison. They handle the bow and the spear with wonderful dexterity, and destroy the largest and most powerful animals by ingenious contrivances. It is seldom they suffer by beasts of prey, as they are extremely sharp-sighted, and as agile in ascending the trees as the monkeys. Their mode of destroying elephants, in order to procure the ivory, of their flesh, is most extraordinary and ingenious. They lie in wait in small parties of two or three, when they have perceived any elephants ascend a hill, and as they descend again, which they usually do at a slow pace, plucking the branches as they move along, while the hind legs are lifted up, the Semang cautiously approaching behind, drives a sharp-pointed bamboo, or a piece of neebong which has been previously well hardened in the fire, and touched with poison, into the sole of the elephant's foot with all his force, which effectually lames the animal, and most commonly causes him to fall, when the whole party rush upon him with spears and sharp-pointed sticks, and soon despatch him. The rhinoceros they obtain with even less difficulty. This animal, which is of solitary habits, is found frequently in marshy places, with its whole body immersed in the mud, and part of the head only visible. The Malays call the animal "Badak Tapa," or the recluse rhinoceros. Towards the close of the rainy season, they are said to bury themselves in this manner in different places, and upon the dry weather setting in, and from the powerful effects of a vertical sun, the mud becomes hard and crusted, and the rhinoceros cannot effect its escape without considerable difficulty and exertion. The wild buffaloes of North Australia are often found in a similar predicament, and are sometimes shot by the hunters before they can extricate themselves The Semang prepare themselves with large quantities of combustible materials, with which they quietly approach the animal, who is aroused from his reverie by an immense fire over him, which being kept well supplied by the Semang with fresh fuel, soon completes his destruction, and renders him in a fit state to make a meal of. The projecting horn on the snout is carefully preserved, being supposed to be possessed of medicinal properties, and highly prized by the Malays, to whom they barter it for their tobacco, &c. The following notes have reference to a party of Semang Bukit on the Ijau, a feeder of the Krian, will show the physical condition of this negro race. Average height of adults, four feet eight inches, highest four feet ten inches. Head small, ridged, that is rising above the forehead in an obtuse wedge shape, the back rounded and somewhat swelling, the forehead small, low, rounded, and markedly narrower than the zygomatic or middle zone, the face generally narrower and smaller than the Malay, eyebrows very prominent, standing out from the forehead and projecting over the ocular furrow which extends across the face, the root of the nose sinking into it, and forming a deep angle with the base of the superciliary ridge ; the nose short and somewhat sharp at the point, and often turned up, but the alæ spreading ; eyes fine, middle-sized and straight, iris large, black and piercing, conjunctive membrane yellow, the upper eyelashes, owing to the deep ocular depression, or prominent ridges, are compressed or folded, the roots of the hair being hidden ; the cheek bones generally broad, but in some cases not remarkably prominent save with reference to the narrow forehead ; mouth large or wide, but lips not thick or projecting ; the lower part of the face oval or ovoid, not square. The deep depression at the eyes, and sinking in the root of the nose, gives a very remarkable character to the head compared with the Malay. The projecting brow is in a vertical line with the nose, mouth, and chin, and the upper jaw is not projecting or prognathous. The person is slender, the belly protuberant, owing to their animal life in the jungles, and precarious food. This induces them to cram themselves whenever they can, and the skin of the abdomen thus becomes flaccid and expansible, like that of an ape. The skin generally is fine and soft, although often disfigured by scurf, and the colour is a dark-brown, but in some cases lighter and approaching to the Malay. The more exposed hordes are black. An individual who, many years ago, was brought to Pinang, and who has hitherto represented the race in European ethnology, probably belonged to such a horde. His lips were thick, and Mr. Anderson says he exactly resembled two natives of the Andamans, who were brought to Pinang in 1819. Mr. Anderson adds that a Semang of Tringanu, who lived in Pinang was 'not of such a jet-black glossy appearance' as the Semang from Kidah whom he saw, and the two Andamani. The hair is spiral, not woolly, and grows thickly on the head in tufts. They have thick moustaches, the growth being much stronger than in the Malay race. The head is neither Mongolian nor Negro of the Guinea type. It is Papu-Tamulian. The expression of the face is mild, simple, and stupid. The voice is soft, low, nasal, and hollow, or cerebral. A line of tatooing extends from the forehead to the cheek-bones. The adjacent Binua also tattoo. The practice is Indian among the Konds, higher Abor tribes, &c., also ultra-Indian and Asianesian. The right ear is pierced, the orifice being large, but they do not pierce the septum of the nose like one of the adjacent Binua tribes of Perak, and many of the Asianesian Papua. The hair is cropped save a ring or fringe round the forehead.—*Mr. Logan*; *Jour. Ind. Arch., Vol.* iv, *p.* 427 ; *Ib. in Jour. Ind. Arch.* ; *Mr. G. W. Earl's Indian Archipelago.* See India, Jakun, Kedah or Quedah.

SEMAO also called Savu, a moderately-sized island, 15 miles long, fronting the south-west end of Timor. The village of Oeassa, is remarkable for its soap springs, one of which in the village rises like a small volcano. The water contains alkali and iodine. The natives of this Semao Island have been named by Mr. Crawfurd the Negro Malayan race. The people are like those of Timor with frizzly or wavy hair, a coppery brown colour. Semao Island, has abundance of monkeys, one of them is the Macacus cynomolgus, or hair-lipped monkey, which is found all over the western islands of the Archipelago.—*Bikmore, p.* 116 ; *Wallace, p.* 186. See India.

SEMAVAH, see Chaldea.

SEMA VATTI, TAM. Sethia indica, *DC.*

SEMBAL, or Semal, HIND. Bombax heptaphyllum ; Cotton tree. Sembal-gond or Musali Sembal, the gum of Bombax heptaphyllum.

SEMBELU PULI PILLA, TAM. Cinnamonum iners, *Rein.*

SEMBHALA, or Sembhalu, HIND. Vitex negundo.

SEMBILA, TAM. Cinnamomum iners.

SEM-KA-GOND, on quite the outer Himalaya, in the Dera Dhoon, is collected a gum known locally as Sem-ka-gond, which Mr. R. P. Colvin, of Gurhwal, believes to be from a species of Bauhinia. Lindley refers to the gum in his Vegetable Kingdom, as obtained from a Bauhinia, and the natives say it is exported from the Dhoon for purposes of dyeing. The gum of Bauhinia parviflora, *Vahl.*, is used medicinally in Southern India.

SEMBULINJA MARAM, TAM., also Thavadarum, TAM., properly Devadaram, TAM. Sethia indica.

SEMBU NIRINGHI, SINGH. Tribulus lanuginosus, *Linn., Roxb., W. & A., W. Ic.*

SEME, also Semian, TAM., TEL. Vermicelli.

SEMECARPUS, a genus of plants, of the south-east of Asia, of the sub-order Anacardieæ. They are moderate-sized or large trees, and many furnish wood and other useful products. Semecarpus acuminata, *Wall., Thw.*, is a middle-sized tree in the forests of the Ratnapoora, Galle and Ambagamowa districts of Ceylon at no great elevation, and it grows also in Chittagong. S. cassuvium, *Roxb.*, the Cassuvium silvestre of Rumphius, is a tree of the Moluccas, where its tender leaves are eaten and the acrid juice of its stem is employed to varnish shields, canes, &c. Semecarpus coriacea, *Thw.*, is a moderate-sized tree of the central province of Ceylon, at an elevation of 5,000 to 7,000 feet. Semecarpus gardneri, *Thw.* Badoolla-gass, SINGH., is a moderate-sized tree, very common in the central province of Ceylon, up to an elevation of 3,000 feet. S. humilis, *Wall.*, occurs at Promo. Semecarpus Moonii, *Thw.*, is a moderate-sized tree of Ceylon, in the south of the island, at no great elevation. S. nigro-viridis, *Thw.*, is a moderate-sized tree in the central province of Ceylon, at an elevation of 2,000 to 4,000 feet. S. odoratus, *Wall.*, in the Royal Garden, Ceylon. S. oblongifolia, *Thw.* Badoolla-gass, SINGH., is a moderate sized tree, common in the hot, drier, parts of the island of Ceylon, up to an elevation of 3,000 feet. S. obovata, *Moon*, is a moderate-sized tree of Ceylon, growing at Caltura, and near Ratnapoora. S. obscura, *Thw.*, a moderate-sized tree, growing at Deltotte, in the central province of Ceylon, at an elevation of 3,000 feet. S. parvifolia, *Thw.* Heen-badoolla-gass, SINGH., is a small-sized tree of Ceylon, in the Hinidoon Corle, in the Galle district. S. pubescens, *Thw.*, is a small-sized tree of the Ratnapoora district in Ceylon, at no great elevation. S. subpeltata, *Thw.* Maha-badoolla-gass, SINGH., is a large tree of Ceylon, 30 to 40 feet high, in the Singhe-rajah and other forests between Ratnapoora and Galle.—*Thw. En. Pl. Zeyl., p.* 75, *Voigt. Hort. Cal., p.* 271 ; *Roxb. Fl. Ind., Vol.* ii, *p.* 85.

SEMECARPUS ANACARDIUM, *Linn.; Roxb.; W. & A.; W. Ic.*

Anacardium latifolium, *Lam.* | A. officinarum, *Gært.*

This is a common tree in the Madras presidency, and on the skirts of the Bombay forests; it grows also in Berar, Kumaon, Sylhet, Assam, to Dera Doon and Kyarda. It is common in the Pegu and Toughoo forests, where it grows to be a middle-sized tree. The juice is, however, so acrid that wood cutters are unwilling to cut the tree until after it has been killed, by ringing the bark. Extreme height 40 feet. Circumference 4 feet. Height from ground to the intersection of the first branch, 20 feet. Dr. McClelland says that the wood is adapted for fancy work and cabinet-making, but to Dr. Wight it was reported to be of no value. The softness of the wood and its acrid juice, which renders it dangerous to work, detract from its value. The nuts are exported from the Dekhan and Mysore as a mordant. The danger of felling, Mr. Jacob thinks, is over-rated, as he has never seen natives hesitate to hack it. As an ornamental tree, either in full foliage or before the fall of the leaf, it merits observation. The fruit which grows attached to the nut, when ripe, is pleasant and harmless to eat. Its corrosive resinous juice is at first of a pale milk-colour, but when the fruit is perfectly ripe it is of a pure black colour and very acrid, and in both respects resembles that of several other plants of the same family, as in the cashew-nut, species of Rhus, and some of the varnish-trees. The juice is employed, externally, in medicine, by the natives of India, and to mark all kinds of cotton cloth. The colour is improved and fixed by a mixture of quicklime and water. This common tree is of no value as timber. A considerable quantity of the nuts are exported from the Dekhan and Mysore, as a mordant. The juice is so acrid that wood-cutters are unwilling to cut the tree until it has been killed by ringing the bark.

An acrid and vesicating oil is found between the two laminæ of the pericarp of the marking nut. It is collected and used, as a preventive against the attacks of white ants, and by native practitioners in rheumatic and leprous affections. By boiling the whole nut not divested of its pericarp, an oil is also obtained which acts as a blister. The preparation or collection either of the oil or acrid juice is liable to cause much irritation and inflammation of the hands, face, &c., of those engaged in the work. The nuts are black, smooth, shining, and flattened on both sides. The acrid black juice of the nut is employed by the natives externally to remove rheumatic pains, aches and sprains, by rubbing a little over the affected part. It is also universally used for marking cotton cloth, whence its name of marking nut, the colour being improved and prevented from running, by being mixed with lime-water.—*Drs. Wight, Mc Clelland, Gibson, Cleghorn, Voigt, Roxb., Vol.* ii, *p.* 85 ; *W. Jacob, Esq.*, c.p. ; *M. E. J. R.*; *Faulkner* ; *Powell's Hand-book, Vol.* i, *p.* 338 ; *Capt. Macdonald* ; *Mr. Thompson* ; *Rhode.* See Dyes, Drugs, Oil.

SEMECARPUS CUNEIFOLUM, *Wall.* Syn. of Semecarpus anacardium, *Linn.*

SEMECARPUS CUNEIFOLIUS, *Roxb.*

Biboowa,	Mahr.	Bibwa,	Mahr.

This tree grows in the Bombay ghauts, Lanowlee Grove, Khandalla, and about Parr ; also in Hindustan, Nepaul, and the Himalaya. Dr. Gibson says, the wood is not of any value, but might be turned to some account by being creosoted, of which the openness of its fibres would admit.—*Drs. Gibson* ; *Voigt* ; *Roxb., Vol.* ii, *p.* 86.

SEMENCE DE TREFLE, Fr. Clover seed.

SEMEN DE COIQ, also Quincunx, Fr. Quince seed.

SEMEN CONTRA, Sahibi, Hind. The undeveloped calices of Artemisa judaica. A well known and much esteemed anthelmintic, especially in the round and long worm of children, (Lumbricus teres). The action is heating and stimulant, dose 10 grs. to ½ a drachm finely powdered, in electuary with honey, or diffused through milk, and taken when the stomach is empty. In infusion or decoction the bitterness is quite disgusting ; cathartics should either follow or accompany its use. The use of moxa, or of actual fire, to the surface of the body is a favourite practice in all savage and even half-civilized nations. In China, the down of the Artemisia chinensis is set on fire, and the burning end applied directly to the part. In India, a red-hot gool, or hooka pastille, is usually employed. In Italy a small flame of hydrogen has been lately tried, and in Germany it is a common practice to place a particle of phosphorus on the skin, and then ignite it. The object in all is to effect counter-irritation, and the usual cases in which it is applied are chronic rheumatism, sciatica, neuralgia, deep-seated diseases of the bones, cartilages or ligaments. In India, gools are used by the native empirics for almost all diseases, especially for enlargements of the spleen and liver.—*O'Shaughnessy, p.* 417.

SEMEO, see Naga.

SEMERINDEM, see Kyan.

SEMI, HIND. Vermicelli.

SEMI-AVITTI, TAM. Cassia alata.

SEMIRAMIS. The great Assyrian queen, wife of Ninus, extended her conquests into western Asia until they even embraced Bactria or Bactriana, which is now represented by the modern Balk. Little is known of the history of these regions prior to Alexander's conquests, but Bacchus, Semiramis, Sesostris, Alexander, and many before them, would never have carried their arms into India, if they had not been attracted by the name of the country. Semiramis marched on India B. C. 1230. She captured on the Kophen (the Kabul river, the Kubha of the Rig-veda,) the city of the same name. She fitted out her armament in Bactria, but was opposed by Jarasandha of Bagadah, the Barhsatide. Semiramis crossed the Indus with a great strength, but Jarasandha, with a formidable force of archers and elephants, drove back the Assyrians in total disorder to the river, which they crossed with immense loss. Semiramis concluded an armistice, and retreated into Bactria, with a third of the army she had brought against India. Semiramis was said to have been changed into a dove, she was afterwards worshipped as a dove, and Mr. Maurice thinks that Ninus and Semiramis are Vishnu and Siva. The dove is mentioned in Solomon, chs. ii, iv, v ; Jer., ch. xlviii, v. 28. The power of Bactria was broken by the Assyrians, B. C. 1200. Both C'tesias and Isadore mention a statue and pillar of Semiramis at Baptane, but the sculptures of Semiramis and the inscription in the Syriac character have wholly disappeared. Baghistan is traditionally described as the pleasure-grounds of the queen. The possibility has been surmised of another queen of this name in the ninth century B. C.—*Bunsen, Vol.* iv, *p.* 417 ; *Sonnerat's Voyages, p. 5.* See Besitun, India, Ninus.

SEMITIC RACES. The land of the sources of the Euphrates formed the primæval seat of the Semitic races. The Semites, according to Bunsen, (iv, 487) emigrated out of the country of the sources of the Euphrates and Tigris, B. C. 10,000 to 11,000. The term Semitic was first applied by Eichorn. Their languages are all more or less intelligible, their physiognomy Caucasian. Their language in one form was that of the Judaic portion of christianity in the Old Testament, the Talmud, and the Syrian fathers. In another form it was that of the Koran or mahomedanism. It was the language of the earliest alphabet of Phœnicia and the Punic colonies. It fell into the Aramæan, the Arabic and the Æthiopic divisions. The Aramæan contained the Hebrew, the Samaritan, and the Syriac of Edessa, Palmyra, Damascus and other important cities, and the people who spoke it were enterprising merchants, bold mariners and monotheist priests. The Semitic populations in Asia are the Arabians, Syrians, Samaritans ; in Africa, Abyssinians of Tigre and Amhara, Agow, Falasha, Gafat. Conquest and commerce, but chiefly the former, has greatly diffused this race. In various inroads, they have gone northward and eastward into Persia, India and China, and smaller parties are to be found located in Burmah, in Malaya and Polynesia. Many of them have likewise conquered and migrated to the west, along the north of Africa and into Europe, where, as in Spain, they ruled for 700 years, but were again driven back into Africa. They are now found in Africa, as Fetish worshippers, christians, mahomedans and Jews. Abyssinia is christian, being acquainted with the chief truths of the Bible, but all much blended with merely human notions. The latest polemics there, have been as to the two or three births of Christ,—born of the father before all worlds, made man, and in the baptism at Jordan receiving the holy Spirit. As regards the two natures of Christ, they are extreme monophysists. Monogamy is their Church law, but concubinage is universal. The Adal, also said to be a Semitic race, are tribes on the west of the Red Sea, who call themselves Afer, but by the Arabs they are called Danakil, from their chief tribe Ad Alli. Dr. Krapf is of opinion that this Afer is the Ophir of Scripture. He thinks that Ophir, in Job. xxvii, v. 6, simply means gold dust. The Galla is a race inhabiting Shoa and one of the finest in Africa, strong, well-limbed, and of a dark-brown colour, living in a beautiful country, extending from long. 8° north to lat. 3° south, with a climate not surpassed by that of Italy or Greece. Speaking a language as soft and musical as pure Tuscan, cultivating the soil and rearing cattle. They are from 6 to 8 millions in numbers. Their religion, like that of all African savages, is Fetish. They acknowledge a supreme being whom they call heaven (Mulungu), and having a notion of a future state. There seem to be three natures or attributes in their Deity, Wak or Waka, Supreme, Ogli, a masculine, and Ateti, a feminine embodiment. They have two holy days, Saturday, which they call Saubatta kenna, or little Sabbath, and Sunday, Saubata gudda, or greater Sabbath. The Kabyla, south of Algiers are Berbers, the old Numidians, and differ in language, form, and habit of mind from the Arabs of the plains, being matter of fact in mind and but little gifted with the glowing imagination of the Arab. The unsubdued portion dwell in the mountainous tract, with bare precipitous peaks, to the south of the little Atlas and of Algiers. They are spare but robust: and of smaller stature than the Nomade, for the Kabyla are dwellers in houses or huts (hence their name), are laborious tillers of the soil, and handicraftsmen, clever in winning metals from their hills and even in forging arms. They are wonderful horse-men, and terrible in a foray as in the days of Sallust, and are always at war with the Arabs. The slopes and valleys of their mountain country are all rich, cultivated lands, covered with olive-trees and corn-fields, and the rocks are said to contain minerals. Their number is about 700,000, possessing some millions of acres of the very best land of Africa, watered by three rivers and teeming with rich harvests. They approach to within 120 miles of Algiers which they separate from Constantine. They are a federal republic, and elect their own chiefs. They are the old Quinquegentes, who gave so much trouble to the Romans, who tried the soldiership of Maximinian, and sixty years afterwards again revolted. Tu ferocissimos Mauritaniæ populos, inaccesis, montium jugisset naturali munitione fidentes, expugnasti, recepisti, transtultisti. By Maximinian's system of transtultsi these five nations were reduced to four. The Kabyle have feuds amongst themselves. The Touareng is a nomade race, dwelling in the great desert, very fair, with long hair, aquiline noses, high foreheads, and thin lips. They say prayers in Arabic, but speak a semitic tongue. Their arms consist of a long lance with a broad head, javelins 6 or 7 feet long, jagged hooks at the pointed end, a round buckler (Darega) of buffalo or elephant hide from Soudan, a poinard and a broad-bladed scimeter. If we proceed west to Morocco, we find its entire population computed at 8 millions to consist of:—

Berber..	...2,300,000	Negro and Abid	120,000
Shellok	...1,450,000	Christian. ...	300
Moor	3,550,000	Renegades...	200
Arab	 740,000		
Jews	 340,000		

The Berber and Shellok are untamed fighting tribes dwelling in the mountains. When possible, rovers of the sea, claiming fanciful origins, but impatient of any subjection. They are the same race whom the French call Kabyle and Zouave. The Moors are lowlanders, traders and dwellers in cities. They are little idle men, who grow fat from indolence, avaricious, perfidious, cowardly, cringing and insolent. They are said to be descendants of the Carthaginians. The Arabs of Morocco are the Moors of Spain, the Saracens of France, tall, graceful sons of the Arabian desert, courteous, brave, hospitable and confiding, descendants of the conquerors, who in the first ages of the hijrah propagated the religion of Mahomed, crossed the Straits of Gibraltar, destroyed the Gothic chivalry, reigned in Spain for 700 years, invaded France, devastated Italy and pillaged the suburbs of Imperial Rome. When the last Arab king submitted to Ferdinand and Isabella, and the Moorish palaces of Grenada were surrendered to the christians, the old conquerors went back to Africa and resumed their nomade life. In Tripoli, the Arab has monopolized the country. In Tunis, the native re-appears in a smaller proportion, and in Morocco he is very scarce. The Berber and Shellok are untamed warlike tribes dwelling in the mountains. When possible, rovers of the sea, claiming fanciful origins, but impatient of any subjection. They are the same race whom the French call Kabyle and Zouave. The Moors are little idle men, who grow fat from indolence, they are lowlanders, traders, dwellers in cities, avaricious, perfidious, cowardly, cringing and insolent. The Berber and Moor profess mahomedanism. When the last Arab king submitted to Ferdinand and Isabella, and the Moorish palaces of Granada were surrendered to the christians, the old conquerors went back to Africa and resumed their nomade life. In Tripoli, the Arab has monopolized the country. In Tunis, the native re-appears in a smaller proportion. In Algeria, he is almost equal to the Arab invader, and in Morocco he is very scarce. The Jews of Morocco are partly urban, partly mountaineers, the latter dating their arrival prior to the nativity. They live in friendship with the Berber, but at hostility with another strange race, who declare themselves descendants of those Philistines whom Joshua drove out of Syria, and who found a refuge in this remote portion of Africa. The Riff dwellers of Kalhiya (Cape Tres Forcas) were formerly much engaged in piratical expeditions which were put down by Muli Abdur Rahman in 1817. Er Rif means shore or bank, and so long ago as Leo the African was used to designate all the sea coast between Tetuan and Mlila or Mililla. It is the country of the chain of the Atlas, and is about 200 miles to 300 long. The word is evidently derived from Ripa, a bank, and is synonymous with the Arabic Sahila. Thus the inhabitants of the Algerine coast are called Sahali, those of Morocco Rifi. The original highland south-west of Armenia (Armiun) the country between the sources of the Euphrates and Tigris, and Mesopotamia proper, is Aram Nahrain. The Aramæans were a Semitic race of highlanders who first settled on the upper part of the Euphrates and Tigris districts, and then passed through Mesopotamia proper (Aram of the two rivers,) the lowland (where is Mash, Mons Masius) which falls gradually towards Syria, afterwards called Aram. The name of Uz, in Nejd, proves that its off-sets extended as far as North Arabia. The Aramaic tribes, according to Ch. Bunsen, are the historical nations of Syria, Aram, Mesopotamia and Babylonia, speaking Syrian in the west and the so-called Chaldaic in the east. In the gradual diffusion of mankind, the western provinces of Iran seem to have fallen to the share of the Aramæans and Elamites—and the Semitic people and language displaced the Cushite. From their primitive language two distinct branches sprung,—the original Arabic, with the Musnud, Koresh and other dialects of that tongue, being one, and the Aramaic, the other. The latter had two grand subdivisions, from one of which, known as the Western Aramaic, were derived the Amharic, Syriac, Hebrew, &c., &c., and from the other or Eastern Aramaic came the Syrian, Babylonian and Chaldean tongues. From its monosyllabic construction the eastern seems to be more ancient than the Western Aramaic, and it appears likewise to be the root of the Zend, Pehlevi, Sanscrit and other dialects in use throughout a portion of the territory along which it had spread eastwards. The Arabic language, as written in the Koran, is the most developed and richest in the Semitic tongues. It is not now spoken in any part of Arabia, as there written. Probably it never was so, any more than the Latin, the English, the German or Italian have ever been spoken as written in their respective bounds, and Burton quotes from the Arabic Grammar of Clodius that the dialectus Arabum vulgaris tantum differt ab erudita, quantum Isocrates dictio ab hodierna lingua Græca. Indeed the Arabs themselves divide their spoken and even written language in two orders, the "Kalam Wati," or vulgar tongue, sometimes employed in epistolary correspondence, and the "Nahwi," or gramatical or classical language. Every man of education uses the former and can use the latter. And the Koran is no more a model of Arabic (as it is often assumed to be) than "Paradise Lost" is of English. Inimitable, no man imitates them.

The people known as Arabs, are spread from Syria to the Indian Ocean. They are chiefly in tribes and those who occupy the country around Jerusalem, are the Anezi, Shammar, Mowali and Salhan. The Assir tribe occupy between Meccah and Medinah. They have six Kabile, Binul-Asmar, Bin-ul-Akmar, Charaan, Assir, Roufeida and Abida, and muster about 44,500 fighting men. The Cha'ab-Arabs occupy the lower part of Mesopotamia. They are a tall, warlike race, strong limbed and muscular, active and healthy. It is necessary, when considering the Arabs, to distinguish between a series of grades towards civilization, in which they may at present be found. The Bedouin, is wandering, pastoral, tent-loving, disdaining to trade, yet avaricious and willing to sell his ghee, his mutton, or his horse, and always found in wide and open wastes, unpressed upon by adequate exterior power. Yet, even the Bedouin bends to circumstances. He accepts the region allotted for his pasture grounds. Plunder has its laws and vengence its chivalry. If he will not trade, he still has wants: and suffers the presence of a Jew or Saleebah as the Affghan suffers that of the hindoo. A little higher in the scale, as with the Cha'ab, is the original wandering pastoral Arab, in a district where he is pressed upon from without, and where boundless plunder and roaming are restrained by exterior force. The Arab then partly turns to agriculture, and for this he must in some degree settle. Society harmonizes to this level. Trade is possible. Corn is sold. The abba cloaks are woven and exported. Dates are planted. The appetite for trade grows by what it feeds on. Huts of reeds replace tents; and one sees in their feeble efforts at reed ornamentation, and in their rough twisting of their reed rope for their bunds, the possible germ of some architectural efforts. Yet higher in the scale is the Arab flourishing as an experienced and wealthy merchant in a town, or administering a well-ordered and comfortable rural district. Passing among these people, society is seen in its transitional state towards civilization. The present Arabians, according to their own historians, are sprung from two stocks: Kahtan, the same with Joktan or Yoktan, of the Bible, the son of Eber, whose descendants occupy the south; and Adnan descended in a direct line from Ishmael, the son of Abraham and Hagar, who occupy the north. Yoktan according to Ch. Bunsen, was one of the two sons of Nimrod and was the chief of the first Arabian emigration that proceeded southwards. Tradition points to the mountains of Armenia as the birthplace of the Arab and Canaanitish races. It is supposed that they travelled along the banks of the Tigris into Mesopotamia, from which a portion of them commenced a great migration southwards, the result of which was the foundation of the primeval kingdoms of Southern Arabia, the kingdoms of the Adites in Yemen, who believe that they came from the sacred North, and once lived in a glorious garden of the earth which they are to restore. In the matter of their present locations, Dr. Latham, in his Ethnology, mentions that Hejaz, is peopled by the descendants of Ishmael, but the inhabitants of Meccah and Jedda, consist of pilgrims and their descendants of African, Persian and Turk-blood. In Southern Arabia, Yemen, Hadramaut and Oman, the people are more or less Himyarite in blood, history and civilization. Those of the towns of Mokah, Sanai, Rodda and Loheia, are the more civilized and the desert and hill Arabs are rude and ignorant, one of them so rude in speech as to be named the Bin-i-Kalb, children of dogs—and the Berekede a branch of the Asir are said to lend their wives like the Jakuri Hazara. At Hasek is the tomb of the prophet Hud, the fourth in descent from Shem. At the entrance of the Persian Gulf, the pirate coast begins and extends 300 miles northwards. The southern tribes of the Peninsula of Senai, are more or less fishermen. The early Arab religion was Sabæanism, a worship of the heavenly bodies, mixed with idolatry, but with Mahomed commenced the Arab conquests, the creed, science and literature. At present, the Arabic alphabet is in use amongst the Turks, Persians, Malays, some of the people of India and Africa. It was however of Syrian origin. The Arab family is mahomedan, except the christian Arabs of Malta. Nejd or Central Arabia is Syrian, and arranged into divisions called " Suk." The people occupying the Arabian peninsula, are, however, regarded by Captain Burton as of three distinct races : viz., the aborigines of the country, who have been driven, like the Bheels and other autochthonic Indians, into the eastern and south-eastern wilds bordering upon the ocean : second, a Syrian or Mesopotamian stock, typified by Shem and Joktan, that drove the indigenæ from the choicest tracts of country ; these invaders still enjoy their conquests, representing the great Arabian people. And thirdly, an impure Egypto-Arab clan, well personified by Ishmael, his son Nebajoth and Edom (Esau, the son of Isaac)—that populated and still populates the Sinaitic peninsula. The indigens or autochthones, he says, are those sub-Caucasian tribes which may still be met with in the province of Mahrah, and generally along the coast between Muscat and Hadramaut. The Mahrah, the Jenabah, and the Gara especially show a low development, for which hardship and privation only will not satisfactorily account. These are " Arab el Aribah," for whose inferiority oriental fable accounts as usual by thaumaturgy. Dr. Carter has remarked the similarity between the lowest type of Bedouin and the indigens of India, as represented by the Bheel and other jungle races. The principal immigrant race, he also says, are the Noachian, a great Chaldæan or Mesopotamian clan which entered Arabia about B. C. 2,200, and by slow and gradual encroachments drove before them the ancient race and seized the happier lands of the peninsula. This race would correspond with the Arab el Muta-Aribah or Arabicised Arabs of the eastern historians. The third family, an ancient and a noble stock, dating from B. C. 1,900, and typified in history by Ishmæl, still occupies the Sinaitic Peninsula. These Arabs, however, do not, and never did, extend beyond the limits of the mountains, where they are still dwelling in the presence of their brethren. Captain Burton, (iii, 31) considers it highly probable that the Copts, or ancient Egyptians, were "half-caste Arabs ;" a mixed people like the Abyssinian, the Galla, the Somali, and the Kafir, an Arab graft upon an African stock. Hence the old Nilitic race has been represented as woolly-headed and of negro feature, The Arab are not so scrupulous as the Turks and Persians about their women ; and though they have the harem, or women's part of the tent, yet such as they are acquainted with come into it.

The Pirate race whose power and influence was long felt by the neighbouring tribes and is still intimately connected with their political condition, occupy a part of the coast within the Persian Gulf, comprehended between the mountain range and the sea-shore, and extending in that direction from Kasab to the island of Bahrein,—a distance of 350 miles. On the map, this portion bears the designation of the Pirate coast. Ibn Haukal, in his version of the Koran, informs us that before the deliverance of the children of Israel from Egyptian bondage, the subjects of a pirate monarch in these parts seized on every valuable ship which passed. The possession of a few ports within and near the entrance of the Persian Gulf, where it is not more than thirty miles across, enabled them to perceive and sally out on all passing vessels. To the Portuguese during their brief career in India, they proved quite as troublesome as they did in the latter part of the eighteenth century to the British: with these robbers the imams of Maskat have been repeatedly at war. In 1809, an expedition was sent against them under Captain Wainwright, in his Majesty's ship Chiffonne. Their principal stronghold, Ras-ul-Khaïmah was stormed and taken, and fifty of their largest vessels burnt or destroyed. Leit, on the island of Kishm, and several other ports, were reduced; but though this had the effect of checking them for a time, they soon re-built these ports, and gradually returned to their old practices. The inhabitants of the Pirate coast consider themselves to be far superior to either the Bedouin or town Arab. The latter, especially those from Oman, they hold in such contempt, that a Maskatti and an arrant coward are by them held to be nearly synonymous. They are taller, fairer, and, in general, more muscular than either of the above classes, until they attain the age of thirty or forty years, when they acquire a similar patriarchal appearance.

The Zanzibar dominions comprise that portion of the coast included between Magdashoa in 2° north latitude, and Cape Delgado in 10° 42′ south latitude. Beyond them, to the north, are the independent Somalee tribes, which extend almost to the Red Sea, where they meet the Dankalie race; and on the south they are bounded by Mozambique. The extent of coast under the dominion of the sultan of Zanzibar is about eleven hundred miles, but the most valuable parts of his sultanate are the islands of Zanzibar (containing the capital of the same name), Pemba and Monfia. The first is situated at a distance of from twenty to thirty miles from the mainland; and is in size about equal to the Isle of Wight. It contains none but small streams.

The Assyrians are recognized to have been Semites. It has been proved by a comparative list of declensions and conjugations, that Hebrew, Chaldee, Syriac, Arabic, Ethiopic, and Amharic are all but dialects of one original language, and constitute one family of speech, the Semitic. The following nations form compact mass, and represent one physiologically and historically connected family; the Hebrews, with the other tribes of Canaan or Palestine, inclusive of the Phœnicians, who spread their language, through their colonization, as that of the Carthaginians; the Aramaic tribes, or the historical nations of Aram, Syria, Mesopotamia and Babylonia, speaking Syrian in the west, and the so called Chaldaic in the east; finally, the Arabians, whose language is connected (through the Himyaritic) with the Æthiopic, the ancient (now the sacred) language of Abyssinia. The term Semitic is the name now generally adopted among German Hebrew scholars. In Semitic, words the root remains always distinct and unmistakeable. In Aryan, on the contrary, it soon becomes altered and disguised. Hence Semitic dictionaries are mostly arranged according to the roots, a method which in Aryan languages would be most inconvenient, the root being often obscure, and in many cases doubtful. The Amharic as also the Hebrew and Syriac is derived from the Western Aramozi. The term Semitic, Eichorn adopted from Shem. The language is the oriental language of some authors, the Syro-Arabian of Farrer and the Arabic of Leibnitz. The Semitic family of languages is divided by Professor Max-Muller into three branches, the Aramaic, the Hebraic, and the Arabic. The Aramaic occupies the north, including Syria, Mesopotamia, and part of the ancient kingdoms of Babylonia and Assyria. It is known to us chiefly in two dialects, the Syriac and Chaldee. The former name is given to the language which has been preserved to us in a translation of the Bible (the Peshito) ascribed to the second century, and in the rich christian literature dating from the fourth. It is still spoken, though in a very corrupt form, by the Nestorians of Kurdistan, near the lakes of Van and Urmia, and by some christian tribes in Mesopotamia; and an attempt has been made by the American missionaries, stationed at Urmia, to restore this dialect to some grammatical correctness by publishing translations and a grammar of what they call the Neo-Syriac language. The name of Chaldee has been given to the language adopted by the Jews during the Babylonian captivity. Though the Jews always retained a knowledge of their sacred language, they soon began to adopt the dialect of their conquerors, not for conversation only, but also for literary composition. The bóok of Ezra contains fragments in Chaldee, contemporaneous with the cuneiform inscriptious of Darius and Xerxes, and several of the apocryphal books, though preserved to us in Greek only, were most likely composed originally in Chaldee, and not in Hebrew. The so-called Targums again, or translations and paraphrases of the Old Testament, written during the centuries immediately preceding and following the christian era, give us another specimen of the Aramaic, or the language of Babylonia, as transplanted to Palestine. This Aramaic was the dialect spoken by the Lord Jesus and his disciples. The few authentic words preserved in the New Testament as spoken by our Lord in His own language, such as Talitha kumi, Maranatha, Abba, are not in Hebrew, but in the Chaldee, or Aramaic, as then spoken by the Jews. The second branch of the Semitic family is the Hebraic, with which is connected the Carthaginian, Phænician and Arabic. This third, or Arabic branch sprang from the Arabian peninsula, where it is still spoken by a compact mass of aboriginal inhabitants. Its most ancient documents are the Himyaritic inscriptions. In very early times this Arabic branch was transplanted to Africa, where, south of Egypt and Nubia, on the coast opposite Yemen, an ancient Semitic dialect has maintained itself to the present day. This is the Ethiopic or Abyssinian, or, as it is called by the people themselves, the Gees language. Though no longer spoken in its purity by the people of Habesh, it is still preserved in their sacred writings, translations of the Bible, and similar works, which date from the third and fourth centuries. The modern language of Abyssinia is called Amharic. These three branches, the Aramaic, the Hebraic, and Arabic, are closely related to each other. Besides these, Egyptian, Babylonian, Assyrian and the Berber dialects are now considered to have a Semitic character, by Champollion, Bunsen (Egyptian), Lassen, Eugene Bornouf, Dr. Hincks, Sir H. Rawlinson, (Assyrian), and Professor F. Newman (Berber.) Some branches of the Semitic race, ignorant of science, theocratic, have devoted themselves to the expression of religious instincts and intuitions, in one word to the establishment of monotheism. The doctrine of a future life and retribution, which in one form or other was inwoven with the religious ideas of Egypt, appears to have been unknown to the Semitic nations. The Assyrians were Semites. The names of the Assyrian gods, as Baal or Belus (the supreme deity amongst many of the Semitic races), Nisroch and Mylitta (known by a nearly similar name to the Arabians), of members of the family of the king, such as Adra-meleck (son of Sennacherib), and of many of the principal officers of state mentioned in scripture, such as Rab-saris, the chief of the eunuchs, and Rab-shakeh, the chief of the cup-bearers, are purely Semitic. The language spoken by Abraham when he left Mesopotamia closely resembled the Hebrew; and his own name was Semitic. Moreover, a dialect of the same tongue is still spoken by the Chaldæans of Kurdistan; who, there is good reason to suppose, are the descendants of the ancient Assyrians. The common origin of their languages, is, however, the only connecting bond which unites the widely separated Semitic nations, Hebrews, Babylonians, Phœnicians, Carthagenians and Arabs. The Arab, the Hebrew, and the Palestine descendants of Terah were nomade tribes. The Phœnician, the Syrian and the people of Mesopotamia and Yemen, formed civilized nationalities. It has not been unusual to describe the Semites as essentially monotheistic, but their tribes and nations were worshippers of El, Elohim, Jehovah, Sabaoth, Moloch, Nisroch, Rimmon, Nebo, Dagon, Ashtaroth, Baal or Bel-Peor, Baal-zebub, Chemosh, Milcom, Adram-Melek, Anna-Malek, Nibhaz, Tartak, Ashima, Nergal, Succoth-benoth, the Sun, the Moon, the Planets and all the Host of Heaven. Amongst the nomade branch, there seems early to have been a monotheistic belief, but the great bulk of the Hebrew nation continued to worship idols of their own manufacture, and the prophet when ordered by inspiration to proceed to the wilderness of Damascus was told that there were only in Israel 7,000 people who believed in the one God. There have ever been a few monotheists amongst the idolatrous hindoos as may be illustrated by the writings of a Tamil writer, Sivavaykiar, who says—

Stones, resonant when struck, ye break, and make images of them.
Such stones, as worthy of worship, ye adorn with flowers and sacred ashes.
Threshold-stones ye tread upon, even to wearing them away.
Neither of these two kinds of stones are stones pleasing to God.
How many various flowers have I culled and cast (before the idol.)
In vain how many mantras have I said.
Whilst roaming, how often have I upraised water (standing in rivers or tanks, in homage of the rising sun-god.)
How often have I encircled Saiva temples.
Those sages, who have known and inwardly realized the dwelling place of the Shepherd of the Worlds,
To visible fanes, as if they were divine, raise not hands (of worship.)

The grand epithet "Shepherd of the Worlds!" is as beautiful as anything that ever was said or sung by any Semite, and the beauty of the thoughts which this stanza contains is not surpassed by any of the Hebrew writings. Terah, the father of Abraham, served other gods. In the book of Job, it is God who can number the clouds, in wisdom, who can stay the battles of heaven, (xxxviii, 37) who hath divided a water course for the overflowing of waters, and a way for the lightning of thunder, (25) who hath begotten the drops of dew(28) and in Proverbs (xxx, 4) who hath bound the waters in a garment, who hath established all the ends of the earth. Abraham, indeed, was inspired with a knowledge of the one true God, but his family had images, the teraphim which Rachel stole from her father Laban, (Gen. xxxi, 19-30) and when Jacob fled from Esau into Padan Aram and dreamed the dream at Bethel, he evidently had belief in many gods, for he endeavoured to make a bargain with the deity saying, if God will be with me and will keep me in the way that I go, and will give me bread to eat, and raiment to put on, so that I shall come again to my father's house in peace, then shall the Lord be my God. (Gen. xxviii, 20) Such language only shows a belief that there were other gods, one of whom might be Jacob's own protector. The same principle is invoqued in the commandment later proclaimed by Moses to have none other gods but the Lord God, and even more lately Joshua has to urge the people to put away strange gods, (Joshua) to put away the gods which their fathers served on the other side of the flood, "Choose ye this day he says, whom ye will serve, whether the gods which your fathers served on the other side of the flood, or the gods of the Amorites amongst whom ye dwell, but as for me and my house we will serve the Lord." Later still, the Psalmist says, (xxxvi, 8) amongst the gods there is none like unto thee, O! Lord, neither are there any works like unto thy works.—*History of Ancient Sanskrit Literature, by Max. SEMNAI, a name by which Clemens of Alexandria, designates the buddhist nuns of his day. Buddhism and brahminism are of independent origin, and existed a long time contemporaneously, buddhism, in its early stages, is as ancient as brahminism. Clemens of Alexandria mentions buddhist pyramids, and the habit of depositing bones in them ; their practice of fortelling events : of their continence and of the buddhist Semnai or holy virgins, and he names their god Bouta. Porphyry tells us that the brahmans were born to their dignity while the Samanai were elected. Cyril of Alexandria states that there were samans in Bactrea. Buddha is seemingly the word Bhot. For buddhism, in Nepal and Tibet, its vehicle was Sanscrit rather than Pali. The monuments of Priadasi at Dhauli in Kuttack, Girnar in Guzerat, and at Kapurdigiri in Kabul, each contains the same inscription, in which is mentioned the name of Antiochus—and in an ancient Singhalese work, Priadasi is stated to be Asoka. The Dhauli and Girnar alphabets are the oldest of the oldest Pali. Buddhist statues are sometimes of great height, one of Buddha near Mehintala in Ceylon, is 70 feet high : one of Gotama Raja at Carculla is 38 feet.—*Sir J. E. Tennant's Ceylon.*

SEMOLA, It. Bran ; but often employed by grocers and other vendors, to designate semolina.

SEMOLINO.

Semoule,	Fr.	Soojie,	Hind.
Gruau,	„	Semolino,	It.

The fine hard inner part of wheat, rounded by attrition in the mill-stones is used exclusively in India for making loaf-bread, about 50 tons of it are annually imported into England from Italy. The best semolino is obtained from the wheat of the southern parts of Europe. In France the name of semolino is given to the large hard grains of wheat retained in the bolting machine after the finer parts have been pressed through its meshes. See Soojie, Wheat.

SEMOOM, ARAB. A hot wind of Arabia, which often proves fatal to man and beast. It blows in gusts for about ten minutes, the air is dimmed but there is no sand or dust raised.—*Palgrave.* See Simoom.

SEMPAGUM, Sempanga-maram, TAM. Michelia rheedii, *W.*

SEMPOE ISLAND, on the south coast of Java, in lat. 8° 28′ 30″ S., and long. 112° 43′ E., is five miles long and consists of high rocks.

SEMPERVIVUM TECTORIUM.

Givet-kya-pen pouk, BURM.

House Leek.

SEMROUL, a river near Seroha in Rewah.

SEMSCHIANUI, also Koshi, RUS. Chamois leather.

SEMUGH, ARAB. Gum.

SEN, HIND. Pisum sativium. Pea.

SEN, in Bengal, a patronymic of persons of the medical caste.

SEN, Adisur was the founder of the Sen dynasty, he brought from Kanouj, five Sagnic brahmans, of the tribes or gotra Sanhila, Kashyapa, Vatsa, Saverna and Bharudwaja; also sudra families, Ghose, Bhose, Dutt, Guha and Mittra, accompanied them, and these take the position of Kulin Kaists. In the reign of Bullal Sen, about 284 years before the mahomedan invasion, all these Kulin brahmans and Kulin sudras had greatly increased, and though degenerated in learning they arrogated to themselves a position above all the Sapta-sali or aboriginal brahmans, and Bullal Sen enobled these brahmans by giving to them the title of Kulin. The Kulin brahmin subsequently consented to marry the daughters of the aboriginal brahmin, who now eagerly seek alliances with the Kulin, and the Kulin have taken advantage of this and have established a scale of fees for condescending to accept a daughter of an inferior. They marry gold. Of the Kayats who came from Kanouj, Bhose, Ghose and Mittra were enobled by Bullal Sen, into Kulin Kayats. Dass, Day, Dutt, Guha, Kar, Paulit, Sen and Sing hold a second rank. Kulin brahman women are married with difficulty and generally to aged men. In A. D. 1868, there were 11 Kulins in Hooghly and one in Burdwan, each of whom had contracted 50 to 80 marriages;—24 in Hooghly and 12 in Burdwan, who had contracted from 20 to 50 marriages, and 48 in Hooghly and 20 in Burdwan, who had contracted between 10 and 20 marriages. Kulinism is thus a great polygamic institution, and a few women have become prostitutes. In A. D. 1867, the abolition of this polygamy, was contemplated and will doubtless soon be carried out.—*Calcutta Review, May* 1868.

SENA, SANS. An army. Sena-Pati, general commanding, lord of the army.

SENAA, a town in the mountains in the S. W. part of Arabia whence the Mocha coffee comes. After the expulsion of the Turks in A. D. 1630, the whole of Yemen came under the government of the Imams of Senaa; but at the time of Carsten Neibuhr's visit to Senaa in 1763, the native Arab tribes of the provinces of Aden, Aboo Areesh, Taez, and others had thrown off allegiance to the Imams. In 1799, when the British government took measures to oppose the expected invasion of India by the French, and to revive the lost trade of the Red Sea, Dr. Pringle obtained facilities for trade, but Sir Home Popham subsequently lost these. At the beginning of the present century, Imam Ali Munsoor suffered severely at the hands of the Wahabee sect who overran and wrested from him some of the best districts of his dominions. In 1816 Mahomed Ali Pasha after he destroyed the Wahabi power restored the districts to Imam Ali. In 1817, in consequence of a dispute in which an Arab had been temporarily detained at the factory at Mokha, the residency was attacked and plundered, and a British Officer was dragged before the Governor, by whom he was subjected to the most brutal insults. In 1840 a commercial treaty was concluded with the Governor of Mokha by Captain Moresby, similar to that concluded in the same year with the Chief of Zaila. For some years the country of Senaa fell into absolute anarchy. In 1832 Mokha and all the sea coast fell under the suzerainty of the Turks. It was afterwards recovered for a time, but again finally lost in 1848. Ali Munsoor, who succeeded his father as Imam of Senaa in 1834, was deposed three years after. During the internal revolutions in Senaa and the desultory warfare with the Turks, the Imams repeatedly endeavoured to enlist the aid and advice of the British government in their cause. A rigid abstinence, however, was maintained from all interference in their affairs.—*Playfair's Hist. of Yemen*; *Papers in the Foreign Office; Treaties, Engagements and Sunnuds, Vol.* vii, *pp.* 300-302. See Wahabi.

SENACIA GLAUCA, *Lam.* Syn. of Elæodendron glaucum, *Pers.*

SENADHI PATI or Senapati, SANS. A general. See Sena.

SENAGA, plural Senagalu, TEL. Cicer arietinum, *Linn.*

SENAI, see Hindoo.

SENAIGUNG, a river near Moogra in Comillah.

SENAN, Malay. Acetate of copper.

SENAPA, It. Mustard seed.

SENA PANTHI, an extinct hindoo sect of vaishnavas, founded by Sena, a barber, a disciple of Ramanand. Sena was barber of the raja of Bandhagurh.

SENA SAHIB SUBA, see Bhonsla rajas of Nagpur.

SENASURA, see Singhalese.

SEND, Hind. Elate sylvestris, *Roxb.*

SENDAL, Port. Crape.

SENDELHI, a river near Seraiegogo in Saharunpoor.

SEND'H, Hind. Euphorbia tirucalli, *Linn.*

SEND'HI, Hind. The tuft of hair which hindoos leave at the top of their head. In Tamil it is called kurmi, and in Telugu, juttu.

SENDI-KA-JHAR, Duk. Elate sylvestris, *Linn.* Sendi, Duk. The palm wine tree from ditto.

SENDOORKUM—? Carthamus tinctorius.

SENDRI, Mahr. Rottlera tinctoria.

SENDU BIR KAIA, Tel. Luffa amara, *Roxb.*

SENDULA, a nuddi or stream of Gwalior, runs near Akbarpoor.

SENDURKAM, Tam. Carthamus tinctorius. Safflower.

SENE, Fr. Senna.

SENECIO JACOBÆA, one of the compositæ, Purple rag-wort, a native of the Cape of Good Hope ; it is easily raised from seed like other species of grounsels in common garden soil.

SENECIO SONCHIFOLIA, *Mœnch.* Syn. of Emilia sonchifolia, *DC.* It is the sadbarg of Hindustan.

SENE-DE-LA-PALTHE, see Cassia plants.

SENE-DE-TRIPOLI, Fr. Cassia obovata, *Merat.*

SENEGAL, see Tree, Gums and Resins.

SENGAR-CHAORI, Hind. The nuptial hall, from the purpose to which it is applied. Chaori is the term always appropriated to the place of nuptials ; sengar means 'ornament.' *Tod's Rajasthan, Vol.* ii, *p.* 709.

SENGARARY MARAM, Tam. Canthium parviflorum, *Lam.*, *Roxb.*, *DC.*

SENGOW, see Kyan.

SENGRA, Hind. Raphanus sativus.

SENJERO, a race of eastern Central Africa. Like the old Romans, they elect their king by the flight of birds, and choose the individual on whom a vulture alights. They sell their women into slavery, and sacrifice their first-born to secure a propitious harvest.—*Krapf.*

SENITRA, Rus. Saltpetre.

SENJNA, Hind. Moringa pterygosperma.

SENKHAM, Tel. Chank shells.

The leaves of certain species of Cassia, C. elongata ; C. acutifolia ; C. lanceolata ; and C. obovata ; all agree in certain properties ; the odour of the leaves is heavy and peculiar, taste bitter, nauseous and glutinous, powder yellowish-green. At least eight varieties of senna leaf are known in commerce in Europe : 1, the Senna palthe ; 2, Senna of Sennaar, or Alexandria ; 3, of Tripoli ; 4, of Aleppo ; 5, of Moka ; 6, of Senegambia ; 7, the false or Arguel ; 8, the Tinnevelly. The Senna palthe is prepared at Boullac, and is known to contain 5 parts of the Cassia acutifolia, 3 of C. obovata, and 2 of the Cynanchum oleifolium. It is in this variety of the drug that the poisonous leaves of Coriaria myrtifolia have been found by M. Dublanc. The Moka senna is chiefly cultivated for exportation to India, where it is common in all the bazars. The other foreign varieties do not require particular notice. The Tinnevelly drug is in species identical with the Moka. From all parts of Upper Egypt these packages arrive at the entrepôt near Boullac, called la Palthe. The Palteers sort, mix, and adulterate the drug, and pass it into commerce through Alexandria. Simmonds says, the dried leaves of C. lanceolata or orientalis, grown in Egypt, Syria, and Arabia, the true Mecca senna, are considered the best. In Egypt the leaves of Cynanchum argel are used for adulterating senna, Cassia obovata or C. senna, a native of Egypt, is cultivated in the East Indies, as well as in Spain, Italy, and Jamaica. It is a perennial herb, one or two feet high. In the East Indies there is a variety (C. elongata) common about Tinnevelly, Coimbatore, Bombay, Agra, &c. Several species are common in the West India islands. The plants, which are for the most part evergreens, grow from two to fifteen feet high ; they delight in a loamy soil, or mixture of loam or peat. The seed is drilled in the ground, and the only attention required by the plant is loosening the ground and weeding two or three times when it is young. The senna leaves imported from India are not generally so clean and free from rubbish as those from Alexandria. They are worth from 20*s.* to 27*s.* per cwt. in the Bombay market. The prices are—

Alexandria, 1½*d*. to 6*d*. per lb.; East Indian, 2*d*. to 3*d*. per lb.; Tinnevelly, 7*d*. to 9½*d*. per lb. Senna is collected in various parts of Africa by the Arabs, who make two crops annually; one, the most productive, after the rains in August and September, the other about the middle of March. It is brought to Egypt from Abyssinia, Nubia, and Sennaar, also by the way of Cossier, the Red Sea and Suez. The different leaves are mixed and adulterated with arghel leaves. The quantities imported into Great Britain are from the

	East Indies.	Other places.	
1838...lbs.	72,576...lbs.	6,988...Total lbs.	142,115
1839... „	110,409... „	6,566... „	174,275

In 1840, 211,400 lbs. paid duty, which is now only 1*d*. per lb. In 1848, was imported 800,000 lbs. from India; in 1849, the total imports were 541,143 lbs. The imports into the United Kingdom were, in 1847, 246 tons; 1848, 402 tons; 1849, 240 tons. It is entered into the United Kingdom of Great Britain free of duty. The imports were respectively in 1848, 1849 and 1850, 246,402 and 240 tons.

Senna of Mecca and Tinnevelly Senna are from Cassia lanceolata, *Royle*.

Alexandrian senna is from C. obovata, (*Culladon*), C. acutifolia, (*Delile*), and sometimes C. æthiopica, (*Guibourt*.) Alexandrian senna is said by some to constitute the bulk of the senna consumed for medical purposes in Europe. It is much adulterated with the leaves of Cynanchum arghel, Tiphrosia apollinea and Coriaria myrtifolia. Alexandrian senna, according to Mr. Jacob Bell, contains a mixture of two or more species of true senna. It consists principally of Cassia obovata and C. obtusata, and according to some authorities it occasionally contains C. acutifolia. This mixture is unimportant.

C. obovata also yields the Aleppo, Senegal and Italian senna, and is sometimes along with C. æthiopica, in Tripoli senna.

C. æthiopica is the source of Smyrna senna, American senna is the product of C. marilandica.

C. lanceolata and C. æthiopica furnish other kinds of senna, the greatest part of their produce finds its way to India through the Red Sea, Surat, Bombay and Calcutta, the imports into Calcutta, in 1849, having been 79,212 lbs.

In Egypt the senna harvest takes place twice annually, in April and September; the stalks are cut off with the leaves, dried before the sun, and then packed with date leaves.

The leaves of the Cynanchum arghel are similar in form to those of the lanceolate senna, but they are thicker and stiffer, the veins are scarcely visible, they are not oblique at the base, their surface is rugose, and the colour grey or greenish drab; their taste is bitter and disagreeable, and they are often spotted with a yellow, intensely bitter gummo-resinous incrustation. Being less fragile than the leaflets of the true senna, they are more often found entire, and are very easily distinguishable from the varieties which constitute true Alexandrian senna. In their botanical character they are essentially different, being distinct leaves, not leaflets, which is the case with true senna.

Tinnevelly senna is that most esteemed by the profession, and is known by the size of the leaflets, which are much larger than those of any other variety; they are also less brittle, thinner and larger, and are generally found in a very perfect state, while the other varieties, especially the Alexandrian, are more or less broken.

Senna grown in the southern provinces of the Madras presidency is highly esteemed in Britain, and is preferred by many to all other sorts, as being both cheaper and purer. Senna raised at Dapooree from Tinnevelly seed, has been found equal to the best Arabian senna. The picking of senna leaves in Guzerat of sowings in August, is made in September: and Dr. Burn states that the virtues of the leaf, depend greatly on the time of the picking.

Dr. Royle, was unable to distinguish the three kinds of Senna, C. elongata, C. lanceolata, and acutifolia. They are all included in the C. officinalis.

Cassia ovata of Merat, is the C. æthiopica of Guibourt, found in Nubia and Fezzan.

Cassia forskalii, is the C. lanceolata of Forskal and Lindley, grows in Fatme, Surdud and Mor, and called Suna, by the Arabs.

Cassia obovata, *Colladon*, a native of Africa from Senegal to the Nile, grows in Fezzan—Egypt, from Cairo to Assouan, Nubia—in the Adil country near Sultailli—Desert of Suez, Syria, Kaira in Guzerat: Dukhan, near Delhi, in the Rangurh valley near Peshawar, and in Mysore. The sennas of commerce, are called Tinnevelly Senna, arranged into Saharunpore, Madras and Tinnevelly, (2) Bombay or common Indian Senna (Suna) Mukhi, (3) Alexandrian Senna, (4) Tripoli Senna, (5) Aleppo Senna.

Cassia tora is common all over the plains of India and in Tenasserim, it is one of the most abundant weeds in the country. Its leaves are fœtid, mucilaginous, and gently aperient. They are much used for adulterating senna and in various external applications. The seeds ground with sour butter-milk are used with excellent effect in itchy eruptions, and they are used in preparing a blue dye, generally fixed with lime water. The root rubbed to a pulp with lime juice has almost specific powers in the cure of ringworm. Like all the allied species of Cassia this seems to owe its virtues to its astringency alone.

Senna absus, *Roxb.* Syn. of C. absus, *Linn.*

Senna alata, *Roxb. Royle*, Syn. of Cassia alata, *Linn.*, *W. & A.; W. Ic.* See Berthelotia lanceolata.

SENNABLATER, GER. Senna.

SENNA LEAVES, see Senna, Cassia.

SENNA, SANS. Crotalaria juncea.

SENNACHERIB, king of Assyria, ruled in Nineveh. He was coeval with the latter years of Hezekiah, and contemporary with Nabonassor. After various struggles with the princes of Babylon, he invested his son Assar Haddon, with the sovereignty of Babylon. Sennacherib reigned 18 years and was slain B.C. 676. See Babylon.

SENNANG, MALEAL. Verdigris.

SENSAFAI, HIND. Asparagus racemosus.

SENSARPAL, HIND. Asparagus filicinus and A. punjabensis.

SENSITIVE ANIMALS, invertebrate animals are divided by Lamarck into two groups, which he calls Animaux apathiques and Animaux sensibles. The latter, or the Sensitive animals, contain six classes, of which insects are the first.

SENSITIVE PLANTS, is a term commonly applied to those species of plants that possess the property of visibly moving their leaves when they are touched or otherwise stimulated. A number of plants of various families, possess the power of moving their leaves under the influence of a slight touch ; That which is best known is Mimosa pudica, a native of tropical climates. A knock upon the ground at a short distance from the plant is sufficient to produce an influence on its leaves ; and Von Martius says, that at Rio de Janeiro the falling of horses' feet by the way is sufficient to set whole masses of the plant in motion. If various corrosive substances, as bichloride of mercury, sulphuric acid, caustic potash, &c., are applied to the knots of the joints, the same phenomena are observed. The removal of the plant to a higher temperature will produce the same result, as well as exposing it to a lower temperature or a draught of cold air. They are destroyed by the application of chloroform and other anæsthetic agents. Its leaflets rapidly fold together and droop when touched, and its leaf stalk, to its base, droops downwards ; on the approach of evening, the foliage of this plant assumes the same appearance. Besides the Mimosa pudica, the M. sensitiva, M. viva, M. casta, M. asperata, M. quadrivalvis, M. pernambucana, M. pigra, M. humilis, M. peltata, M. dormiens, possess the same property though not in so remarkable a degree. Species of other genera of the Leguminosæ exhibiting these movements are Smithia sensitiva, Æschynomene indica, Æ. pumila, and Desmanthus stolonifer. The locust tree when its branches are roughly shaken closes up its leaves, and the same has been observed of Gleditschia triacantha. Of another family of plants the Oxalidaceæ, Oxalis sensitiva, called by De Candolle on account of its sensitive properties Biophytum, has long been known to possess this property. Averrhoa bilimbi and A. carambola possess the property of folding their leaves on the application of a stimulus. Oxalis stricta, if hit smartly on a warm day, will contract its leaves and assume a position as in the ordinary sleep of the leaves of these plants, and the same movements occur in O. acetosella, O. corniculata, and many other species. The movements in these plants consist in the folding up of their leaves, so that the two halves of the leaf approach each other by their superior surface. The midrib is also slightly bent, so that its inferior surface presents a convexity ; and the petioles of the leaflets bend downwards, so that the leaf, when irritated, becomes dependent. In the family Droseraceæ, or Sun-Dews, the leaves of Dionœa muscipula, or Venus Fly-Trap have the remarkable property of contracting upon insects that may happen to alight upon their surface. None of the Sun-Dews inclose insects in their leaves in this manner, but the surface of their leaves is covered with long hairs, which secrete a viscous matter. When any insect settles upon the leaf, it is entangled with the viscous secretions ;.and before it has time to escape, the hairs exhibit a considerable degree of irritability, and curving round, pin the animal down on the surface of the leaf. Other instances of vegetable irritability occur in the Berberis vulgaris, Mimulus, and Stylidium. In the Desmodium gyrans one of the Fabaceæ called the Telegraph plant, a native of the East Indies, the large terminal leaflet when exposed to the bright light of the sun, forms a direct and continuous line with its leaf stock ; but is manifestly depressed, if placed in the shade for a few minutes. Its position varies with the increase or decrease of light during the day.—*Morren, Notes, sur l' Excitabilitè et le Mouvement des Feuilles chez les Oxalis, in the 6th volume of the Bulletins de l'Acadèmie Royale de Bruxelles* ; *in Eng. Cyc.* ; *Chamber's Journal*, 1863, *Vol.* xx, *p.* 179.

SENTHA also Senthi, BENG., HIND. Saccharum sara.

SENTHETIVER, MALEAL. Root of Ixora coccinea.

SENTUL, a light, close-grained, and easily worked wood of Java : it resembles the suren.

SEO, HIND. The apple, Pyrus malus.

SEO-JI, in the Bhaka tongue, is a title of Siva, the ji, is merely an adjunct of respect. —*Tod's Rajasthan, Vol.* ii, *p.* 22.

SEONI, a district of the Central Provinces of British India, the beauty of its scenery, the fertility of its valleys, the elevation of its plateau, its salubrity and moderate temperature, make it attractive, it once supported a far larger population than now. It lies between 21° 35' and 22° 55' of north latitude, and between 79° 20' and 80° 10' of east longitude ; and is bounded on the north by Jabalpur and Mandla, on the west by Narsinghpur and Chhindwara, on the south by Nagpur and Bhandara, and on the east by Mandla and Balaghat. The area is about 3,608 square miles, and the population amounts to 421,650 souls, or 116 to the square mile. The fiscal sub-divisions are Seoni, Katangi, and Lakhnadon, each of which is managed by an officer of the rank of tahsildar. The plateaus of Seoni and Lakhnadon have a varying height of from 1,800 to 2,200 feet. They are well cultivated, clear of jungle, and their temperature is always moderate. In the Bengal As. Soc. Journ. is recorded receipt from Seoni of five copper plates in questionable Sanskrit, often unintelligible, of date eighteenth year of Pravara dhamanrajya Samvat, a local era, after Mahendra Gupta of Kanouj. The character used in Inscription is Allahabad, No. 2, with an open parallelogram at the head of each letter. The Divinities mentioned are Bhairava, Sivalinga, Mahesvara, Yudhisthira, Vishnu, Sama Veda, Vyas ; and of kings or princes, rajas Pravara Sena, Sri Rudra Sena, Prithivi Sena, Rudra Sena, 2nd : Pravara Sena, 2nd. None of the princes are known in history ; but the inscription adds another Gupta (Deva) who is called "Paramount Sovereign," and whose daughter was the mother of Rudra Sena, 2nd. The Deva Nagari is curious, having an open parallelogram at the head of each letter. The Vikramaditya era is not used in this nor commonly in early inscriptions. Gives a village to a brahman, but without any eulogy of brahmans. Begar, or forced labour, is mentioned. Similar Deva Nagari is met with at Chattisgarh.—*Vol.* v, *p.* 727.

SEORA, HIND. Epicarpurus orientalis.

SEOREE, or Sivira, a race in Ghazepur, Gorukpoor, Behar, Benares and Mirzapur, whom Buchanan thinks distinct from the Kol and the Cheroo. The Cheroo aborigines in Ghazepur, a part of Gorukpur, the southern part of Benares and Mirzapur, and of Behar, are sometimes said to be a branch of the Bhar. They seem to be the same as the Sivira or Seoree, but Buchanan considers them distinct. The Cheroo declare themselves to be descended from the great serpent, from which they may be supposed to be the Nagbunsi of Magadha. Remains of buildings attributed to them are found near Buddha, Gya Sasram and Ramghur, and the images of Siva and Hanuman found in them indicate that they belonged to the hindoo religion. They appear to have been expelled from their ancient abodes by the Pramara of Bhojpur, the Hyobun of Hurdi and the Bhoonhar, a little before the first mahomedan invasion, about which time there seems to have been a general convulsion in India, during which several tribes acquired their present possessions. The features of the Cheroo are said to resemble the occupants of the Vindhya mountains. They live by cutting timber, collecting drugs, and killing game, and though their numbers are very low they continue to create a rajah for every five or six houses, and invest him with the tilak in due form. The emperor Sher Shah, subdued Muhartu, a Cheroo zemindar of Behar, which seems to have been a last strong effort of the Cheroo. The chief of Singrowli in Mirzapur is a Cheroo, though he calls himself a Ben-bans. Sir H. Elliot suggests that the Sivira, Seori and Cheroo, may perhaps be the Saura, descendants of the Suraseni. In the Harivansa is the following passage : "From his race came the Sauravira and Saurasena.

The great king Sourasena has given his nam to the country over which he reigned."—*Elliot's Glos.*

SEONTEE, Beng. White rose, Rosa nepalensis.

SEOTI, a river of Allahabad and of the Mirzapoor district.

SEPA CHETTU, Tel. Oxystelma esculentum, *R. Br.*

SEPAH and Buzotee, are small, but ver brave Affghan tribes, numbering. The Buzotee have 500, Sepah 300, fighting men. They liv in tolerably close connexion with their mor powerful neighbours, the Afreedee, and manage to hold their own. They acted up t their engagements in regard to the Khybe Pass, and generally behaved well towards the British.

SEPEDONIUM MYCOPHILUM, see Fungi.

SEPHALICA, Sans. Nyctanthes arbortristis.

SEPI, Hind. Pji, the same as Kamin or ghair mulazim.

SEPIADÆ, the Cuttle-fish family o Molluscs, of the class Cephalopada, section Decapoda. Mr. Woodward enumerates three fossil genera, Belemnosis, Beloptera, and Spirulirostra and the genus Sepia, of which there are known five fossil and thirty living species, of which Sepia officinalis is the type. Sepia officinalis is the common cuttle-fish, whose shell is so often thrown up by the waves on the beach. The ink (nigræ succus loliginis), common to this and other species of Cephalopods, is not only ejected as a defence to colour the water in order to favour the escape of the animal, as was well known to the ancients (Oppian, Halient iii., ; Pliny's Nat. Hist., ix, 29), but as a direct means of annoyance, the juice was used by the ancients as ink as shown in the lines in the graphic description of the idler by Persius. (Sat., iii, lin. 10, et seq.) The flesh of the naked cephalopods was rather esteemed of old, as it is indeed now in Italy and other countries. Aristotle declares that these animals are in the highest season when pregnant, and those who wish to taste a cuttle-fish sausage, will find a receipt for making that savoury viand in Athenæus. Mr. F. D. Bennett states that the Fe, or cuttle-fish, is considered a luxury by all classes of the Sandwich islanders, and that when fresh and well cooked it is an excellent food, and in consistence and flavour not unlike the flesh of a lobster's claw. Its shell, called cuttle-fish bone, is sometimes 1½ feet long, it is used for rubbing down paint.—*Bennett, Narrative of a Whaling Voyage round the Globe, London,* 1840.

SEPIOTEUTHIS SEPIACEA, *De. Blainville.* See Sepiadæ.

SEPISTAN, BROAD-LEAVED. Cordia latifolia, *Roxb.*

SEPISTAN, NARROW-LEAVED, Cordia angustifolia, *Roxb.*

SEPISTAN PLUM TREE, Cordia myxa, *Linn., Roxb.*

SEPOO, Dalbergia acuminata.

SEPOY, Anglo-Hind. Sipahi, Pers. A native soldier of the Indian army.

SEPSIDÆ, a family of Molluscs.

SEPS-LIZARDS, see Chalicides, Reptiles.

SEPTACANTHIS WALKERI, one of the Acanthacea (quere Nillhoo of Ceylon) perfumes by its fragrance, the jungles especially around Needoowattum and paths leading to Goodaloor.

SEPTA-HINDU, the Punjab.

SEPTA-PIMA, Sans. Alstonia scholaris, *R. Br., Don.*

SEPTIMUS SEVERUS, see Septuagint, Bible, Barbarian.

SEPUDDY Malay. Aucklandia costus, *Falconar.* See Putchuck.

SER, Hind. An Indian weight of varying quantities from 25 tolas to lbs. 2, oz. 2.

SERAI, Hind. A lodge for travellers.

SERAI KILLA, a Rajput chieftainship, designated Koer, near the Colehan.

SERAMPORE, a town near Calcutta, long belonging to the Danes, but, about A. D. 1855, ceded to the British, it is opposite Barrackpore. The range of houses along the river makes up a gay and brilliant picture. The interior keeps the promise which a distant view has given. It is the best-kept town in India. It and Negapatam, were long Danish settlements, and Serampore gave shelter to William Carey who set up his missionary press there and printed the Bible in forty different Indian tongues.—*Tr. of Hind., Vol.* i, *p.* 6.

SERAN, Hind. Acer creticum, (Kharpata.)

SERANG, Hind. A petty officer of a ship.

SERANG, the island called Ceram.

SERANGANI ISLANDS, distant 12 or 15 miles from Mindanao, on the north-east of Celebes : they consist of two considerable slands extending from lat. 5° 20′ to 5° 31′ N., and a high peak on the more westerly is in ong. 125° 32′ E.

SERAPADA or Sripada, the name given n Ceylon to the footstep of Buddha, on the mountain Sumanakuta or Adam's peak.—*India in the 15th Century.*

SERAR, Hind. Pinus strobilus.

SERBAL PEAK, is supposed to have a etter claim than Sinai, to be thought the oly mount from which Moses delivered the handments to the people, and the point called Mount Sinai by the monks, which is about a day's march to the east of this the only habitable valley in the neighbourhood. The Sinai of the Jews was probably the Mount Nissa of the Egyptians, described as a lofty mountain in Arabia between Phenicia and Egypt, the fabled dwelling-place of the god Osiris when a child, and the fancied origin of his Greek name Dio-Nysus. The Midianite tribe of Ishmaelites or Arabs, held the southern part of the peninsula.—*Sharpe's History of Egypt, Vol.* i, *p.* 54.

SERD-SEER properly Sard-sair, signifies the cold region, but it is also termed the sarhada, a word literally signifying " boundary or frontier," but generally applied to any high land where the climate is cold. The " Garm-sair" of Sejistan is a narrow tract of country along the lower course of the Helmund. The Baluch races seem to pronounce it " Gurmsehl" or Garm-sail, and one of their wintering places is north-west of Nooshky, and distant about 75 miles.—*Pottinger's Travels in Beloochistan and Sinde, p.* 103.

SEREBRO, Rus. Silver.

SEREGADDA, Tel. Ehretia lævis.

SEREI, Hind. Quercus incana.

SERENGE —? a dyeing seed.

SERGE, a quilted woollen cloth, *Faulkner.*

SEREGADA, Tel. Ehretia lævis, *Roxb., Cor., W. Ic.*

SEREKEI, see Kyans.

SEREN-DIVA or Serendip, Ceylon.

SERES. The name of Seres, which Horace and the ancients use, seems to have been strictly applicable to some nation in the west of China. The western term China is not traceable, but many authors have surmised that it was given to the country when the Tsin dynasty carried their arms to the west. Whatever may have been its origin, the term China (Cheena) was that early given by the people of the N. W. of India to the race whom Europe now calls the Chinese. There are two mentions of the Seres which may be much earlier. One is in a passage ascribed to Ctesias, which speaks of the Seres as a people of portentous stature and longevity.—*Yule Cathay, Vol.* i, *p.* 39.

SER GRASS, Anglo-Hindi. Imperata koenigii.

SERH, a river of Seoni.

SERHAD, Pers., properly Sar-had, the term given to the wintering encampments of the wandering Persians, in opposition to their Garmsair, or summer grounds.

SERIAB, now Shorab or Sar-ab, is west of the Helmund.

SERISHA, Beng. Acacia speciosa, *Willd.; W. and A.* A. serissa.

SERILOPHUS LUNATUS are much freer flyers than the species of Eurylaimus.

SERIMA, Tel. Conocarpus latifolia.

SERINGAPATAM, in L. 12° 25′ 6″ ; L. 76° 39′ 7″ in Mysore, is built on an island in the Cauvery river. The mean height of the station is 2,558 feet ; the level of the Cauvery is 2,321 feet. Seringapatam, first battle was fought on the 14th May 1791. Peace was concluded on the 6th March 1792. *Cull.* See Sri Sampradaya.—

SERINGHAM, or Sri-Rangham island is formed by the separation of the Godavery into two arms, 5 miles N. W. of Trichinopoly, there are two hindoo pagodas on the island, and from 1751 to 1755, the island and its pagodas were the frequent objects of the contests between the French and the British. In those contests, several rocks, the golden, pine, French and sugar-loaf, were the points of the battles.—*Orme.*

SERINUGGUR, the capital of Cashmir, according to Jacquemont, is 5,246 feet above the level of the sea. Many of its women are extremely beautiful, but filth, poverty and tyranny have made their impressions on the Cashmeree, who for centuries has been subject to tyrannical governments. —*Adams.*

SERISSA, Acacia serissa. In China, is cultivated around flower beds and parterres like the box.—*Fortune.*

SEROHI, Rao Sheo Sing, with whom the British government concluded a treaty in 1812, was called to power, in 1818, by the unanimous voice of the chiefs of Serohi who had deposed his elder brother Oudeybhan-jee for tyranny and oppression and placed him in confinement. Maharajah Man Sing of Jodhpore, who laid claim to supremacy over Serohi, sent a force in 1819 to liberate Oudeybhan-jee, but he failed ; and Oudeybhan-jee continued in confinement till his death in 1847. During the disturbances incident on the Jodhpore invasion, Rao Sheo Sing craved the protection of the British government. On the death of Oudeybhan-jee without children, Sheo Sing, whose position under the treaty had been that of Regent only, was acknowledged as successor to the State, and his son as heir apparent. One of the most refractory of the nobles was the thakoor of Neembuje, with whom, after the Meena race had been reduced by a British force, an engagement was mediated by the Political Agent ; guaranteeing to him his lands on condition of feudal service and payment of three-eighths of his revenues to the rao. The rao made over to the British government in 1845, some lands on Mount Aboo for the establishment of a sanitarium.

The grant was fettered by several conditions, one of which was that no kine should be killed. The rao on several occasions was requested to cancel this condition, but he always refused. In consequence of the incapacity of the rao, the general control of affairs was, in 1861, made over to his son Omeid Sing, the old rao retaining the dignities and honors of office. The late rao did good service in the mutinies, in consideration of which he received a remission of half his tribute which had been fixed at rupees 15,000 to 7,500, he also received the right of adoption and a salute of fifteen guns. Serohi contains an area of 3,000 square miles and a population of 55,000. The revenues amount to only rupees 80,900. The only military force consists of 69 horse and 218 foot. The State pays for no local corps or contingents. In 1868 it was discovered that both in Serohi and in Marwar, the practice of Samadh, or burying alive, prevailed to a considerable extent. This mode of self-destruction, however, on enquiry, appeared to be confined almost entirely to persons in the last stage of leprosy' by whom it was practised to put an end to their sufferings. As it was thought probable that in some cases priestly influence, and in others the desire of the other members of the family to rid themselves of the presence of a nuisance, might have induced the self-sacrifice, the Political Agent considered it advisable to bring to the notice of the Durbar of his highness the rao, that government regarded the commission of a Samadh in the same light as a suttee, and that they would expect his highness to use his best endeavours to put a stop to it. It was also notified that in case of his not doing so, he would incur the displeasure of government, and the number of guns with which he was saluted be reduced. His Highness at once took steps to comply with the request of government, but at the same time stated that this was the first occasion on which the desire of the government for the stoppage of the practice had been brought to his notice, and that it was quite as common during the management of the State by the British government as at the present time. He at once issued a proclamation declaring that Samadh was forbidden, and that any one assisting at any case in future would be liable to imprisonment extending to ten years, and that the Jaghirdar on whose estate it took place would be liable to the same punishment, and the forfeiture of his estate, and any raj official, through whose culpable neglect a case might occur, would also incur the same liability. The maharajah of Marwar was also addressed on the same subject, although the Political Agent of that province could not hear of any cases having occurred.—*Treaties, Engagements and Sunnuds, Vol.* iv, *p.* 157 ; *The Englishman, April* 25, 1868. See Aboo.

SERON, a package, formed of pieces of wood, fastened with hides.—***Faulkner.***

SEROO-NAVAL-POO, a drug.

SEROUG, see Mesopotamia.

SERPA, a Bhot people in Nepal and Sikkim, who speak a dialect of Tibetan.

SERPAH, HIND. Urtica heterophylla.

SERPENT.

The serpent from its powers to bite and poison has been known to the human race from long before historic times, has been regarded by many races an emblem of evil, and by other nations as a source of good. The Tamil word "Sarpam," is derived from the Sanscrit, and is used in almost all Indian anguages with the addition or elision of some letter. In our translation of the Bible are frequent notices of serpents, but it would seem that the same Hebrew word "Nachash," relates to all reptile forms which may explain why it has been variously rendered. The fiery serpent "Saraph," alluded to in Numbers xxi, 6, 8 ; Deut, viii, 15, and in Isaiah xiv, 29, and xxxi, 6, has not been identified by naturalists ; neither have the flying serpents, so often alluded by ancient writers, although the attention of Niebuhr and his companions was specially directed to this point. Niebuhr suggested that the reptiles called "heie thiare" by the Arabs of Basra, may have obained this name, of flying serpents, from their habit of swinging themselves with a spring from the branch of one palm tree to that of another. The serpent was worshipped n Chaldea, where, as in Egypt, it was called Oub, hence the Greek οφις, and Obion are said to be still in use in Egypt, as Afa and Afi is n Arabia, to designate a snake. This word as "Oboth" is translated familiar spirit, in Leviticus xx, 27, so xx, 6. See also Deut. xvii, 11 ; I. Sam. xxviii, 3, 7, 9 ; II. Kings xxi, 6, xxiii, 24, and Chapter xxxiii, 6. The woman of Endor is called a mistress of Ob," and Jotham, king of Israel, built much on the wall of Ophiel, *i. e*, the serpent-god, for the worship of snakes was a form of idolatry very much diffused in ancient times, and still very prevalent in India. Obi men nd Obi-women, the designation of the pretended diviners amongst the negroes of the West

India colonies, is the same word, and probably brought with them from Africa. The pethen of the Hebrews, the python of the Greeks, and bæten of the Arabs, from which we have our words python and pythoness, is that form alluded to in Acts xvi, 16, as the damsel with the spirit of divination. But what the Asp, the pethen of the Hebrews, was, and which is employed in Deut. xxx, 33 ; Job. xx, 14 and 16; Psalms lviii, 4 ; xci, 13, and Isaiah xi, 8, is also not determined by naturalists of the present time. Forskal describes the bæten of the Arabs to be about a foot long, and spotted black and white. The bite of the Hebrew pethen was said to be so poisonous as to produce death in a few hours, with a rapid decomposition of the body. In the mythology of the Greeks, the python was a huge serpent that had an oracle on Mount Pernassus, famous for predicting future events. Apollo is said to have slain this serpent. Amongst all idol-worshipping nations the serpent has been regarded as an emblem of immortality, and hence derived his name Pytheus. In almost every village, throughout India, are to be seen, some beautifully carved, others in the rudest style, figures of the Naga or Cobra di capello, set up as objects of worship, and two are occasionally represented twining round a rod as in the figures in the mythology of Greece. In the Elephanta cave, Garuda, the vahan of Vishnu, is often seen with one as an appendage ; and on several very old gold coins he has snakes or elephants in his talons and beaks—for he is sometimes spread, and double-headed, like the Prussian eagle, —and one round his neck but he is not so represented either in pictures or casts. Destroyer of serpents, Nag-antaka, is one of his names. Some legends make Garuda the offspring of Kasyapa and Diti. This all-prolific dame laid an egg, which it was predicted would produce her a deliverer from some great affliction : after a lapse of five hundred years, Garuda sprung from the egg, flew to the abode of Indra, extinguished the fire that sorrounded it, conquered its guards, the devata, and bore off the amrita (ambrosia), which enabled him to liberate his captive mother. A few drops of this immortal beverage falling on the species of grass called Kusa (the Poa cynosuroides) it became eternally consecrated ; and the serpents greedily licking it up, so lacerated their tongues with the sharp grass, that they have ever since remained forked ; but the boon of eternity was ensured to them by their thus partaking of the immortal fluid. This cause of snakes having forked tongues is still popularly, in the tales of India, attributed to the above greediness ; and their supposed immortality may have originated in some such story as this : a small portion of amrita, as in the case of Rahu, would ensure them this boon. But in all mythological language the snake is an emblem of immortality ; its endless figure, when its tail is inserted in its mouth, and the annual renewal of its skin and vigour, afford symbols of continued youth and eternity, and its supposed medicinal or life-preserving qualities may also have contributed to the fabled honours of the serpent tribe. In hindoo mythology serpents are of universal occurrence and importance, and the fabulous histories of Egypt and Greece are also decorated with serpentine machinery. Learned authors attribute this universality of serpent forms to the early and all-pervading prevalence of sin, and the figure of Krishna crushing, but not destroying, the type of sin, has been largely discussed. Garuda is also the proverbial, but not the utter, destroyer, for he spared one, they and their archetype being, in reference to created beings, eternal. His continual and destined state of warfare with the serpent, a shape mostly assumed by the enemies of the virtuous incarnations or deified heroes of the hindoos, is a continued allegory of the conflicts between vice and virtue, so infinitely personified. Garuda, at length, appears the coadjutor of all virtuous sin-subduing efforts, as the vehicle of the chastening and triumphant party, and conveys him, on the wings of the winds, to the regions of eternal day. Images of snakes are common : the idea of their medicinal virtues is very old in India : a hindoo attacked by fever, or other diseases, makes a serpent of brass or clay, and performs certain ceremonies to its honor, in furtherance of his recovery. Such ceremonies are particularly efficacious when the moon is in the nakshatra (mansion, sign, or asterism), called Sarpa, or the serpent ; called also Aslesha. It is not known if Dhanwantara, the Esculapius of the hindoos, has an attendant serpent like his brother ofGreece: the health-bestowing Dhanwantara arose from the sea when churned for the beverage of immortality. He is generally represented as a venerable man, with a book in his hand. The 11th day of the bright half of the month Ashada commences with the summer solstice : in hinduism it is the night of the gods :—nine days thereafter, that is, on the fifth after the full moon, is a festival in honor of Devi, the goddess of nature, surnamed Manasa, who, while Vishnu and all the gods were sleeping, sat in the shape of a serpent on a branch of a Euphorbia (Snuhi) to preserve mankind from the venom of snakes. The 5th day of the bright half, of the month Sravana, is called Naga-panchami, and is sacred to the demi-gods in the form of serpents who are enumerated in the Padma and Garuda Puranas. Doors of houses are smeared with cow-dung and leaves of the Nim tree (species of Melia and Azederachta) as a preservation from poisonous reptiles. Both in the Padma and Garuda Puranas, is mention of the serpent Kaliya, whom Krishna slew in his infant hand, and which is also worshipped on this day. The feast of Naga-panchami, from Naga, serpent, and panchami, five, is celebrated, as the name implies, on the 5th day of the bright half of the month of Sravana ; but some hold it on the 4th day also, when the day is called Naga-chauti. (Naga, serpent, and chauti, four.) This day is observed chiefly among the brahmins of northern India, Maharashtra and Telingana and their corresponding inferior castes, or in other words among the northern hindoos. The Tamil brahmins and sudras do not observe it. On this day the women bathe and adorn themselves in their best clothes and jewels, and proceed to the places where the figures of the Nagas or serpents are consecrated and established, or to ant hills, supposed to be the abode of snakes, where they pour milk and place garlands of flowers, but especially of cotton, and the usual accompaniments of hindoo worship or puja, such as betel-nuts, fruits, cakes, &c. Some worship at their own homes the figure of the Naga (or cobra) made in gold or silver ; and others send for the real cobra to their homes, feed it with milk, and give small presents to the snake-charmers who frequent the streets on this day. Men and women having no children, and others who are troubled with ailments of the ear, make anew, or fulfil their old, vows on this day, should the object of their desires have been obtained. There are various medical virtues ascribed to the cobra. The poison of the cobra, doubtless an innocuous substance in the stomach, is eaten by old-opium eaters, and the cast off skin is used for magical purposes, and some say for keeping out vermin. The enemies of the cobra, mythologically as well as in fact, are the Garuda, the bird-vehicle of Vishnu, and the Mayil or the peacock which is the favourite vehicle of Subramaniya, the second son of Siva. In the South of India, the accepted type of Garuda is the common Brahmany kite, Haliætus ponticherianus, which is held in some respect and fed with goat's or sheep's flesh, on Sunday mornings by those who consider it a favorable omen to see Garuda on the morning of that day, or on the evening of Thursday. This bird pounces upon and carries off the cobra in its claws and kills it. Granite figures of the Naga are always placed in a pagoda, or under a Margosa and Peepul tree in a garden, by the side of a river, tank, &c. The consecrating and establishing of the granitic figures of serpents is attended with very much expense. It is performed by the wealthy, when they are childless, and the whole ceremony is called Naga-pratishta (Naga, serpent, and pratishta, to establish.) A serpent, popularly believed to fly at its victims, is said to live in the bush of the Tala, Pandanus odoratissimus, which produces the flower called Talampu. It is described to be about a span in length, and never to crawl as snakes generally do. But most serpents or snakes can move by springs or leaps, often of considerable extent. The editor has seen a cobra cross the high road in the flats at Bombay by two leaps.

The Asp is mentioned in Deut. xxx, 33 ; Job xx, 14, 16 ; Ps. lviii, 4 : xci 13, and Isaiah xi, 8, but though supposed to be some kind of serpent, naturalists have not determined the particular reptile alluded to. The word is probably very ancient, and is possibly the "Oub" serpent worshipped in Chaldæa and Egypt, and Obion is said to be still used in Egypt as Afa and Afi is in Arabia, to designate a snake, and the Greek term οφις is the same.

Serpent-worship was one of the many forms of totem worship, through which many nations in some stage have passed, but why it got a pre-eminence, is not apparent. Serpent-worship is supposed by Mr. Bathurst Deane to have been the only universal idolatry. In Asia evidence of serpent-worship has been found in Persia, Cashmere, Cambodia, Thibet, India, China (traces), Ceylon, and among the Kalmucks. Amongst the primitive tribes many have totems, animal or vegetable gods, after which they are named. The American Indians all possess them ; as also the Australian tribes, and, in Central Asia, most of the Kirghis tribes trace their origin back to some animal which they venerate and worship. In the tribes near the Naga country on the Indian frontier, is a tribe who claim the rat as their progenitor. The snake or Naga tribes of India worship the snake. It is supposed that an Ant tribe existed to the north of Cashmere, and that Herodotus alluded to them in describing their search for gold. The cat, the lion, the boar, the bull, the horse, all seem to have been warlike : the horse occupies a prominent position in the sculptures of Oomravati. In the Mahabarata the horse-sacrifice occupies a prominent place. If we compare serpent-worship with quadruped-worship, or bird-worship, or sun-worship, we shall find that it has no exceptionally wide area. And if the totemic origin of serpent-worship be the correct one, the serpent, like other totemic deities, would, from its origin, have a benevolent character.

M. Boudin says "le culte duserpent, est independent de toute *influence ethnique : and M. Lajard says dans la plu-part des langues* dites Semitique, le mot que signifie la vie, hayy, ou hay, haya, heyo, hayya signifie egalement le serpent. In several of the ancient religious systems the serpent presides at the creation of the world, and is the god of life or health. All over America, the serpent-worship prevailed. Adi Sesha, old serpent, or first serpent, is a term used in hindoo mythology, but its meaning is unknown. Serpent-worship does not seem to have been known in Germany, though the tree was worshipped there, as also in Gaul. But the serpent was worshipped on the East coast of Scotland. Nonnus, a Greek poet singing of the delivery of Beroe, in which the ark is allegorically described, writes :—

> Æon had seen
> Age after age in long succession roll
> But like a serpent, which had cast his skin
> Rose to new life, in youthful vigour strong.

The serpent in Egyptian monuments is always in connection with the tree of life. Serpents with all Semitic nations is associated with the introduction of sin. In Egypt, both tree and serpent-worship prevailed, as parts only of the general animal and vegetable-worship. The Grove, alluded to in I. Kings, xiv, and 23, where the Jews built them images and groves on every high hill and under every green tree, was possibly the Asherah. The tree at Mamre was worshipped to the time of Constantine. Solomon says, "they worshipped serpents void of reason." It seems to have been repressed, but it again cropped up amongst the same people in the christian sects of Ophites, Nicolaitans and Gnostics. According to Tertullian, the Ophites even preferred the serpent to Christ. They kept a living serpent in a chest, as, or to represent, the God. The serpent was honoured in Tyre from an early period down to the time of Alexander. Hea or Hoa, the serpent-god, according to Sir H. Rawlinson, was the third person in the Babylonian Trinity. Serpent and tree-worship prevailed in Greece. In Epidaurus, down to the time of Pausanias, serpents were kept and fed in the grove attached to the temple of Æsculapius, and a huge serpent was kept in the temple of Æsculapius at Alexandria. At Athens, the Erectheum now occupies the site of the temple of the serpent-god Erecthonios. The serpent is seen as a "genius loci" upon the coins of many of the towns of Asia Minor,—Cyzicum, Pergamos, Marcianapolis, in Mysia ; Aboniteichos and Amastris, in Paphlagonia ; Nice and Nicomedia, in Bithynia ; Tomos, in Pontus ; and Mindus, in Criaa, exhibit the serpent as their ensign.

Serpents and trees, seem to have been allied *and co-existent objects of idolatry. Primitive races often believed that the spirits of deceased persons delighted to dwell in trees and spoke* oracles through the rustling of their branches. In India almost all the Aryan and non-Aryan races still believe trees to be the serpent-worship, was often associated with good fortune. Whether in the wilderness of Sinai, the groves of Epidaurus, in the Sarmatian huts, the serpent was always the Agathodæmon, the bringer of health and good fortune, the teacher of wisdom, the oracle of future events. In Egypt, however, Apoph or Typhon was the Evil Serpent. The Greeks had myths regarding the python and hydra, the echidna and the dragon of the garden of the Hesperides, but in historic times the Athenians kept a serpent in the Erectheum, and its escape warned them to fly from the Persians, and Pausanias tells us that the Epidaurian serpents held their place amongst the gods of Greece till long after the age of Christ. Livy, (x, 47,) Valerius Maximus, (i, 8, 2,) Aurelius Victor, (xxii, 1,) and Ovid, (Met. xv, 5,) mention the serpents of Æsculapius kept at Epidaurus, which the Roman Senate sent an embassy to obtain. A plague ravaged Rome in the year of the city 462, a living serpent was solemnly fetched from Greece to Italy, and received with divine honours, on the banks of the Tiber, by the senate and people of Rome, and Æsculapius received honours similar to those alluded to in Numbers (xxi, 8, 9,) as occurring in the Arabian desert. After that occasion a serpent, in a conventional attitude, was, in the Roman world, the recognised type of a sacred place. The serpent python (the Pethen) is mentioned in Ps. lviii, 4 : xci, 13 ; in Deut. xxxii, 33 ; in Job xx, 14 and 16 ; and Isaiah xi, viii. This is supposed to be the asp of ancient writers, and there is considerable authority for believing that the extremely poisonous Coluber haje of Linnæus is the animal intended. It was from the arts practised with this animal, that those who were supposed to possess a spirit of divination, were called πιθονες pythones. Harris says that in the Egyptian language, the serpent was called Ob, or Oub, and was the same in the Chaldee language, hence the word Ophis, οφις. Thus we read in Leviticus xx, 27, of a man or a woman that hath a familiar spirit, "oboth ;" see also, xx, 6. Also, II. Kings xxi, 6 ; 23 and 24 ; and II. Chronicles, xxxiii, 6. The woman of Endor, who had a familiar spirit is called mistress of Ob. Mr. Fergusson regards tree-worship, in association with serpent-worship, as the primitive faith of mankind. Serpent-worship still prevails in Africa amongst the people of Dahomi and Whidah, and the Dahoman Trinity, Serpent, Tree and Ocean is identical with that of Greece, 3,000 years ago. At one time, in Cashmere, there were 700 places where images of the serpent was worshipped. A demi-god serpent, with a human face and the tail of a serpent is said to have sprung from Kadru, the wife of Kasyapa, and to have been created to people Patala or the regions below the earth. The chief of these creatures is sometimes called Sesha or Ananta and Vasuki. Under the term Adi Seshi, or old serpent, this deity takes an obscure part in hindoo mythology. It is represented as an immense snake, with many heads.

Vishnu is fabled to have become incarnate in the form of a tortoise : in which shape he sustained the mountain Mandara, placed on his back to serve as an axis, whereon the gods and demons, the vast serpent Vasoky serving as a rope, churned the ocean for the recovery of the amrita, or beverage of immortality. And the result of the operation, that chiefly distinguished this avatara, was the obtainment of fourteen articles, usually called fourteen gems, or chaturdesa ratna, in common language chowda ratni : 1, the Moon, Chandra ; 2, Sri, or Lakshmi, the goddess of fortune and beauty ; 3, Sura, wine, or Suradevi, the goddess of wine ; 4, Oochisrava, an eight-headed horse ; 5, Kustubha, a jewel of inestimable value ; 6, Parijata, a tree that spontaneously yielded every thing desired ; 7, Surabhi, a cow similarly bountiful ; 8, Dhanwantara, a physician ; 9, Iravati, elephant of Indra, with three probosci ; 10, Shank, a shell conferring victory on whoever should sound it ; 11, Danusha, an unerring bow ; 12, Bikh, poison, or drugs ; 13, Rhemba, the Apsara, a beautiful and amiable woman ; 14, Amrita, the beverage of immortality. In hindoo mythology serpents are of universal occurrence and importance, and the fabulous histories of Egypt and Greece are also decorated with serpentine machinery. Ingenious and learned authors attribute this universality of serpent forms to the early and all-pervading prevalence of sin, which in this identical shape, old as the days of Eve when there was but one woman ; its prevalence, now there are so many, this is no place to discuss. Krishna crushing, but not destroying, the type of sin, has been largely discussed. Garuda is also the proverbial but not the utter, destroyer, for the spared one, they and their archetype being, in reference to created beings, eternal. His continual and destined state of warfare with the serpent, a shape mostly assumed by the enemies of the virtuous incarnations or deified heroes of the hindoos, is a continued allegory of the conflicts between vice and virtue, so infinitely personified. Garuda, at length, appears the coadjutor of all virtuous sin-subduing efforts, as the vehicle of the chastening and triumphant party, and conveys him on the wings of the winds, to the regions of eternal day.

Though an attempt to explain the origin of evil by the war between the old serpent and the human race finds a place in the book of Genesis, it formed no part of the Jewish philosophy ; it belongs to the legend on the Egyptian sarcophagus. That man fell from a state of innocence by tasting the forbidden fruit offered to him by woman, was an Egyptian, not a Jewish opinion. Mr. Boswell regards the ancient representations found in the peninsula of India of serpents carved on stones, as the work of a pre-historic race before the Scythians overspread the country ; all over the country, are to be seen, on stones, representations of snakes, and throughout the peninsula, the cobra snake is worshipped by all hindoo races, under the designation of Nag-Iswara-Swami. He thinks that the Scythians brought with them to India the worship of the phallus and therewith the original idea of what subsequently became the philosophic principle of Adwaitam, the theory that there is but one soul in the universe, the soul of man being identical with that of God. The phallus is now closely associated with Siva, one of whose chief titles is Naga-bhushana, the snake adorned one, and forms a symbol in the representation of Siva, the destroyer. Siva is described as wearing serpents round his neck as ornaments, and Vishnu reclines on the serpent Adi-Sesha. The Chiun mentioned in Amos, v, 25, is supposed to be the deity Siva, Givun is a Phœnician word signifying serpent. Cabrera thinks Chivun has the same signification as Givun or Hivim, *i. e.*, descendant of Heth, son of Canaan. The Givun or Hivites (Avims or Avites) see Deut., Joshua xiii, 23, were descendants of Cadmus and Hermione his wife, who according to Ovid's metamorphosis were changed into serpents and had divine honors paid to them. Tripoli was formerly called Chivun, Votar says I am a serpent because I am a Chivim which can also be rendered " I am a Hivite from Tripoli." Stones with the figure of a serpent engraved thereon are either placed by the hindoos beneath a holy fig tree, or under any shady grove. It is not considered lawful to point at these figures, the superstition being that such would cause the fingers of one's hand to rot off. A remedy, is, however, prescribed by biting the fingers wi the teeth, and this is supposed to obviate th danger. Though the serpent is considered a deity, the brahman studiously avoids its sight as a very bad omen. The serpent-god hears, it is said, the prayers of the devotee whose house he occasionally visits. A superstitious woman, filled with awe and fear, instead of turning the venomous god away, beseeches him to retire, and when the god dilates his hood, and sways it to and fro, she thinks that it thereby promises her safety. She will not allow her children to smell a lemon, however fragrant it may be, and warns them that the serpent-god may transform himself into a lemon and bite their noses. This refers to a story of "Pariksiti," which is still prevalent in the hindoo family circle. A Puranic hero was doomed by a sage to die of a snake-bite. In order to escape this fate, the hero retreated to a barren island, believing that as the serpent could not ford the water, he would be quite safe. But the serpent having assumed the form of a lemon swam over to the island. The lemon was beautiful to behold and the hero could not resist the temptation of smelling it. Having done so, the lemon bit the nose of Pariksiti and he fell into a swoon, and died. Of the many temples erected in their honor, the temple at Subramañya, one of the highest peaks of the Western Ghauts, is celebrated in the hindoo world. It is a square in form, with open cloisters on the four sides, and the sanctuary containing the idol "Subbarao" is in the centre. Like most of the pagodas in Canara, it falls short of those in the Carnatic in point of architecture, but is substantial and neat, being built of laterite, sandstone and granite. Many reptiles have taken up their residence within it, in holes made for the purpose. People from all directions resort to this sacred place during the December festival to perform their vows, and make purchases at the extensive cattle-fair held at the same time. Such persons as have made vows roll around the quadrangle of the pagoda, while others roll up to the pagoda from a river about a mile distant. These fanatics on their return home, bring with them some earth taken out of the sacred holes within the temple. This earth is said to possess the virtue of rendering a barren woman fruitful if she daily put it into her mouth ; and the leper rubs with it the part of the skin affected.

In the immediate neighbourhood of Madras, at Trivetoor, Washermanpettah and Perambore, are several snake temples, but one at Vasarapadi is the most famed. There are the sculptured snake stones, either of single snakes or of the two snakes intertwining in the form of the Esculapian rod, called amongst the Tamil people Naga-ga-Jendram, also the naonaga, or nine-headed snakes; there likewise are many cobra serpents living in the numerous ant-hills, and every Sunday morning, two or three hundred men, women and children attend there to worship, to return thanks, to offer milk, raw rice, camphor, the red led and cradles. All classes of hindoos come, but brahman and vaisya women are the most numerous. There, also, is a local deity named Rangam, whose chief priest, styled kuri-chulikiravin, is a Yenadi. The existing influence of the snake-worship may be illustrated by mentioning that in A. D. 1872, a daughter born to M. R. R. Rama Chendra Rao, Esq., Deputy Commissioner of Police at Madras, a brahman gentleman of rare intellect, was named Nagamah, or Snake-mother, because a snake was supposed to have been seen at conception.

General Cunningham says the city of Klisoboras has not yet been identified, but he feels satisfied that it must be Vrindavana, 6 miles to the north of Mathura. Vrindavana means the "grove of basil-trees," which is famed over all India as the scene of Krishna's sports with the milkmaids. But the earlier name of the place was Kalika-vartta, or "Kalika's whirlpool," because the serpent Kalika was fabled to have taken up his abode just above the town, in a kadamba tree, overhanging the Jumna. Here he was attacked by Krishna, and the rapid convolutions of his tail in his dying struggles are said to have caused the eddy, which is now known by his name. The Latin name of Clisobora is also written Carisobora and Cyrisoborka in different MSS., from which he infers that the o iginal spelling was Kalisoborka, or, by a slight change of two letters, Kalikoborta or Kalikabarta. In the Prem Sagar this whirlpool of the Jumna is attributed to the poison that was vomited forth by the serpent Kali against Krishna, when he was swimming in the river. Allusion is made to the natural increase of the serpent's poison by offerings of milk, which would seem to refer to a previous state of serpent-worship. Milk offerings are still made occasionally, but only to test the divine nature of the serpent, who is supposed to possess the most miraculous powers of drinking. As a further illustration of the great influence which the snake legends exercise on the hindoo races, it may be mentioned that in the 18th century, raja Chet Singh, of Benares, is said to have poured all the milk of the two cities of Mathura and Vrindavan down the hollow kadamb tree, and as the waters of the Jumna were not even tinged, the serpent Kalika's miraculous powers of milk-drinking were established more firmly than ever. Also, Buddha, died B. C. 543, buddhism was in

India only a struggling, lingering sect, till the time of Asoka, whose edicts B.C. 255 remain engraved on rocks. In the inscriptions of Asoka, buddhism appears as a system of pure abstract morality, no trace being exhibited of the worship of buddha himself, or of the serpent or tree. About the beginning of the christian era, however, a Naga or Turanian revelation became incorporated with it. It had at this time fallen into a state of decadence and was represented by no fewer than eighteen different sects. The buddhist school of this time was known as the Hinayana. At this time Nagarjuna appeared. The sayings of Sakya Muni had been during his life-time recorded by the Nagas, from whom Nagarjuna obtained the documents and he proclaimed them in A. D. 410. The gateways of the Sanchi Tope belong to the first half of the 1st century of the christian era, and though subsequent to the Naga revelation the sculptures scarcely indicate its existence. Buddha does not appear on the Sanchi sculptures as an object of worship. The serpent is there, but rare. The dagoba or depositary of the relics of saints is there, as also are the tree, the wheel and other emblems, and, the whole of the sculptures on the Sanchi tope may be illustrative of the Hinayana school of buddhism, at the period when other doctrines were about to be introduced. The Amravati sculptures again belong to a period 300 years later than that of Sanchi, and in them the new school of Mahayana buddhism may be studied. In these buddha is an object of worship, but the serpent is his co-equal. The dagoba tree and wheel are reverenced and the sculptures contain all the legends of the later books, though in a purer form. Hindoos, Dasya and other men, women, and animals, especially monkeys, appear in the sculptures worshipping the serpent and other gods. The serpents are all divine, five and seven-headed, and representations are numerous of the Naga angelic orders, the female Naga, with one serpent only springing from the back, the male Naga with three.

The Puranas relate that Janumajeeya was sorely afflicted with leprosy as a punishment for having killed some serpents. Hindoos believe that a man who may have killed a serpent in his former life is sure to be attacked with leprosy. The leper, whose very sight is loathsome, is regarded as the worst sort of creature on the earth. After his death, his remains must be buried, and cannot be burnt without certain peculiar rites. Also, now, at the close of the 19th century, a man who has not been blessed with offspring, and whose doom is sealed if he do not beget a son, considers that the serpent has denied him children, and thus barred his entrance to the gates of heaven. The disease of "sore eyes" is also attributed to the serpent's wrath. The worship of the serpent is therefore essential to lepers, the sore-eyed, and the childless who, to appease the wrath of the serpent, perform many costly ceremonies of "Surpa Smaskara" and "Nasamandal," for the former of these ceremonies, a day is selected either the 5th, 6th, 15th or 30th of the month. The family-priest is summoned as the director of the ceremony. The childless sinner has first to take a bath, and next to dress himself in silk, or linen garments. A spot in the house is chosen, and the family-priest sprinkling grains of rice drives away any devil that may have been lurking there. He takes his seat with the performer on two wooden stools. He gets some rice, or wheat finely pulverized, and kneading the dough makes a figure of the serpent. The holy "mantra" are then said to give the figure animation, and transform it, to all intents and purposes, into a live serpent. It is then offered milk and sugar. The image receives the worship common to other gods. After the worship, the mantra snatch away from the figure the life just imparted, for they are said to have the power of giving life and of taking it away again ! After the serpent is dead, the sinner assumes the signs of mourning which consist in shaving off his beard and moustaches. Then he carries the figure on his head, and having reached the bank of a river he reverentially places it upon a pile. The figure is carefully fenced in with chips of sandal or jackwood ; and camphor and melted butter are poured over it. The pile is then kindled with the fire which the performer brings with him from his house. He previously enters into a vow with the fire that it shall be solely used for the cremation of the serpent-god. The fire reduces the mass to ashes, which are carried to the river, and put into the water. The performer is considered unholy, and cannot be touched for three days. On the fourth day, the funeral of the serpent-god or "Sampaskara" ends with an entertainment to eight unmarried youths, below the age of twenty. They are considered to represent eight serpents, and are treated with the utmost respect. The performer rests satisfied for a time that the ceremony will produce the desired effect. But if such be not his good fortune he then resorts to the other ceremony 'Naga-mandal.' On one of the days named the leper gives a grand feast to a number of his caste-men and unmarried youths. The evening comes, and one of the "Deckayavara," or musicians duly summoned for the purpose, scatters on the spot already selected some bruised rice, and inscribes the figure of a huge serpent in a large circle. The figure is worshipped, and then the musicians perform their part. They are the children of the Deva-Dasa or temple women. They drink a quantity of toddy in order to sustain them against the fatigues of the night. Their band generally consists of two pipes and several drums. They dress themselves for the occasion in women's clothes, and put on various jewels. The chief man among them pretends that he can represent the deity, and going to and fro reels about expressing the approbation of the deity by uttering some words which are attended to, as if they proceeded from the mouth of the deity itself. The musicians produce a variety of discordant sounds little suited to please an unaccustomed ear. While the drummers tap with their fingers on each side of the drum, their head, shoulders and every muscle of their bodies are in motion. The musicians, the drummers, the observers of the ceremony, and the representative of the deity keep going round the circle throughout the night, singing songs at one time in praise, at another in depreciation of the deity. To keep up their strength, the drummers have frequent recourse to the toddy bottle, and soon become intoxicated. As the night passes away, the ceremony is over.

One of the severe tests to which the leper and the childless expose themselves is as follows : On the 6th day of every month, he entertains a number of unmarried youths at dinner. Though fasting the previous day, he does not himself partake of food in their company. After dinner, and before the leaves whereon the guests had taken it have been removed, he enthusiastically rolls himself over them ; but in thus rolling, if he should vomit, his labour is lost. After he has thus rolled, he has, as the next part of the ceremony, to cleanse himself in a bath, and for the remainder of the day, he cannot take any food that contains salt. A rich sudra of low birth is not allowed to observe any of these rites. But the compassionate priest comes to his aid, and offers him his services by observing them on his behalf. After they are over, the priest takes some water in his hand and pours it into that of the sudra. This process is said to transfer every merit of the ceremony to the sudra, while the priest holds himself liable for all the defects in the observance. The two annual feasts consecrated to the worship of these creeping gods, go by the name of "Naga-Panchami" and "Kukka Shesti." The one takes place about August, the other in December. A harmless dark-brown water-snake, with yellow spots, is frequently used as food by the Bayeiye, in Southern Africa. Some races in S. E. Asia, also eat snakes.—*William's Story of Nala, p.* 166 ; *Taylor's Hind. SERPENT EAGLE, Circaetus gallicus, *Gmel.*

Common Serpent Eagle.		C. brachydactylus, *Meyer.*	
Sap-maril,	BENG.	Pamula Gedda,	TEL.
Mal-patar,	CAN.	Rawul of the Wagri.	
Samp-mar,	HIND.	Kondatelle of the Yerkali.	
Pambu Prandu,	TAM.		

This serpent eagle is found in the south of Europe, North Africa, common all over India and Asia ; has been killed in Denmark, but never in the British Islands ; prefers the open ground, questing like a harrier. It eats any creature, but snakes and lizards are its chief food, hovering in the air, and pouncing suddenly like a stone down. It seizes with its talons the snake by the part of the head, and the snake often twines its body around the bird, and encumbers it.

Glaine nan druidhe,	,,	

It was held in high estimation by the Druids.

SERPENT GEM, a superstition still lingering in Scotland, and amongst the ruins of Tadmor.

SERPENT STONE. Shi-hwang-chin, the bezoar. Tavernier says some are almost oval, thick in the middle, and thin about the sides. The Indians, he says, report that it is bred in the head of certain serpents, but he supposed it rather to be a story of the idolater's priests, and that the stone is rather a composition of certain drugs. Whatever it be, he says it is of excellent verdure to drive any venom out of those that are bit by venomous creatures. If the person bit be not much wounded, the place must be incised; and the stone being applied thereto, will not fall off till it has drawn all the poison to it. To cleanse it, you must steep it in woman's milk, or for want of that, in cow's milk; after the stone has lain ten or twelve hours, the milk will turn to the colour of an apostemated matter. The archbishop of Goa carrying him to his cabinet of rarities, showed him one of these stones, and after he had assured him of the rare qualities it had, gave it to Tavernier. Once as he crossed a marsh in the island of Salsete where Goa stands, one of the men that carried his pallequis, being half-naked, was bit by a serpent, and healed at the same time. He bought several, but there were none but the brahmins that sell them, which made him believe that they compound them. There are two ways to try whether the serpent-stone be true or false. The first is by putting the stone in your mouth, for then it will give a leap, and fix to the palate. The other is, by putting it in a glassful of water; for if the stone be true, the water will fall aboiling, and rise in little bubbles up to the top of the glass. There is another stone, which is called the serpent-stone with the hood. This is a kind of serpent that has a kind of hood hanging down behind the head, as it is represented in the figure. And it is behind this hood that the stone is found, many times as big as pullet's-egg. There are some serpents both in Asia and America of a monstrous bigness, 25 foot long; as was that, the skin whereof is kept in Batavia, which had swallowed a maid of 10 years of age. These stones are not found in any of those serpents that are not at least two foot long. This stone being rubbed against another stone, yields another flime, which being drank in water by the person that has the poison in his body, powerfully drives it out. These serpents are nowhere to be found, but upon the coasts of Melinde; but for the stones you may buy them of the Portuguese mariners and soldiers that come from Mozambique.—*Tavernier's Travels, p.* 155.

SERPENTINE is a term which has been applied to diallage, to crystallized and fine grained greenstone, and to a magnesian limestone, and when of the latter composition is called verd antique marble. A beautiful serpentinous marble is obtainable in the eastern part of the Cuddapah district, and in the Kurnool district. One species called noble serpentine, green and translucent, is valued as an ornamental stone. Precious serpentine exists in the Hookhoong valley, north-west of Ava, whence it is exported to China, and brought into the southern parts of the empire. It is also found in the country of the Singpho, about 8 or 9 miles to the north of a large lake, the Eng-dan-gyi, over a hilly country of 18 or 20 miles in length. At particular seasons, about a thousand men, Shans, Burmans, Chinese, Shans and Singphos, are at work in the serpentine mines. Epsom salts or sulphate of magnesia may be profitably manufactured from serpentine.—*Waterston; Faulkner; Mason; Walton's State, pp.* 38, 39; *Tomlinson.*

SERRANUS, a genus of fishes of the family Percidæ.

SERRA, the Roman name of Tyre. The place is now known to the natives by its ancient Hebrew name of Tsur, corrupted by the Greeks into Tyrus, and by the Romans into Serra.—*Robinson's Travels, Palestine and Syria, Vol.* i, *p.* 260.

SERRATULA ANTIHELMINTICA, ***Roxb.***

Vernonia anthelmintica.

Blue flea bane,	ENG.	Nalwa bakshi,	HIND.
Worm saw wort,	,,	Kali-ziri,	,,
Somraj,	HIND.	Kakshama,	SANS.
Bakchi,	,,		

All parts of this plant are bitter. The powdered seeds are used as a worm medicine. Dr. Honigberger, at p. 261, states that Conyza anthelmintica, Vernonia anthelmintica, Serratula anthelmintica—is officinal at Lahore. It is said, that when the flea-bane is roasted, flies take to flight, and when the powder of the flea-bane is sprinkled on the floor, fleas disappear. It acts as a bitter tonic and anthelmintic, and is recommended in the treatment of skin disease, especially in porrigo and lepra. —*O'Shaughnessy, p.* 419; *Powell's Handbook, Vol.* i, *p.* 358. SERVA CHETTU, TEL. Casuarina equisetifolia, also Casuarina muricata, *Roxb.* This is doubtless from the Persian, sarv, a cypress.

SERVA-DEVA, see Saraswati.

SERVARASA, see Yavana.

SERWATTY ISLES, or Sea-way isles, in the Eastern Archipelago, consist of Wetta, Kissa, Lette, Moa, Roma, Nusa, Midka, Damma, Lakor, Luan, Baba, Semata, Zeon, and

Nila, with others, too many and too small to particularize. They are situated a little to the southwest of Timor, directly north of Cambridge Gulf in New Holland. They extend about 105 miles in an easterly direction from the east end of Timor towards the south end of Timor Laut, in the Arafura sea. Clusters of hillocks covered with green rise in harmonious arrangement amid cultivated fields, where neat wood-built villages are sprinkled at intervals among groves of trees and crops of rice and maize. Beautiful edifices have been built on them, which are regularly attended by congregations of men, women and children, dressed partly in old European fashions, partly in their ancient costume, but in pious simplicity, accepting the interpretation of the christian faith. School-houses and other structures diversify the aspect of the hamlets. All the buildings are neat, all the people are industrious. Every dwelling has its garden, tastefully laid out with beds of Indian corn, tobacco, cabbages, and other productions shaded by lines of trees. In the fat pastures of the vallies herds of cattle graze.—*St. John's Indian Archipelago, Vol.* ii, *p.* 87 ; *George Winsor Earl in Journal of the Indian Archipelago Vol.* iv, *p.* 172. See Java, Keffing islands.

There are two strongly marked varieties of this plant under cultivation. Black sesamum **and white or yellow** sesamum, which possess **the same properties,** and in commerce are met **with both in a mixed** and separate state. It is **an annual plant** growing all over India, but **cultivated** there and in Egypt, the Levant, **West Indies and** South America. It is an an**nual, and in a good** soil grows generally to be **about three or four** feet high. In the Dekhan, it is a common plant springing up in waste places, and flowering towards the close of the rains. Roxburgh states that his figure of this plant, called Sesamum indicum by Linnæus, is the Krishna til of the hindoos, which Roxburgh regards as a variety of his S. orientale. It is larger, more ramous, the stem and branches tinged with a rusty reddish colour, the leaves a darker green, but in form and structure the same. The flowers are deeply tinged with red and seed of a darker colour. There are great differences, however, in the seed and harvest times, the white variety being sown in Bengal in February, and the crop got in three months afterwards, so that the dews and the little remaining moisture of the earth, are the only sources of humidity by which it can benefit, as this is generally a period of drought. The black variety of Sesamum indicum is sown on high places, about the beginning of the rains, June, and the crop cut down in September.

The first sort Gingelly, in the Northern Circars, is the produce of the plant, which is sown in the month of March, after the rice crop, and is irrigated twice, once at sowing and once afterwards. The seed, which is black, is called 1st sort gingelly, from the fact of its yielding the largest per centage of oil, it ripens in May, and sells at the rate of Rs. 60 per candy of 500 lbs. The oil obtained from both varieties, sells at the same price, viz., Rs. 2-14-6 to Rs. 3 per maund of 25 lbs. according to quality.

The second sort Gingelly of the Northern Circars is sown in June, and produces a red seed. The plant although a little larger, resembles in most respects the former, it has, however, a somewhat longer leaf, and the flower differs a shade or two in colour. A candy of 500 lbs. of this seed sells at Rs. 57-8-0. The price of the oil is the same as that of gingelly. About A. D. 1845 this seed began to be exported to France, in consequence of which the price doubled. The black-seeded variety has a deep red, or deep rose coloured blossom ; while the flower of the white-seeded variety is of a pale purple or whitish rose colour. Both varieties are cultivated in various countries, but especially in India, Egypt, and Syria, and in Southern Asia. They have also been taken to the West Indies, where the plant is called Banglo or WangloandOil-plant. The seeds are slightly oval, small, tasteless and inodorous. Sesamum seeds are sometimes added to broths, frequently to cakes by the Jews, and likewise in the east. It is about the same size as mustard seed, only not round. The expressed oil is as clear and sweet as that from almonds, and probably the Behens oil used in varnish, is no other. It is called by the Arabs "Siriteth," and the seed "bennie" in Africa. In Mysore, after being cut it is stacked a week, then exposed to the sun for three days, but gathered into heaps at night; and between every two days of such drying it is kept a day in the heap. By this process, the pods burst and shed their seeds without thrashing. Any disparity of colour observed in this oil is to be attributed to the mode of preparation. The method sometimes adopted is that of throwing the fresh seeds, without any cleansing process, into the common mill, and expressing in the usual way. The oil thus becomes mixed with a large portion of the colouring matter of the epidermis of the seed, and is neither so pleasant to the eye, nor so agreeable to the taste, as that obtained by first repeatedly washing the seeds in cold water, or by boiling them for a short time, until the whole of the reddish brown colouring matter is removed, and the seeds have become pefectly white. They are then dried in the sun, and the oil expressed as usual. This process yields 40 to 44 per cent., of a very pale straw-coloured sweet smelling oil, an excellent substitute for olive oil. In India, the oil is chiefly used in cookery, in anointing the person, for making soap, and for burning in lamps. In England, it is chiefly used for the manufacture of soap, and for burning in table-lamps, for which it is better suited than cocoanut oil, owing to the lower temperature at which it congeals. The value in England (January 1855) £47-10 per ton. In different parts of the Madras presidency the price of this oil varies from Rs. 1-5-0 to Rs. 6 per maund of 25 lbs. In S. Arcot it is procurable at Rs. 27-12-5 per candy. The prices per maund of this oil, at the undermentioned stations, for the quarter ending 31st October 1854, were as follow :—

Arcot............	Rs.	3	8	0	Madura.........	Rs.	5	8	3

Second sort Gingelly Oil, erroneously called "Rape," (Kharasanee yelloo), is obtained from the red-seeded variety. This oil differs but little from the one abovementioned. In Tanjore, it is procurable at Rupees 3 per maund.

Gingelly Seed.

Year 1847-48.	Year 1848-49.

Year 1851-52.	Year 1852-53.
Gl. 46,196......Rs. 26,722	Gl. 72,607 ....Rs. 43,608

Of the gingelly seed exported from Madras in 1852-53, the United Kingdom received cwt. 12,713—Ceylon, cwt. 590—France, cwt. 2,87,225—Pegue, cwt. 741—Bombay cwt. 113—Malacca, cwt. 33, and Travancore, cwt. 148. Of the quantity of oil (72,607 gals.) exported in the same year—gals. 42,043 were shipped to the United Kingdom—gals. 2,963 to Ceylon—gals. 4,232 to Mauritius and Bourbon—gals. 19,698 to Pegue—gals. 46 to Bengal—gals. 27 to the French (Indian) ports, and gals. 3,593 to Malacca. The oil might be substituted for olive oil; in Egypt, India, Kashmir, China, and Japan, it is used both for cooking and burning. It will keep for many years and not acquire any rancid smell or taste, but in the course of a year or two becomes quite mild, so that when the warm taste of the seed, which is in the oil when first expressed, is worn off, it is used for all the purposes of salad oil if divested of its mucilage, it competes with oil of olives, it can be raised in any quantity in the British Indian presidencies. It is sufficiently free from smell to admit of being made the medium for extracting the perfume of the jasmine, the tuberose, narcissus, and of the yellow rose. The process is managed by adding one weight of flowers to three weights of oil in a bottle, which being corked is exposed to the rays of the sun for forty days, when the oil is supposed to be sufficiently impregnated for use. Gingelly oil is used in India to adulterate oil of almonds. The flour of the seed, after the oil is expressed, is used in making cakes, and the straw serves for fuel and manure. The oil is much used in Mysore for dressing food, and as a common lamp oil. From 200 to 400 quarters under the name of Niger seed are imported annually into Liverpool for expressing the oil. Sesamum seed contains about 45 per cent. of oil. It is largely cultivated in Tenasserim by the Karen, who bring the seeds to market and sell them to the Burmese, and they express the oil.

In Bengal, S. orientale is sown during February and the crop harvested at the end of May; but S. indicum is sown on high, dry soil, in the early part of the rains of June, and the harvest occurs in September.

About Poonah it is sown in June and harvested in November.

In Nepaul two crops are obtained annually; one is sown as a first crop in April and May, and reaped in October and November; the other as an autumn crop, after the upland rice, in August and September, and reaped in November and December.

A hectare of land in Algeria yields 1,475 kilogrammes of seed, which, estimated at 50 cents the kilogramme, amounts to 737 francs, whilst the cost of production is only 259 francs, leaving a profit of 478 francs (nearly £20).

The oil obtained from this seed is inferior to good olive oil, but is better adapted for the manufacture of soap. This plant is not unlike hemp, but the stalk is cleaner and semi-transparent. The flower also is so gaudy, that a field in blossom looks like a bed of florist's flowers, and its aromatic fragrance does not aid to dispel such delusion. It flourishes most upon land which is light and fertile. The fragrance of the oil is perceptibly weaker when obtained from seed produced on wet, tenacious soils. A gallon of seed seems to be the usual quantity sown upon an acre. In the United States it yields about 2½ gallons of oil to the bushel: the produce being about 20 bushels to the acre. Flax seed yields a gallon to the bushel. The leaf of the plant has been found an excellent remedy in the bowel complaints of children and adults, and for this purpose put or dip three or four leaves in water which they render mucilaginous, but do not impart any unpleasant taste. The Negroes cultivate it for food using the parched seeds with their meals. In Arabia, the oil (siritch, Ar.) is much used as an article of diet, for frictions, and lighting. The oil-cake mixed with honey and preserved citron is esteemed a luxury. The leaves of the plant are used as poultices. Nine pounds of the seed yield two quarts of perfectly sweet oil, which will keep many years without becoming rancid; the oil made in Persia, and thence largely exported, is called Kurit-schuk. Sesamum oil is of the sp. gr. 911, insoluble in alcohol, readily saponifies with alkalies, and combines with the oxide of lead. For all purposes of medicine and pharmacy it is when well-prepared quite equal to the best olive oil. Ainslie tells us it is highly esteemed amongst the Japanese who cultivate the plant in great abundance.—*Voigt*; *Riddell*; *Roxburgh*; *M. E. of* 1856; *Eng. Cyc.*; *Simmond's Comml. Jayant, Beng.
Dhanicha, Dunchi, Hind.
Brihatchakramed, „
Erra jiluga, Tel.
Voigt, Uria.

This hardy plant grows in the two Indian peninsulas and in Bengal, growing rapidly from six to ten feet high; and is considered an ameliorating crop. About thirty pounds of seed is allowed to the acre. It may be sown in poor, low, wet soil, without preparation. The price of Dhunicha in Bengal is about Rs. 1-8 per maund. The fibres are from six to seven feet long: but unless cut at a very early period, they are coarser and more harsh than hemp. In Bengal, the fishermen make drag-ropes for their nets, on account of its strength and durability in water. It was valued in England at £35, and would probably always fetch £30 to £35. It is an excellent fibre for common chord and twine purposes and certainly superior to jute in strength and durability. The plant is cultivated in northern India, on account of the fibres of its bark, which are coarse, but more durable than some other substitutes for hemp, especially when exposed to wet, and are therefore employed for the drag ropes and other cordage about fishing nets.

SESBANIA ÆGYPTIACA, *Pers.*

Æschynomene sesban, *Linn.*, *Roxb.*
Æschynomene indica, *Burm.*
Coronilla sesban, *Willde.*
var. (*a.*) Sesbania bicolor.
var. (*b.*) Sesbania concolor.

Juyuntee, Hind.
Jaintar; jaint, „
Jaith, Hind.
Kedangu, Maleal.
Jyantika, Sans.
Karun chembai, Tam.
So'minta, Tel.

A very elegant rapid growing shrub, or small tree of Ceylon, and British India, suitable for hedges. The var. S. bicolor has orange flowers and a vexillum purple on the outside: while the var. S. concolor has a vexillum yellow speckled with black dots and lines. It is cultivated and used as a substitute for the bamboo ; its wood makes excellent gun-powder charcoal and its leaves as a cataplasm to promote suppuration. Commonly cultivated in gardens as a hedge, and for its bunches of flowers, particoloured, yellow, and occasionally white. It is a ready and quick grower, and the wood sometimes attains 2 feet in girth.—*Drs. Roxb., Mason, Voigt., J. L. Stewart,* M.D.

SESBANIA BICOLOR, and Sesbania concolor, are syns. of vars. of Sesbania ægyptiaca, *Pers.*

SESBANIA CANNABINA, the Dhanchi of Bengal, is not found wild. It is cultivated on account of the fibres of its bark, which are coarse, but more durable than some other substitutes of hemp, especially when exposed to wet, and are therefore generally employed for the drag-ropes and other cordage about fishing-nets.—*Eng. Cyc.*

SESBANIA COCHINENSIS, see Dhanchee.

SESBANIA GRANDIFLORA, *Pers.* Syn. of Agati grandiflora, *Desc., W. & A.*

SESBANIA PALUDOSA ?

Æschynomene paludosa, *Roxb.*

Kath-sola, Beng. | Munta-jiluga mokka, Tel.

An annual, but has the appearance of an elegant tree, it is a native of wet marshy places, in the south of India.—*Roxb.* ; *Flor. Ind., Vol.* iii, *p.* 333.

SESELYUS MALDODA, Hind. Leucas cephalotes.

SESHA-NAGA, in hindoo mythology, a great serpent, with a thousand heads. He is fabled to have aided Nanda to cross the Jumna when flying with the infant Krishna and to have persuaded the king of the Naga race to give the jewel which was to restore Arjuna to life. It has probably some untraceable connection with the Scythic naga race. Ananta, is a name of Sesha, the king of the serpents. Sesha means duration, and Ananta endless, in hindoo theogony, the serpent on which the deity Vishnu reposes in the intervals of creation. It was the serpent Sesha under the shade of whose hood, while resting on the Chira samudra or Sea of Milk, that Vishnu as Krishna reposed for four months. The thousand-headed serpent, is emblematic of eternity, named Ananta, meaning Endless or Infinite, the primeval serpent, on which the deity reposes in the intervals intervening between one Calpa or another creation or formation. See Adisesha, Ballaji, Calpa, Hindoo, Inscriptions, Kalpa, Lakshmi, Sesha, Tripati, Vishnu.

SESHNAGA, see Barhadratha, Inscriptions, Magadha, Yama, or Dhermarajah.

SESIN, Chin. Pellitory.

SESODI, a rajput tribe, who take their name from their totem Sissoo, a hare.

SESOSTRIS. About 900 years after the deluge, and previous to the destruction of Troy, Sesostris, king of Egypt, started the brilliant idea which M. de Lesseps in A.D. 1869 worked out satisfactorily. The Egyptian monarch caused a canal to be cut from the Red Sea to a branch of the Nile, and had ships built for carrying traffic, but for some reason or other the enterprise did not succeed, possibly because the canal was not made deep enough, or because it was not connected merely with a branch of the Nile instead of the main stream. He is said to have sailed through Babul-mandeb, and to have founded a colony, to check the irruptions of the Scythian hordes. See India.

SESQUICARBONAS SODÆ, see Soda.

SESQUI-OXIDE OF IRON, is a shining crystalline oxide, called Surma, from its resemblance to antimony ore.

SESQUI-SULPHURET OF ANTIMONY, Eng. Sulphuret of antimony.

SESSU or Sissu, Hind. Dalbergia acuminata.

SESUVIUM ANACARDIUM, Syn. of Holigarna longifolia.

SET, appears in Hind., Karn., Mahr., Tam., Tel., in various forms, Setti, Shet, Chitti, an honorific term given to a person engaged in trade, whether hindoo, mahomedan, or Parsi.

SET, the primeval name of God, in Asia.—*Buns.*, iv, 33.

SETA, It. Silk.

SETÆ, Lat. Bristles.

SETANG, a river of British Burmah. There is neither a road nor a river which can be traversed, at all seasons of the year, connecting the Pegu river with the Setang. In the dry season there is a mere cart road, made by the wheels of Burmese carts, which convey goods across the country at very high rates, and in the rains a creek is of course open to navigation by boats of small draft of water. An approach up that river, by entering its mouth, is a thing, which is not at all practicable on account of the Bore. During the war of 1851, the steamer "Proserpine" was directed to proceed up that river from Moulmein. The attempt appears to have been made but the vessel was nearly lost by the Bore. At its entrance are numerous and extensive sand banks, the channels between which have been properly surveyed. The Tungthu dwell between the Setang and the Salwin, also in Amherst province, and are in their dialect more closely connected with the Yuma languages than with the Burman. The Tung-thu has a large glossarial agreement with Karen, but it has special affinities with the Kumi and other Yumi dialects, and particularly with the Khy-eng. The Tung-thu are islamized Chinese and are said to resemble the Anamese, but as their dress resembles that of the Anamese, this may create deception. They occupy a portion of province Amherst, and are the only people there who understand the plough. They are esteemed good cultivators. The bore in the Setang river is stated to be at the mouth and for some miles up, thrice as high as the surf at Madras, from 25 to 30 feet. The inhabitants of Setang, however, say that unless in spring tides, at particular seasons, it never exceeded three and a half to four and a half feet in height, and was not dangerous. The tide they say is felt, as high as Shway Ghyeen, the river rising and falling about three feet. The last particulars are from the Setang chief, Moung Goung. During the neaptides in the north-east monsoon, when the wind blows directly off the land out to sea, there can be hardly any bore at all in the Setang river, but during spring tides in the course of the south-west monsoon, the bore might easily enough, attain to a perpendicular height of twenty to thirty feet. Between the south-west, or wet monsoon, and the north-east, or dry monsoon, there is no similarity whatever in the state of the weather on this coast. With the rains pouring down, at the rate of one hundred and fifty inches in the course of a monsoon, the rivers are all swollen and risen thirty to forty feet. The silting up of the alluvial deposit, at the mouth of the Pyne-Choung creek, is doubtless due to this cause. If native tradition is correct, two thousand years ago, the sea washed within eight or ten miles of the old royal city of Pegu.

SETA PAJJA, Hind. Rhamnus virgatus.

SETAR, a three stringed instrument, from sih, three, and tar, wire.—*Pottinger's Travels in Beloochistan and Sinde, p. 29.*

SETARIA ITALICA, *Beauv.* Syn. of Panicum italicum, *Linn.*

SETA-VER, Hind., of Lahore. Asparagus adscendens, *Roxb.*

SETH or Chetty, see Khatri, Set.

SETH, fourth son of Adam. See Abu-kubays.

SETHI, Sans. An honorary term in use in Western India, applied to all respectable mercantile people of the hindoo and Parsee races. See Set.

SETHIA ACUMINATA, *Arn.*

Batta-kerilla-gas, Singh.

A Ceylon tree, in the Ambagamowa and Saffragam districts, at an elevation of 1,000 to 2,000 feet, wood not known.—*Thw. En. Pl. Zeyl., p.* 53.

SETHIA INDICA, *DC., W & A., W. Ill.*

Erythroxylon monogynum, *Roxb.*
,, areolatum, *Ains. and Wight.*
,, sideroxyloides, *Roxb.*

Deodaru,	Duk.	Simi natti.	Tam.
Sembu linja maram?	Tam.	Devadaram, Thavadaram,	,,
Sembu-linga maram?	,,	Adavi gorenta,	Tel.

A small tree of the drier parts of Ceylon, with timber resembling sandal wood. Dr. Gibson had not seen it in the Bombay forests. Ainslie states that the wood is so fragrant, it is used in Mysore as a substitute for sandal wood. An empyreumatic oil or wood-tar, used for preserving timber employed in the construction of native boats, is obtained from the wood.—*Thw. En. Pl. Zeyl., p.* 53; *Drs. Roxb., Wight and Gibson, Voigt, Ainslie, p.* 213; *Royle's Ill. Him. Bot., p.* 133; *M. E. J. R.*

SETHIA LANCEOLATA, *Wight.* A Ceylon tree growing on the banks of streams, at Galagama, at an elevation of 2,000 to 3,000 feet.—*Thw. En. Pl. Zeyl., Vol.* i, *p.* 54.

SETHIA OBTUSIFOLIA, a tree of the Central Province of Ceylon growing at an elevation of 2,000 to 4,000 feet.—*Thw. En. Pl. Zeyl., Vol.* i, *p.* 54.

SETHU, a former name of the island or peninsula of Ramisseram was, "The Bridge" or causeway, from which the chiefs of the adjoining territory of Ramnad or Marawa derived their title of Sethu-pati or "Lord of the Bridge," and perhaps this name is disguised under the form Sitia.—*Yule Cathay, Vol.* i, *p.* 218.

SETIM, Port. Satin.

SETIPINNA, Bristle-finned Sprat, a small fish of the herring tribe, two species of which are found in Burmah seas. It is, however, easily distinguished by a long filament or bristle, which is attached to each pectoral fin. Both species are often called sprats by Europeans, and they belong to the same tribe. See Fishes, Sprat.

SETOLE, It. Bristles.

SETOLE: Spazzole, It. Brushes.

, Seu, Cho of Ravi, Pyrus malus, *Linn.* The apple tree.

SETROONJEE, river of Kattywar, rises in lat. 21° 15′, long. 70° 25′ E., into the Gulf of Cambay. Length 60 miles.

SE-TSANG, see Tibet.

SEUKUNDIR, see Kohistan.

SEUNI, or Seoni, in lat. 22° 6′, long. 79° 33′, in Berar, near the left bank of the Wynganga, 82 miles S. S. W. of Jabulpur. The mean height of the cantonment is 2,133 feet. —*Rob., Schl.*

SEVA DEVA, see Inscriptions.

SEVA, or Siva-desa-paradhi, the circumference of a circle of longitude in any point on the globe of the earth, removed from the equator; or, as Europeans would say, which has latitude. The degrees of these small circles of the sphere are taken by the hindoos to be in the direct ratio of the cosines of the latitudes; and dissolved into assignable quantities from the dimensions of the equatorial circle, which they take to contain 5,059 yojana. Siva-desa-madhya-paradhi, is the circumference of the Terrestrial Equator. Siva-desa wydia, is a term (it seems obsolete) for the oblique ascension of a planet. This element is important in the resolution of all gnomonic problems, and for fixing the longitude of places.—*Capt. E. Warren's Second Memoir, p.* 90. See Ullagna, Yojana.

SEVAJEE, the founder of the Mahratta empire, in A. D. 1646, was encouraged by the weakness of the mahommedan sect to assume independence, in 1674; and when he died, in 1682, he had established his authority over the greatest part of the Concan country, which lies between the great range of hills that bounds the Dekhan on the west and the sea-coast, and is now under the Bombay government.

The family of Sevaji, rajas of Sattarah, was founded in A. D. 1644 by Shah-ji, a subhadar of the Carnatic under Aurungzeb, bestowing jagires on his sons, giving Tanjore to Ekoji. His son Sevaji, the founder of the Mahratta empire, was born in 1627, he was rigid in matters connected with the hindoo religion. When only 16 years old, he headed a band of people residents of the Mawal or ravines of the ghauts, and subsequently by incessant predatory excursions largely extended his possessions. In 1664 he plundered Surat. In 1659 he treacherously stabbed Afzul Khan, a general of the Adil Shahi family, at an interview. He was alternately making aggressions on the Moghul territories and making treaties with their ruler Aurungzeb and at length, in a pitched battle he completely routed an imperial army of 40,000 men whom Aurungzeb had sent under Mahabat Khan. On the death of the king of Bejapore in 1672, Sevaji annexed all the Concan with the exception of the English, Portuguese and Abyssinian settlements, and assumed royalty at Raighur on the 6th June 1674, and for the next 18 months he was engaged in extending his possession to the south, exacting the Choutha or quarter share of the revenues and annexing the dominions of his half-brother Venkaji. He suddenly died in April 1680 at Rairee. From this time, a troubled period of usurpations occurred till 1707, when, on the death of Aurungzeb, Sevaji II, son of Sambha, nick-named Shao-ji, was released and crowned at Sattarah in March 1708. His nominal successor was **Ram Raja** in 1749, but the power rested with the **peshwa** or minister, the last of whom, **Baji Rao**, surrendered to and was pensioned by the British in 1818. Pertab Siva or Sinh was re-instated at Sattarah by the British on April 11, 1818, but he was dethroned in 1840 and sent to Benares, his brother being raised in his place, and the family became extinct with this brother's demise. See Mahratta Government, Polygamy.

SEVAN, 26° 25′; 67° 57′, in Sindh, a large town on the right side of the Indus. Dâk bungalow, 147 feet.—*Schl., Rob.*

SEVATHERIUM GIGANTEUM, a fossil ruminant discovered by Sir P. T Cautley in the Sewalik hills. See Markanda.

SEVEN is a frequently recurring quantity in the social and religious customs of several races. Amongst the Chaldean it seems to have had its origin in the seven-day periods of the lunar changes, but there are other septenarian numberings not reconcileable by this astral system. Amongst the Egyptians were the seven Kabiri genealogies. The race of Kronos and Rhea had seven sons, the seven primeval forces of the visible creation, perhaps identical with the seven Pleiades. The race of Kronos and Baaltis had seven daughters, not supposed to be connected with the Tartars. The Jewish records speak of 7, 70 times 7 and 7,000.—*Bunsen.* See Number.

SEVEN BROTHERS, a group of island on the Sawai bay.—*Bikmore,* 254.

SEVEN PAGODAS, an interesting series of monolithic temples, 34 miles south of Madras, by the natives called Maha-balipuram, the city of the great Baly. Here is the spot where the haughty Kehama, and Lorrinite, the enchantress, imprisoned the Glendover.

> * * * "The Sepulchres
> Of the Ancient kings, which Baly in his power
> Made in primeval times; and built above them
> A City, like the Cities of the Gods,
> Being like a God himself. For many an age
> Hath Ocean warr'd against his palaces,
> Till overwhelm'd, they lie beneath the waves,
> Not overthrown, so well the aweful Chief
> Had laid their deep foundations."

So wrote Southey, in the story of Kehama's Curse to these wondrous ruins. The traditional character of Baly was in some respects not unlike the poet's representation of the great rajah Kehama. Like Kehama, the Giant Baly had nearly raised himself to a dominion over the lower gods; like him, he had nearly driven the Devatas from heaven, and seized for himself the Swerga throne; when Vishnu came incarnate in the form of a brahmin dwarf, and humbled the Giant to the dust. Unlike Kehama, however, Baly repented and humiliated himself before the deity; and the old tradition is well told by Southey,

"Their talk was of the city of the days
Of old, Earth's wonder once, and of the fame
Of Baly its great founder .... he whose name
In ancient story and in poet's praise,
Liveth and flourisheth for endless glory,
Because his might
Put down the wrong, and aye upheld the right,
Till for ambition, as old sages tell,
At length the universal monarch fell:
For he too, having made the world his own,
Then in his pride, had driven
The Devetas from Heaven,
And seized triumphantly the Swerga throne.
The Incarnate came before the Mighty One,
In dwarfish stature, and in mien obscure;
The sacred cord he bore,
And ask'd, for Brama's sake, a little boon,
Three steps of Baly's ample reign, no more.
Poor was the boon required, and poor was he
Who begg'd, ... a little wretch it seem'd to be;
But Baly ne'er refused a supplicant's prayer.
He on the dwarf cast down,
A glance of pity in contemptuous mood,
And bade him take the boon,
And measure where he would.
"Lo, son of giant birth,
I take my grant! the Incarnate power replies.
With his first step he measured o'er the Earth,
The second spann'd the skies.
Three paces thou hast granted,
Twice have I set my footstep, Vishnu cries,
Where shall the third be planted?
Then Baly knew the god, and at his feet,
In homage due, he laid his humble head.
Mighty art thou, O Lord of Earth and Heaven!
Mighty art thou! he said,
Be merciful, and let me be forgiven.
He ask'd for mercy of the Merciful,
And mercy for his virtue's sake was shown.
For though he was cast down to Padalon,
Yet there, by Yamen's throne,
Doth Baly sit in majesty and might,
To judge the dead, and sentence them aright.
And for as much as he was still the friend
Of righteousness, it is permitted him,
Yearly, from those drear regions to ascend,
And walk the Earth, that he may hear his name
Still hymn'd and honour'd by the grateful voice
Of all mankind, and in his fame rejoice."

SEVERNDROOG, a low island off the coast of Konkan, in lat. 17° 47½' N., long. 73° 5' E. Severndroog Fort, on the small island, is 8 miles north of Dubul. Conagee Angria took it from the Mahrattas when he revolted, as also three forts on the mainland, but in March 1755 all these were re-taken by Commodore James and restored to the Mahrattas.—*Orme.*

SEVRUGA, the species of fish which yield the European supplies of Isinglass are the Great Sturgeon, Osseter, Sevruga and Sterlet, also the Silurus glynis, Barbil, Cyprinus, Brama and Carpio and Perca lucioperca, which do not belong to the tribe of sturgeons.

SEVERUS, see Polyandry.

SEVIYAN, Hind. Vermicelli.

SEVO, It. Tallow.

SEVUKA, Sans. From sevu, to serve.

SEVUTEE, Beng. See Tectona grandis.

SEW, a river near Somnee in Nagpoor.

SEWAD, see Kabul, Swat.

SEWALIK HILLS, a sub-Himalayan range, known to science for the numerous fossil remains discovered in them, fossil camels, a fossil gharial: fossil bear (ursus sivalensis); fossil tiger (felis cristata): a new fossil ruminant called Sivatherium giganteum and many other mammals and reptiles. The country below these hills seems to have become depopulated after the advent of mahomedans, the low alluvial tract, known as the Terai, is the valley formed by the junction of the Sewalik with the Himalayan inclined rocks. The Sewalik hills are covered with dense jungle, the principal trees being sal, seud, sisam jamun, haldu, and chir, the two first, hard and valuable wood for building timbers; the third resembles rosewood and for furniture, the 4th and 5th are yellowish tinted woods of inferior value, while the 6th is the long-spined Himalayan pine, which grows with a curious corkscrew fruit. The Sewalik hills are about 8 to 10 miles across, and are a mass of boulder and sandstone hills, generally quite dry, but broken up into ravines, through which sudden floods or "raos" rush in the rains. The Sewalik hills, which bound the Dhoon to the south, are in height from four to six hundred feet. The Sewalik range is 155 miles long, its greatest breadth is 10 miles from Hurdwar to Roopur, S. E. to N. W. The height is from 3,000 to 3,500 ft. in the highest part, in long. 30° 17', and lat. 77° 50', is between the Timli and Lal Derwaza passes. In many places each hill might be represented by a right-angled triangle, the base resting on the pass perpendicular facing towards the plains; hypothenuse sloping towards the Dhoons, in the opposite direction. See Bara lacha, Kabul, Lat.

SEWAN, or Sehwan, a town of twelve hundred houses on the right bank of the Indus, erected on an elevation within a few hundred yards of the river, having many clumps of trees, especially to the south. The houses are built of clay, often three stories high, with wooden pillars supporting the floors. To the north of the town are the remains of a very ancient and extensive fortress, sixty of its bastions being still visible; and in the centre the vestiges of a palace still known as Raja Bhirterri-ca-Mahul, who is said to have reigned here when driven from Oojein by his brother Vicramaditya.—*Tod's Rajasthan, Vol.* ii, *p.* 333.

SEWANA MEDIYA, Singh. A fig tree, the rough leaves of which are used as sand-paper at Galle.

SEWANCHI. Jalore is one of the most

important divisions of Marwar. It is separated from Sewanchi by the Sookri and Khari, which, with many smaller streams, flow through them from the Aravalli and Aboo, aiding to fertilise its three hundred and sixty towns and villages, forming a part of the fiscal domains of Marwar. Jhalore fortress stands on the extremity of the range extending north to Sewana and guards the southern frontier of Marwar. Sewanchi is the tract between the Loonie and Sookri. Macholah and Morseen are the two principal dependencies of Jhalore. Beenmal and Sunchore are the two principal divisions to the south, each containing 80 villages. Bhadrajoon, a fief of Jhalore, has a Joda chief and Meena population. The Thul of Goga is very thinly inhabited with many sand-hills, called t'hul-ka-tiba. The t'hul of Tiruroe lies between Gogades and Jessulmer. The t'hul of Khawar is between Jessulmeer and Barmair in the most remote angle of Marwar. Barmair t'hul, also called the Malli-nat'h-ka-t'hul is occupied by cattle-breeders. The Kherdur or land of Kher, and Nuggur Gooroh on the Loonie are the chief t'hul. The Chohan rajput of the desert has on the N. and E. the above tracts of Marwar, to the south Koliwarah and the Runn, to the west the desert of Dhat. The sterile ridge which passes through Chotun to Jessulmer passes west of Bankasir on to Nuggur Parkur. The wells are 65 to 130 feet deep. The Sehrai, Khossa, Keli and Bhil inhabitants are predatory races. The Chohan rajput does not wear the zonar and does not much respect the brahmans. The Pit'hil and Bania are farmers and traders. The Runn or Rinn, is a remarkable feature of the desert. It is a salt marsh, 150 miles broad, into which the Loni or Looni or Salt river enters and then runs on to the sea. The Looni rises in the Aravalli. In Marwar it separates the fertile land from the desert, afterwards runs through the Chohan territory, dividing it into the eastern part called Raj-Bah or Sooi-Bah, and the western part called Parkur or "beyond the Khar or Looni." The Kaggar rises in the Sewalik hills, flows under Bhutnair walls and once emptied itself between Jessulmer and Rori Bukkur.—*Tod's Rajasthan, Vol.* i, *p.* 19 ; *Vol.* ii, *pp.* 289 *to* 330 ; *The British World in the East*; *Ritchie, Vol.* i, *p*, 7.

SEWATI-RANG, HIND. Toad-colour.

SEWI, see Kaker.

SEWING. The art of sewing is now practised in India chiefly by men, who are mahomedans. They form the class of tailors (darzi), who make the dresses of their mahomedan brethren. One is usually kept in the service of most Europeans.—*Royle's Arts, &c., of India, p.* 505.

SEWISTAN, see Affghan, Kaker.

SEWTI, HIND. Rosa centifolia.

SEWUN, DUK. Gmelina arborea, *Roxb.*

SEYARD, BEN., HIND. Euphorbia antiquorum.

SEYCHELLE ARCHIPELAGO, is an extensive group of more than thirty islands, of which Mahe is the largest. Mahe and the islands in its vicinity are of primitive rock, but well-watered with numerous streams. The desolate and barren appearance of the Seychelles, when viewed from a distance, dies away as you approach. Their mountains rise as high as 2,000 feet above the level of the sea, and are clothed with verdure to their summits, the bamboo, cocoanut, tamarind, plantain, orange, coffee-plant, mango, date and sugar-cane. A coral reef surrounds the island of Mahe, which is said to be composed of granite, and consequently forms an interesting geological feature compared with other oceanic islands. The Seychelles are likewise famous from being the only locality where the celebrated coco-de-mer (Lodoicea seychellarum, the seychelle or double cocoanut tree is found. This graceful palm attracts the stranger's attention on landing at Mahe, where several may be seen in the centre of the town. It has been introduced into the island of Mauritius, but is said not to produce fruit anywhere except in its native islands. Respecting the (Lodoicea sechellarum), many fabulous accounts were formerly related, such as, that it was produced at the bottom of the sea, the nuts being only found thrown up on the coasts of the Maldive Islands. They were called Coco de Maldivia, or Coco de Salomon, by the early Portuguese navigators. Many marvellous medical virtues were ascribed to these nuts by the physicians of the age, both Asiatic and European, and they were consequently sold at a high price. At present they form only objects of curiosity, and are well-known under the name of Double Cocoanuts. The tree yielding them was first noticed by Barre, a French officer of engineers, in 1697, then described by Sonnerat, but for the first time accurately described by Labillardiere, in Ann. Mus., Paris, ix, p. 140, t. 13. A very full description and illustrative plates have been given by Dr. Hooker, in the Botanical Magazine, (N. S., Nos. iv, v and vi, 1827) and a paper on the subject was read at the Royal Asiatic Society by a resident of the Seychelle Islands. To the inhabitants the tree is useful for its timber, which is hard externally, and employed in building their huts and for posts; the leaves and their footstalks are used for the roof, walls and partitions, and for many other domestic purposes. The nuts weigh from 23 to 25 pounds each, and when fresh contain a white, transparent and jelly-like substance, which is edible. The shells are employed in making vessels and dishes of various kinds, and the entire nuts form articles of commerce, as they are esteemed in other countries both for their fabled virtues and as curiosities. In 1851 the Seychelle islands had a population of seven thousand, and some French capitalists residing at the Mauritius kept up large establishments chiefly for the preparation of cocoanut oil. Mahe is the chief island of both the Seychelle, Chagos and Amirante groups and is visited by the outward and inward bound Mauritius mail steamers every month. The two best harbours are Fort Victoria at Mahe, and Curience Bay at Isle Curience. In Mahe alone, Commander Hardinge, R.N., says there are 72,000 acres of waste land well-suited for cotton cultivation. In 1859 the exports of the whole archipelago amounted to about £12,000 chiefly in cocoanut oil and tortoise-shell. Indian coolies will make the group a wealth of paradise while Pegu and Assam languish for want of labour.—*Eng. Cyc.; Adams.* See Lodoicea, Sea-cocoanut.

SEYEE, near this is the ancient boundary of Vrij, marked by a pillar.—*Tr. of Hind., Vol.* ii, *p.* 116.

SEYER ISLANDS, a part of the Mergui Archipelago, bold islands, visible at sea from a distance of 24 or 27 miles. North Seyer Island is in lat. 8° 41′ N. and the body of the great island in long. 97° 39⅓′ E.

SEYR, Tel., Mahr. Euphorbia tirucalli, *Linn.*

SGAU, a Karen tribe.

SGAU TRIBES, as the sea-board is approached, the Sgau and the Pwo are found mingled together from Bassein to Mergui. They speak the Sgau dialects. They are, however, found from Mergui in lat. 12° N. to Prome and Tounghoo in lat. 19° N. a few have passed westerly into Arakan, and on the east they have wandered to the east of Zimmay over the watershed that separates the Meinam from the Salween. They are the most numerous of all the Karen tribes. They wear a white coat, with a few horizontal bands of a red colour near the bottom, and from this, they are called White Karen. Where the population is sparse they cultivate the most favourable spots, first, before hewing down the trees abjuring the departure of all evil, and then dibbling in the rice seed, which they do not sow broadcast like the Burmese, planting also cotton, capsicum, Indian corn, and Job's tears between the rows. They also fish largely, for they eat all creatures, lizards, snakes, deer, wild hog, elephant, rhinoceros, wild ox, buffalo, they gather the wild cardamom, or wash for tin. They have no mechanical art, but some of the women weave and embroider. Their betrothals are in infancy and the married couple early associate, but there are frequent separations. All the Sgau and the Pwo burn their dead, but a bone is taken from the ashes and in the dry season it is buried with a festival, with music and dancing. The bone is placed in a booth and around it the articles belonging to the deceased are hung, with a torch at the head and another at the foot to represent the morning and evening stars. The Sgau Maunepgha, occupy the hills between the Youk-tha-wa and Meet gnan creeks, their dialect is different from the Sgau.

SGAU, Burm. Psychotria.

SGEENAM, see Kunawar.

SGURMA, a sweetmeat of Little Tibet, made from sprouting wheat, dried, pounded, and boiled, and the strained liquor added to almond or apricot oil.

SHA, Burm. Acacia catechu, *Willd.*

SHA, Burm. Bast.

SHA, Hind., of Kanawar. Fothergilla involucrata, also Parrotia jacquemontiana.

SHA, Tibetan. Ovis montana, occurs in Ladak. It browses in large flocks on the left banks of the Indus below Le. It is of the size of a stag with large wiry hair of a reddish brown colour on the back, gradually changing to white on the stomach. The chest is covered with a long fringe of dirty black hair. Its horns are massive and touch at their bases.

SHAB, Pers., night. Shab-bu, Hind. Mathiola annua, gul shabbu, Hind., is Polianthes tuberosa.

SHABAN, the eighth month of the mahomedans, also a feast so called, the Shaban feast, of Shab-i-Barat, on the 14th day of that month.

SHABGEZ. Every caravan-sarai and halting place between Danghan and Sharud is infested with a bug of this name. The extraordinarily venomous bite of this animal is well known, and as has been remarked by many travellers, if it does not kill, it causes severe illness.—*Modern Traveller; Persian Note on Meani, by Dr. Campbell; Ferrier's Journ., p.* 76.

SHAB-I-BARAT, or night of record, a mahomedan religious festival, held on the eve of the 14th of the month Shaban, it is a solemn vigil with fasting and prayers and illumination. In Northern India, lamps are lit and prayers are said in behalf of deceased ancestors. See Barat, Shaban.

SHA-BIN, Burm. Acacia catechu, *Willd.*

SHABIT, Ar. Anethum sowa, *Roxb.*, also Anethum graveolens, *Linn.*

SHAB-I-YEMENI, Pers. Alum.

SHAB-NAM, Hind. A fine kind of Dacca muslin, literally night-dew.

SHADA-BOORI, Beng. Secamone.

SHADA-HAJURMUNI, Beng. Phyllanthus niruri, Indian annual phyllanthus.

SHADA-HOORHOO-RIYA, Beng., also Shada-hurhurija, Beng. Gynandropsis pentaphylla, *DC.*

Shada-kanoor, Beng. Pancratium triflorum.

Shada-juba, Beng. Hibiscus albo-plenus.

Shada-jati, Beng. Barleria dichotoma.

Shada-jamai-pulishim, Beng. Lablab gladiatum, flore albo.

Shada-jhanji, Beng. Utricularia nivea.

SHAD-A-MANJI, Tam. Spikenard.

SHADA-NUTEEYA, Beng. Amarantus albus, eatable amaranth.

SHADAVELI, Maleal. Asparagus sarmentosus, also Asparagus adscendens, *Roxb.*

SHADDOCK, also pumplemose and pummalo, Eng. Citrus decumana, *Linn.* A large species of Citrus, commonly cultivated in the East and West Indies, for the sake of the delicate, subacid, juicy pulp, with which the fruits abound. The larger are called Pompoleon ; the smaller, form the forbidden fruit of the English markets. It is named after Captain Shaddock, R. N., who introduced the Citrus decumana, *W.*, into the West Indies, and there gave to the fruit his name.—*Faulkner.*

SHADEE, lit., rejoicings, marriage. In British India, the most respectable form of mahomedan marriage. See Nikah, Polygamy.

SHADIA, see Jell.

SHADIDA KALLI, Maleal. Euphorbia antiquorum, *Linn.*

SHADILINGUM, or Enghillicum, Tam. also Jadilingum, Tel. Cinnabar.

SHADIPA, Sans. Hemidesmus indicus, *Rheede, R. Brown, W. Ic., Contr.*

SHADRE KALLI PALL, also Shadrikalli, Tam. Euphorbia antiquorum, *Linn.*

SHADU, see Kelat.

SHADUPOOR, near a river of Sylhet.

SHAEE, see Kelat.

SHAFAEE, one of the mahomedan sects.

SHAFAF, Hind. Transparent, a hard and transparent ruby, &c.

SHAFAR, or Rangchul, Hind., of Kanawar, Syringa emodi.

SHAFI. Abu Hanifa and Ibn Hanbal, mahomedan religious men, who gave rise to the schools known by their names.

SHAFRI, Hind. Syringa emodi.

SHAFTAL, Hind. Trifolium repens, clover and lucerne. See Grasses.

SHAFT-ALU, Hind. Amygdalus persica, var. Lævis.

SHAG of Kanawar, Betula bhojputra, *Wall.* ; *Royle.*

SHAGAL, or Gur Shagal, is Desmodium tiliæfolium.

SHAGALI, Hind. Indigofera heterantha, Ban shagali, Hind. is Staphylea emodi.

SHAGAR, see India.

SHAGGY-BUTTON-WEED, Eng. Spermacoce hispida, *Linn.*

SHAGHAR, Hind. Brassica rapa.

SHAGREEN.

Chagrin,	Fr.	Schagrim,	Rus.
Schagrin,	Ger.	Schagren,	,,

It is an oriental manufacture, and the method of preparing it was long kept secret. It is employed in the manufacture of small cases and boxes. The leather is prepared in Poland, Astracan in Russia, and various parts of the Levant. Shagreen differs from leather in not being tanned or tawed. It bears some resemblance to parchment, but the grain or hair side is granulated or covered with small round rough specks. It is said to be prepared from the skins of horses, wild asses and camels, those portions being preferred which cover the chine. The fillets of skin are steeped in water until the hair is sufficiently loosened to be scraped off ; the skins are then stretched upon a board, and are unhaired and fleshed with a knife. Each fillet is then stretched in a frame, as in the preparation of parchment, and is moistened from time to time and gradually distended. While still moist, the grain or hair side is sprinkled over with the seeds of a kind of Chenopodium ; they are hard, of a shining black colour, and about the size of poppy seed. These seeds are forced into the surface of the skin by the pressure of the feet or by means of a simple press, a piece of felt or thick stuff being laid over the seeds. In this state the skin is left to dry in the shade, and when the seeds are shaken out by beating the skin, the surface of the latter is pitted with small hollows corresponding with the forms of the seeds. The skin is now stretched on an inclined plane, by attaching its upper end to hooks and fastening weights to its lower end, it is thinned off with a half-moon knife, care being taken not to cut so far as the bottom of the little pits occasioned by the seeds. On macerating the skins in water they swell, and they become prominent over the shaven surface. The process is completed by steeping the strips in a warm solution of soda ; salt brine is then used, and the skins are ready for the dyer.—*Tomlinson* ; *McCall.*

SHAH, Hind., Pers. A king, also royal. The term is also given to the faqir or darvesh of India, who is often called shah : the sikhs also applied it to their founder Shah Nanuk, whom also they styled Nanuk Narinkar, Nanuk the omnipotent. Shah is the equivalent of the Arabic and Turkish sultan. Shahu-shah, an emperor.

SHAH, Burm. Catechu, or Cutch Tree, Acacia catechu.

SHAH, Hind. A money lender or trader: the principal in relation with an agent, shah gumashta.

SHAH ABBAS, see Hormuz, Ormuz, Kandahar.

SHAHABAD, a revenue district of Bengal, formed out of the ancient Bahar.

SHAH ABDOOLLAH, Shootare-nak.

SHAHAD, Hind., Pers. Honey.

SHAHADAT, Ar. Martyrdom. From shahid, a witness.

SHAH ALAM was defeated at Patna on the 25th January 1766. Shah Alum died in his eighty-sixth year. His son Akbar Shah, died at eighty. Bahadur Shah sunk into the grave at about the same age.—*Tr. of Hind.*, *Vol.* ii, *p.* 374.

SHAHAB-UD-DIN, in A. D. 1193 conquered India. Kutub-ud-din, successor of Shahab-ud-din, in A. D. 1205, conducted in person, a war against the northern Jit.

SHAHARANPUR, a town of the Merut district of the N. W. Provinces.

SHAH BALUT, Hind., Pers. Acorns of Quercus incana, Q. semecarpifolia, and Q. ilex.

SHAH-BAZ, Hind. Limnaetus cristatellus, *Temm.* In Sind'h the Baz or Shahbaz is the female, and the Zorru or Jurrah is the male. It is a native of Khorasan. The shah-baz gulab or yellow eye hawk is a noble bird. In Persia the Shahbaz, or hawk-king, is a large grey gos-hawk with yellow eyes, caught in the hills of Affghanistan and its surrounding regions, brought down to the plains and sold, when well reclaimed, trained, and in good condition, for *5l.* or *6l.* The tiercelet or male, is as usual, much smaller than the female, and is called Jurrah, in Persian, "the active." Both are uncommonly strong and ferocious. They are accounted the noblest birds; the Sher-baz, "lion-hawk," is the falcon or peregrine of Bokhara and the snowy regions.

SHAH-BU, also Shahbui, Pers. Ambergris.

SHAH BUDDEE-OOD-DEEN, or Zinda shah mudar. See Faqir.

SHAHD, Hind., Pers. Honey.

SHAH DAWUL KI ROTIAN, a mahomedan ceremony.

SHAHDHERI, the site of Taxila which Arrian, Strabo and Pliny described as so magnificent and in the treasury of which the celebrated Asoka found nine millions sterling.

SHAH DOLA, a mahomedan saint, at whose shrine oblations are offered. Shah Dola died in the seventeenth year of the reign of Alumgeer. At first a slave of Kumayandar Sialkoti in Lahore, he seems afterwards to have attained great affluence as well as fame; for having settled at Ch'hotee Goojrat (little Guzerat), he built tanks, dug wells, founded mosques, and bridges, and embellished the city. Though his contemporaries came to visit him from far and near, and made him presents of gold, money, and other objects, he returned to each three or four-fold more than he received.

SHAHD-KI-MEKHI, Hind. The honey-bee.

SHAH HUSSUN, see Hot springs, Kandahar.

SHAHID, Pers., Hind. A martyr for the faith, a mahomedan who has fallen in battle against infidels.

SHAHIN, the Bhairi or Falco calidus, so celebrated amongst Indian falconers for her boldness and power, and her tiercel, is in Sindh commonly called the Shahin. It is found only in some parts of the province. They fly at partridges, hares, bustards, curlews, herons and the saras. They are long-winged hawks or birds of "the lure," and are taught to fly high, to "wait on" the falconer, and to "make the point." Bahree or (bhairi) is the female, and the Bahree-buchee or Shahin is the male. The shaheen, the royal falcon of North India (the falco-peregrinator) has been seen in the centre of the cantonments of Dugshai while it was stooping on a Himalayan pipit.

SHAH ISMAEL, one of the first of the Suffavean kings of Persia reigned about A. D. 1,500. He was supported by seven Turkish tribes, one of whom, the Baharloo are part of the Kazzilbash.

SHAH ISMAIL, see Kajar, Kazzilbash.

SHAHIZYE, see Kelat.

SHAH JAHAN, son of Jehangir, reigned from 1627 to 1665, when he was deposed and confined by his son Aurungzeb. He was the most magnificent of the emperors of Baber's line. His revenues were thirty crores. He erected the Taj Mahal. He survived his dethronement for seven years, during which he was kept a prisoner in his own palace, but was treated by Aurungzeb with great respect. Akbar was one of the greatest sovereigns of India; his grandson, Shah Jehan, has left some noble monuments, Aurungzeb, was son of Shah Jehan. Shah Jehan's expenditure was great in his expeditions to Candahar, his wars in Balkh, and in maintaining a regular army of 200,000 horse, but he left a treasure estimated by Bernier and by Khavii Khan, from 6 to 26 millions sterling and a vast quantity of gold and silver jewels.—*Bunsen*, *Vol.* iii, *p.* 484. See Affghan, Fasli, Khyber, Panjab.

SHAH JAHAN ; Merv, the ancient capital of the province of Margiana, was founded by Alexander the Great, and afterwards embellished by Antiochus Nicator, who gave it the name of Antiochia. It was one of the four imperial cities of Khorassan, and was long the seat of many of the sultans of Persia ; but, in particular of those of the Seljukian dynasty. The fruits of Merv were finer than those of any other place, and the walls were, on all sides, surrounded with stately palaces, groves, and gardens. Here Alp Arslan, the most powerful prince of his time, reigned for a number of years, in all the pomp and splendour of oriental magnificence.—*Kinneir's Geographical Memoir, p.* 179.

SHAH JEHANPORE, a town of Rohilcund. The Shah Jehanapore massacre occurred on the 31st May 1857.

SHAH JI, father of Sivaji, was born in 1592. He was a mercenary soldier, employed by the Adil Shahi family of Bejapore. He obtained jaghirs in the south of India. He died in 1664. See Mahratta Governments in India, Sevaji.

SHAH MAKSADI, HIND. A kind of marble from Yusufzai.

SHAH MAMA, or Shah Muma, is the name of the smaller of the idols at Bamian. The words are supposed to be a corruption of Shak-muni. See Bamian.

SHAH NAMEH is one of the longest poems in the world, and contains not less than 120,000 lines. It is the great epic of the east, is a historical poem, comprising a romantic history of the kings of Persia, from the commencement until the conquest of the country by the mahomedans. See Jamshid.

SHAH NUSHEEN or Dad muhal, HIND. See Faqir.

SHAH NAWAZ, see Khyber.

SHAH NIZAM OOD DEEN OWLEEA, by some supposed to have been born at Gazna, A. H. 630 (A. D. 1622-3), and by others in A. H. 634 (A. D. 1236) at Badaam, a town in the province of Delhi where he lived. He died A. H. 725 (A. D. 1325), and was buried near Delhi, hard by the tomb of Qutb-ud-Deen. Through his great piety he was considered one of the most eminent saints of Hindoostan, and oblations are offered to him.

SHAH-PASAND, HIND. Centaurea moschata.

SHAHPUR, a suburb of Belgaum in the Southern mahratta country. Belgaum is called by the compound name Shahpur Belgaum.

SHAHPUR lies on both banks of the river Jhelum. Its chief products are grain of all kinds, except rice, cotton, wool, ghee, opium, salt and saltpetre. There are no less than six hundred weaving establishments at Khosab, and about one hundred and fifty at Girot. The cloth woven in Girot and its neighbourhood has a high reputation for its fineness and durability and fetches comparatively high price. In former days nearly the whole of this cloth was carried across the frontier into Affghanistan by the Dera Ismael Khan and Peshawur routes, but of late years, a considerable portion of the trade has been diverted in the direction of Sind. The Povindia merchants are large purchasers of this cloth on their way back to their homes, and the Khoja and Piracha of Bhera convey large quantities of it to Cabul. The shearings of the large flocks in the Thull are collected by the Khutree of Noorpoor (Tuvana), who buy the wool from the sheep-owners at so much a sheep ; the rate is four pothi per rupee, the produce of the shearing of each sheep being called a pothi. The average annual produce of opium is 400 maunds, worth not less than 1,60,000 rupees ; nearly the whole of this leaves the district under passes, the destination of by far the greater part being Lahore and Umritsur. The standing crop is purchased by resident Khutree, who after extracting the drug either export it themselves or sell it to traders from other districts. Shahpoor and Bukkur are the head-quarters of this trade. The Wurcha salt mines in this district supply the more southern districts, the salt being entirely carried on beasts of burden. The prosperity of the town of Mianee opposite Pind Dadun Khan, is entirely dependent on the trade in salt. The Jhilam and Shahpoor districts are intersected by the Salt Range.

SHAHPOORA, a petty state in the North-west Provinces. The rajah of Shapoora is of the Sesodea Rajpoot clan, and immediately descended from a former rana of Oodeypoor. The founder of the house of Shahpoora was Sooraj Mull, a younger son of the rana, from whom the chief in A. D. 1850, was tenth in direct lineal descent. Sooraj Mull received as his portion the pergunnah of Khyrar, in Meywar, and his son also acquired from the emperor Shah Jehan of Delhi, in reward of his gallant services, a grant out of the crown lands of Ajmeer, of the Pergunnah of Phoolea, upon condition of furnishing certain horse and footmen for service. He abandoned the town of Phoolea, and founded Shahpoora. In 1850, the rajah held Khyrar under the sovereign of Oodeypore, and Shahpoora under the British Government as part of Ajmeer. His possessions are estimated to yield nearly three lakhs per annum. In 1848 he received a sunnud from Government, fixing the amount of his tribute at rupees 10,000 per annum. In March 1862 he received a sunnud guaranteeing to him the right of adoption.—*Aitcheson's Treatise, p.* 58.

SHAHPUR, see Khuzistan.

SHAHPUR ARDASIR, see Kutch.

SHAHR, Ar. A month.

SHAHR, Pers. A town. Shahri or "citizen," is used in Persia as a term of contempt, to signify unwarlike, the soldiers of that country being all men of wandering tribes. —*Malcolm's History of Persia, Vol.* ii, *p.* 185.

SHAHREK, see Jehanabad.

SHAH-RUH, son of Timur, succeeded to his father's empire and reigned 42 years. He was not the lineal ancestor of sultan Baber. In A. H. 823-5, (A. D. 1440) as king of Herat, he sent Abd ur Razzaq, his son Jemal ud Din on a mission to the king of Vizianuggur: subsequently to Ghilan, and then to Egypt, and to Ching-tsu, the third emperor of the Ming dynasty. Of this embassy a narrative written by Khwaja Ghaias-ud-din, surnamed Nakkash or the Painter, a member of the mission, has been preserved in Abd-ur-razzak's History of Shah Rukh, and has been translated by M. Quatremere.—*Yule Cathay, Vol.* i, *p.* cxl.

SHAHR-SABZ, a city, formerly called Kesch.—*Malcolm's History of Persia, Vol.* ii, *p.* 252. See Kesh.

SHAH SHUJA UL MULK, was ruler of Kabul, for a short time, in the beginning of the 19th century. In 1812, after a series of reverses, he was seized in Peshawur, by Jehandad Khan, Governor of Attock, and until 1839, he continued at times a wanderer or a prisoner in the Punjab, and after 1816 at Loodianah. He was restored by the British in 1839, but was assassinated shortly after they left, in the reverses of 1841 and 1842.

SHAH SHAMS OOD DEEN, DARIAI is a mahomedan saint buried at Depaldal in Lahore. He is stated to have had even a pious hindoo among his disciples. The latter having expressed a wish to go and bathe in the Ganges, the saint directed him to shut his eyes, when lo! the hindoo found himself among his relations and friends on that sacred stream, in which (as he supposed) he bathed with them. On opening his eyes again, he straightway found himself beside his spiritual guide in Lahore. His tomb is guarded by hindoos, who will not resign their posts to the mahomedans. It is also related that some carpenters having proceeded to cut down a tree which grew near his tomb, split it into many pieces for use. Suddenly a dreadful voice was heard; the earth shook, and the trunk of the tree arose of itself; the workmen fled terrified, and the tree did not fail to resume its flourishing condition. Oblations are offered to him.

SHAH SHURF BU-ALI-QALANDAR, a ceremony.

SHAH SHURF-UD-DIN, Yahia moonayree.

SHAH SUJAH, see Khyber, Shah Shuja.

SHAH TARA, Hind. Fumaria parviflora, fumitory.

SHAH TUSH, Hind. Tus.

SHAH TUT, Hind. Morus alba, &c. M. serrata, Hind. Morus nigra, the cultivated mulberry fruit.

SHAHUM, Ar. Tallow.

SHAH-WULLEE, see Khyber.

SHAH ZAMAN, see Runjit Singh.

SHAH ZIRA, Duk. Cuminum cyminum.

SHAH-ZOUNG, Burm. Aloe. This occurs in many varieties, and is used in Burmah both for medicine and chewing with the betel. *Malcom, Vol.* i, *p.* 183.

SHAI, Hind. Brassica, *sp.*

SHAI-I-BAZI, Pers. Toys.

SHAIKH. In India, a division of the mahomedans who class themselves according to their Arab origin, Ansaria, Faroki, Koreshi, Mahaji, and Sadiki. Shaikh is the word generally applied to the principal teachers among the Sufi, and is always used by this author to describe them. Shaikh, amongst the Arab tribes, is the chief of the tribe, but the Shaikhs of the small tribes are subordinate to the greater shaikhs of the potent tribes.—*Malcolm's History of Persia, Vol.* ii, *p.* 413.

SHAIKH ABU ISHAK, of Kazerun, was patron saint of the mariners in the India and China trade, who made vows of offerings to his shrine when in trouble at sea, and agents were employed at the different ports to board the vessels as they entered and claim the amounts vowed, which generally came to large sums. Applicants to the shrine for charity also used to receive circular notes payable by parties who had vowed. When the recipient of such a note met any one owing an offering to the shrine, he received the amount on presenting his bill endorsed with a discharge.—*Ibn Batuta, Vol.* ii, *pp.* 90, 91; *Yule Cathay, Vol.* i, *p.* 253.

SHAIK MIRZA, chief of Farghana, father of the emperor Baber.

SHAIK SAFER, a Darvesh. See Kazzilbash.

SHAIK-UL-SHAYUKH, on the Euphrates, 154 miles from Babylon.

SHAIK ASMAN, an aqueduct which leads into Aden.

SHAIKWA, a town in Assam, 335 miles from Calcutta.

SHAIN, also Shain-kanta, Beng. Acacia suma.

SHAINWARI, see Affghan.

SHAIR, a river near the right bank of the Nerbudda in Gurrawara near Nursingpore.

SHAIR, also Dhourra, Arab. Barley.

SHAIR-UL-JIN, Arab. Adiantum capillus veneris, maiden-hair.

SHAISTAH KHAN. During the administration of Shaistah Khan, subadar of Bengal, the English were subjected to much oppression. He exacted a duty of 3½ per cent. on their merchandize, and his officers arbitrarily extorted large sums from the factors, till, in 1685, it was resolved to seek redress by force of arms. The hostilities of the English exasperated the emperor Aurungzeb, who ordered that the English should be expelled from his dominions. The Company's factories were seized, and their affairs were brought to the brink of ruin, when negociations for peace were set on foot, and a reconciliation was effected. In 1698 the English obtained permission from Azeem-oos Shah, grandson of Aurungzeb, and Governor of Bengal, to purchase the towns of Chuttawutty, Govindpore, and Calcutta. The sunnud is not supposed to be extant.

SHAITAN KA JHAR, Hind. Alstonia scholaris. *R. Br.*

SHAJINA, Beng. Moringa pterygosperma, *Gærtn.*

SHAJR, Ar. A tree ; a genealogical tree. Shajar-ul-Jin, Erythroxylon areolatum ?

SHAJRAH-MIRIAM, Arab. Cyclomen europeum, *W.*

SHAJRAT-UL-MURR, Ar. A tree of Arabia, yielding myrrh, supposed to be a species of Balsamadendron.

SHAJRAT-UL-DAB.

Akuj, Ar. | Laroos, Hind.

SHAJR UL HYAT, Ar. Cupressus sempervirens, *Willde.*

SHAK, Beng. The teak tree, Tectona grandis.

SHAK, Hind. Pennisetum italicum, also Brassica, *sp.*

SHAKAKAL, Hind. Sium, *sp.*

SHAKAK-UL MISRI, a medicinal root.

SHAKAR, Hind. Pers. Sugar.

SHAKAR DANA, Hind. Colebrookia oppositifolia.

SHAKARI or Shakara shora, Maleal. Cucurbita maxima, *Duch.* ; *W. & A.*

SHIKARI, Hind. A hunter, a sportsman. In the centre of the peninsula of India is a hunter race who style themselves Bhowri, but are known as Hirn Shakari and Hirn Pardi.

SHAKARKAND, Hind. Batatas edulis.

SHAKARI-SHORA, Maleal. Cucurbita maxima, *Duch.*

SHAKARKANDI, Hind. Convolvulus pentaphylla.

SHAKAR-PITAN, Hind. Euphorbia royleana.

SHAKAR SURKH, Hind. Saccharum officinarum, "red sugar" pale molasses or moist sugar.

SHAKAR TAGHAR, Hind. Manna from Calotropis.

SHAKARTARI or Shakarkand, Hind.

SHAKAR UL ASHAR, also Shakar-ut-tighal, manna from Calotropis procera.

SHAKAS, see Inscriptions, Karli.

SHAKASI COPAL or Tree Copal, is so called to distinguish it from the fossil variety ; it is known in commerce as jackass copal.

SHAKA-TUNGA, Tel. Cyperus hexastachyus, *Rottl.*

SHAKAVU, Can. Branch of a tree.

SHAKEI, Hind. Thymus serpyllum, Missiessya hypoleuca.

SHAKENI, Sans. Mulukaraug vare patte.

SHAKERA-KOOMATI. Cucurbita citrullus.

SHAKH, Hind., Pers. A branch, also a horn.

SHAKH, Hind., of Kanawar. Betula bhojputra, *Wall.* ; *Royle.*

SHAKHA, Sans. A branch, from shakh, to overspread.

SHAKH CHINARI, Hind., lit.,. plane tree branch, it is a yellow colour with a suspicion of black or blue.

SHAKHI, Hind. Fraxinus floribundus.

SHAKH-I-AMBAR, Pers. Aromatic sticks used as pastilles brought from Lhassa.

SHAKH-I-HIRAN, Hind. Stag's horns.

SHAKPOOL, Pers. Cytisus cajan, *Linn.* Cajanus indicus, *Spreng* ; *W. & A.*

SHAKINI, Sans. Moolay keeray.

SHAKONG—? Gypsum.

SHAKPA, Hind., of Chenab in Lahoul. Juniperus excelsa, J. arborea, pencil cedar.

SHAKTA, Sans., from shakti, energy.

SHAKTABHISHEKA, Sans., from shakta, a worshipper of the divine energy, and abhisheka, to anoint.

SHAKTEKAS, Hind. Ribes leptostachyum.

SHAKTI, see Sakti, Shakta, Bhavani.

SHAKAK-UL-MISRI, Hind. Eryngium planum.

SHAKUL, Beng., Hind. Cytisus cajan.

SHAL, Beng. Saul tree, Shorea robusta.

SHAL, see Kaker, Shall.

SHALA, of Ravi. Coriaria nepalensis, *W.*

SHALAKAT, Hind. Myricaria germanica.

SHALANGLI, Hind. Skimmia laureola.

SHALANGLU, Hind. Litsæa, *sp.* Machelas odoratissimus.

SHALANGRI, Hind. Daphneoleoides.

SHALAPAPRA, Hind. Hibiscus mutabilis.

SHALATA, see Chaldeo.

SHALE, a term applied to any argillaceous deposit naturally divisible into laminæ parallel to the plane of deposition. Thus there are sandy, calcareous, purely argillaceous, and carbonaceous shales ; there is also a black and a brown bituminous shale. Shales and fire clays, occur at Streepermatoor, Tripasoor, Chingleput, Mettapollium and Cuddapah.—*Tomlinson* ; *M. Exh. Jur. Rep.*

SHALEYA, Sans. Anethum sowa, *Roxb.*

SHALGHAM, Hind. Brassica rapa ; a turnip.

SHALGHAM MISRI, Hind. Convallaria verticillata.

SHALI, Hind. Pennisetum italicum.

SHALI, Uria. Bauhinia vahlii, leaves used for rolling tobacco in, as a cheroot.

SHALI, Hind., Singh. Unhusked rice, paddy.

SHALI DAG GANCH, Hind. Rubus fruticosus.

SHALIMAR, a garden near the town of Kashmir, famed in Lalla Rookh. The Shalimar contains a building of polished black marble at the upper end of a walled garden. The term is derived, by Vigne, from Shah-ul-imarat, or Royal gardens, but it may be Shahi-mari royal-house. Mohun Lal says, its original name was 'Sholah Mah,' or the flame of the moon. The streams of water running at the four corners, give an idea of the Mahtab Bagh, a palace of Delhi. The gardens of Shalimar, made by the emperor Shah Jehan, were begun in the fourth year of his reign and finished in the thirteenth, on which occasion the emperor gave a grand festival to his court. These gardens were laid out with admirable taste, and cost the enormous sum of a million sterling. At present, their appearance does not give cause to suppose such an immense sum has been laid out upon them, but great part of the most valuable and costly materials have been carried away.—*Mohun Lal's Travels, p.* 14 ; *Tr. of Hind., Vol.* ii, *p.* 308.

SHALIMAR, 28° 41′ ; 77° 9′, in Hindostan, 6 miles N. W. of Delhi, 847 feet.—*Schlagintweit's General Hypsometry of India, Vol.* ii, *p.* 115.

SHALIMBO-BANSO, Tel. Extreme height 40 feet, circumference $2\frac{1}{2}$ feet. Two species of bamboo which abound in the Ganjam and Gumsur forests.—*Capt. Macdonald.*

SHALKANTA, Beng. Acacia suma.

SHALL is one of the districts of Beluchistan, where snow lies for two months of the year. The population consists of the Kassi tribe of Affghans who claim affinity with the Safi clans, but in spring and summer numerous Brahui toman range over its plains. Its capital called Shall by the Baluch, by the Affghans is called Quettah, an equivalent for Kot or fort, and the town of Shall is often called Quettah, and Kot. It is surrounded by a slight mud crenated wall, and may comprise three hundred houses. These lie at the base of a huge mound, on which stands a citadel. The bazaar is tolerably well supplied, and is a fair one for a provincial town, which appear as if newly planted, the trees being young. There are the vine, the fig, the pomegranate, the plum, the apple and pear ; mulberries and apricots are plentiful, as are also melons in their season. The valley of Shall may be about twelve miles in length, with an average breadth of three or four miles. It is well supplied with water ; and besides good wheat and barley, yields much lucern, with, it is said, some madder. The neighbouring hills—the native region of the wild sheep—provide ample pasture for very numerous flocks of the domestic animal, and Shall is proverbially celebrated for the excellency of its lambs ; many small hamlets belonging to the Sherwani Brahui are towards the south. There are likewise some castles contiguous to the town, the principal of which is owned by Samandar Khan, a Durani nobleman of note. The valley of Shall was originally held by the Kassi Affghans, who still dwell in the town and immediate vicinity. Having passed under Brahui rule, the Sherwani tribe have intruded themselves into the southern parts of the valley ; and some of the villages bordering on it, and included in the district, as Kuchilak, on the road to Peshing, and Berg, on the road to Mastung, are wholly or chiefly held by Khaka.—*Masson's Journey, Vol.* i, *pp.* 328-333.

SHALLOT.

Allium ascalonicum, *L.* | Gundhund, Hind.

Shallots are the mildest of the onion tribe, seed seldom ; propagated by the young bulbs like the chive ; used in sauces, salads, &c.—*Riddell* ; *Jaffrey.*

SHALMULI, Beng., Hind., Sans. The roots of Bombax heptaphyllum, supposed by natives of India to have great power in preventing the access of old age, if taken daily, and no acid swallowed.—*Powell's Hand-book, Vol.* i, *p.* 333.

SHALOOK, Beng., Hind. Nymphœa pubescens.

SHALPANEE, Beng. Hedysarum gangeticum, oval leaved hedysarum.

SHALPURNI, Hind. Desmodium tiliæfolium.

SHAL-SHAIN-BABULA, Beng. Acacia tomentosa.

SHALU of Chenab, Coriaria nepalensis, *W.*, also Pennisetum italicum.

SHALWI, Hind. Hedychium spicatum.

SHAM, also Sam, a tile of Krishna.

SHAM, in the East, the name of Damascus. See Barrada.

SHAMA, a name of Krishna.

SHAMA, Hind. The Cercotrichas macrourus, not unfrequently designated the Indian Nightingale. It is common to India and the Malay countries and is undoubtedly their finest song-bird ; there is a second species (C. luzoniensis) in the Philippines, and a third (C. erythropterus) in Africa. The esteemed Indian songster is le Merle tricolor de longue queue of Levaillant. The Orocetes cinclochyncha is termed Shama in the Madras Presidency.—*Oiseaux d' Afrique, pl.* 114. See Bulbul.

SHAMA, Beng. Purple panic grass, also Oplismenus colonus, also Panicum frumentaceum, wheat-like panic grass or millet.

SHAMAKA, Sans., also Shamakh, Duk. Panicum miliaceum. This is the grain which in N. W. India is used, in the kharif crops, as an offering to the lares or household gods, in the Arwun ceremony. In the rubbee crops, barley is the grain used in the Arwun, as it is called in Rohilcund and the Upper Doab, but it is also called Nuwan from naia,new,and corn, when the arwun is brought home, the grain is taken out of the ear, mixed up with milk and sugar, and every member of the family tastes it seven times ; the season is one of festivity. " Phoola-phoola kyun phire ? G'hur arwan aya"—Why walk you so gladly ? The arwan has been brought home. The Dit'hwun is a similar ceremony, when cutting the sugar-cane, part of it is brought home and spread before the saligram, and the officiating brahmin declares the fortunate moment for beginning operations, the cutting is commenced. The whole village is a scene of hilarity ; and dancing and singing are the order of the day :—

> Et cererem clamore vocent in tecta ; neque ante
> Falcem maturis quisquam supponat aristis,
> Quam Cereri torta redimitus tempora quercu
> Det motus incompositos, et carmina dicat.

What the ceremony of Dit'hwun is to the sugar-cane, that of Arwun is to the Shamak'h and barley grain.—*Ell. Supp. Gloss., Georg.*, ii, 350. See Arwun, Jooree, Dogur.

SHAMBAR, also dud shambar, Desmodium itiliæfolium.

SHAHZADI KHANUM was the name of Akber's eldest daughter and sister of Jahangir.—*Cal. Review, Jan.* 1871.

SHAMAL, Arab. Literally the North, but in Aden, a name given to the hot sandy north winds which occur there between the months of April and September. It is extremely oppressive, and Vanden Broeck, who visited Aden in 1614, described one vividly.

SHAMAN, a Tunguzian word, meaning exorciser of spirits. Shaman is supposed by Bunsen to be a corruption of Sramana, a term applied to Buddha and to buddhist priests in general. Shamanism found its way from India to Siberia vià Tibet, China and Mongolia. Rules on the formation of magic figures, on the treatment of diseases by charms, on the worship of evil spirits, on the acquisition of supernatural powers, on charms, incantations and other branches of Shaman witchcraft, are found in the Strangyour or Tanjur, the second part of the Tibetan canon. Shamanism means a deification of the powers of nature and a spirit-worship. According to Dr. Latham, Saman is the name given by the Turk population of the Lena, called the Yakuts, to their highest divinity. Shaman or Shamanism, are terms which seem to have originated in India, for Megasthenes in B.C.295, in his embassy from Seleucus to Sandracottus (Chandragupta), divided the philosophers of that country into the Brachman and the Sarman, Sraman or Saman. Of these latter, the most famous were such as lived a life of asceticism in the woods, clothed in the bark of trees, and feeding upon seeds and fruits. The modern Shaman, however, affects a peculiar intimacy with the divinities of the stream, cave and forest, and acts as a medium between them and their believers. He fashions rude images of what he calls deities, and in his exorcisms he works himself into a strange mixture of trance and epilepsy. Shamanism exists undisguised amongst the Shanar of Ceylon—among many of the less civilized races of India and mixed with hinduism, in almost every village. It is found amongst the races of Scythic or Tartar origin, who occupied India prior to the arrival of the Arian hindoos. But even to the present day branches of the Tamil race in the extreme south of India continue to practise fetich and shaman rites. Shamanism, amongst the Turanians was evinced by exstatic excitement. In shamanism, the superior deities are far more powerful than man, and of a different nature. Their place of abode also is far away, and accessible only to Shamans. As totemism overlies fetichism so does shamanism overlie totemism. The word is derived from the name used in Siberia, where the shamans work themselves up into a fury, supposing or pretending that in this condition they are inspired by the Spirit in whose name they speak, and through whose inspiration they are enabled to answer questions and to foretell the future. Colonel Dalton states that ' the paganism of the Ho and Moondah in all essential features is shamanistic. Speaking of the Singe Dyaks, Sir James Brooke says, religion they have none ; and although they know the name for a god, which is probably taken from the hindoos, 'they have no priests, no idols, say no prayers, offer no offerings.' The Kol of Central India worship the sun, 'material idol-worship they have none.' In China it is observable that there is not to be found in the canonical books, the least footstep of idolatrous worship till the image of Fo was brought into China, several ages after Confucius.

From Sloudenka to Koultouk the distance is only twenty miles, but a part of this station is very bad, till the road descends to the shore of the Baikal which it reaches near a mass of rocks named Shaman Kamen. Formerly the religious fanatics executed their criminals here. Their religion and its ceremonies are founded on sorcery ; they believe in good and evil spirits, and sacrifice parts of the maral to their god, whom they name Bour-khan. They give themselves little trouble about the good spirit, but for the evil one they have a great reverence. They believe him an inhabitant of our earth, that he has his abode in dense forests and rugged mountains, and that he is ever active in the midst of terrific storms. They also think that he has the power to transform man into whatever shape he pleases. With the shamans, the priesthood is hereditary ; it is a rare instance that a stranger is admitted into it. A few miles further and the Baikal is seen spreading out like a sea, and its rolling waves are heard lashing the rocky shores. The Shaman-Kamen is more distinctly seen. It is held sacred by all of the shaman creed, and they never pass it without offering up their devotions. Rude figures have been sculptured upon its surface, and formerly both men, women and children have been offered upon its summits, or hurled into the flood. On this coast there are several hot mineral springs, that of Tourkinsk is the most accessible, and has become the Buxton of Oriental Siberia. Many families from Irkoutsk spend part of their summer here, and people go more than a thousand miles to take a dip in its waters. Between this place and the Ourt Bargouzine there are other springs, in which the gushing fluid scalds the hand if placed in it. Bargouzine is famed for its sables, no skins have yet been found in any part of the world equal to them. The fur is of a deep jet-black, with the points of the hairs tipped with white, and this constitutes their peculiar beauty. For a single skin the hunter demanded the sum of eighteen pounds. The Argoun river is celebrated throughout Siberia for its carp, which are carried in the winter several thousand miles when they are produced at the tables of the wealthy as a great delicacy.

The government have a glass manufactory, and a very large tan-yard at Shilkinskoi. The leather made here has a great reputation among all the tribes beyond the Argoun and in Mongolia. It is famed even among the Russians in Siberia. Mineral springs are frequently met with on the banks of the Shilka, and some are resorted to by the natives. Some geographers say that the Onon must be considered the source of the Amoor, which, when united with Ingoda, forms the Shilka. But the Keroulu seems to be the parent to this great river of Asia. The religion of the Manyarg is shamanisim. They are exceedingly supersitious, and the priests possess great power over them, influencing all their actions even in their domestic and family intercourse. The Manjourians claim the Soungaria as parent to the Amoor, and say that that part of the river above its mouths is only an affluent.—*The Upper and Lower Amoor*, *pp*. 372, 382, 389, 390, 408, 411, 416, 437, 444, 450 ; *Latham* ; *Lubbock's Origin of Civil.*, *pp*. 119, 222, 225, 227 ; *Ravenstein's Russians on the Amoor*, *pp*. 364, 384, 392, 464. See Krishna, Kurilians, Pariah, Shanar.

SHAM-NATH, a name of Krishna.

SHAMANTI PUVVA, Tel. Camomile.

SHAMBABLU, Hind. Vitex trifolia.

SHAMBHU, see Inscriptions.

SHAMDULUN, Beng. Elephantopus scaber, *Linn.*

SHAMEULA, Mahr. Eriodendron anfractuosum.

SHAMEEANA, Hind. A canopy.

SHAM GADHAL, Hind. Bat.

SHAMGURH, a town on the Aravulli range. The extreme breadth of Marwar lies between two points in the parallel of the capital, viz., Girap, west, and Shamgurh, on the Aravalli range, east. This line measures two hundred and seventy British miles. The greatest length, from the Sirohi frontier to the northern boundary, is about two hundred and twenty miles. From the remote angle, N. N. E., in the Deedwanoh district to the extremity of Sanchore, S. W., the diagonal measurement is three hundred and fifty miles. The limits of Marwar are, however, very irregular, and present many salient angles and abutments into other states. The most marked feature that diversifies the face of Maroo, is the river Looni, which, rising on her eastern frontier at Poshkur, and pursuing a westerly course, nearly bisects the country, and forms the boundary between the fertile and sterile lands of Maroo. But although the tracts south of this stream, between it and the Aravalli, are by far the richest part of Marwar, it would be erroneous to describe all the northern part as sterile. An ideal line, passing through Nagore and Jodpore to Bhalotra, will mark the just distinction. South of this line will lie the districts of Deedwanoh, Nagore, Mairta, Jodpoor, Palli, Sojut, Godwar, Sewanoh, Jhalore, Beenmahal and Sanchore, most of which are fertile and populous ; and we may assign a population of eighty souls to the square mile. The space north of this line is of a very different character, but this requires a sub-division ; for while the north-east portion, which includes a portion of Nagore, the large towns of Filodi, Pokurn, &c., may be calculated at thirty, the remaining space to the south-west, as Godadeo-ka-thul or desert of Goga, Sheo, Barmair, Kotra and Chotun, can scarcely be allowed ten. In round numbers, the population of Marwar may be estimated at two millions of souls. Of this amount, the Jit constitute five-eighths, the Rajputs two-eighths, while the remaining classes, sacerdotal, commercial, and servile, make up the integral number. If this calculation be near the truth, the Rajputs, men, women and children, will amount to five hundred thousand souls, which would admit of fifty thousand men capable of bearing arms, especially when we recollect that the Jit or Jat are the industrious class. The Rahtore character, stands deservedly high in the scale of the "thirty-six tribes," and although debased by the use of opium, the Rahtore is yet noble and requires only some exciting cause to show that the spirit, which set at defiance the resources of the empire in the zenith of its prosperity, is dormant only, not extinct. The Rahtore cavalry was the best in India. At one time, there were several horse-fairs, especially those of Bhalotra and Poshkur, where the horses of Cutch and Cattiawar, the jungle, and Mooltan, were brought in great numbers. Valuable horses were also bred on the western frontier, on the Looni, those of Ravdurro being in high estimation. Of soil in Marwar, viz., Baikal Chikni, Peela and Suffed, the first pervades the greater part of the country, being a light sand, having little or no earthy admixture, and only fit to produce bajra (millet), moong, moth (pulse), til (sesamum), melons and jowar. Chikni or (fat), a black earth, pervades the district of Deedwanoh, Mairta, Pali, and several of the feudal lands in Godwar.—*Tod's Rajasthan, Vol.* ii, *pp.* 162, 163, 164.

SHAMIULA, Mahr. Eriodendron anfractuosum *DC., W. & A., W. Ic.*

SHAMIR, Heb. Corundum.

SHAMI-KA-BIJ, Hind. Seeds of Clitorea ternatea.

SHAMI, Hind. Emblica officinalis.

SHAMLAH, Hind. Simla.

SHAMLOO, Turk. The Shamloo, or "Sons of Syria," are one of the most numerous of all the Turkish tribes in Persia. The Karagoozooloo, the Baharloo, and several other tribes in Persia, are branches of the Shamloo, who were brought into Persia from Syria by Timur. Ismail took full advantage of the enthusiasm of his disciples, to cherish feelings so essential for the political greatness of the empire he governed. The seven Turkish tribes, who had been the chief promoters of his glory and success, were distinguished by a particular dress : they wore a red cap, from which they received the Turkish name of Kuzel-bash, or "golden heads," which has descended to their posterity. The swords of these tribes were consecrated by these distinctions, to the defence of the shiah religion ; and a sense of that obligation has survived the existence of the family by whom it was first created. The names of these tribes were the Oostajaloo, the Shamloo, the Nikalloo, the Baharloo, the Zulkudder, the Kujur, and the Affshar. Each of these had seven subordinate tribes under them ; but this probably refers not to the eel, or tribes, but to subordinate teerah, or branches.—*Malcolm's History of Persia, Vol.* i, *pp.* 390, 391, 502, 503. See Kajar, Kuzzilbash.

SHAMMAR, the 24th king of Hamyar, extended his conquests to Mosul. He defeated the Tartars at Azerbijan, subsequently he subdued Khorasan, passed into Balk and Sogd, which he re-built and called Shammar-kand, *i. e.*, Shamar destroyed it. He passed into Tibet, in one of the deserts of which he with his army was destroyed by thirst. This expedition is placed in the reign of Gushtasp, as also in that of Bahman of Persia. See Bhot, Samarcand.

SHAMMY, or Chamois leather.

Chamois,	Fr.	Camoscio,	It.
Shamischleder,	Ger.	Samschanui, Koshi,	Rus.

—*McCulloch's Com. Dic., p.* 1018. See Chamois leather.

SHAMOR, Hind. Zizyphus vulgaris.

SHAMPOO, to press the different parts of the body by the hand. The most common mode of shampooing is to knead, as it were, the body all over ; squeezing and stretching the joints at the same time. There are, however, many other ways of its being done. A writer says, a man lay down and three or four people came and patted every part of him (not even missing his face) until he went to sleep.

SHAMS, Ar. The sun.

SHAMSHAD, Hind. Myrsine africana, also, Buxus nepalensis, and Buxus sempervirens, wild box.

SHAMSHER BAHADOOR, see Mahratta Government.

SHAMS-I-TABRIZ, a great Sufi philosopher. He is said to have resided in Multan and fabled once to have drawn the sun from the heavens to cook his food.

SHAMUKEI, Hind. Taraxacum officinale.

SHAMUKHA, Hind. Panicum antidotale.

SHAN, Hind., of Jhelum. Hibiscus cannabinus, *Linn.*, *Roxb.*, *W. & A.*

SHAN, Hind., of Kanawar, Salix, *sp.*

SHAN. The Shan, or Tai as they call themselves, are the most extensively diffused and probably the most numerous of the Indo-Chinese races. Lapping the Burmese round, from north-west by north and east to south-west, from Assam and the Brahmaputra to the Gulf of Siam, they are found from the borders of Munnipur to the heart of Yunan and from the valley of Assam to Bankok and Kamboja; everywhere buddhist; everywhere to some extent civilised, and everywhere speaking the same language with little variation. Their traditions as also those of Siam, speak of a great kingdom held by this race in the north of the present Burmese empire, but the race is now split into a great number of unconnected principalities, and the kingdom of Siam is now perhaps the only independent Shan state in existence; all the others are subject or tributary to Ava, China, Cochin-China or Siam. In lat. 24½° to 25½ north-east of the Kakhyen, the Shan tribe occupy the left bank of the Nam Kathe or Munnipoor river between the 23rd and 24th degree of north latitude south of the Kathe, or Moi tai tribe and west of the Kubo valley; also, near Bamo on the right bank of the Irawadi with the Kakhyen on the north and on the east, mixed up with the Pwo and with the Kadoo on the south. Shan states are extensive at the forks of the rivers which in lat. 18° north form the sources of the Menam river, and in lat. 15 north and between long. 99 and 100 E., they dwell in the mountains on which grow the sappan wood forests. The Shan who are a Siamese or T'hay people, are tributary to the Burmese empire, consist of twelve petty states, the chiefs of which called Tsawbwa, are hereditary, holding from Amarapura. Of the twelve states, seven are on the west and five on the east of the Salwen. Mobye and Mohmo, the states nearest to the Red Karen, pay tribute to them. The other states are named Nyung-yu-we, Myelat, Mone, Legya, Theinne Mormeit and Thung-bain, Kaingma-Maing-maing, Maingleng-gye, Kiang-hung, Kiang-tung and Kiang-khen. The Shan are called Kabu in the Munipurian language. Those residing in Burmah are generally smaller than the Burmese, from whom they are readily distinguished by their black jackets of glazed calico and short blue breeches. The Shan country is the Laos of geographers. Leaving out of view the intruding and partially interspread Shan or Lau tribes, the Burmans march on the north with rude tribes of their own family, collectively termed Singpho (properly Sing Phol) who occupy the upper Irawadi. On the extreme north the linguistic boundaries of the Singpho are unknown. It is possible that they march with the Khampa or ruder Tibetans of the S. E., unless the snowy mountains which there form the water-shed between the Irawadi and the Tsang-po, cut them off, as is more probable, from all intercourse with their northern neighbours. The Shan or Tai, the powerful Siamese, on the extreme south-east, are the youngest, but the most powerful, member of the Shan family: and excepting the Siamese, the whole Tai race are now tributary to surrounding nations. They trace their origin to an offshoot from the Laos whom they formerly denominated Great Tai, while they called themselves Little Tai. They were originally tributary to Cambodia, but became independent in A.D. 1350.

The Ahom, on the extreme north-west, came into Assam about the beginning of the 12th century, about the same time that the Siamese went south.

Before the 13th century, the Tai formed a compact body on the east and perhaps north of Burmah, probably pressed on by the Moghuls in China, Kablai Khan having fixed himself in Assam in the time of the first Ahom chief.

The exact position of the Great Tai, the Laos of geographers, is unknown.

In the basin of the Irawaddi, the Shan are intermixed with the Tibeto-Burman tribes amongst whom they have intruded, but in large portions of it, they are the principal population and in the N. E. corner of the empire, the Khamti may be considered as independent. It is probable that the Siamese, with the tribes of the upper Me-nam and of the Mekong, are directly connected with those of Yun-nan and are not offshoots from the colony of Muang-gaung. The Siamese have advanced more than half way down the Malay peninsula, and but for the check given to them towards the close of last century, by the establishment of Pinang, as a British settlement, their sway would now have embraced Perah, and probably have extended to the confines of Malacca. The northern clans almost everywhere retain their independence, although owning a nominal allegiance, and in some instances paying tribute to Burmah, to China, or to Siam, those on the frontiers of Yun-nan propitiating both the Golden Foot and the son of Heaven, by an acknowledgment of fealty, and some sending a triennial offering to the latter.

On the south-east of Assam are numerous Shan tribes, many of them subject to the Burmese. These belong to the Siamese or Thay group who are composed of the Siamese proper, the Khamti, the Laos and the Shan who each speak a dialect of their own, none of which are like the Burmese.

Shan and Shyan calling themselves Thi or Thai, occupy great part of Laos and Siam and bordering districts of Burmah. In personal appearance, customs and languages the Shan and Karen are but offshoots of the same stock. The Laos, the Shan and the people called Ahom were originally the same and once held Assam and Bhotan under their dominion.

The Shan race thus swarm in countless tribes over the countries stretching from the vallies between China and Tibet on the north, to the Gulf of Siam in the south, and if united, would form the most formidable state in Eastern Asia. They occupy all the territories between the Irawadi and the mountains of Anam. At Bhamo, to the north, east, and south-east of which they are numerous, the language of the Shan corresponds with that of the Siamese. Their habits, mode of living, cultivation of the ground, correspond with those of the Khyeng and Karen.

Thai is the native name of the Siamese and their chief division are Laos, Shan, Shyan, Ahom and Khamti. Their general complexion is light-brown, their hair black and abundant, nose not flattened. The name of the original conquerors, their alphabet and language was Ahom, and Ahom or Ehom was the designation of the races mixed with the royalty of Arracan and opposed to the pretensions of the king of Ava at a very early period of Burmese history.

The Siamese may be considered as having a remarkable modification of the Burmah-Chinese head, with a peculiar tendency to elongation and verticality. They have large straight faces, flat occiputs, lowness of the hairy scalp, comparatively small and firm mouth, hard staring eye and a grave expression. Siamese appears by far the most widely-spoken language of Ultra-India. It was at one time the lingua franca of Kidah, almost as much as the Malay, and even that wandering negro tribe, the Simang, spoke it in some places. It was also current in Asam and Yun-nan at the opposite extremities of Ultra-India. Cambodia, Laos of the Lu country, Luang, Phra Bang and Nan are tributary to Siam.

The Shan tribes as will have been seen, are widely distributed, from lat. 25½° N. to the gulf of Siam, in lat. 13½ N. in the vallies of the Munnipoor river, the Kyeudwen river, the Irawadi, the Salwyn and the tributaries of the Menam. Furthest north the tribe occupies for about 60 miles on the left bank by the Namtomai or Kyendwen river from lat. 24½ N. About the fourteenth century of the christian era, the Lau were a powerful and conquering people in the upper portion of the basin of the Irawadi, where their capital was at Mo-gaung (Muang-gaung or Mung Khong) and whence, in A. D. 1224, they sent an expedition which subjugated Asam and established Ahom rule. Their native country was a portion of the basins of the Mekong and the Menam, including Yun-nan. About the same time, they took possession of a higher portion of the upper basin of the Mili, where their chief seat was at Khamti, whence the name by which this branch is still known. At present, the Lau, under the names of Shan and Khamti, are found in Upper Assam, and scattered over a large portion of the northern half of the basin of the Irawadi, near to the confluence of the Khyen-dwen with the principal stream. Sporadic villages are even found in Arakan, on the eastern side. The Lau, on the borders of China, differ little from the Chinese of Yunnan, and their stock was probably the same. Where they are in contact with the old races they have considerably altered. In the valley of the Menam, their height is about 1½ inches less than the average Chinese, but the average stature of the French is the same, viz., 5 feet 3 inches

The Lau or Shan race speak a language which was primarily east Himalaic, like Mon, Kambojan, Anam and Pa-long. Like them, it was carried at some remote period, into the Brahmaputra Gangetic province, and received some Dravidian roots. Subsequently it shared in the great eastern movement of Himalaic dialects from the basin of the Ganges into that of the Irawaddi, where it was intimately connected with some of the intrusive west Himalaic or Tibeto-Burman dialects. It was then pressed further into the east, into the basin of the upper Mekhong and Tongking, and became the language of Yunnan. During the Han dynasty, Chinese colonies began to occupy the valleys of Yunnan, and from that time Lau was exposed to the influence of Chinese and began to receive the modified form it possessed when the pressure of that great race on the older tribes of Yunnan caused the Lau to swarm to the westward and southwaed. When they re-entered the basin of the Irawaddi, they had acquired from their partially Chinese civilization, a superiority over the Tibeto-Burman tribes of northern Ultra-India, which made the Lau clans predominant along the central belt of Ultra-India from the Himalaya to the mouth of the Menam.—*Yule, Jour. of Royal Geog. Soc., Vol.* xxvii, 1857 ; *Dr. Mason, Tenasserim* ; *Latham's Descriptive Ethnology, pp.* 157-257. See Laos, India, Karen, Siam.

SHANAL, or Shanapam, TAM. Shanamu, TEL. Crotalaria juncea, *Linn.*

SHANAR, or Sanan, a race in the south of India, about Tinnevelly and Travancore, who are toddy-drawers. They are a dark-skinned race, with low foreheads, sunken eyes and prominent cheek bones, timid and superstitious. They occupy, in considerable numbers, the districts of Madura and Tinnevelly, and are not so good-looking as the Maravar. The Rev. Dr. Caldwell has so well described the extravagant devil or demon-worship of the Shanar race in the south of India, that it may here well find a place in illustration of the varieties of forms in which what is supposed in Europe to be called hinduism appears. Every hindoo work containing allusions to native life, and the dictionaries of all the hindoo tongues, prove the general prevalençe of a belief in the existence of malicious or mischievous demons, in demoniacal inflictions and possessions, and in the power of exorcisms. But the Shanar race systematically worship the demons in which they believe. Their devil-temples are called "Pe-'Koil." Some of them, especially those erected to the sanguinary form of Kali, are small mean tomb-like buildings with an image at the further end of the cloister. But the majority of the devil-temples are of a still more primitive construction. A heap of earth raised into a pyramidal shape and adorned with streaks of white-wash, sometimes alternating with red ochre, constitutes, in the majority of cases, both the temple and the demon's image ; and a smaller heap in front of the temple with a flat surface forms the altar. In such cases a large conspicuous tree—a tamarind,—an umbrella tree, or even a palmyra whose leaves have never been cut or trimmed—will generally be observed in the vicinity. This tree is supposed to be the devil's ordinary dwelling place, from which he snuffs the odour of the sacrificial blood and descends unseen to join in the feast. The devil-pyramid is sometimes built of brick and stuccoed over ; and when thus built of coherent materials it rises into something of the shape of an obelisk. The angles of the pyramid are made to correspond with the cardinal points. Its height rarely exceeds eight feet and is generally less than five. This pyramidal obelisk is a distinguishing characteristic of devil-worship, and appears to have no compartment in brahmanism or any other ism in India. Dr. Caldwell often wished to discover what was supposed to be signified by this peculiar style of image ; but never met with any one who could give him any information. Sometimes the worshippers go to the expense of building walls and a roof for the permanent accommodation of their demon, with a porch for the musicians. The devil in this case being of brahminical lineage, they generally erect an image to his honor, in imitation of their brahminical neighbours. Such images generally accord with those monstrous figures with which all over India orthodox hindoos depict the enemies of their gods, or the terrific forms of Siva or Durga. They are generally made of earthen-ware, painted white to look horrible in hindoo eyes ; with numerous upraised hands and instruments of torture and death in each, and the representation of infants crushed between their teeth ; or with buffalo-heads and huge spiked clubs. In every such case the artist borrows his realization of the fiend's character from images invented and patronized by the brahmans themselves. In the worship of the aboriginal Shanar devils, the pyramid mentioned is the nearest approach to an image which Dr. Caldwell observed. It is worthy of remark that every word which denotes an image is of Sanscrit origin, and as such must have been introduced from the brahmans. Two particulars connected with devil-worship, are essential features of the system, namely, devil-dancing and the offering of bloody sacrifices. This demonolatrous creed is found in all the hill-regions, and amongst all the semi-civilized or migratory tribes who have not yet been enslaved by the higher castes and completely subjected to brahminism, and prevails more or less throughout India especially as allied with the worship of the female powers of Siva, and in its most primitive shape, it still forms the creed of the greater part of Tinnevelly and Travancore. And though brahmans despise both devils and their worship, as also the worship of the village-gods called Amman, in times of calamity, the brahmans do not hesitate to worship the Amman and even make offerings to demons, though by stealth or through the medium of other persons. Emigrants from the Telugu country, who form a considerable portion of the population in some parts of Tinnevelly, have generally become worshippers of devils. But the system more usually followed by this class is the worship of the satellites of the brahminical deities, or that of the female energies. Such devils, in the proper sense of the term, as they are found to worship, are of Tamil origin, as their names denote, and were probably worshipped at first from a wish to conciliate the gods of the soil. The origin of the Shanar demonolatry lies in the unknown depths of antiquity, an antiquity apparently equal to that of the worship of the elements or the heavenly bodies. If the allusions contained in the Vedas to the victories gained by the elementary deities over hostile fiends be considered mythic representation of historical facts, the worship of devils would seem to have been anterior to the Vedic system itself. Of elementary worship there is no trace whatever in the history, language, or usages of any portion of the Tamil people.

Notwithstanding their traditional use of the name of one god, practically the Shanar race are destitute of the belief in God's existence, and their only real faith is in demonolatry. They do not appear to believe in any future state or any state of rewards and punishments. When a person has died a sudden, untimely or violent death, especially if in his life-time he had been remarkable for crimes or a violent temper, his spirit is supposed to haunt the place where his body lies, or wanders to and fro in the neighbourhood, as a newly-born demon, an aerification and amplification of the bad features of the deceased person's character, a goblin which, with the acquisition of super-human power, has acquired super-human malignity. A few of the Shanar race, however, imitate the brahminical practice of ceremonies for the dead; and similarly a few are believers in the metempsychosis. The brahminical deities that have obtained a place in their esteem are honored merely with a passing bow and an annual festival. They attend the festival of Subramanya, the second son of Siva, at Trichendoor, and Shasta, the Hari-haraputra of the brahman, and the guardian of boundaries and protector of paddyfields, is worshipped to a considerable extent in his official relations. But it is demons, devils or fiends, of unmixed malignity, spirits of a jealous, watchful and vindictive temper that they worship with earnestness and assiduity as the worship of their every-day life. It is that which governs their minds, sways their wills, and influences their characters, and which they have recourse to in sickness and loss. A large portion of the devils are of purely Shanar or Tamil origin and are totally unconnected with brahmanism. A few of their demons are forms of Kali, or rather that of Amman, the earth-goddess whom the people of Southern India who follow brahmanism, have consented to regard as Kali, and whose worship is performed by a particular class of Sudra priests. Their devils were originally human beings who in their lives had made themselves objects of dread who met a violent or sudden death, and are therefore of both sexes of all ranks, and of native or foreign origin. But all of them are powerful, malicious and interfering; and all desirous of bloody sacrifices and frantic dances. The temples or images built to the honor of the different demons, also differ—as do also the insignia of the priests, who variously prefer for the sacrifice, a hog, a goat, or a cock, and Pariar demons, invariably require ardent spirits. The majority of the demons are supposed to take their abode in trees. Some wander in uninhabited wastes, or seek shady retreats. Demons occasionally take up their abode in houses, and it often happens that a devil will take a fancy to dispossess the soul and inhabit the body of one of his votaries; in which case the personal consciousness of the possessed party ceases, and the screaming gesticulating, and pythonizing are supposed to be the demon's acts. Every malady, however trivial, is supposed by the more superstitious to be inflicted by a devil, and a sacrifice is necessary for its removal; but the unusual severity or continuance of any disease, or the appearance of symptoms which are not recorded in the physician's shastra, are proofs of possession of which no Shanar can entertain any doubt. The medical science of so rude a people not being very extensive cases of unquestionable possession, are, as they think, of frequent occurrence. When a woman is heard to laugh and weep alternately without any adequate cause, or shriek and look wild when no snake or wild beast can be perceived, a Shanar can only suppose a devil to be the cause of the mischief. The native doctor, himself a Shanar, is sent for to give his advice. He brings his library with him, (he can't read, but it is all safe in his memory,)—his "complete science of medicine in one hundred stanzas, as revealed by the sage Agastya to his disciple Pulastya;" but in vain he recites his prescriptions, in vain he coins hard words. As no description of hysterical complaints is contained in his authorities, what can he do but decide that a devil has taken possession of the woman and recommend that a sacrifice be offered to him forthwith, with a cloth and a white fowl to the doctor? Sometimes the possession takes the shape of a stroke of the sun, epilepsy or catalepsy, a sudden fright, mania, or the vertigo and stupor caused by an overflow of bile. But any ordinary disease when it seems incurable and the patient begins to waste away, is pronounced a possession. Sometimes the friends are not desirous of expelling the evil spirit all at once but send for music, get up a devil-dance, and call upon the demon to prophesy. This is particularly the case when some member of the family has long been sick, and they are anxious to know what is to be the result of the sickness, and are wishing and waiting for a demon's visit. If they desire to expel the devil, there is no lack of moving ceremonies and powerful incantations, each of which has been tried and found successful innumerable times. If the devil should prove an obstinate one and refuse to leave, charm they never so wisely, his retreat may generally be hastened by the vigorous application of a slipper or a broom to the shoulders of the possessed person, the operator taking care to use at the same time the most scurrilous language he can think of. After a time the demoniac loses his downcast, sullen look. He begins to get angry and writhe about under the slippering, and at length cries, "I go I go." They then ask him his name, and why he came there. He tells them he is such and such a devil whom they have neglected ever so long and that he wants an offering: or he calls himself by the name of some deceased relation who as they now learn for the first time, has become a demon. So soon as the demon consents to leave, the beating ceases ; and not unfrequently immediate preparations are made for a sacrifice, as a compensation to his feelings for the ignominy of the exorcism. The possessed person now awakes as from a sleep and appears to have no knowledge of anything that has happened.

Native christians sometimes become similarly possessed but the Missionaries have found the attacks always yield to Tartar emetic. The demons are frequently contented with inflicting minor injuries. The failure of rain ; a blight on the crops, accidents, diseases which befall cattle, losses in trade, are all considered instances of a demon's malevolence. Or, people hear a strange noise at night and immediately they see a devil making his escape in the shape of a dog as large as a hyena, or a cat with eyes like two lamps. In the dusk of the evening devils have been observed in a burial or burning ground, assuming various shapes one after another as often as the eye of the observer is turned away ; and they have often been known at night to ride across the country on invisible horses, or glide over marshy land in the shape of a wandering, flickering light. In all their journeyings they move along without touching the ground : their elevation above the ground being proportioned to their rank and importance. Dr. Caldwell has known a village deserted and the people afraid even to remove the materials of their houses, in consequence of the terror caused by stones being thrown on their roofs, at night, by invisible hands. Demons more malicious still have sometimes been known under cover of the night to insert combustible materials under the eaves of thatched roofs. Even in the daytime, about the close of the hot season, when the winds fail, they may often be seen careering along in the shape of a whirlwind, catching up and whisking about in their fierce play every dry stick and leaf that happens to lie in their path. In short, the demons do much evil, but no good. They often cause terror but never bestow benefits, or evince any affection for their votaries. They must be placated by sacrifice because they are so mischievous ; but there is no use of supplicating their favour. If in any case the hope of obtaining a benefit may seem to be their votary's motive in worshipping them, further inquiry proves that it is under the supposition that the demon's malignity stands in the way of what would otherwise be obtained as a matter of course. Natives think that Europeans have no reason to fear from demons, and a similar exception is sometimes made in the case of the mahomedans. The god worshipped by the mahomedans is supposed to be more powerful than the demons, and able to protect his worshippers from their assaults. The demonolaters seem to consider European christians as secure from danger. They suppose them even more than a match for any of the poor black man's goblins. In consequence of this immunity, whilst the servants and followers of a European are exposed to many alarms, their master neither sees nor hears anything unusual. When it is determined to offer a sacrifice to a devil, a person is appointed to act the part of priest. Devil-worship is not, like the worship of the hindoo deities, whether supreme or subordinate, appropriated to a particular order of men, but may be performed by any one who chooses. This priest is styled a "devil-dancer." Usually one of the principal men of the village officiates ; but sometimes the duty is voluntarily undertaken by some devotee, male or female, who wishes to gain notoriety, or in whom the sight of the preparations excites a sudden zeal. The officiating priest, whoever he may happen to be, is dressed for the occasion in the vestments and ornaments appropriate to the particular devil worshipped. The object in view in donning the demon's insignia is to strike terror into the imagination of the beholders. But the party-coloured dress and grotesque ornaments, the cap and trident and jingling bells of the performer, bear so close a resemblance to the usual adjuncts of a pantomime that a European would find it difficult to look grave. The musical instruments, or rather the instruments of noise, chiefly used in the devil-dance are the tom-tom, or ordinary Indian drum, and the horn ; with, occasionally, the addition of a clarionet when the parties can afford it. But the favorite instrument, because the noisiest, is that which is called the bow. A series of bells of various sizes is fastened to the frame of a gigantic bow ; the strings are tightened so as to emit a musical note when struck ; and the bow rests on a large empty brazen pot. The instrument is played on by a plectrum, and several musicians join in the performance. One strikes the string of the bow with the plectrum, another produces the base by striking the brazen pot with his hand, and the third keeps time and improves the harmony by a pair of cymbals. As each musician kindles in his work and strives to outstrip his neighbour in the rapidity of his flourishes, and the loudness of the tone with which he sings the accompaniment, the result is a tumult of frightful sounds, such as may be supposed to delight even a demon's ear. When the preparations are completed and the devil-dance is about to commence, the music is at first comparatively slow, and the dancer seems impassive and sullen, and either he stands still, or moves about in gloomy silence. Gradually, as the music becomes quicker and louder, his excitement begins to rise. Sometimes to help him to work himself up into a frenzy he uses medicated draughts, cuts and lacerates his flesh till the blood flows, lashes himself with a huge whip, presses a burning torch to his breast, drinks the blood which flows from his own wounds, or drinks the blood of the sacrifice, putting the throat of the decapitated goat to his mouth. Then, as if he had acquired new life, he begins to brandish his staff of bells and dance with a quick but wild, unsteady step. Suddenly the afflatus descends. There is no mistaking that glare, or those frantic leaps. He snorts, he stares, he gyrates. The demon has now taken bodily possession of him ; and though he retains the power of utterance and of motion, both are under the demon's control, and his separate consciousness is in abeyance. The by-standers signalize the event by raising a long shout attended with a peculiar vibratory noise, caused by the motion of the hand and tongue, or the tongue alone. The devil-dancer is now worshipped as a present deity, and every by-stander consults him respecting his disease, his wants, the welfare of his absent relatives, the offerings to be made for the accomplishment of his wishes, and, in short, everything for which super-human knowledge is supposed to be available. As the devil-dancer acts to admiration the part of a maniac, it requires some experience to enable a person to interpret his dubious or unmeaning replies—his muttered voices and uncouth gestures ; but the wishes of the parties who consult him help them greatly to interpret his meaning. Sometimes the devil-dance and the demoniacal clairvoyance are extemporized, especially where the mass of the people are peculiarly addicted to devil-worship, and perfectly familiar with the various stages of the process. In such cases, if a person happen to feel the commencement of the shivering fit of an ague or the virtigo of a bilious headache, his untutored imagination teaches him to think himself possessed. He then sways his head from side, fixes his eyes into a stare, puts himself into a posture, and begins the maniac-dance ; and the by-standers run for flowers and fruit for an offering, or a cock or goat to sacrifice to his honour. The night is the time usually devoted to the orgies of devil-dancing. And as the number of devils worshipped is in some districts equal to the number of the worshippers, and as every act of worship is accompanied with the monotonous din of drums and the bray of horns, the stillness of the night, especially during the prevalence of cholera or any other epidemical disease, is frequently broken by a dismal uproar, more painful to hear on account of the associations connected with it, than on account of its unpleasant effect on the ear and nerves. The Shanar, are about half a million in number, a sixth part have embraced christianity. Their religion is a kind of fetishism and their civilization little above that of the Negroes. The people of India are continuously making new deities or demons. On the left bank of the stream at the village of Assaye, at which Scindiah's artillery was posted during that battle, is a tree, beneath which is the tomb of an officer who fell during the battle, and his spirit is punctually worshipped by the people of Assaye and all the neighbourhood. Sir Battle Frere mentions that he accidentally found an order in existence at government house, Dapoorie, handed down by each non-commissioned officer, for the native sentry on guard to present arms if a cat or dog, jackal or goat, entered or left the house or crossed near his beat during certain hours of the night, because it was a ghost of a former governor who is still remembered as one of the best and kindest of rulers. The rajah of Wunpurty, one of the Reddi race, who have founded small principalities along the banks of the Kistnah river, died in 1868 at Hyderabad. He had led a turbulent life and retained to the last much of the spirit of his youth. At the close of that year, an outbreak of cholera occurred in that neighbourhood, which the people attributed to the spirit of Wunpurty, and they made a clay image of him, riding on an elephant, and placed near him the clay image of a Brinjari and worshipped all with the Maha Bali sacrifice. The Shanar of Tinnevelly occupy a middle portion between the Vellaler and their Pariah slaves. Their hereditary avocation is that of cultivating and climbing the palmyra palm, the juice of which they boil into a coarse sugar. A considerable number have become land-owners and farmers and engaged in trade. They are in humble circumstance, rude and unlettered. Their traditions state that they were emigrants from Ceylon, where the Shandrar, a similar caste, still exists. They are said to have come to Tinnevelly from Jaffna, but one class of them now called Nadan, or lords of the soil, entered Tinnevelly by way of Ramnad, bringing with them the seed nuts of the palmyra of Jaffna and obtaining from the Pandya princes the sandy waste lands of Manad in the south-east of Tinnevelly. To the present day, the Nadan claim rights of seignorage over this tract. The labouring Shanar, on the other hand, are said to have come by sea, to the south of Travancore, where vast numbers of them are still to be found, and from whence they spread over Tinnevelly on the invitation of the Nadan and other land-owners, who would derive little profit from their immense forests of the palmyra palm without the aid of their poorer neighbours as climbers. Some of these emigrations have probably taken place since the christian era. The Syrian christians of Travancore assert that one portion of the Shanar race, the slaves, were brought over from Ceylon by their christian ancestors for the cultivation of the cocoanut palm. The Shanar, however, though from Ceylon, is not a buddhistic Singhalese. The traditions of this latter race connect them with Behar and the Arian or brahmanical race, while the Shanar are of the Tamil people, the descendants of early Tamil colonies or of marauding bands of Chola who frequently invaded the island both before and after the christian era, and still occupy all the north of Ceylon. The Shanar of Ceylon occupy a higher social status than those of Tinnevelly. In the south of the Peninsula the Shanar are only second to the Maravar in numbers, and more than one-half of them profess the christianity of the protestant or Romish churches. The other half follow demonology, the usual bloody sacrifices and devil-dances. In the sandy sea coast wastes of the south of the peninsula they have widely extended the cultivation of the palmyra tree, they are largely occupied in extracting the palm wine. A man will attend to about 50 palm trees. Shanar women lately wished to cover their bosoms, and their attempt to do so was interfered with by the nair race. A large portion of them are proprietors of small patches of ground in which they grow the palmyra. But the majority are as poor as the Pariar and pullur slaves of the rice-growing districts. The Nadan are in possession of extensive tracts of land, besides claiming hereditary rights of seignorage over the lands and habitations of the Shanars, and as a class are in comfortable circumstances. Shanar or Sanan tribe, in the south of India, about Tinnevelly and Travancore, are a dark-skinned race, with low foreheads, sunken eyes and prominent cheek bones, timid and superstitious. They occupy, in considerable numbers, the districts of Madura and Tinnevelly, but are not so good-looking as the Maravar, either as to physique or features.—*Madras Government Proceedings ; The Reverend Dr. Caldwell on the Tinnevelly Shanar.*

SHAN BLACK DYE is obtained from the Diospyros mollis. See Dyes.

SHANDANAM, Tam. Santalum album.

SHAND, Hind., of Kohat. A third quality of land, it is allowed to be fallow, and is cultivated for paddy.

SHANDAI GUL, Hind. Tulipa stellata.

SHANDA LAGHUNE, Hind. Buxus semper-virens.

SHANDUSE, a cotton scarf, coloured border and ends, used in Khyrpoor.

SHA-NE, Burm. A bast of Aracan, of a reddish-brown colour, rough and coarse.

SHANG, the 2nd Chinese dynasty, began B. C. 1559, lasted 509 years to 1050. Twenty-eight reigns in fifteen generations.

SHANG, or Shangal, Hind. Fraxinus xanthoxylloides.

SHANGALA, Hind. Ilex dipyrena.

SHANGAM KUPI, Tam. Volkameria inermis, Clerodendron inermis.

SHANGAR, Hind. Prosopis spicigera.

SHANGARF, Pers. Cinnabar.

SHANGHAI, in lat. 31° N., and long. 121° 30, E., is situated 14 miles from the mouth of the Wu-sung river, on its northern bank. The Wu-sung opens into the Yang-tse-Kiang, below the town of Wu-sung. The country around is flat and uninteresting. In the town of Shanghae as well as in many other large Chinese towns, there are a number of public hot water bathing establishments. There are two outer rooms used for undressing; and dressing the first and largest is for the poorer classes; the second for those who wish to be more private. A placard hung near the door, informs you what the charges are, and a man stands there to receive the money on entrance. Arranged in rows down the middle and round the sides of both rooms are a number of small boxes or lockers furnished with lock and key, into which the visitors put their clothes. The bathing-room is about 30 feet long and 20 feet wide; the water occupying the whole space except a narrow path round the sides. The water is from 1 foot to 18 inches deep, and the sides of the bath are lined with marble slabs, from which the bathers step into the water and on which they sit and wash themselves: the furance is placed on the outside and the flues are carried below the centre of the bath. In the afternoon and evening this establishment is crowded with visitors, and on entering the bath room the first impression is almost insupportable, the hot steam or vapour meets you at the door, filling the eyes and ears and causing perspiration to run from every pore of the body; it almost darkens the place, and the Chinamen seen in this imperfect light with their brown skins and long tails sporting amongst the water, render the scene a most ludicrous one to an Englishman. Shanghai, is the most northerly and most important of the five ports that have been opened to foreigners; is a heen, a district city of Sun-keang-foo, in the province of Keang-soo, is situate on the right bank of the Woo-sung river, lies in lat. 30° 25′ N., and in long. 120° 32′ E., being distant from Chusan about one hundred miles, in a north-westerly direction. The Woo-sung river flows into the Yang-tsze-kang (child of the ocean) which is called by many, and most appropriately, the the main artery of China, as it flows through many provinces, and some of the most wealthy cities of China are built upon its banks. The Woo-sung, or Shang-hae river, is deep, and easily navigable when the bearings are understood. Canal coal is found in abundance near Shang-hae. The interior of the island of Chusan is remarkably beautiful and picturesque, and no part is more beautiful than the long valley, christened by Europeans "Anstruther's Valley," as it was there that officer fell into the hands of the Chinese. Coal was used very early in China as fuel; it is mentioned by Du Halde as "black stones dug out of the mountains, which stones burn when kindled, and are used by many persons in preference to wood, of which there is abundance." It is found in the north and in the south, and probably might be had in nearly every province in the empire. At Shanghai, it has been used on board the government steamers. Le Compte assures us that there is not any country better supplied with coal than China, and he particularizes the provinces of Shan-se, Shen-se, and Chihle.—*Sirr's China and Chinese, Vol.* i, *pp.* 209, 224, 236, 424, 425; ***Fortune's Wandering, p.*** 262-63.

SHANGHAI BUTTER, Solid oil of Brassica chinensis.

SHANGKUPI, Hind. Volkameria inermis.

SHANGRI, or Sangri, Hind. The seed-pods of the jhand, Prosopis spicigera, one of the common shrubs of the rakh or waste lands of the Panjab.

SHANGNIZ, Hind., Pers. Ginger.

SHANI—? see Linden.

SHANI, Tam. Cow-dung, see Bratties.

SHAN OIL, a peculiar oil used in Burmah for mixing with paints. It derives its name from being made by the Shan people, from, it is said, the fruit of the wood-oil tree, a species of Dipterocarpus.

SHANK, the chank shell. See Chank, Kurma, Sankasura.

SHAN KA JOGI, see Jogi, Yogi.

SHANKANRAI, Hind., Pushtu. Fire clay.

SHANKASH WAR, see India.

SHANK PUSHPU, Hind. Evolvulus alsinoides.

SHANKU KARAM, Hind. Dracocephalum heterophyllum.

SHANMA, Hind. The pea, Pisum sativum.

SHAN MAI, also Mai nay, Burm. Indigofera tinctoria, *Linn.*

SHANPEE ISLANDS, in the Gillolo passage, a group of three or four, extending north and south, 9 or 12 miles in about lat. 0° 30′ N. They are mostly level, of considerable size.

SHANTEE, Sans., from sham, quiet. Shantee-poora, Sans., from shantee, peace, and poora, a town.

SHAN-SE, one of the smallest provinces in China, it resembles in form an oblong lozenge, and is bounded on the north by Tartary, on the south and south-west by Ho-nan, on the east by Pe-che-le, and on the west by Shen-se.

SHAN-TUNG, is in the form of a long peninsula, extending towards Corea, dividing the Gulf of Pe-che-le from the Yellow Sea; it is bounded on the north-west by Pe-che-le, on the south-east by Ho-nan, and on the south by Keang-se. Its surface is estimated at 56,000 square miles, and the population is nearly twenty-nine millions. Besides grain, this province supplies large quantities of fish, a great portion of which, packed in ice, is sent to Pekin by the Imperial canal. Among the vegetable oils imported into Ningpo and other Chinese ports, from Shantong, Leatong and Teisin, are "oil of teuss," obtained from green and dried peas, black oil of the fruit of the tree kiu (?) and oil from the pea of Suchau.—*Fortune.*

SHANUCHI, BENG. Alternanthera sessilis.

SHAO-JI, see Sevaji.

SHA-PHYU, a bast of Aracan, long, thin, smooth layers, light-coloured, tough and flexible.

SHAPIANG, HIND. Withania coagulans.

SHAPOO, or wild sheep of Ladakh. Moorcroft in his Travels, mentions seeing one killed near Lameru.—*Adams.*

SHAPOOR ISLAND, on the Arracan coast, its north-west point is in lat. 20° 46′ N., and long. 92° 20′ E.

SHAPOOR, a city built by the monarch whose name it bore, the Sapores of Greek and Roman historians.

SHAPROCHI, HIND. Saxifraga ligulata.

SHAPUR, I., the son of Ardashir of Persia, he captured and flayed alive the Roman emperor Valerian.

SHARA, or Shara-gachh, BENG. Ramoon tree, Trophis aspera.

SHARA, BENG., HIND. Epicarpurus orientalis.

SHARAWANI, HIND., of Dera Ismail Khan, Flacourtia sepiaria.

SHARAET, TAM. Agathotes chirayta.

SHARBAT, HIND. A cooling beverage, made of lime juice or pomegranate juice, or merely sugar and water, the French Eau-sucré. When a Bedouin turns his back on a person, he intends an insult. When a man prepares coffee he drinks the first cup—the "Sharbat-i-kajari" of the Persians, and the "Sulaymani of Egypt, render this precaution necessary The Sharbat-i-kajari is the "Acquetta" of Persia, and derives its name from the present royal family. It is said to be a mixture of verdigris with milk : if so, it is a very clumsy engine of state policy, more probably a poison of more activity. In Egypt and Mosul, Sulaymani (the common name for an Affghan) is used to signify "poison." The banks of the Nile are infamous for these arts, and Mohommed Ali Pacha imported, it is said, professional poisoners from Europe.—*Burton's Pilgrimage to Meccah, Vol.* iii, *p:* 43.

SHARBATI, HIND. "Wine-coloured," a yellow or reddish husked rice.

SHAREGI, see Jehanabad.

SHARGAR, HIND. Rhododendron campanulatum.

SHARGUNDEI, HIND. Lepidium sativum.

SHARI, HIND. Prunus armeniaca.

SHARIAR, or Sarbazas, see Sassanian kings.

SHARID, HIND. Philipæa calotropidis.

SHARIFA, HIND. Anona squamosa.

SHARIVA, SANS. Sarsaparilla.

SHARKARA KUNDA, SANS. Convolvulus batatas.

SHARUNNAY, Trianthema obcordata.

SHARK.

Kalb ul bahr, AR. | Auwal, HIND. | Iyu, yu, MALAY.

The sharks belong to the cartilaginous fishes, they abound in numbers and species, and are remarkable for their wide geographical distribution. They enter rivers to a considerable distance from the sea. Shark skin is used by the native workmen for polishing wood and ivory ; and shark-fins are largely exported to China. Sharks are numerous along all the coasts of Southern Asia. In the Sunderbuns, the hammer-headed shark, (Zygæna), is occasionally caught off the Sandheads. Sharks are said to attack the fair-skinned races more frequently than men of darker hues, and the Pearl-divers of the Persian Gulf used to blacken their skins with a view to avoid these monsters. In the Gulf of Manaar they are taken for the sake of their oil, of which they yield such a quantity that "shark's oil" is a recognised export. A trade also exists in drying their fins, for which, owing to the gelatine contained in them, a ready market is found in China ; whither the skin of the basking shark is also sent to be converted, it is said, into shagreen. Ceylon divers, Mr. Kerr and his assistant Mr. Creasy, after five days proved successful in their search after the missing treasure chest, the box was found covered with sand though sufficiently raised above the bed of the sea to interfere with the free perambulations of the diver who stumbled against it and was thus led to pick it up. Mr. Kerr had heard much of the sharks frequenting the roads, but excepting that he saw a large shark moving through the water preceded by a number of pilot fish, his labors suffered no interruption of the kind most dreaded.—*Tennant's Sketches of the Nat. Hist. of Ceylon, p.* 325. See Arts and Manufactures, Fisheries, Fishes, Zygæna.

SHARKS' FINS.

Paak, DUK., GUZ., HIND. | Soora meen sepputay TAM.
Iyu sirap, Yu sirap, MALAY |

Sharks are numerous and of great size in the seas of the Eastern Archipelago, and their fins are a regular article of trade for the market of China, where they are prized for their real or imaginary stimulating and restorative qualities. The name for the shark in Malay and Javanese is Iyu, or, abbreviated Yu, and this name has a very extensive currency, for it is even found in some dialects of the islands of the Pacific. Sharks' fins are largely exported from Bombay and Madras to China, where they are much esteemed as a strengthening food. They are chiefly collected in the Persian and Arabian Gulfs, on the Coasts of Mekran and Malabar, and other places along the sea coasts. The Chinese fishmongers of the Straits' Settlements, obtain sharks' fins from the same localities which supply them with fish maws. These fins are not extensively selected from sharks (Squali), but equally from (Raiæ). Quantities examined at Pinang were composed of fins of the genera Stegostoma, Carcharias, Sphyrna, Pristis, Rhinobatus, Trygon, and Myliobatis. Of all fishes, sharks and rays are the most valuable to the Chinese. The fish and entrails of all, not even the electric rays (Torpediuideæ) excepted, are eaten either fresh or dried, the skin is used for polishing or converted into shagreen; gelatine is obtained from the larger fins, glue from the smaller. All, except the caudal fins, are cut at the root so as to leave as little flesh as possible. The root is dipped in wetted lime (chunam) in the erroneous belief of preventing attacks of insects, and then the fins are dried in the sun. Those imported in Straits' Settlements are packed promiscuously in gunny bags, each containing from one-half to one pikul. According to the value in the Chinese market, the fishmongers assort the fins in two kinds, "white" and "black." The white consists exclusively of the dorsal fins, which are on both sides of a uniform light colour and reputed to yield more gelatine than the other fins. In China, the lovers of gelatinous soups pay from 30 to 40 Spanish Dollars per pikul of white fins. The pectoral, ventral and anal fins pass under the denomination of black fins. The colour, however, varies according to the species from buff to grey or brown, and most of them are of two different colours, the upper surface being dark, the lower light. The black fins, for obvious reasons the most numerous, are supposed to yield a comparatively small quantity of gelatine and sell in China from 15 to 20 Spanish Dollars per pikul. Mr. W. T. Lewis has communicated the annexed table, showing the quantity of sharks' fins imported into, and exported during 10 years from Pinang to China. The total quantities of sharks' fins imported into and exported from Prince of Wales' Island, from 1832-3 to 1842-3, were:—

IMPORTS.			EXPORTS.		
1832—33 to 1841—42	Quantity in Pikuls	Value in Spanish Dollars	1832—33 to 1841—42	Quantity in Pikuls	Value in Spanish Dollars
Total..	1,350	19,216	Total..	3,177	48,036

Sharks' fins are sought for from the Indian ocean to the Sandwich islands to supply the Chinese market. The chief supply is from Bombay and the Persian Gulf. They are fat, cartilaginous, and when cooked, esteemed by the Chinese as a stimulant and tonic. They should be thoroughly dried and kept from any moisture. About five hundred pieces are contained in a pikul. The price is from 6 to 60 Spanish Dollars per pikul. There seems to be little or no choice as to what species of shark the fins are from, but those of a whitish colour are valued much higher than the black sort. Sharks and rays of all kinds form a common article of food on the Chinese sea coast. The trade in sharks' fins is likely to extend at the north. From Travancore sharks' fins are largely exported to China, also from every maritime country, between the Arabian Gulf and the East Indian islands. A pikul of shark-fins usually sells in China as high as 32 Sp. Dollars, or £6 1*s.* per cwt., which high price makes it evident, that they are only articles of luxury for the use of the rich. In the market of Macassar the ordinary price is about 15 Sp. Dollars, or £2 16*s.* 8½*d.* per cwt. In the four years 1857-8 to 1860-1, shark-fins, to the value of £60,467 were exported from India to China and other places, nearly all of it from Bombay. There are many large boats with crews of twelve men each, constantly employed in the shark-fishery at Kurrachee. The value of the fins sent to Bombay varies from Rs. 13,000 to Rs. 18,000 a year. Of this a portion only passes directly into the hands of the fishermen, each boat earning perhaps Rs. 1,000 annually, or Rs. 100 for each man. From this falls to be deducted the cost of material and other charges. This trade was noticed by Dr. Royle in 1842. It affords on some occasions to Bombay alone, taking fish-maws and shark-fins together, as much as four lacs of rupees—£40,000, and furnishes the chief means of support to at least three thousand fishermen or, including their families to probably not less than fifteen thousand human beings. One boat will sometimes capture at a draught as many as a hundred sharks of different sizes, but sometimes they will be a week, sometimes a month, without securing a single fish. The fishermen are very averse to revealing the amount of their captures: inquiries of this sort are supposed by them to be made exclusively for the purpose of taxation. The great basking shark, or mhor, is always harpooned: it is found floating or asleep near the surface of the water, and is then struck with a harpoon eight feet long. The fish once struck is allowed to run till tired, and is then pulled in and beaten with clubs till stunned. A large hook is now hooked into its eyes or nostrils, or wherever it can be got most easily attached,—and by this the shark is towed in shore : several boats are requisite for towing. The mhor is often forty, sometimes, sixty feet in length ; the mouth is occasionally four feet wide. All other varieties of shark are caught in nets in something like the way in which herrings are caught in Europe. The net is made of strong English whip-cord, the mesh about six inches : they are generally six feet wide, and are from six to eight hundred fathoms, from three-quarters to nearly a mile, in length. On the one side are floats of wood, about four feet in length, at intervals of six feet ; on the other, pieces of stone. The nuts are sunk in deep water from eighty to one hundred and fifty feet, well out at sea : they are put in one day and taken out the next, so that they are down two or three times a week, according to the state of the weather and success of the fishing. The lesser sharks are occasionally found dead,—the larger ones much exhausted. On being taken home, the fins are cut off and dried on the sands in the sun : the flesh is cut up in long stripes and salted for food, and the liver is taken out and crushed down for oil. The head, backbone, and entrails, are left on the shore to rot, or thrown into the sea, where numberless little sharks are generally on the watch to eat up the remains of their kindred. The fishermen themselves are only concerned in the capture of the sharks : so soon as they are landed they are purchased by Bania merchants, on whose account all the other operations are performed. The Bania collect them in large quantities, and transmit them to agents in Bombay, by whom they are sold for shipment to China. Not only are the fins of all the ordinary varieties of shark prepared for the market, but those also of the saw-fish, of the cat-fish, and of some varieties of ray or skate —the latter, indeed, merges almost insensibly into the form of the shark. The cat-fish, known in India by the same name as in Britain, has a head very like that of its European congener, from which it differs in all other respects most remarkably. Its skin is of a tawny yellowish brown, shading from dark-brown on the back to dirty-yellow on the belly : it is beautifully covered all over with spots, of the shape and size of those of the leopard, similarly arranged. The value of sharks' fins annually exported from Bombay amounts to betwixt a lakh and a half and two lakhs of rupees : the largest fishery at any given port is probably that of Kurrachee, which affords nearly one-tenth of the whole, but the shark-fishery is conducted all along the Bombay coast. The fishermen along the Bombay coasts are divided into four great castes, over each of which a headman or jemadar presides : 1, Wayttree ; 2, Sonkoli ; 3, Dongur-koli ; 4, Thankur-koli. One great jemadar or chief, rules supreme in the craft over all the fisher-castes. The value of sharks' fins annually exported from Bombay amounts to betwixt a lakh and a half and two lakhs of rupees : the largest fishery at any given port is probably that of Kurrachee, which affords nearly one-tenth of the whole, but the shark-fishery is conducted all along the Bombay coasts. Sharks' fins and 'tripang,' or sea slug, are exported by the Bugis boats from the eastern parts of the island of Borneo ; they are first sent to Singapore, afterwards to China.

In the Fiji says a writer, we were puzzled at one time to make out the use of a curiously formed piece of wood, about four feet long, and in shape very much like a whale boat, but solid : from a hole in the centre descended a strong cord of twisted rattan, forming a running noose, like a hangman's knot. The mystery was solved shortly after. As I was leaning out of the cabin windows, when there was just sufficient wind to give the ship steerage-way, I observed a shark swimming leisurely along some twenty fathoms below the surface. The natives from their canoes observed the monster about the same time. In a few minutes several of these oddly-shaped buoys were dropped into the water. Some of our people fancy they saw them sprinkle a powder in a sort of magic circle round the buoys ; I did not observe them use any bait : what charm they used, if any, we did not ascertain, but certain it is that the shark shortly after rose, and was fool enough to shove his head into the fatal noose, when he was as completely hanged in his own element as ever rogue was from the gallows' tree. The buoyancy of the float prevented his diving with it. Having flourished his tail about for twenty minutes, he was drawn up by his head on a level with the water, and there belaboured with the heavy end of their paddles until he seemed satisfied that resistance was useless ; they then tumbled him bodily into the canoe, and hurried on shore amidst the yelling of the whole flotilla, where no doubt he underwent the further process of dissection.—*Keppel's Ind. Arch., Vol.* ii, *pp.* 205-6 ; *Low's Sarawak, p.* 89 ; *Bombay Monthly Times, from* 11*th to* 24*th May* 1850 ; *Dr. Royle, on the production of Isinglass, London,* 1842. SHAROI, Sharoli, or Shurlige, PANJ. Corylus colurna, *Linn.*

SHARON, a fertile strip of land on the sea coast between Joppa and Cæsarea. Over the valley of Sharon, the road passes to Rama, wild roses are to be found upon it, and it is sprinkled with flowers. 'It shall come to pass,' says Ezekiel, in that day, 'I will give to gad,' or the Scythians, 'a burial place in Israel, the valley of the passengers on the east of the sea. And it shall stop the noses of them that pass by, and there shall they bury gad and all his multitude.'—*Skinner's Overland Journey, Vol.* i, *p.* 186 ; *Sharpe's History of Egypt, Vol.* i, *pp.* 32, 133 ; *Diod. Sic., lib.* i, 6, 7.

SHARPEY, Captain Alexander, visited the Red Sea and Aden, in A. D. 1609, in the Ascension, a vessel belonging to the E. I. Company.

SHARRA, Ar. Hind., Pers. Law ; equity, the precepts of Mahomed ; religion ; faith, justice. The faquir or darvesh act in accordance with religion (ba-sharra) or differently (be-sharra). They are classed as

Ba-shara, family-men and living according to the laws of the Koran.

Be-shara, without the law, majzub, colobates, whose sanctity places them above the laws of the Koran.

In India, the chief fakirs are

Kadaria or Banawa whose founder lived at Bagdad.
Chistia followers of Banda nawaz whose shrine is at Kulburgah.
Shuturiah.
Tabkatia or Madria.
Malanej.
Rafai or Gurzmar.
Jalalia.
Sohagia.
Naksh bandia.
Bawapiari ka Fakir.

—*Wilson's Gloss.*

SHART, Arab., Hind. From shart karna, to wager, a term employed by mahomedans in Southern India to indicate a horse conveyance, either buggy or palankin carriage. In Bombay, the Tamil words Sikram-po, literally go quickly, are applied to the latter conveyance.

SHARUDIYA, Sans., from sharada, the clear sky season.

SHARUNNE, Tam. Trianthema obcordata, *Roxb.*

SHARUNNE-KIRE, Tam. Glinus trianthemoides.

SHARVELI-KIRE, Tam. Trianthema.

SHARWA, Hind. Brassica, *sp.*

SHA-SI, Burm. Catechu.

SHASTRA, Sans. The holy books of the hindoos. Of the six Vedanga or bodies of learning, three belong to grammar ; one relates to religious ceremonies ; a fifth to the whole compass of mathematics ; and the sixth, to the explanation of obscure words or phrases in the Vedas. Subordinate to these Anga (though the reason of the arrangement is not obvious,) are the series of sacred poems, the body of law, and the six philosophical shastras. Shastra, Sans., is from shas, to rule. See Veda.

SHASTRI, see Bhairava.

SHATAWAR-KA-PATTA, Hind. Asparagus racemosus.

SHATAWI, Maleal. Asparagus adscendens, *Roxb.*

SHATCHAKRA, see Yug byasa.

SHATHA-KUPPA, Tel. Anethum sowa.

SHATIR, a running footman, or messenger.

SHATKRATU, see Indra.

SHATOOL, see Kanawer.

SHAT-UL-ARAB, literally the river of the Arabs, is the united stream of the Tigris and Euphrates, and is about 700 yards broad ; its ordinary depth 30 feet. Within a distance of 22½ miles by water, or 20½ miles direct, S. 70° E. it forms three large islands between its fork and the small town of Mohamarah. Here the Karum enters it, after a long course from the Koh-i-zard through Shuster, Ahwaz and other places. After the junction of the Euphrates and Tigris rivers, this one tidal channel has the well-known appellation of Shatt-el-Arab, when five miles below Kurnah the united waters receive those of the Kerah, or Kerkhah, which, coming from the mountains of Ardelan through an extensive tract of country, passes a short distance westward of the ruins of Susa and likewise of the town of Hawizah. After receiving this accession, the Shatt-el-Arab flows through date groves and near several villages, chiefly on the left bank, and at length arrives opposite Basrah, which is 39½ miles by the river, and 36 miles S. 34° E. direct from Kurnah. In the whole of this distance there are but two islands, both of them large : and the river has an average width of 600 yards, with a depth of 21 feet ; it has a current of two knots per hour during the flowing, and three knots per hour during the ebb tide, empties itself into the Persian Gulf, 80 miles from Bassorah.—*Euphrates and Tigris, Col. Chesney, p.* 39 ; *Ed. Ferrier's Journ., p.* 28. See Kerman, Koorna, Khuzistan.

SHATRA, Pers., Duk. Fumaria officinalis, Fumaria parviflora, *W. & A.*

SHATRANJI, Hind. A cotton carpet.

SHATT-AL-DIJLAH, see Tigris.

SHATURUJ, Pers. Fumaria parviflora, *W. & A.*

SHATUT, Duk. Morus atropurpurea.

SHAVALI, It. Shawls.

SHAVING. There are amongst hindoos propitious days for this.

SHAVIRUM, Tam. One of the mercurial preparations of India.

SHAUNIZ, Hind. Cuminum cyminum, black cummin.

SHAWA, Hind., Pushtu. Dalbergia sissoo, sissu tree.

SHAWA, Hind. Populus ciliata.

SHAWALI, Hind. Rosa webbiana.

SHAWLS.

Shawl, Guz., Hind.,	Pers.	Saluvaigal,	Tam.
Shavali,	It.	Saluvalu,	Tel.
Kayin-rambut,	Malay.		

These well-known articles of dress, made of wool, silk, or more commonly of silk and wool mixed. Fine shawls are made at Cashmere, and are largely exported from Bombay to London. The chief seats of the shawl manufacture in Britain are Paisley and Norwich; the French shawls are, however, much more esteemed than the English. Although in many branches of textile manufacture, England has outstripped her oriental teacher, there is still found among the workmen of the east, a degree of taste in the adjustment of their designs, an amount of skill applied to the getting-up of the fabric and the blending of patterns and colours so aptly combined, as to leave nothing to be desired, but rather to show that what we are now arriving at in arts design by the aid of scientific teachings, has been practised amongst that ancient race during the last thousand years. The correct principle which science has laid down in the schools of the west, that the patterns and colours of woven goods should diversify plain surfaces without disturbing the impression of flatness, has evidently been known to them from the earliest times. Nor is it in this alone that the workmen of the east excel: they are equally celebrated for the rich and varied beauty of their patterns, and the strict appropriateness of these to the colours employed. Foremost amongst the woven fabrics of India are the world-famed shawls of Cashmere, the finest of which, in spite of many imitations in Europe, are still produced in the "Vale of Cashmere," whence continues to come the supply of the most valuable wool employed in the manufacture. The Cashmere goat thrives nowhere so well as amidst the grassy ravines and shady clefts of the Cashmerian hills; and from the neck and underpart of the body of the animal is taken the fine, flossy, silk-like hair, which is worked up into these beautiful shawls with an exquisite taste and skill which all the mechanical ingenuity of Europe has never been able to imitate with more than partial success. Mention may be found of these shawls in the Mahabharata and other ancient works of the east. The people of the countries adjacent to Cashmere are there spoken of as bringing skins and cloths of wool embroidered with gold as tribute to the sovereign. From the Ayeen Akbari, written in the sixteenth century, we gather that the emperor Akbar encouraged the manufacture of these shawls by every means in his power, even designing some himself, and introducing a greater and richer variety of colours in their patterns. The same work informs us of the extension of this manufacture to the state of Lahore, where it is said there were then a thousand manufactories employed on them. A mixture of wool and silk for turbans is also spoken of; and some space is occupied with an enumeration of the various qualities of the shawls and turbans, and the mode of classifying them for value. Since the above period, the many troubles and political changes in the position of the country have materially affected this branch of industry; and we accordingly find that from 30,000 looms, which was at one time the number at work in Lahore, there were, some years since, but 16,000. Doubtless the more settled state of the country, and the increasing demand for the article in various parts of the world, will now help to revive this manufacture. In all eastern countries the shawl is ever considered the most essential and graceful part of ornamental dress; and even in Europe, with their many beautiful imitations, the true Cashmere shawl is still sought and paid for at enormous prices. Even in India it is by no means unusual for a rajah to pay ten thousand rupees (1,000*l.*) for one of the finest of those productions; and which, in all probability, will have cost the labour of a whole family for a life-time. The annual value of these shawls imported into Great Britain does not exceed six or seven thousand pounds, and forms no sort of criterion as to the yearly produce of the Cashmerian looms, since by far the most valuable are taken by native rulers and rajahs, and large quantities are also despatched to Russia, Turkey, Greece, America, and continental Europe. Previous to the imitation of these goods at Paisley, the imports had amounted to as much as 16,000*l.* annually. In embroidered shawls, scarfs, handkerchiefs, &c., in silk, cotton, and mixed fabrics, India stands pre-eminent. Here also, as in the make of Cashmere shawls, the hindoos, by their skilful and delicate manipulation, are able to produce fabrics of such exquisite fineness, as to defy the more scientific labours of European nations. Their scarfs of brocaded gold and silver, laid upon red, white, and green grounds, and worked in and interspersed with beetle's wings and other ornaments, are at once the wonder and admiration of the world.

Bangalore Silk Shawls.—At the Madras Exhibition of 1855, two Bangalore Silk Bed Quilts, exhibited by Moonshee Nunjapah Dondala Esmursan were good specimens of this description of native manufacture, but were priced so much above their real value as to prevent their being brought into general use. A Bangalore silk shawl by Moonshee Nunjapah, weighing 2 lbs., 3 oz., 5½ dr., price 125 Rs., was the best woven fabric of this description, and the jury awarded him a 2nd Class Medal.

Mr. Moorcroft in the early part of the 19th century estimated the annual value of the Cashmere manufacture of shawls at £300,000, but this seems a small estimate if the raw material be worth £75,000 alone, that is, 1,000 horse loads of 300 pounds, each pound being worth five shillings. In the 11 years, 1850–51 to 1860–61, the quantities and values of Cashmere shawls exported from India, were as under :—

Years.	Pieces.	Value.	Years.	Pieces.	Value.
1850-51	13,405	£171,709	1856-57	?	£290,640
1851-52	10,594	146,270	1857-58	?	227,618
1852-53	16,711	215,659	1858-59	?	310,027
1853-54	?	170,153	1859-60	?	252,828
1854-55	?	197,890	1860-61	?	351,093
1855-56	?	209,279			

Of the above, 90 per cent. was shipped from Bombay ports, and 80 per cent. to the United Kingdom, Suez, the Arabian and Persian Gulfs,—America, France and China taking the remaining part. The Central Committee, Lahore, reported that this is now by far the most important manufacture in the Panjab ; but thirty years ago it was almost entirely confined to Kashmir. At the period alluded to, a terrible famine visited Kashmir ; and, in consequence, numbers of the shawl weavers emigrated to the Panjab, and settled in Umritsur, Nurpur, Dinangar, Tilaknath, Jellapur and Loodianah, in all of which places the manufacture continues to flourish. The best shawls of Panjab manufacture are manufactured at Umritsur, which is also an emporium of the shawl-trade. But none of the shawls made in the Panjab can compete with the best shawls made in Kashmir itself ; first, because the Panjab manufacturers are unable to obtain the finest kinds of wool, and secondly, by reason of the inferiority of the dyeing, the excellence of which in Cashmere is attributed to some chemical peculiarity in the water there. On receipt of the raw pashm or shawl wool, the first operation is that of cleaning ; this is done generally by women ; the best kind is cleaned with lime and water, but ordinarily the wool is cleaned by being shaken up with flour. The next operation is that of separating the hair from the pashm ; this is a tedious operation, and the value of the cloth subsequently manufactured varies with the amount of care bestowed upon it. The wool thus cleaned and sorted is spun into thread with the common 'churka' or native spinning-machine. This is also an operation requiring great care. White pashmeea thread of the finest quality will sometimes cost as much as £2 10*s*. a pound. The thread is next dyed, and is then ready for the loom. The shawls are divided into two great classes, viz., woven shawls, called 'Teliwalah ;' and worked shawls. Shawls of the former class are woven into separate pieces, which are, when required, sewn together with such precision that the sewing is imperceptible. These are the most highly prized of the two. In worked shawls, the pattern is worked with the needle upon a piece of plain pashmeea or shawl-cloth. A woven shawl made at Cashmere of the best materials, and weighing 7 lbs., will cost in Cashmere as much as £300. Of this amount, the cost of the material, including thread, is £30 ; the wages of labour, £100 ; miscellaneous expenses, £50 ; duty, £70. Besides shawls, various other articles of dress, such as choga, or outer robes, ladies' opera cloaks, smoking-caps, gloves, &c., are made of pashmeea. Latterly great complaints have been made by European firms of the adulteration of the texture of Cashmere shawls ; and there is no doubt that such adulteration is practised especially by mixing up Cashmere wool with real pashm. In order to provide some guarantee against this, it has been proposed that a guild or company of respectable traders should be formed, who should be empowered to affix on all genuine shawls a trade-mark, which should be a guarantee to the public that the material of the shawl is genuine pashm, especially as the Indian Penal Code provides a punishment for those who counterfeit or falsify trade-marks, or knowingly sell goods marked with counterfeit or false trade-marks. At Delhi, shawls are made up of pashmeea, worked with silk and embroidered with gold lace. A very delicate shawl is made of the wool of a sheep found in the neighbourhood of Ladak and Kulu : the best wool is procurable in a village near Rampur, on the Sutlej ; hence the fabric is called 'Rampur Chudder.' The other woollen manufactures in the Panjab and Peshawur are choga, made of the wool of the Dumba sheep, and of camel's hair, and choga made of Patti, or the hair of the Cabul goat. The shawl bafs or weavers of the Panjab, according to their means, keep up an establishment of from three to four hundred shagird, or apprentices, of children from five years of age, to old men and women of eighty. The shawl baf pays to government a capitation tax of from 16 and 18 to 50 rupees per annum, for each shagird that he employs. The Argoun merchants and traders of Ladak and Chanthan have made it a point, from time immemorial to advance large sums of money for the purchase of pam throughout the different districts of pam-producing provinces. The Cashmere woollen fabric is now manufactured in other towns, in the form of shawls, coats, scarfs. Formerly Cashmere shawls were exquisitely woven, with unrivalled elegance and chasteness of design, softness and finish in quality, arrangement of colours and use of dyes, which the finest Paisley and French shawls do not approach. These exquisite shawls of Cashmere became rarer and rarer every year, and their place has been usurped by hand-embroidered fabrics of lower value, with more showy and more vulgar patterns. In the Panjab and in Delhi, of late years, workmen have commenced to embroider Cashmere cloths and net with floss silk and braid, but solely for sale to Europeans, who wear them as tunics, jackets, scarfs, and the like. In the hand-worked Cashmere shawls, as also in the Delhi work, wooden needles of hard wood are used slightly charred, with a hole in the centre of the needle to receive the yarn. Cashmere weavers have settled at Umritsir and Jellalpur and other places, and have flourished. Cashmere shawls have still, however, a wide-spread fame, on account of their extreme softness, brilliancy, and elegance; and it has long been the aim of European nations to imitate, and if possible to equal them, applying to their manufacture the more speedy and elaborate methods which modern science has placed within reach. The oriental shawls are woven by an extremely slow process, and are therefore very costly. The date of the manufacture is unknown, but Cashmere shawls have been celebrated ever since the British established themselves in India. As far as can be gathered from the observations of various writers, the Thibetan wool, being imported from Tibet and Tartary into Cashmere, is first bleached to rid it of a greyish hue which naturally belongs to it, then spun into yarn by women, and dyed of various colours. The yarn is next given out to the weavers by a merchant, who perhaps enters largely into the shawl trade, and engages a number of shops in which men work for him; or else he supplies a certain number of overseers called Ustad with yarn, delivering to them at the same time instructions as to the quality, colour, patterns, &c., of the goods, and these men carry on the manufacture at their own houses, with the help of ordinary weavers. The Ustad receive six or eight pice a day for their wages, the common workmen from one to four pice, the value of a pice being about three half-pence. Though the shawl-weavers of Cashmere are thus scantily rewarded, the fabric they produce has often been sold in London at from 100*l*. to 400*l*. the shawl. But it is fair to state that the manufacture of a remarkably fine and elaborate shawl will sometimes occupy a shop for a whole year, two or three or perhaps four persons, being constantly engaged on it. Plain shawls are simply woven with a long narrow and heavy shuttle, but variegated shawls are worked with wooden needles instead of a shuttle, there being a separate needle for each colour. In some of the richest shawls, scarcely a quarter of an inch is completed by three persons in one day. Sometimes, in order to hasten the process, a shawl is made in separate pieces in different looms, and the pieces are afterwards sewed together This is done with great dexterity, so that it is not immediately detected. An overseer at each loom, superintends the workmen, and if the pattern be new, he directs them as to the figures and colours, keeping before him a paper-pattern of the device which is to be produced. The rough or inferior side of the shawl is uppermost on the frame, nevertheless the pattern is most accurately preserved by the workers, who sit on benches while so employed. The shawls are made both long and square, the former generally measuring 54 inches wide, and 126 long, the latter 63 to 72 inches square. They are exquisitely soft and warm, surpassing in these respects every other clothing material. In some parts of Asia these shawls are worn just as they come from the loom; but all those destined for India are carefully washed and packed near Lahore. The extent of the manufacture in Cashmere has been differently stated: some years ago there were said to be 16,000 looms in that kingdom; and if it be correct that above five shawls (including the inferior qualities: are made on an average at each loom during the year, this gives a total of 80,000 shawls as the annual produce of the kingdom. When Cashmere was tributary to Affghanistan, a considerable portion of the revenue was exacted in shawls instead of money.

The beauty and value of Cashmere shawls has led to various imitations, which at length have proved successful, both in France and Great Britain. The government of the former country gave encouragement to a patriotic and zealous man, M. Jaubert, who exposed himself to great risk and hardship, in bringing from the East in 1823, a flock of Tibet goats, part of which were successfully reared at St. Oven, near Paris. The climate suited them well, so that for several years the proprietor was enabled to sell a great number of male and female goats, which were called Cashmere goats. Cashmere wool is still imported from Tibet and comes into Europe by way of Casan, on the eastern bank of the Volga. The mills for spinning it are very numerous in France where three principal descriptions of Cashmere shawls are manufactured, at Paris, Lyons, and Nismes. The Paris shawls are principally of the kind known as French Cashmere, in which, by the aid of the draw-loom and of the Jacquard, a surface appearance is given precisely similar to that of the oriental shawls. Both the warp and the weft are the yarn of pure Cashmere down: the figures and colours of Indian shawls are faithfully copied, and the deception would be complete, did not the reverse side show the cut ends. What is called the hindoo shawl, manufactured at Paris, has its warp in spun silk which reduces the price. These imitation shawls are executed by as many shuttles as there are colours employed, which are thrown across the warp according to the requirements of the pattern, and being in many cases introduced only at intervals, the yarn remains floating loose at the back of the piece, and is cut off afterwards. To contrive a method of weaving shawls that should be, like the eastern ones, both sides alike, was a difficult task, but was at last accomplished by Parisian ingenuity. In this case the yarns of the weft are not only equal in number to the colours of the pattern, but there are also as many little shuttles or pirns filled with these yarns as there are colours to be repeated in the breadth of the piece. Each of these small pirns or bobbins passes through only that portion of the flower in which the colour of its yarn is to appear and stops on the one side and the other of the cloth exactly at its limit: it then returns upon itself, after having crossed the thread of the adjoining shuttle. From this reciprocal interweaving of the various yarns of the shuttles, it happens that, although the weft is made up of a great number of different threads yet they form a a continuous line in the whole breadth of the web, upon which the lay or batten acts in the usual manner. The great art consists in avoiding confusion of the shuttles, and in not striking up the lay till all have done their part. A woman assisted by two girls is able to conduct the whole operation. But this close imitation of the oriental shawl is a very slow process, and therefore the shawls must be necessarily costly. Lyons is famous for its Tibet shawls, the weft of which is yarn, with a mixture of spun silk. The shawls of Nismes are celebrated for their low price, and the ingenuity with which spun silk, Thibet down, and cotton, are all worked up together.

The Cashmere shawls are usually divided into three groups, the "Border Shawl;" the Rizai or shawl of the finest texture, and the ordinary Cashmere shawl. Cashmere, and the next in quality Umritsir shawls, possess unequalled fineness, delicacy, and warmth. These shawls are brought to Bombay in large quantities direct from Cashmere, which are almost entirely exported to London. The trade is entirely in the hands of the natives.

The great Punjab mart for Cashmere shawls, is Amritsar. The largest import is of pashmina goods, consisting of shawls, needle-worked goods (amlikar), embroidered chogas, &c., plain pashmina cloth, shawls of kinds, square, long, and double, both woven and worked by hands, the latter being called "amlikar." About A. D. 1860 the maharajah of Cashmere, to check the deterioration in the quality of shawls manufactured in his dominions, issued the following circular:—Be it known that in the city of Siree Nugger, alias Cashmere, a Paradise on earth, the number of men and women employed in the occupation of shawl-weaving aggregates 70,000, and in fact nearly all the inhabitants of this far famed city are connected with the trade. That owing to the dulness of the market in England and France, caused chiefly by the inferior description of shawls manufactured, many tradesmen and merchants have been subjected to heavy loss and some to bankruptcy, and a large proportion of weavers have been thrown out of employ. On the maharajah's late tour through Cashmere the circumstance occupied his chief attention and from the information he obtained he ordered the following rules to be established in order to serve both manufacturers and traders:

1.—Shawls to be uniform in size as follow:—

Lady's shawls,	3½ yards	by 1½
Turbans,	2 „	by 2
Jamawar,	4½ „	by 3

2.—Any shawl badly wove to be destroyed—the value to be recovered by the proprietor from the weaver. Should the fault lie with the proprietor, he will be punished by the Government.

3.—A designer is at liberty to dispose off his designs, but should he attempt to conceal any part of a design which is purchased from him, he will be severely punished.

4.—Any person convicted of robbing a firm of a design will be severely punished.

5.—One designer is not at liberty to transfer designs to another, and as the Government has now relinquished the tax, it is hoped that there will be considerable improvement in the art.

6.—Not more than six shawls are to be wove from one design, or a heavy fine will be inflicted.

7.—The seller of a design is not to retain a duplicate or attempt to form another exactly like the one sold, in such a case fine will be levied equal to ¼th its value.

8.—In future duty will be levied by measurement of wool and worsted and not by weight as heretofore, this will induce spinners to produce a finer description of the material and will be more profitable to the wearer.

9.—His Highness taking into consideration the distressed condition of all manufactories for want of sufficient funds, and seeing that tradesmen are not disposed to assist them with advances, has placed in the hands of Pundit Hunna Nundjoe and Hajee Mooktiar Shah, a sum of Rs. 1,00,000 for the purchase of raw material, the same to be delivered proportionately to manufacturers, the value of which is to be refunded to Government on the sale of shawls.

10.—His Highness the maharajah is greatly indebted to Dewan Kirparam, who from his experience had assisted greatly in framing these rules and encouraging this important branch of manufacture.

Shawl-Weaving, is practised at Nurpur and Adinanagar, but with greatest success at Amritsar; none of these cities, however, equal either in fineness of texture or beauty of colors and design, the genuine fabrics of Cashmere. The shawl-weaving of Gujrat and Gurdaspur is quite inferior. In Lahore, shawls are made from "Kabuli pashm," a wool which is inferior to the Thibetan shawl wool. These shawls are plain and not patterned like the others. They are called "Lahori chaddar." Shawl-weavers of Cashmere have largely emigrated into British territory though the maharajah of that province uses efforts to prevent their departure. Pashm wool can now be brought into Kooloo and Amritsar through Ladak, paying only a five per cent. transit duty.—*Bengal Hurkaru, Dec.* 15; *Moorcroft's Travels, Vol.* ii, *pp.* 165, 194; *Cunningham's Hist. of the Sikhs, p.* 4; *Powell's Hand-book, Econ. Prod., Panjab, pp.* 8, 9, 181-82; *M. E. J. R.; Dr. Watson*; *Tomlinson, p.* 337; *Capper's Three Presidencies*; *Faulkner's Com. Dict.*; *McCulloch's Com. Dict.*; *Madras Ex. on Jur. Reports*; *Cal. Cat. Ex.*, 1862. See Shawls, Wool, Arts and Manufactures.

SHAWL, a name of Quetta. See Quetta Shal.

SHAWL-GOAT, Eng. Capra hircus, *Linn.* The Shawl Goat of Spiti, yields inferior wool to that of Tibet. Shawl Goat's hair is called Pashm in Hindi, and Kashmiri Lena in Tibetan. The common domestic goat of Ladak is the well-known shawl-goat. It thrives only in the most elevated districts. It is bred in Nubra, Zanskar and Rukchu, but the finest wool is brought from Ruthog [illegible] Gnari, which formerly belonged to Ladak, [illegible] from Chang Thang, or the southern and mo[illegible] tainous districts of Kotan. It is only shorn once a year, and the wool is at once separated from the coarser hair. The hair is manufactured into blanketting, for tents, coarse sacking, and ropes for home consumption. The wool is exported to Kashmir, and to Nurpur, Amritsar, Lahor, Ludiana, Ambala, Rampur on the Sutlej, and Nepal. To Rampur and Nepal, the wool is exported direct from Ruthog and Gnari, but Leh is the entrepot between the other shawl-marts and the wool-producing countries. The fine shawl wool is called Le-na, the common wool Bal, and the hair Pu. These Tibetan names being the same as the Latin lana and English wool. In Kashmir, the wool is sold to the merchants at Kashmiri Rs. 4-8, or Co.'s Rs. 2-10 per seer. The average quantity of shawl wool exported from Ladak to Kashmir and other places is about 16 loads or 6,400 maunds of 16 seers each, half of which goes to Kashmir alone. The average price in Ladak is about two rupees per seer, or £20,400 a ton. Each shawl goat yields about half a seer. The goats are about 80,000 in number, and their value £32,000, each goat being priced at four rupees. The shawl goats imported by Napoleon were brought from the province of Talish, on the western bank of the Caspian. The Kashmirian merchants purchase the wool at Leh, at the rate of 80 pul (small handfuls,) for a small rupee. Shawl wool is produced most abundantly and of the finest quality in the steppes between the Shayuk and the main branch of the Indus. About £10,000 worth may be carried down the Sutlej to Loodianah and Delhi. • Mr. Moorcroft estimated the importation into Kashmir alone at £75,000 of value, and the annual value of the shawl manufacture of Kashmir at £300,000. In Thibet, there are two varieties of Shawl wool goats; one is a large animal, with great horns, called Rappoo; the other smaller, and with slender horns, is called "Tilloo." The latter yields the finest wool, but they are mixed for ordinary purposes. Dr. Hooker was assured that the sheep, of which he saw large flocks afford the finest wool of any. The animals are caught by the tail, their legs tied, the long winter's hair pulled out, and the remainder cut away with a broad flat knife, which was sharpened with a scythe stone. The operation was clumsily performed and the skin much cut. One of the most valuable imports is the Thibetan shawl wool, and which supplies the shawl-weaving cities of Amritsar, Gujrat, &c., comes from Changthau viâ Leh and Rampur. Wool, the produce of Rampur itself, is also imported.—*Vigne* ; *Cunningham* ; *Hooker's Him. Jour.*, *Vol.* ii, *p.* 88.

SHAWULLA, see Khyber.

SHAYANG KOTTE, also Shayrang kotte, TAM. Marking nut, Semecarpus anacardium. —*Ains. Mat. Med.*, *p.* 111.

SHAYANG COTTE YENNAI, TAM. Marking nut oil ; Semecarpus anacardium. See oil.

SHAYUK, a valley and river in the N.W. Himalaya, is very bare of vegetation. The cause of this difference seems to lie in the frequent floods which have at different periods, devastated the whole course of the Shayuk valley, from the glaciers of Sassar. These floods, which appear to be due to the blocking up of the upper course of the river by the ice, have been most destructive to the prosperity of the valley. An encamping-ground on the plain of the Shayuk river, is called by the Turki merchants Murgai, by the Tibetans, Murgo-chumik ; the former name being probably a corruption of the latter.—*Dr. Thomson's Travels in Western Himalaya and Thibet*, *p.* 422. See Ladak, Tibet.

SHAYRAIT, TAM. Agathotes chirayta, *G. Don.*

SHAZOUNG, BURM. Euphorbia ligularia, *Roxb.*

SHEA, HIND. Lonicera glauca.

SHEA BUTTER is a solid oil obtained from the nuts of Bassia parkii, a tree of the interior of Africa, the nuts are allowed to ripen on the tree, and are gathered from the ground in the morning by women and children. The pulp surrounding the nuts is rubbed off, and generally eaten. As a fruit it resembles an over-ripe pear ; but it is too sweet to be much relished by Europeans. The nut is next dried by exposing it to a slow heat in large clay caldrons with perforated bottoms. This, besides carrying off moisture, causes the nut to shrink in its shell, of which it is divested in the next operation, viz., threshing. This is done on floors, or sometimes it is slightly bruised in large wooden mortars instead. The nut, now free, is next thoroughly pounded with pestle and mortar, then ground between stones : at this stage it looks just like black mud in paste. This mass is washed in cold water, then boiled till the butter rises white, and is skimmed from the surface. Shea butter remains hard at a high temperature when well prepared, and does not become rancid with age. It has a slightly smoky taste, acquired during its preparation. Some people dislike it. It has been used in cooking, and Mr. Barter often, in the boat, lived on it and yams without inconvenience.—*Letter from Mr. Barter to Sir William Hooker.*

SHEA KAI ELE, TAM., properly Sikaia ele, TAM. Leaves of Mimosa abstergens.

SHEAR GARH, see Kunawar.

SHEBA, mentioned in Ezek. xxxviii, 13. "The merchants of Sheba and Raamah," &c. Haran and Canneh and Eden, "the merchants of Sheba, Ashur and Chilmad, &c." Ezek. xxvii, 21-23, is Saba or modern Ard-us-Saba. The Balad-ul-Jahaf, a district of Yemen, is the land of Sheba, the Ard-us-Shaba, so called to the present day, by the Arabs. There are two hills of Balak in the district, six hundred paces apart, between which Balkis queen of Sheba built a masonry dam, which burst, and the bursting is famed as the Sail-ul-Arun ; Balkees queen of Sheba, was stated to Soliman to have hairy legs ; the Koran, (Ch. xxii) mentions the plan he adopted to ascertain the fact.—*Ouseley's Travels, Vol.* i, *p.* 336. See Balkis, Nureh, Saba.

SHEBB, also Shabb, AR. Alum.

SHECHEM, the modern Nablus, has in its neighbourhood the two mountains, Gerizim and Ebal, each about 2,500 feet high with Joseph's tomb and Jacob's well at the eastern end of the valley, the former near the foot of Ebal and the latter near the foot of Gerizim. One Tur, is the mountain mass near Sinai. Another Tur, the Et Tur, is mount Gerizim near Nablus. Shechem was made the metropolis of the conquering Israelites. Jerusalem only became of importance after the vision of David in II Chron. iii, 1. It was from Gerizim and Ebal that Moses ordered the law to be read. It was here that the field was bought by Jacob, (Gen. xxxiii, 19, and xxxiv, 2-4.) Shechem of Samaria, was a refuge city. See Bast.

SHEDAKH-NINDI, AR. Amarantus oleraceus, *Linn.*

SHEEAH, followers of Ali, a mahomedan sect, and opposed to the Soonnee sect.

SHEEKAI, TAM. Acacia concinna.

SHEELANDEI ARISI, TAM. Cyperus geminatus.

SHEELASSETTO, TEL. Agathotes chirayta.

SHEEM, BENG., HIND. Canavalia gladiata.

SHEEMI or Simi Pooshini-kai, TAM. Cucurbita ovifera.

SHEEN ?—cover for pots.

SHEENDI CODEI, TAM. Menispermum cordifolium, Cocculus cordifolius.

SHEEN-THAN, BURM. Platina.

SHEEOABAD, is regarded as the farthest town in which the polished Oordoo of the quondam mogul court of Agra is to this day spoken without any taint of rural corruption. *Tr. of Hind., Vol.* i, *p.* 370.

Pecoro,	IT.		

The shawl-goat, and a dwarf variety (black, with short horns), also a race of black-faced sheep, and the dumba, or broad-tail, are reared in Ladakh in great numbers. Four horned varieties of this sheep are not uncommon. The "black-face," or hunniah, stands much higher than any seen elsewhere, and is a handsome animal. A herd of shawl-goats, and two of the hunniah sheep were brought to the Punjaub. Although the former throve very well all the sheep rapidly lost flesh and pined away within a month after their arrival on the plains. The Yak seldom survives beyond a few months, and even rapidly degenerates in the valley of Cashmere. The heat and insects are evidently its greatest enemies in the tame as well as wild state ; and none of these animals, not even the goats, seemed to care for the luxuriant vegetation of the lowlands, preferring whatever resembles their Tartaric furze and bent to the rich clover and grasses of Cashmere.—*Adams*. See Ovis.

SHEEP-SKINS. Besides local supplies, many thousands are imported into Britain from the Cape of Good Hope, British India. Those of the Cape are distinguished by the greater width of the skin that covers the tail. They are simply tanned, and employed for various purposes for which a thin, cheap leather is required ; such as for common bookbinding, leathering for common bellows, whip-lashes, bags, aprons, &c. Sheep-skins also form the cheaper kinds of wash-leather for breeches, gloves, and under-waistcoats ; as also coloured and dyed leathers and mock morocco, used for women's shoes, for covering writing-tables, stools, chairs and sofas, lining carriages, &c. See Hides, Leather, Skins.

SHEER, PERS. Milk.

SHEERANNEE. On the mountainous border of Dera Ismael Khan, the most formidable tribe are the Sheerannee ; they frequently descended to rob and murder. Previous to annexation, the Sheerannee made themselves the terror of the border.—*Record, Govt. of India, No.* 11.

SHEERAZ, is one farsakh, 3¾ miles in circumference ; and is surrounded with a shabby-looking wall of sun-dried bricks and mud ; outside of which is a moat nearly dry.

SHEER-BIRINJ, or Kheer.

SHEER-DARAKHT ZEKOOM, PERS. Euphorbia canariensis, *Linn.*

SHEERI-GUMUDU, HIND. Gmelina parviflora.

SHEER-I-KHASH-KHASH, PERS, also Ufyun, PERS. Opium.

SHEERU KALLY, a river near Noondla in Nusseerabad.

SHEER KULLA, see Kulla.

SHEERNEE, sweets.

SHEERUDEK, TAM. See Ganta baringa.

SHEERWATERS are birds of the skimmer (Rhynchops) genus.

SHEESH, DUK. Lead.

SHEESHAH, PERS. Glass.

SHEET KHYÆ, BURM. Semecarpus longifolia, *McClell.*

SHEET MA TET, BURM. Asparagus acerosus, *Roxb.*

SHEETALA, SANS. Cold.

SHEETALA, in hindoo mythology, the goddess who cools the body when afflicted with the small-pox, she receives many honours from the lower orders of hindoos.—*Ward's view of the Hindoos, Vol.* i., *p* 38.

SHEETALA-PATEE, BENG., SANS., from sheetala, cold, and patee, a mat, from pat, to move. The mat is from the Maranta dichotoma.

SHEFTAH, or Shafta, called in Syriac, Agal, is a skein of camel's wool thread, about nine feet long, bound at distances of about twelve inches with silk and gold thread. It is wound round the kufia, forming a large turban, and is principally worn by the Aneyseh. —*Hamilton's Sinai Hedjaz, London, p.*183.

SHEGAL, HIND. Pyrus variolosa.

SHEGAPU THUNDU KIRE, TAM. Amarantus atropurpureus.

SHEGAPU - MUNTHARI - MARAM, TAM. Bauhinia purpurea.

SHEGGURU, SANS. Hyperanthera moringa.

SHEIKH, amongst mahomedans a father of tradition, a term given to descendants of Arabian origin, some of whom claim Oomar as their ancestor, also applied generally to all of the Sunni sect other than syuds, pathans or moguls. The Sheikh therefore is of the most varied origin, and is engaged in all avocations, military and civil, as soldiers, in regular and irregular armies, as police, shopkeepers, and a very few, a mere sprinkling of them, in learned professions or occupations requiring prior education. The Sheiks are of three origins, the Koreishee, Mahomed's tribe ; the Siddeqee, Aboo Bukr's tribe ; and the Farooqee or Oomar's tribe.

SHEIKH BAHA OOD DEEN, ZAKARIA, born at Cotcaror in Mooltan. He was a great traveller, having it is said, overrun Persia and Turkey, and a disciple for some time of Shahab ood Deen, Sohurmurdee, at Bagdad. He died on the 7th Sufur, A. H. 665 (A.D. 7th September 1266), and was buried at Mooltan. See Sunna.

SHEIKH FAROOQEE, sheikhs descended from Oomar.

SHEIKH MAHOMED ALI, HAZIN, JILANI, his tomb is at Buxar, where he died in A.H. 1180 (A.D. 1766-67), distinguished for his science, learning, and literary talents. He wrote in both prose and verse with equal skill.—*Herkl.*, *p.* 432.

SHEIKH MAKRANI, see Wahabi.

SHEIKH QORAYSHEE, Mohummud and all his companions and descendants.

SHEIKH ALI SHADULI, IBIN OMAN, see Mocha.

SHEIKH SALEH, see Lohaia.

SHAIKH SHARIF BOO ALI, QALANDAR, born at Paniput, a town thirty coss north-west of Delhi, to which capital he came at forty years of age, and became a disciple of Qootb-ood-Deen. He devoted himself for twenty years to external sciences; after which he threw all his books in the Jumna, and began to travel for religious instruction. In Asia Minor he profited greatly by the society of Shams Tabreez and Mulvi Roomi. He then returned home, lived retired and worked miracles, and is said to have died A. H. 724 (A. D. 1323-24 ?)

SHAIK SIDDEEQEE, sheikhs, descended from Aboo Bukr, Siddeeq.

SHEIK SULTAN KULI, see Hyderabad.

SHEIKH SUDDOO, a Musulman who became a demon. Sheikh suddoo kee kurraee, is a ceremony.

SHEIKH SHAH, see Malwa.

SHEIKH UL SHAYUKH, see Mesopotamia.

SHEIKH UL BALAD, ARAB. President of the municipal affairs of a Turkish town. Chief of a village.

SHEKHAN, see Khyber.

SHEKHAWATTEE. This country extends about eighty miles from north to south, and less from east to west. It has the extensive dominions of the rajah of Jypoor on the south; on the east the dependencies of the British Government, and on the west the territories of Bikaneer; on the north-west it has the barren country of the Battee clan, formerly a plundering tribe, remarkable for carrying on their depredations on foot, and still more so, for the length and rapidity of the incursions thus made: on the north is Hurreeana, the scene of the exploits of George Thomas.—*Elphinstone's Kingdom of Caubul, p.* 3.

SHEK-U, CHIN. A mineral substance used in China as a dentifrice, also as a tisan, in fevers. It is brought from the north of China and is said to be gypsum or alabaster. —*Bennett.*

SHELAH, HIND., of Kohat, a torrent or hill stream.

SHELANDI ARISI, TAM. Rice of Cyperus bulbosus, *Vahl.*

SHELL, the protective covering of the molluscous class of animals widely distributed throughout the earth, the fresh water, and the ocean. This covering is in most cases exterior, and large enough to enclose the whole body; but in some cases it is interior, and only of sufficent size to protect the heart and lungs. Shell is a secretion from the skin which covers the back of the animal, and which is of a peculiar thickness and fleshy consistence, and is called the mantle. This fleshy mantle is very evident on the back of the common grey slug, in which it covers only a portion of the body, and contains in general, within the substance, an internal shell, small, flat, transparent, and oval. The snail affords a familiar instance of an external shell. Shells are called univalve or bivalve according as they consist of one part, or of two parts joined together by a hinge. The snail is univalve, the oyster is bivalve. Bivalves are inferior in the scale of existence to univalves, both as it respects powers of motion and organs of sense. The generality of the bivalve shells, including various oysters, muscles, &c., are termed nacreous shells, from nacre, the French for mother-of-pearl. The so-called shell of the tortoise, is merely a bony covering, and different in structure from true shell: it is obtained from Ceylon, the Eastern Archipelago, France, Trinidad, &c. The beautiful lining of oyster-shells, known as mother-of-pearl, is manufactured into articles of great beauty. Most of the univalve shells are of the character called porcelanous from their brittleness, translucence, and the resemblance of their fracture to that of porcelain. In the manufacture of Cameos, it is best to leave the edge of the figure quite square, for the thickness of about $\frac{1}{20}$th of an inch. The surface of the cameo should be finished as nearly as possible with the cutting tools, as all polishing with abrasive powders is liable to remove the sharp angles of the figures, and deteriorate the cameo by leaving the form undefined. When, however, the work has been finished as smooth as possible with the cutting tools, the final polish may be given by a little putty-powder used dry, upon a moderately stiff tooth-brush, applied with care, and rather to the dark ground than to the carved surface; this is the concluding process, after which the cameo is ready for removing from the block prior to mounting. The covering of the tortoise is called its shell, but it partakes of the nature of horn. Sir J. E. Tennent tells us that the trade in shells is one of extreme antiquity in Ceylon. The Gulf of Manaar has been fished from the earliest times for the large chank shell, Turbinella rapa, to be exported to India, where it is sawn into rings and worn as ankles and bracelets by the women of Hindustan, Dacca being the chief place of manufacture : another use for those shells is their conversion into trumpets which are sounded in the temples on all occasions of ceremony. A chank, in which the whorls, instead of running from left to right, as in the ordinary shells, are reversed, and run from right to left, is regarded with such reverence that a specimen formerly sold for its weight in gold, but one may now be had for four or five pounds. Cosmas Indicopleustes, writing in the fifth century, describes a place on the west coast of Ceylon, which he calls Marallo. Thevenot translates this name 'oysters,' in which case Marallo might be conjectured to be Bentotte, near Colombo, which yields the best edible 'oysters' in Ceylon. But the shell in question was most probably the chank and Marallo was Mantotte, off which it is found in great numbers. In fact, two centuries later Abu-Zeyd, an Arab, who wrote an account of the trade and productions of India, speaks of these shells by the name they still bear, which he states to be schenek ; which is merely an attempt to spell the local term, chank, in Arabic characters. In general, shells are more prized for their beauty than valued for their rarity, though some of the 'Argus' cowries have been sold as high as four guineas a pair. One of the principal sources where the Ceylon supplies of shells are derived is the beautiful Bay of Venloos, to the north of Batticaloa, formed by the embouchure of the Natoor river. The scenery at this spot is enchanting.

Near Singapore, says Dr. Traill, there are numerous sheltered bays and inlets, with large tracts of level sand, and in other places, shelving rocks clothed in part with a variety of algæ. It may, however, be questioned whether the geological formation of the coast is such as favours the growth of shells; naturalists are but imperfectly acquainted with the primary formation of the calcareous coverings of these animals ; it is known that the membrane which is called the mantle of the animal, secretes a fluid more or less tenacious, which gradually hardens into the consistence of shell, and the manner in which it is deposited, layer by layer has been minutely described by authors, yet it is not known from whence the mineral substance is derived, or what change it undergoes to convert it into the material forming shell. It appears probable, however, that soluble salts, or other combinations of lime existing in the water, are absorbed into the body of the animal, and from thence by the proper ducts conveyed to the surface for the formation and nourishment of the shell. Should this be the case it might, cæteris paribus, be expected that shells of the largest size would be found where calcareous rocks fringe the coast and vice versâ : here indeed an explanation of the difficulty seems at hand, for there are no rocks of a calcareous nature in this neighbourhood ; on the other hand, it is difficult to account for the immense extent and rapid growth of the corallines which line that coast for many miles, and in the elegance of their forms, and variety of their species, almost vie with our land forests. This description of animal vegetation, if it may be so called, appears also to obtain its nourishment by absorption from the sea water ; and he considers it not altogether unlikely that this constant and active process maintained by the corallines may interfere with the growth of shells in the immediate neighbourhood. One evident cause of the scarcity of many species of shells, near Singapore, is, that the poorer Malays and Chinese use most kinds of shell-fish as food, and search the shores for them with such diligence as to have caused a dearth of such as are common in less frequented parts of the coast. Among the group of small islands, 30 or 40 miles south of Singapore, where human habitation is rarely seen, the general character of the shells is similar to those of Singapore, but they are more abundant and of larger size, particularly the genera Hippopus, Tridacna, Spondylus and Chama, which, especially the two latter, are much used as food by the natives. Shells are used as a flux in the Beypore blast furnace instead of lime and along the coast, near Madras the finest plaster is made from calcined shells. The Placuna placenta or window shell is still used as a substitute for glass.—*Tomlinson, p.* 129 ; *Journal of the Indian Archipelago, No.* v, *November* 1847, *p.* 228 ; *Tennent's Sketches of the Nat. History of Ceylon, p.* 369-371 ; *Cosmas Indico-pleustes, in Thevenot's ed., t.* i, 21 ; *Shells of Singapore by Dr. Traill* ; *Cat. Ex., p.* 162. See Cement, Chunam, Lime, Mollusca.

SHELLAC or shell-lac.

Chapta-lac, Duk., Guz., Hind. | Lak, Malay.

The most common form in which lac is generally known, is the substance liquified, strained, and formed into thin transparent laminæ.—*Faulkner*. See Lac.

SHELLOK. The Berber and Shellok are untamed, warlike tribes, dwelling on the mountains of N. Africa; when possible, rovers of the sea, claiming fanciful origins, but impatient of any subjection. They are the same race as those whom the French call Kabyle and Zouave. The Moors are little idle men, who grow fat from indolence, they are lowlanders, traders, dwellers in cities, avaricious, perfidious, cowardly, cringing and insolent. The Riff-dwellers of Kalhiya, Cape Tres Forcas, correspond to the Arab Saheli on the Red Sea coast, the name being evidently from 'ripa' a bank.

SHELLU, Tam. Termes, White ants.

SHEM, son of Authur, restored three cities. See Calah, India, Nineveh, Semitic.

SHEMA KALANGU, Tam. Colocasia antiquorum, *Schott.*

SHEMBADAWAR, fishermen of Southern India.

SHEMGAR, see Affghan, Kabul.

SHEMITES, see Arians, Iran, Semitic races.

SHEMLIT, Pers. Fenugreek seed, Trigonella fœnum-græcum.

SHEM MARAM, Tam. Amoora rohituka, *W. & A.*, also Swietenia febrifuga, or Soymeda febrifuga, one of the Cedrelaceæ, *Roxb.*, *c.* 17. The Choar Kulli of N. India. It is a large tree, tolerably abundant, timber very durable and strong, yet light and easily worked, deserving of attention. Its bark is called Rohun ka chilka, Rohun bark. A decoction is made of ten drachms, water two pints. In preparing compound chalk powder, powdered Rohun bark is substituted for the Tormentil of the London Pharmacopæia, which is only used for its astringency.—*Beng. Phar.*, *p.* 404.

SHEM MULI, Tam., Tel. Barleria prionitis, *Linn.* Shemmoolli elley, leaves of Barleria prionitis, *Linn.*

SHEMOOGAH, a town in North-western part of Mysore.

SHEM PARITI, Maleal. Hibiscus rosa-sinensis, *Linn.*

SHEMTSCHUNG, also Perlu, Rus. Pearls.

SHEMSAQ, an inferior deity of the Kuki, a rude block of wood is put up in every quarter of a village: to him a goat is offered, and they place before it the heads of the slain in battle or the heads of animals killed in the chase. See Khumia, Kuki.

SHENBAGA MARAM, Tam. Michelia nilagerica, also Michelia champaca.

SHEN-CHANDANAM, Maleal. Pterocarpus santalinus.

SHENDE CODI, Tam. Cocculus cordifolius, *DC.*

SHEN-DOO, a Burmese tribe, who call themselves Heu-ma, and dwell in the mountains north of Arakan. The Khyoung-tha or children of the river, are of Arakanese origin, speak the old Arakan dialect and conform to buddhist customs. The Toung-tha, or children of the hills, are of mixed origin, if indeed they are not aborigines of the country. They speak numerous dialects and worship the deities of the elements and spirits of the hills and streams. The Shen-doo occupy the very remote mountainous country at the heads of the several rivers. They are said to comprise twelve powerful clans, whose habitations extend from the Blue Mountains to Cachar and Burmah proper. They are much feared but little or nothing is known respecting them. Captain Lewin describes them as much taller than ordinary hillmen, and of much fairer complexion: and the faces of those he saw bore no signs of that Mongolian type of physiognomy, which generally prevails amongst the Toung-tha tribes. Both males and females are more decorous in their dress than the other hill tribes, and field labour as a general rule is performed only by the men, and never by the women, excepting in the case of poverty. The Shendoo, possess muskets which do not appear to be of European manufacture: the stocks are painted red, black and yellow, and are highly varnished. Their powder flasks are made of gyal horns, and are polished and beautifully inlaid with silver and ivory. Captain Hughes, in charge of the Arracan hill tribes, writing in 1872, mentioned that they have no Ka-mi, or Koo-mee, or Quaymee; Koon, or Mru. The Shendoo tribe divides itself into five or six branches, who all speak a different dialect; the most powerful of whom are the "Shaing Tee" and Tna-krai-mi, the latter approaching Burmah proper, "Chyn or Khyn." Dr. Mason never before A. D. 1872 heard of the "Tee and Tna-krai-mi," but thought it probable the names only are new.—*Dr. Mason in literis.* See Heuma.

SHENG, Chin. The sheng are not produced by any alteration of the vowel sound, for sounds which we can only write with one and the same vowel, as for instance, *a* in *fang*, *fan*; *u* in *chu*, are pronounced with all the different sheng.—*Meadows' Desultory Notes*, *pp.* 29-60.

SHENGÀZHANIR PU, Tam. Nymphæa odorata.

SHENGHARF, Pers. Cinnabar.

SHENG-KOTTE, Tam. Nut of Semecarpus anacardium.

SHENI, Hind. Rubia cordifolia.

SHENKODI VELI, Tam. Plumbago rosea, *Linn.*

SHENKU, Sans., Tel. Chank shells.

SHENSI, one of the most extensive Chinese provinces, but the western part of it has been erected into a province under the name of Kan-su.

SHENSOY, one of the two Parsee sects in India.

SHENTU, Tseindu or Shiamdu, see India.

SHENUZAN, see Kabul.

SHENWARI KHYBERI, a race even more infamous for their robberies than the Afridi Khyberi.—*Moorcroft's Travels, Vol.* ii, *p.* 354. See Khyber.

SHEO, Hind. Wine.

SHEOPUR, or Siva-pur, the city of Sheo or Siva, the hindoo god of war, whose battle-shout is Hur ; and hence one of his epithets, as Heri is that of Krishna or Kaniya.

SHEORA, Beng. Epicarpus orientalis, *Blume*, also Trophis aspera.

SHEORANEE. Below the Wuzeeree limits, a little south of the Goomul river, are the Sheoranee hills, stretching from the latitude of Dehra Ishmael Khan downwards to nearly the latitude of Dehra Futteh Khan, a distance of fifty miles. In these hills is the lofty square-shaped mountain called "Solomon's Throne," (Takht-i-Suliman) which gives its name to the Suleemanee range, running parallel for 300 miles to the Indus and forming the western frontier of British India. At the base of this mountain runs the important Zerkunnee pass, the high road for caravans to and from Kandahar. The Sheoranee are of Pathan lineage, of inferior stature to the Wuzeeree ; they are warlike and predatory, and quite independent. The number of their fighting-men has been set down at 10,000 ; but this is high. They can muster 1,000 men within a day's notice ; in the course of three or four days they will muster 3,000 more. They adjoin the British tracts of Tak (partially) in the north, then Kolachee then Durrabund, and lastly Choudwan—all in the Dehra Ishmael Khan district, and forming the border plains of the Upper Derajat. With all the above tracts the Sheoranee, up to A. D. 1850, had been at feud. They would be the aggressors, attacking towns, burning villages, carrying off prisoners and cattle. The people of the plain would make reprisals and retaliation and thus the feud would be inflamed. The Sheoranee however were so much feared, that the arable lands skirting the base of the hills were all left untilled and the neighbouring plain villages paid them regularly one-fourth of their produce to buy off depredation : such was the state of things up to annexation by the British, the Sikh government being unable to restrain them. See India, Khyber, Panjab, Sheranee.

SHEPHALIKA, Beng., Hind. Nyctanthus arbor-tristis.

SHEPHERD. The chief shepherds of the S. of India, are the Kurumbar race, their name being from Kuru, a sheep. In the south of India, the shepherds and milkmen, wool-shearers, cow-herds, cow-keepers, Oree golla wanloo, Coraba golla wanloo, Hunde Coraba wanloo, are divisions of the shepherd or cow-keeper races who intermarry. There are several other sections of this people. Golla is the Greek gala milk. In the Tamil country, shepherds are divided into many classes, as, Manyakarar, Kuruku, Pavalangattee, Sambar, and Sival Edyar, &c. &c. They are called Pillay and Kouar. The Dhangar shepherd race are a very numerous body, known in the south as the Kurumbar, from "Kuru," a sheep. There are 55,947 Dhangar in the Berars. In Hindustan, the Dhangar are in some places called Hatkar, and a considerable body of the Hatkar tribe dwell in the peninsula from Bassim north of Hingolee into Berar, and in the hills on the northern bank of the Pain Ganga. They are a warlike race, obstinate and quarrelsome, independent in bearing and pretensious in character, and arrange themselves into the Poli, Gurdi and Muski clans. They eat with the Kunbi ; they burn the dead who die in battle or in the chase, but inter those who die of disease, seating the body cross-legged, with a small piece of gold in the mouth of the corpse. This mode of interring the corpse in a sitting posture is followed by the goldsmith, carpenter, stone-mason, blacksmith and brazier, and by all the vira-saiva lingaet religionists.

Another cow-keeper race is the Gaoli or Goli people, who have been settled from time immemorial along the Satpurah range, and once ruled the hill country round Baitul. It has been suggested that the very numerous "Gaoli" of Bengal are Koli, but such a supposition is as regards the Gaoli of the Peninsula, wholly untenable, the latter being a tall, fair race, evidently of northern origin. The Gaoli of Seoni have many sub-divisions. In the centre of the peninsula the Gaoli are generally robust fair men, and they are scattered all through the Hyderabad country. A settlement in Secunderabad are great, bulky men and women. The shepherds of India have a custom, which is purely Asiatic, of preceding their flocks of pasture; "He shall feed me in a green pasture, and lead me forth beside the waters of comfort," said the Psalmsit; and the daily custom of the shepherd tribe of Hindustan, proves that this poetical and beautiful simile, was drawn from the practices of common life. The Ahir of Northern India now rear cattle, though seemingly in former times shepherds. Near Benares, there are 16 clans. The Ahar of Moradabad and Rohilcund seem identical with the Ahir. The Garariya of Hindustan rear sheep and goats. The Rewari of the Rajputanah oases rear camels.—*Campbell, p.* 7; *Postans' Western India, Vol.* i, *p.* 196. See Jat or Jet, or Jut, Sherring Castes.

SHEPHERDIA, see Elæagnaceæ.

SHEPHERD'S DOG, see Canis.

SHEPHERD'S TINDER, Eng. Chaptalia gossypina.

SHEPPEY, see Kunkur.

SHER, Hind. Pyrus malus.

SHER, Pers. A lion: a tiger.

SHERAIT-KUCHI, also Kiriat, Tam. Cheretta.

SHERKHIST, Hind. Manna from Fraxinus floribundus.

SHER KHAN BABI, see Kattywar, India.

SHERWAN, a province of Beluchistan. See Kelat.

SHERAWANE, Hind. Flacourtia sepiaria.

SHERANI, a tribe who occupy the Takht-i-Suliman, with hard features, grey eyes, and high cheek bones. They marry late and receive a dowry with the bride. They are engaged in agriculture. See Affghan, Sheoranee.

SHERAROW, in lat. 25° 2′ N., long. 52° 18′ E., a small island on the south side of the Persian Gulf.

SHERBET, Eng. Sharbat, Arab., from sharb, he did drink, water sugared, and generally flavoured,

Sharab ul laimun, Lemon sherbet.
" " banafshah, Violet "
" " toot, Mulberry "
" " hommeyd, Sorrel "
" " zebeed, Raisin "

Sherbets are favourite, cooling, and refreshing beverages used in the east; and made with the juice of limes, pomegranate, pineapples, and other fruit, mixed with water and sugar, with the addition of rose-water, or some other fragrant ingredient. The Persian sherbets are most esteemed.—*Faulkner.*

SHERE, Hind., of Sutlej and Kanawar, Coriaria nepalensis, *Wall.*

SHERE AFKUN, the mightiest name in the annals of sportsmanship, whose pugilistic victory over an enormous tiger is a recorded fact in Mogul history. He lies buried in old Burdwan far away from the place of his birth in Turkomania.—*Tr. of Hind., Vol.* i, *p.* 157.

SHEREF-UD-DIN, see Kabul.

SHERGHOTTI, in lat. 24° 33′ 4″; long. 84° 47′ 0″, in Bahar, 58 miles N. W. of Hazaribagh. Its dâk bungalow, 439 feet, *Robt. Schlagent*; 460 feet above the sea, *Hook.*

SHERIF, Ar. Noble; in British India, a title of a mahomedan whose father was a shaikh, and mother a syudani; also the title of the ruler of Mecca. The sherif of Mecca is very erroneously regarded by some persons in Europe as a sort of mussulman pope, a comparison which is utterly destitute of foundation. He combines no spiritual with his temporal power; the cadi and the mufti give decisions in law and religion with which he cannot interfere, he bears the sword, not the crosier; in the house of God he has no distinguishing place. Hamilton, an old writer describes the sherif of Mecca of this day as having three slashes on each side of the face called masha-ly, which though then falling into disuse had been till lately the mark of all persons born within the sacred territory. In his hand he carried the mashab, the camel stick of almond wood, which is undoubtedly the original of the jackal-headed wand with which some of the Egyptian deities are represented and which is here almost regarded as the symbol of royal power. In his Cashmere waist band was stuck a poniard with a gold and jewel studded handle.—*Hamilton, Sinai, Hedjaz and Soudan, p.* 116.

SHERI MANU, Tel. Anogeissus latifolius, *Wall.*

SHERKI, Ar. The east-wind of scripture. Rich notices an exclamation: "The sherki is come!" As soon as this wind came on, the thermometer rose 10 degrees, from 80 to 90°. The so much-dreaded sherki, seems to blow from any quarter, from E. to N. E. It resembles the Italian sirocco, pronounced scirocco, and no doubt the same word as sherki, *i. e.*, easterly. The Koords call it Baya Rish, or black wind.—*Rich's Residence in Koordistan, Vol.* i, *pp.* 125, 145.

SHERKIST, Guz., Hind., Pers. Manna.

SHERKUN, a six-pointed diagram for which the brahmans have several mysterious names; but it is generally called Sherkun, which means little else than six-pointed. If it have five points, it is also replete with mythological allusions: Siva and Brahma have, or had, five heads. The diagrams have also mathematical properties of a mysterious description; and they serve, like our fox and its distinction solely from its situation in the midst of the commercial routes ; Herat, Candahar, Shal and Kalat, are its western marts ; *Bombay and Hyderabad* are its southern marts. Candahar supplies Shikarpur with the silk of Herat, Yazd, and Tun, which is sold at a profit of from five to three and four rupees per seer. It is only used by women in embroidery. The city, renowned for its wealth, is particularly celebrated for its hindoo bankers and money-dealers, whose connections are ramified throughout the countries of Central Asia and of Western India. It is especially the home of these people, where their families are fixed,and where are detained those of the gomastah, or agents, located in foreign countries. As the city is not understood to be one of great antiquity, it is possible that the influx of hindoos to it is not of very distant date, and that it was occasioned by the fluctuations of political power. That Multan preceded Shikarpur as the great money mart, and that from it the hindoos removed, converting the insignificant village of the chace into a city of the first rate consequence. Shikarpur, no doubt, attained its high rank under the Durani monarchy of Affghanistan, and much of the prosperity of its bankers was due to the vicious operation of that dynasty. As a city, Shikarpur is indifferently constructed. The bazaar is extensive, with the principal parts rudely covered, so as to exclude or moderate the heat, which is extremely powerful. As usual in Indian cities, there is the inconvenience of narrow and confined streets. Shikarpoor is sixteen coss distant from the island fort of Bakkar in the Indus, and twenty-one coss from Larkhana. About four coss from it, on the road to Bakkar, is the once considerable town of Lakki, which, populous and flourishing under the Affghans, is said to have contributed one lakh of rupees as annual revenue.

Between the domain of Shikarpur and Beluchistan stretches a barren, naked tract ; known as the " pat" of Shikarpur. It is between thirty and forty miles across. Not a tree or shrub vegetates on this expanse. Westward it extends to the superior hills, and separates the lands of the Magghazzi, subjects of Kalat, from those of the Chandi tribe, dependent on Sind. In the hill range east of the plain of Kachi, and intervening between it and the provinces of Harand and Dajil, are the abodes of the Doda Marri, who have been there located above three centuries. Their principal town Kahan, became memorable in A. D. 1840 through its occupation and abandonment by British troops, as well as by the disasters and losses it involved. The Marri had long, been distinguished as daring depredators, and have proved themselves to be a brave race. The Doda are but a division of the great Marri tribe, which is widely dispersed.

The Harand and Dajil, provinces border on the river Indus, it is impossible to concede to Kach Gandava one hundred thousand, or to the Marri hills, with Harand and Dajil, above fifty thousand inhabitants. Granting an equal number to Saharawan, including Nushki, Kalat and Jhalawan, and again an equal number to the Western Provinces, we obtain a total of four hundred and fifty thousand inhabitants for the territories of the khan of Kalat ; Numerous as are the tribes dispersed over the extensive Baluch regions, those considered Baluch may be reduced to three great classes, the Brahui, the Rind, and the Lumri. Of those not Baluch, there are the Dehwar of the capital and the fixed villages, the Jet of Katch Gandawa, the maritime tribes of the coast, the Affghan of Shall, and, to complete the review, the hindoo residents in villages and towns. The race calling themselves Baluch, extend from the eastern limits of Kach Gandawa and the valley of Sind to the frontier of Persia. In this community are comprised many tribes of very different descent, inferring from the physiological distinctions which prevail amongst them, setting aside the variety in the dialects spoken by them. Some of them have dark countenances, which savour much of an Indian pedigree, while others are so much fairer, that we can scarcely believe them to be of eastern origin. If we examine the system of that portion of the Baluch community called Brahui, we find the tribes acknowledging the superiority of one, the Mirwari, from which they select their head, or chief. This tribe is located in the provinces of Mushki, Jow, and Kolwah, which may be considered its head-quarters, and which are intermediate between the central provinces of Saharawan, Jhalawan and the western one of Kej. There is every reason to believe that the Brahui entered the central provinces from the west, as their position, demonstrates ; and they consider Khozdar as their ancient capital, or that which they occupied previous to the acquisition of Kalat. In Kach Gandava we find them only as proprietors of land acquired within a known period, and on a certain occasion. If we analyze the appellation they have assumed, we learn little from it, and of that little we may not be certain. It has been conjectured to be the equivalent of Varaha, and a race of that name figured in contentions with the Rajputs. The Brahui may be divided into three sections, with reference to the parts of the country they inhabit ;

SECTION I.

Inhabitants of the Western Provinces.

Mirwari	dwell in	Mushki, Jhow and Kolwah.
Gitchki	do.	Panghaur and Kej.
Nushirwani	do.	Kharan.
Homorari	do.	Kolwah.
Mehmasani	do.	Mushki.
Rodahi	do.	Kolwah.
Kalmatti	do.	at Kalmat and Pessani, on the coast of Mekran.
Sangur	do.	Malan and Batt, do. do.
Gujar	do.	do. do. do.
Hallada	do.	Jhow.
Zigger Minghal	do.	Nushki.
Rakshani	do.	do.
Saka	do.	Greshar in Mushki.

SECTION II.

Inhabitants of Saharawan. Fighting men.

Raisani	dwell	at Mastung, Shall, &c.	500
Sirpherra	do.	Gurghina	1,000
Shirwani	do.	Mastung	2,000
Mahmudshahi	do.	do.	1,500
Bangul Zai	do.	do.	2,000
Kurd	do.	on Dhasht-be-dowlat and Merv	500
Lari	do.	at Mastung	1,500
Langhow	do.	Mangachar	1,500
Rodani	do.	Ashi Khan and Puden.	400
Ghazzghi	do.	Ghazg	400
Shekh Husseni	do.	in hills, west of Khanak.	300
Samalari	do.	do. do. do.	500
Sunari	do.	Dasht Guran	200

SECTION III.

Inhabitants of Jhalawan.

Zehri	Dwell	in Zehri	
Minghal	do.	hills, north of Las	18,000
Bizunsu	do.	same hills, west of Minghal	18,000?
Kaidrani	do.	hills near Khozdar.	
Saholi	do.	do. do.	
Jetako	do.	hills, east of Zehri.	
Lutiani	do.	Zehri.	

Of the Mirwari it has been already observed, that it is the more illustrious of the tribes, and of the Mehmasani it may be noticed, that branches of it reside in the province of Seistan, and again in the hills of Luristan, W. by N. of Shiraz.---*Mohun Lal's Travels, pp.* 353–412 ; *Masson's Narrative, pp.* 333 *to* 358 ; *Pottinger's Travels in Beloochistan and Sinde, p.* 20 ; *Pottinger's Travels in Beloochistan and Sinde, p.* 90.

SHIKHOE, BURM. A Burmese obeisance made by raising the two hands to the forehead and bowing to the ground.— *Yule, p.* 82.

SHIKHI VAHANA, SANS., from shikhi, the name of a peacock, and vahana, a vehicle.

SHIKH, SANS., from shishyu, a disciple.

SHIKHA, see Hindu or Hindoo.

SHIKHAN. The Shikhan, Mishti and Rakeu-khel tribes occupy districts in the British territory.

SHI-KING, the sacred books of the Chinese, they were translated into Latin by Father Lacharme, a Jesuit missionary in China.

SHIKOH. A darvesh (and likewise a hindoo) named Baba Lal who dwelt at Dhinapoor in the province of Lahore, the founder of a sect called Baba Lalee. He held frequent conversations on the subject of religion with Dara Shikoh, eldest son of Shah Jahan, and brother of Aurungzebe, which have been published in a Persian work by Chundurbhau named Shah Juhanee.

SHIKORIAH, AR. Cichorium intybus, *L.*

SHIKRA, a hawk ; Shikrah, female ; Chipak, male.

SHIKROEN, HIND. Acacia amara.

SHIKSHA, SANS. To learn.

SHILANCHI, see Kelat, Kadjak.

SHILANDI, TAM. Cyperus bulbosus, *L.*

SHILI, HIND. Eremurus spectabilis.

SHILI GHA, HIND. Chrysopogon glaucoptis.

SHILLI, HIND. Fraxinus xanthoxyloides, the crab-ash.

SHILLONG, a mountain in Assam, in lat. 25° 30′, long. 91° 40′, with a height of 6,124 feet above the sea. Shillong on the Cossyah hills, is about 30 miles north of Cherra-poonjee. It overhangs the northern ridge of the range, overlooking the valley of Assam, and it is with relation to Gowhatty as Cherra is to Sylhet. The southern ridge of the range of hills is precipitous. The northern ridge descends by longer and more gradual steps. The sea formerly washed the base of the southern line of hills and the prospect from Cherra is now called a marine view. Shillong is not so grand as Cherra, neither is it so abundant in mountain streams, full of life and health, refreshing to both ears and eyes, as Cherra, which is called the "station of streams." It is however a fine open station, with a view of the snowy Himalayan range. A road is made from Shillong to Gowhatty, distance 62 miles. There are two rivers to cross, formidable enough in the rains, and causing considerable inconvenience. The Shillong mountain is between Assam and the Cossyah hills. It is six thousand feet at its apex, above the sea level, and is within but one day's journey of Gowhatty in Assam, which is accessible from Calcutta by steamer. Shillong is also approachable from the Sylhet side viâ Cherra Poonjee.

SHILPU, SANS. An art.

SHIM, TAM., MALAYALAM. A tree, which grows to an enormous size, commonly known as the buttress tree, 45 feet in circumference and 110 feet long. It has a soft, spongy sort of wood of a white colour ; not durable, nor of much use, unless it be oiled, when it may last for five or six years for canoes or catamarans, provided they are taken out of the water when not wanted. If it be kept in water, two years will render it water-logged and useless.—*Edye, Forests of Malabar and Canara.*

SHIM, Beng. Kidney bean, Phaseolus vulgaris.

SHIM-BATTRAJEE, Beng. Dolichos glutinosus.

SHIMBEAMS, in Madras, are planks 20 to 30 feet long ; 1/4 to 2 feet in breadth and from 4 to 8 inches thick.

SHIMLEE, Sans. Canavalia gladiata, *De Cand., Roxb., W. & A.*

SHIMOOL, Beng. Bombax malabaricum, or Salmalia malabarica, called the silk cotton tree.

SHIN, Hind. Dalbergia sisso.

SHINA, see Dard. The name is derived by Pococke from Sinwar, the people of the Indus. See Kesra.

SHINAR of Scripture, ancient Babylonia.

SHINAZ, Hind. See Shirna.

SHINDAR, Hind. Pyrus variolosa, also Quercus incana.

SHINDU, see India, Shendoo.

SHINDUGA, Tel. Acacia odoratissima.

SHING, Hind. Fraxinus floribunda, also Jasminum officinale ; som shing, Hind., is Pinus excelsa.

SHINGAHAR, Beng. Nyctanthes arbor-tristis.

SHINGAN, Burm. Hopea odorata.

SHINGARA or Singara, Beng. Water caltrops, Trapa bispinosa.

SHINGARF, Hind. Cinnabar, sulphide of mercury. Shingarfi rang is a vermilion or scarlet colour from finely ground cinnabar.

SHINGARI, Hind. Rosa macrophylla.

SHINGE, Tib., is the Yama of the hindoos.

SHINGRA, Duk. Quercus serrata.

SHIN-NONG. In Chinese mythological history, a king who instituted agriculture.

SHINGSHUPA, Beng. Dalbergia sissoo.

SHING TIK, Hind. Lonicera glauca.

SHINKI, see Kurdistan.

SHIN-TAO, see Ka-mi-no-mi-tsi.

SHINTIYAN, is the common sword-blade of the bedouins, in Western Arabia, it is called Major (from the Magyras ?), and is said to be of German manufacture. Good old weapons of the proper curve, marked like Andrew Feraras with a certain number of lines down their length, will fetch, even in Arabia, from 7*l.* to 8*l.* The modern and cheap ones cost about 10*s.*—*Burton's Pilgrimage to Meccah, Vol.* i, *p.* 365.

SHINWALA, Hind. Rhododendron campanulatum.

SHINWARI, an Affghan tribe, besides their portion of the hills, have the lands immediately west of them, and some of the valleys of the Safed Koh range. More westerly still, under the same hill range, they are found south of Jelallabad, and are the neighbours of the Khogani.

SHINZ-KUBI, Brahui. Alhagi maurorum.—*Tourne, W. & A.*

SHIONA, Hind. Calosanthes indica, *Blume.*

SHIOOLI, Beng., Hind. Nyctanthes arbor tristis.

SHIP.

Safika ; Markib,	Ar.
Grab ; Zoraq ; Kosal,	,,
Navire ; Vaisseau,	Fr.
Schiff,	Ger.
Nao ; Jahaz,	Hind.
Nave;Naviglio;Vascello,	It.
Navis,	Lat.
Jahaz ; Kishti ;	Pers.
Nave ; Navio ; Bazel,	Sp.
Buque,	,,
Ghemi ; Tekne,	Turk.

Notices of the various kinds of ships will be found given under the head of Boat. On the eastern side of the Peninsula of India, the ship is built with her keel parallel to the shore ; and, as it may happen, from 200 to 300 feet from low water-mark. When completed, she is placed on two strong pieces of timber, called dogs, (in the nature of a sledge of enormous dimensions) ; and on these, a sort of movable cradle is constructed, to keep the vessel upright. Two long palmyra trees, a lever of the second kind, are then applied to the ends of the dogs, and by means of these powers, they, together with the vessel that rests on them, are gradually pushed forward over a platform of logs, until they arrive at the lowest pitch of low water, or as far beyond it, as the levers can be used. Tackles are applied to the ends of the levers, to increase the power : the fulcrums, are wreaths of rope, fastened to the logs on which the vessel slides : and are removed forwards as she advances. Two cables from the land side, are fastened to the vessel, to prevent her from sliding too rapidly, and these are gradually let out, as she advances. It is commonly the work of two days to transport the vessel to the margin of low water. If the tide does not rise high enough to float her from thence, (which it seldom does, if the vessel be of any considerable burden), part of the cradle is taken away, and the ship left chiefly to the support of the cradles till high water, when they are suddenly let go, and the vessel falls on her side ; and with the fall, disengages herself from the remains of the cradle, and at the same time plunges into deeper water. A ship of 500 tons has been launched in this manner.—*Rennell's Memoir, p.* 245. See Boats, Chittagong or Islamabad.

SHIPKE, see Kunawer.

SHIPU, Tam. Combs.

SHIR, Hind. Machilus odoratissimus.

SHIRA, Sans. A fibre.

SHIRA, Hind. Treacle used in distilling spirit.

SHIRAMI, see Kaysar.

SHIRASH of Beas. Hornbeam.

SHIRHAWTI RIVER, falls into the Gulf of Arabia ; at its embouchure, it is about one-fourth of a mile in width, and in the rainy season some thirty feet in depth. This immense body of water rushes down a rocky slope for 300 feet, at an angle of 45°, at the bottom of which it makes a perpendicular plunge of 850 feet into a black and dismal abyss, with noise like the loudest thunder. The whole descent is therefore 1,150 feet, or several times that of Niagara ; but the volume of water in the latter is somewhat larger than in the former.

SHIRAZ, a neat bustling town. Its bazaar is of great extent, with a lofty arched roof. It stands in a beautifully irrigated Vega. The tomb of Sadi stands by itself in a recess, but that of Hafiz requires to be pointed out from a multitude of others around it. The wine of Shiraz, is a fine powerful dry wine, not so dark as brown sherry. Near the Jahan Numa in Shiraz is a building called Chahal Tan, "the forty bodies or persons." Another, the Haft Tan or "seven persons," (from the number of holy men there buried.) At Shiraz, Hassa and other towns, African slaves are distinguished by flowery names or epithets, expressing beauty and fragrance, in proportion to their natural ugliness or offensive smell, as yasmin the "jessamine," sumbul "the hyacinth," jauhar, "the jewel," and makbul "the pleasing" "or agreeable."—*Vigne* ; *Ouseley's Travels, Vol.* ii, *pp.* 2, 158 See Jews, Kanat, Kemancheh, Sheraz.

SHIRESH, Beng., Hind. Acacia speciosa.

SHIRE, an author of Notes on Indian affairs, severely and searchingly analysing British rule in India.

SHIRI GUMUDU, Tel. Gmelina parviflora.

SHIR-I-DARAKHT-I-ZAKAM, Hind., Pers. Gum of Euphorbia.

SHIRIN, Hind., of Kanawar. Acacia julibrissin, also A speciosa ; kut shirin, is Costus, *sp.*

SHIRIN, Hind. Sweet. Pers., fresh, as of water, not brackish.

SHIR-I-REWAND, Gamboge.

SHIRISH, Beng. Acacia sirissa.

SHIRIVENCHA, or Siruncha, lat. 18° 51′ N. long. 79° 59′ E. in Berar, on the left bank of the Pranhita, 389 feet above the sea. —*Schl. Ad.*

SHIRJA, Hind. Coloured cloth.

SHIR KHIST, Hind. Manna from Fraxinus, *sp.* Khorassan manna, from Khorassan is supposed to be the produce from an olive.

SHIRNA, Hind. The inflated large buffalo or bullock skin used for crossing streams in the Himalaya hills. In Kashmir those large skins are not used but small ones tied two together.

SHIROKA, Hind. Hordeum hexastichum.

SHIROMANI, Sans., from shiras the head, and mani, a jewel.

SHIR-THOHAR, Hind. Euphorbia tirucalli.

SHIRVAN, see Persia.

SHIRWA, Hind. Brassica rapa.

SHIRWA, a lake on the east of Central Africa, reached by Dr. Livingstone.

SHIRWAN, see Iran, Kela‘, Kufra.

SHIRIWAL, Hind. A kind of rice, in Kashmir.

SHIRZY RAO, Ghatgay, a Mahratta leader and minister of great notoriety. He was the father of Baiza Bai, who married Dowlat Rao Sindhiah.

SHISHAI, or Shisham, Hind. Dalbergia sissoo.

SHISHA-LUN, or Nimak, Hind. Crystal salt.

SHISHAM, or Tali, Dalbergia sissoo, the sissu tree, it attains full size and becomes useful in 50 years. Trunk of the tree to the first branch 10 feet in length (some say 20 feet), and circumference 4, 5 or 6 feet ; wood in old tree dark-bay, veined, hard and of great durability ; well adapted for all articles of furniture and also as timber for building purposes.—*Balfour's Timber Trees of India, para.* 151 *of Mr. Barnes' Settlement Report* ; *p.* 33 *of Roorkee Proceedings* ; *Papers on Gwalior Timber* ; *Powell's Handbook, Vol.* i, *p.* 542 ; *Lt. Col. Lake.*

SHISHOO, Beng. Sissoo tree, Dalbergia sissoo.

SITTAMOOTTI, Tam. Pavonia zeylanica.

SITTAMUNAK, Tam. Ricinus communis, the Castor oil plant.

SHITTAM TREE, mentioned by Isaiah, and also in Exodus, is supposed to have been an Acacia. Hippocrates speaks of the Egyptian Acacia and of the white Acacia, distinguished, he says, by its white bark, white wood, and white flowers ; and from this tree his "white fragrant ointment" was probably made. See Gums and Resins.

SHITRAJ, Hind. Fumaria parviflora, also Plumbago europea and Pl. rosea.

SITTRAPALADI, Hind. Euphorbia thymifolia.

SHIVA, one of the chief gods of the hindoos. See Siva.

SHIVA-NIMBA, Sans. Aspalathus indica.

SHIVA RATRI, a hindoo festival occurring in the latter end of February or beginning of March. See Siva-ratri.

SHIVE-OO-DOUNG, a great mass of mountains which runs parallel to the Irrawaddi as far as Amarapura, one peak is estimated to be 6,000 feet in height.

SHIVINAR VEMBU, TAM. Aspalathus indica, or Indigofera aspalathoides, *Vahl.*

SHIVOPAKHYANA, SANS., from Shiva, oopa, prep., and akhyana, to speak.

SHIU-DAGON, a buddhist temple at Rangoon, built on the summit of a laterite hill. This has for two thousand years "shot upwards, like a pyramid of fire" athwart the flats of the delta of Pegu. The height above the ground level is 487 feet, and above the platform 321 feet. See Shooay Dagon.

SHKA, HIND. Cornus macrophylla.

SKHO, HIND. Ulmus campestris.

SHLOŃGA-KUSPI, MAHR. Clitoria ternatea, *Linn.*, *Roxb.*, *W. & A.*

SHLUI, HIND. Hedychium spicatum.

SHAMASHANA-KATEE, SANS. From shmashana, a cemetery.

SHNE, HIND. Turpentine of Pistacia integerrima, Terebinthus.

SHOA. In 1840, Sahela Selassie, king of Shoa in southern Abyssinia, expressed a desire to cultivate the friendship of the British Government and wrote to the Government of Bombay asking to be furnished with guns and warlike stores. Shoa was then one of the most powerful and important provinces in Abyssinia. It is inhabited by the Galla tribe. At the time when Sahela Selassie made these advances, the steam navigation of the Red Sea had given an exaggerated importance to the tribes of Abyssinia. It was therefore determined to send a mission to the court of Shoa, with which country the French also appeared anxious to establish friendly connections. A commercial treaty, was concluded with the king on 15th November 1841.—*Treaties, Engagements and Sunnuds, Vol.* vii, *p.* 310.

The sandal was doubtless the foot-clothing of all ancient times, and the flinging of one on a territory was a symbol of taking possession. The Psalmist says upon the land of Edom do I cast my shoe. In Ireland after the chief took the white rod, the sub-chieftain placed sandals on his chief's feet, retained one as an honorable perquisite and threw the other over his chief's head as an augury of good luck. The sandal is still used by the hindoo and mahomedan nations in the south of Asia, shoes as articles of covering for the feet, are generally made of leather, but cloth of kinds is also used. The shoes, or rather slippers worn by the natives of Southern India, are generally of red leather if for men : they are made for the Madras market at Trichinopoly or Arcot, the patterns are called Appa-shahee ; Chanddooroo ; Chuppul ; and Nok-dar. The rich natives use a buff coloured cloth. The slippers of females are ornamented with spangles. Their price is from 4 annas to a rupee. Thunberg says that, in his time, the shoes of Japan were always the shabbiest part of the dress of the Japanese and being of straw, they lasted but a little time. But they were made in immense numbers, cost but a trifle, and could be bought in every town a village in the empire. The pedestrian, therefore, throws away the old pair by the road side, and buys new ones as he goes along ; while the more provident man takes two or three pairs with him on starting. Immense numbers of discarded shoes were to be found on the sides of all the roads. In wet weather they wear under the shoe a wooden clog, which is attached to the foot by ties of plaited straw. Dignitaries sometimes wear slippers made of fine rattan slips neatly plaited. In Exod. iii, v. 5, the Lord commanded Moses saying, 'Put off thy shoes from off thy feet for the place whereon thou standest is holy ground.' The natives of British India never go into their own houses, nor into the houses of others, with their shoes on, but always leave them at the door. It is a great affront not to attend to this mark of respect in visiting, and to enter a temple or mosque without pulling off the shoes, would be an unpardonable offence. A shoe bearer is a very humble office, and in Matthew iii, 11, John says of Christ, He that cometh after me is mightier than I, whose shoes I am not worthy to bear. Luke xv, 22, says 'And put shoes on his feet.' In Bengal, shoes of a superior quality make one of the distinguishing parts of a person's dress. Some of these shoes cost as much as a hundred rupees a pair. Shoes are put off the feet before entering a room, (Ex. iii, 5 ; Josh. v, 15.)—*Faulkner* ; *Herklots* ; *American Expedition to Japan, p.* 65 ; *Thunberg.*

SHOE-FLOWER, Hibiscus rosa-sinensis. See Dyes.

SHOGHA, HIND. A kind of rice at Peshawur.

SHOGUL, HIND., of Chamba. Pyrus variolosa, wild pear.

SHOI-KIRE, TAM. Fœniculum vulgare.

SHOILA, SANS., from shila, a stone.

SHOIVACHARI, SANS., from Shiva and acharin, practice.

SHOJINA, BENG. Hyperanthera moringa.

SHOKRAN — ? Conium maculatum.

SHOLA, or Sola, Hind. Æschynomene aspera. Its root is made into toys, artificial flowers, birds, garlands, floats for nets, or in bundles for crossing rivers. When charred it answers for tinder. Phool-sola or Bhend, is the Æschynomene aspera ; Æ. roxburghii is the Bhat-sola ; Æ. paludosa is the Kat-sola.

SHOLA, in the S. of peninsular India, a small forest in a valley or on the slope of the hills. In Wynaad, a ravine filled with tree thickets. The forest rules approved by government as applicable to Utakamund, are :— the whole of the sholas, or woods, in the reserved woods at the neighbourhood of the station are absolutely reserved, not only for their beauty but also from fear of injuring the water-springs ; their limits to be marked ; no private cutters to be allowed inside ; old trees to be felled by servants of the department and brought outside, and to be sold there by public auction. Trees to be planted where required, in vacant places.—*Report of Madras Conservator of Forests*, 1859-60, *p.* 11.

SHOLAPUR, a town and fortress in the Dekhan in the Bombay presidency.

SHOLAR, Hind. Scopolia præalta.

SHOLASAGAMANY, Fine rubies have, from time to time, been discovered in many of the corundum localities, particularly in the gneiss at Viralimodos and Sholasigamany, also in the Trichingode talook and at Mallapollaye, but are comparatively speaking rare.

SHOLI, Sans. Curcuma zedoaria, *Roxb.*

SHOLRI, Hind. Salvia lanata.

SHOMA. Hind. Solenanthus, *sp.*

SHOM-LUTA, Beng. Sarcostemma brevistigma, Sarcostemma acidum, *Wight.*

SHOM SINGH, Hind., of Lahaul. Pinus excelsa, lofty pine.

SHON, Beng. Indian trumpet flower, Bignonia indica.

SHONA, Beng. Bauhinia purpurea.

SHONA, or Shyona, Beng., Hind. Calosanthes indica.

SHONAMOOKHEE, Beng. Senna tree, Cassia senna.

SHONDEK PULLA, Duk. Solanum pubescens.

SHONER, see Susa.

SHONFOL, Hind. Berchemia, *sp.*

SHONTI, Tel. Ginger.

SHONULOO, Beng. Purging Cassia, Cathartocarpus fistula.

SHOOCHEE Sans., the pure, from shooch, to purify.

SHOOCHI-MOOKHEE, Beng. Sanseviera zeylanica.

SHOODDHEE, Sans. Pure.

SHOOKCHINA, Beng. Smilax china.

SHOOKLIKA, Sans. Oxalis corniculata, Rumex vesicarius.

SHOOKLA-VARNA, Sans., from shookla, white, and varna, colour.

SHOOI DAGON, a celebrated budd'hist temple on a hill at Rangoon. The golden Htee, presented in 1871-72 to this pagoda by the king of Burmah, was made of solid gold ornamented with rubies and cost lakhs of rupees. A high Burmese official, one hundred soldiers and numerous phoongyees, accompanied the Htee as an escort. There is an old Burmese prophecy to the effect that if ever the king of Burmah crowns the Shoay Dagon Pagoda he will recover possession of Pegu within a year from that date.—*Englishman.* See Shiu-Dagon.

SHOOKR, Ar., Pers. Thanks.

SHOOKRIA, Shookr-guzari, or Shookrana, thanksgiving.

SHOOKR-I-YELDOZ, a planet.

SHOOKUR-THOO-TEE, Beng. Rourea sookurthoontee.

SHOOLI, Beng. Nyctanthus arbor-tristis.

SHOOLIKA, Sans. Curcuma zedoaria, *Roxb.*

SHOOLPHA, Beng. Anethum sowa.

SHOOLINEI, Sans., from shala, a weapon, a lance.

SHOONDOAH, is a tiny ship which hindoos launch on the Ganges. They have garlands of flowers and are illuminated with lamps. It is a ceremony performed by hindoo mothers to propitiate the goddess, in behalf of their sons. The goddess resembles Amphitrite. It is supposed to be a propitiatory rite handed down from times when the hindoos were engaged in maritime avocations. It is held on the day on which, according to hindoo astronomy, the sun turns back from Capricornus to resume his northern ascension, and when the steady N. W. wind blows favourably for outward bound voyages. Feastings are held on that day and farewell entertainments are given to the voyagers.

SHOONEZ, Arab. Nigella seed, fennel flower.

SHOONYA-VADI, Sans., from shoonya, vacuum, and vadi, a speaker.

SHOOR, or Shookpa, see Juniperus excelsa.

SHOORIA MUKTI, Beng. Helianthus annuus, *Linn.*, *Roxb.*

SHOOSHUNA —? Elæagnus dulcis.

SHOOTAREE, a subjunction to names of the darvesh or faquir : Shootareea, an order of devotees.

SHOOTEE-GHAS, Beng. Pennisetum holcoides.

SHOOTHI, Beng. Zedoary. Curcuma zerumbet.

SHOOTHUGNEE, or Shothugnee, Beng., Hind. Boerhavia diffusa or B. procumbens.

SHOOTA, or Shruta, Sans. What has been heard, from shroo, to hear.

SHOR, Hind., Pji. Barren land, which, after rain, shows 'reh' on the surface.

SHORA, or Kalr, Hind. A sort of soil used to remedy kalr or reh.

SHORA, Hind. Saltpetre. Shora Kalmi, refined saltpetre, crystallized in long prisms (kalm.)

SHORABAK, lies due east of Seistan, on the banks of the Lora, and is occupied by the Baraich Affghans, great camel breeders, and acknowledging the supremacy of the amir of Kabul. See Affghan.

SHORA KAI, Tam. Lagenaria vulgaris, *Ser.*

SHORAPEZ —? fish-bone, used for sword handles.

SHORE, Sir John, afterwards Lord Teignmouth, arrived in Calcutta on the 14th Sept. 1786, along with Lord Cornwallis. He succeeded Lord Cornwallis as Governor-General in October 1793.

SHOREA, *Roxb.* A genus of plants belonging to the order Dipterocarpaceæ, but now transferred to the genus Vatica : the following are the species of vatica and their synonyms : —

Vatica camphorifera, *Wight*, syn. of Shorea camphorifera, *Roxb.* and of Dryobalanops camphora, *Gært.*
„ laccifera, *W. & A.*, of the Palghaut mountains.
„ lanceæfolia, *Roxb.*, Assam, Khassya.
„ obtusa, *Wall.*, syn. of Shorea obtusa, *Wall.*
„ robusta, *W. & A.* syn. of Shorea robusta, *Roxb.*
„ tumbuggaia, *W. & A.*, syn. of Shorea tumbuggaia, *Roxb.*

The genus was named in compliment to Sir J. Shore, afterwards Lord Teignmouth, then Governor-General of India. Under the term lard or hogslard shorea, Dr. Mason describes a species as growing on the mountains in the interior of Tenasserim, which produces an oil of the consistence of lard. Wood not known, but being of the same genus as the Sal tree, he deemed it worth inquiring regarding. A species of shorea, the Nyaunglan of the Burmese, grows in Amherst. It is of a peculiar kind, employed for beams, rafters, and boat building. The root is used as umbrella stocks. Forests of S. robusta extend over a narrow belt from Kumaon to Assam. The dammar of Bengal is the resin of Shorea robusta.—*Ben. Phar.* 204 ; *Cat. Ex.* 1851 ; *Dr. Mason.*

SHOREA CAMPHORIFERA, *Roxb.*

Dryobalanops camphora, *Coleb.*

affords both the camphor and camphor-oil of Borneo and Sumatra. On the western coast of the latter island, this tree grows spontaneously in the forests, and is to be found in abundance from the back of Ayers Bongry as far as north of Bacongan, a distance of twenty-five miles. It is one of the largest trees that grows on that coast, several being six or seven feet in diameter, though others are only two and a half.—*Roxb.'s Flor. Ind., Vol.* ii., 616 *Royle's Ill. Him. Bot., p.* 166.

SHOREA OBLONGIFOLIA, *Thw.* A large tree of Ceylon, growing at Saffragam and other districts in the south of the island, at no great elevation.—*Thw. En. Pl. Zeyl., p.* 35.

SHOREA STIPULARIS. *Thw.* A great tree of Ceylon, between Ratnapoora and Galle, at no great elevation, character of wood not known.—*Thw. Enum. Pl. Zeyl. Vol.* i,. *p.* 36.

SHOREA TALURA, *Roxb.* Syn. of Vatica laccifera, *W. & A.*

SHOREA TUMBUGAIA, *Roxb.* Syn. of Vatica tumbugaia, *W. & A.* See Dammer.

SHOREB, Heb. Hordeum distichon, *Linn.* Hordeum hexastichon, *Linn.*, *Roxb.*

SHORINGENAM, Maleal. Tragia involucrata, *Linn.*

SHORE KA TEZAB, Hind. Nitric acid.

SHORKOT, a province of the Panjab, capital of the province, perhaps Alexandria soriane.

SHORLI, Hind. Salvia lanata.

SHORTT, John, m. d., a Madras medical officer, author of a Report on the Medical Topography of the South-west Political District, published by government in 1855. Translated Maclean's Treatise on Small Pox into English—modified and adapted it for the use of the natives of Southern India into Oordoo, Tamil and Telugu, published by government 1856-57. For an Essay on Indigo—received a prize of 800 rupees from the Madras government, 1860. Translated Essays on Indigo into Hindustani and Tamil, 1862. For an Essay on the Culture of Cotton—received the prize of 1,000 rupees, and the gold medal of the Manchester Cotton Supply Association from the Agri-Horticultural Society of India. Author of Hand-book to Coffee-planting in Southern India, 1864. A Treatise on Vaccination in English, subsequently translated into Hindustani, Tamil, Telugu, Canarese and Ooryah, respectively, 1865-66. An account of the tribes of the Neilgherries, Edited a geographical and statistical memoir of the Neilgherry mountains, by Col. Ochterlony. Author of numerous Contributions to Societies, Linnæan, Obstetrical, Zoological, Ethnological, Anthropological, Royal Society of Arts and Odontological—contributed various Reports and Papers to Government, Revenue Board, and Agri-Horticultural Society, Madras, on Agriculture, General Produce, Stock, Cattle Disease, Aboriginal Tribes, &c., &c., for which received repeated acknowledgment and thanks from Government, Revenue Board, and Agri-Horticultural Society, contributed to Madras Quarterly Journal of Medical Science, Indian Annals of Medical Science, Indian Medical Gazette, Lancet, and on other subjects to the local journals. Received a second gold medal from the Manchester Cotton Supply Association for the successful growth of Exotic Cotton. At Local Exhibition, Chingleput in 1859, received 300 rupees in prizes for drugs, gums, stock, &c. Madras Exhibition, 1862, medals and honorable mention ; London Exhibition, 1862, two medals and two honorable mentions ; Calcutta Agricultural Exhibition, prize 50 rupees, Honorable Mention, and Exhibitor's medal.

SHOTHUGHNEE, Beng. Boerhavia diffusa.

SHOTUL, Hind. Trifolium repens, *T. sp.*

SHOTI, Hind. Iris nepalensis.

SHOU or Tibetan stag, Cervis affinis, is from eight and a half to nine feet in length, and from four and a half to five feet high at the shoulder. The head is twenty-two inches long, nine deep and seven and three-quarters wide. The ears are eleven inches long. The tail, less the hair, is three to four inches. The foreleg, from mid flexure downwards, is eighteen inches ; and the hind leg, nineteen inches and more. The fore hoof is four and a half inches long, three and three-eighths wide, and three high. The hind hoof, four and one quarter inches long, three in width, and the same in height or depth. The horns are five feet long, three to four in. spread between the tips, and ten to eleven inches thick at base. The general form of the animal is full of grace and vigour ; assimilated to that of the European stag, but with greater strength of limbs and broader hoofs. The head is finely shaped with broad flat forehead a little depressed before the horns, a slightly arched chaffron and graceful termination forwards, not actually thickened, though less attenuated, than in Hippelaphus, Elaphoides and Axis, or the tropical deer ; and the muffle or nude extremity of the nose is decidedly smaller than in them, perhaps even more so than in the stag of Europe. The sub-orbital sinus is likewise conspicuously smaller, in skin and in skull, than in the tropical deer just cited, or in the muntjacs, though not inferior in size to the same organ in our red deer. In the feet there are no interdigital pores, before or behind ; nor are there apparently any calcic tufts or glands ; though in one sample a nudity appears on the os calcis which has somewhat the semblance of this latter organ. The graceful and majestic horns are inserted on the summit of the frontals but much before the occipital crest, upon a moderate foot-stalk which reclines considerably and is surmounted by a moderate-sized burr. The horns have an ample sweep and curve, both spreading and reclining much, and then approximating more or less, and for the most part greatly so, towards their tips, thus forming large segments of circles. Mr. Hodgson had no doubt that the Shou is the same species as that described by him under the name of C. affinis got in the Tarai. The Shou inhabits a wide extent of country in Tibet, but is rarely if ever found in Chumbi, and not at all in the juxta-nivean districts of Bhutan ; it cannot therefore be classed as Himalayan as well as Tibetan. Captain Cunningham assured him that the stag of Cashmir is the same animal ; but Mr. Gray and Dr. Falconer judged otherwise ; and, as it now appears that the Shou is not found in any cis-Himalayan district, nor even in Chumbi, with its half-Himalayan and half-Thibetan climate, he thinks this identity very questionable, as also that with the Moral or stag of Persia. Blyth was inclined to the conjecture that the stags of Mongolia, of Mantchuria, and of southern Siberia, are all identical in species with the Shou ; and that the Stag of Tibet is specifically the same with the Wapiti of North America, especially that of Canada or the Canadian variety, called often the North-western stag. See Cervus, Mammalia.

SHOUK, Burm Sour-lime, Citrus bergamia, *Risso & Poit, Roxb., W. & A.*

SHOUK-CHO, Burm. Limes.

SHOUQ-UL-BYZA, Arab. Hedysarum alhaji, *Linn.*

SHOVELLER, Anas clypeata.

SHRAB, Hind., Pers. Spirits, wine. See Sharbat.

SHRADDHA, Sans., from shraddha, firm faith.

SHRADDHA, a hindoo ceremonial, for the repose of the dead. The oblation consists of rice, flowers, water, to the manes of the deceased. There are three shraddha for the dead: one, eleven days after death; another, every month; and another at the close of the year after a person's decease. During the ten days of mourning, the relations hold a family council, and consult on the means of performing the shraddha; on the last of these days, after making an offering for the dead by the side of the river, they are shaved. This offering consists of boiled rice, sugar, curds, sweetmeats, milk, plantains, &c., made into ten balls, and presented with prayers. Munoo says, "What sort of oblation given duly to the manes, is capable of satisfying them for a long time, or for eternity, I will now declare, without omission. Brahmans are unclean for ten days after the death of a relation, Kshatriyas, twelve; Vaishyas, fifteen; and Sudras, thirty. The next day, after bathing, the family prepare an open place for the ceremonies. If it be the shraddha of a rich man, all the learned hindoos and respectable people of the neighbouring villages are invited. The company being seated under an awning, the sons and other relations of the deceased, dressed in new garments, place themselves in the midst of the company with their faces eastward, having near them sixteen different gifts, as brass cups, candlesticks, umbrellas, shoes, &c. Next are brought seeds of sesamum, a small piece of gold, and another of a different metal, wrapt up in new cloths. The son of the deceased now puts a piece of new cloth across his neck, and offers an atonement for the sin of having killed insects in sweeping the room, in cooking, grinding spices, and in moving the water jar; then follows an offering to the sun; then, rising, and bringing his hands forward in a supplicating posture, he solicits leave from the company to make the offering; after which he offers the sesamum, gold, and metal, for the happiness of the deceased; takes the kosha, and sprinkles the sixteen gifts with water; then, placing a flower on each, and repeating prayers, he offers them in the presence of the shalgramu, or salagramu, one by one, in the name of the deceased, that he may obtain heaven. The son after this, if in circumstances sufficiently affluent, presents large gifts to the brahmans, as elephants, horses, palanqueens, boats, &c, the receiving of which, however, is not honourable A brahman then marks the foreheads of all present with sandal powder, and puts round the neck of each a garland of flowers. To the ugrudanee brahmans, and others are now given amidst much confusion among the receivers, the sesamum, the morsel of gold, the metal, a large basin full of cowrees, and a conch or two, as well as the sixteen different gifts; after which the assembly breaks up. The son then goes into the house, and placing a brahman and his wife on a seat, covers them with ornaments, worships them, and, adding a large present of money, dismisses them. After this, the son of the deceased requests five brahmans, of some note for learning, to offer a male calf; in doing which they take two cloths each, four poita, four beetle-nuts, and some cowrees, provided for the purpose, and go with the company to a spot where an altar has been prepared, one cubit high, and four cubits square. Four of the brahmans sit on the four sides of the altar, and then worship certain gods, and offer a burnt-sacrifice. Near the altar are placed the shalgramu, four female calves, a male calf, and a vilvu post. The fifth brahman reads certain parts of a poorana, to drive away evil spirits. The female calves are tied to four vilvu posts, and the male calf to a vrishu post. To the necks of the female calves four small slender baskets are suspended, in which are placed, among other things, a comb, and the iron instrument with which the hindoo women paint their eyebrows black. A sheet of metal is placed under the belly of the male calf; on the back a sheet of copper: the hoofs are covered with silver, and the horns with gold, if the shraddhu be performed by a rich man. On the hips of the male calf marks of Siva's trident are impressed with a hot iron. After this, the son of the deceased washes the tail of the male calf, and with the same water presents a drink-offering to his deceased ancestors; and afterwards marries the male calf to the four female calves, repeating many formulas, in which they are recommended to cultivate love and mutual sympathy. The son next liberates the female calves, forbidding any one to detain them, or partake of their milk in future. In liberating the male calf he says, 'I have given thee these four wives to live with them. Thou art the living image of Yama; thou goest upon four legs. Devour not the corn of others, go not near a cow in calf, &c. The female calves are generally taken by brahmans; the male calf is let loose, to go where he pleases. To this succeeds what is peculiarly termed the shraddha. The river side, or the cow-house, or some retired place, is chosen ; after cleansing which, they collect all kinds of eatables, cloth, sesamum, flowers, &c., and place them into dishes made of the excavated trunks of the plantain tree. The son then washes his feet, and sits with his face towards the east, with a shalgramu before him, and repeats many incantations to purify himself; he then worships the shalgramu ; presents to his deceased parent the seven dishes placed to the east, repeating various incantations ; and worships Ganga, Vishnu, and the household-gods, adding an offering to the ancestors of the king, as an acknowledgment for using the king's land at worship.

SHRAVAN or Purnima, a hindoo feast which occurs about the middle of August, on the 15th of Shravan Shukla. It is attended, on the western coast of India, about Bombay, with much ceremonial. The S. W. monsoon is supposed to be ended. Cocoanuts and flowers are thrown into the sea to obtain favour for those who are to trust themselves on the ocean.

SHREE, Sans. A title which signifies excellence or greatness, hence.

SHREE PHULA, Sans. Ægle marmelos, *Corr.*

Shree-Shoila, from shree, excellent, and shoila, a mountain.

Shree-Vidya, from shree, and vidya, knowledge.

Shree-Kunt'hu, from shree, and kunta, the throat.

Shree-Rama-Poora, Sans. From shree, and Ramu, the name of a god, and poora, town.

SHREEN, see Khosroo Parvez.

SHREE-TALUM, Corypha umbraculifera.

SHREW, Eng. Sorex. Natives of India believe that snakes avoid the neighbourhood of the shrew.

SHRIKE. The grey wood-shrike is Tephrodornis pondiceriana. The bay-backed shrike Lanius hardwickii. They belong to the family Laniadæ and are divided into the Lanianæ or True Shrikes: the Malacontinæ or Bush Shrikes ; the Dicrurinæ or Drongo-Shrikes ; the Artaminæ or Swallow-Shrikes ; the Campleophaginæ or Cuckoo Shrikes, the Thamnophilinæ and the Tyranninæ. The Sand Shrikes, Lanius arenarius, are plentiful in cactus bushes in the open country and in the dense foliage of the gardens. See Birds.

SHRIMPS. Crangonidæ, a family of Crustaceæ belonging to the division Decapoda macroura. The type of the family is the common shrimp, Crangon vulgaris, and no other genera are included in it. The common shrimp, has the carapace and abdomen almost entirely smooth, with the exception of one small median spine on the stomachal region. Some species of Alpheus, a genus of snapping shrimps, occur in China and Singapore. See Crangonidæ. Shield shrimp, a species of the genus Apus, one of the Apodidæ.—*Adams.*

SHRINE, see Dargah, Math.

SHROL, Hind., of Hazara, Ulmus nepalensis, Himalayan alder.

SHROLO, Hind. Sedum rhodiola.

SHROTA, Sans., from shroo, to hear.

SHROTRIYA, Sans., from shroota, the veda, a learned brahman. A Kulin brahman can marry as many wives as he likes ; but there are certain brahmans in Bengal, who find the greatest difficulty in getting married to even one wife, and who generally spend their life in single wretchedness. These are Bangshaja brahmans of the Shrotriya class. While a Kulin brahman gets for every wife that he marries a handsome bribe, a Bangshaja Shrotriya brahman has to pay down a large sum of money to the father of the girl, whose hand he seeks to obtain. The consequence is that, owing to their poverty, numbers of Bangshaja Shrotriya brahmans never get married at all. To remedy this evil, in Eastern Bengal, when in any village the number of unmarried Shrotriya becomes inconveniently large, one of the ghatak of the place—those under-servants of Bidhata who take a prominent part in all marriages—goes to Shrihatta in Sylhet. There, with the assistance of his agents in the district, and by means whether fair or foul, he procures a number of girls, to whom he holds out the prospect of a pleasant settlement in life. The girls may not all be brahman girls—some of them may be of the Chandal caste, and others may be young widows ;—but whatever may be their caste, character and antecedents they are huddled together in a boat, often 15 or 16 in number, and taken to the ghaut of the Shrotriya village. The faces of the old Shrotriya bachelors become lighted up with joy, when they hear of the arrival of the hymeneal boat. The sensation which these highly-favoured boats create in Easten Bengal, is infinitely greater than that produced in Calcutta by the orange-boats of Sylhet, or the mango boats of Malda. The Bangshaja bachelors besiege the boat in numbers. Each one selects a girl according to his taste ; a bargain is struck with the ghattak ; and the celebration of the rites of marriage, according to the forms prescribed in the Shastras, soon follows. The plain-looking girl, for whom no Shrotriya may have a fancy, is employed as a maid-servant either of the ghattak himself, or of any other who may stand in need of her service. See Brahman.

SHROATA, Sans., from shrootee, the veda.

SHRUDDHA, Sans., from shrut faith, and dha, to hold. See Shraddha.

SHRUK, Hind. Triticum æstivum, also Hordeum hexastichum.

SHRUL, Hind. Iris, *sp.*

SHRUTI, see Veda.

SHTA, or Shka, Hind., of Kanawar, Cornus macrophylla, dog wood.

SHTAWARI, Maleal or Malay. Asparagus sarmentosus, also applied to the Asparagus adsendens, *Roxb.*

SHU, the Tibetan stag. See Shou.

SHUAL, Heb. Fox.

SHUB, properly Shab, Ar., Pers. Night.

SHUB BEDARI, watching all night and repeating murseea, &c.

SHUB-GASHT, Pers. Nocturnal perambulation, a ceremony practised by the mahomedans in India, on occasions of marriages; circumcision, &c.—*Herk.*

SHUB-I-BURAT, Pers. This mahomedan feast is held on the 14th, and its arfa on the 13th of the eighth month Shaban.

SHUBIT, Arab. Anethum sowa.

SHUB-NAM, or Shab-nam, Pers. Dew, also a name of a cotton fabric. See Cotton manufactures.

SHUB-PARA, or Shab-para, Hind. See Cheiroptera.

SHUDDAY, or Ullum.

SHUDGAR SHID, a tribe of jugglers in Deccan, *Stevenson in Lond. As. Trans.*, 1834, *Vol.* i, *p.* 283.

SHUDIMUDI, Beng. Cacalia sonchifolia.

SHUDNAJ-UDSI, Arab. Nummulite.

SHUENG-GAH, Burm. Asafœtida.

SHUER UL JIN, Arab. Adiantum lunulatum, Burm, *spr.*, maiden hair, literally fairy's hair.

SHUGDUF, a litter. The shugduf of the Hejaz differs greatly from that used in Syria and other creatures. It is composed of two-corded cots, 5 feet long, slung horizontally, and parallel with the camel's sides, about half-way down—*Burton's Pilgrimage to Meccah, Vol.* i, *p.* 343.

SHUGHAR. At all the elevated passes, in the north-west Himalaya, there are a number of square piles of stones, called Shughar, upon which passengers usually place a piece of quartz, or attach rags to poles, which are fixed in the middle, there are also several Shughar on the neighbouring heights, sacred to the deota, or spirits of the mountains, who are supposed to inhabit the loftiest and most inaccessible points, especially where there is much snow. The Shughar at the passes are erected by travellers, but those on the higher peaks are commonly made at the expense of some wealthy pilgrim not much accustomed to the mountains, who has succeeded in crossing a pass which is reckoned an arduous undertaking by an inhabitant of the plains. In Kunawar, the greatest height at which rice that requires water has been observed, is 6,600 feet. Other kinds, which are not watered, grow at 8,000 and 9,000 feet, but what is produced in Kashmir, which forms the chief subsistence of the inhabitants requires the fields to be laid under water, as in Bengal. In the higher parts cows are rare, and their places is supplied by the Yak of Tartary, described by Capt. Turner; the male is called Yak, Yag, or Yokh, and the female Breemo; the produce between them and the cow is common, the male being named Zo or Zofo, and the female Zomo. The Yaks are strong and hardy, and they like cold places.

SHUGHNAN, a hill state north of Badakhshan, its chief claims a Grecian origin. See Kabul, Kush or Cush.

SHUGUL, or Shaghal, Ar. Occupation, employment, a technical term in the science of exorcism.

SHUHAB—? Safflower.

SHUHADAT KA ROZ, lit., the day of martyrdom, a ceremony of the mahomedans.

SHUHEED, a martyr, of whom with mahomedans, there are twenty grades.

SHUHARBANO, the wife of Hosein.

SHUHAR-GUSHT, city perambulation.

SHUJA-UD DOWLAH. In 1764, Shuja-ud-Dowlah, the vizier of Oudh, under the pretence of assisting Meer Kasim Ally, invaded Behar, but his army was completely routed, and the vizier was obliged to throw himself on the generosity of the British.

Nujm-ud-Dowlah died on the 8th May 1766, and was succeeded by his brother Syf-ud-Dowlah, a youth of sixteen.

Syf-ud-Dowlah was succeeded in 1770 by his brother Mubarak-ud-Dowlah, with whom a new engagement was made. By this engagement the Nabob's stipend was fixed at 31,81,991 Rupees. This is the last treaty which was formed with the Nabob. The office of subadar had now become merely a nominal one, all real power having passed into the hands of the British. In 1772 the stipend was reduced to sixteen lakhs a year, at which rate it is paid to this day.

SHUJANPOOR TIRA, See Kohistan.

SHUJH, or Milk-tree, grows to an enormous size on the summit of the lofty hills north of Nepaul.—*Smith's Nepaul.*

SHUJINA, properly Sahajna, Beng. Horse radish tree, Moringa pterygosperma.

SHUJRA, see Shajra, Shijra.

SHUJR-UL-JIN, Arab. Erythroxylon areolatum.

SHUK, Ar. Oxide of arsenic, *White*.

SHU KING, or book of records, is a work supposed to have been edited by Confucius. It contains the annals of China nearly to the time of Confucius.

Shi King, the sacred books of the Chinese, were translated into Latin by Father Lacharme, a Jesuit missionary of China.

Jin Kin, or classes of men, is a Chinese book of great authority. In it the "Sages" occupy the first chapter, and in this Confucius is placed high above all others.

Li, is a Chinese word of very extensive meaning, sometimes rendered, reason, courtesy, propriety, good breeding. The saying is, Li and Wen (learning) make up the whole sum of human excellencies.—*Bowring*.

SHUK-PA, Hind., Tibetan. Juniperus excelsa, pencil cedar; it grows in Ladak.

SHUKR, Hind. Saccharum violaceum.

SHUKR-KUND-ALU, Beng., Hind., Pers. Batatas edulis, Convolvulus batatas.

SHUKSAR, Hind. Arceuthobium oxycedri, Gia Shuk, Hind., is Juniperus communis.

SHUKTEE, Sans. From shak, to be able.

SHUKTEE-DHARA, Sans. From shakti, an iron spear, and dhara, to hold.

SHAKTI or Sacti. The followers of the Shuktee, or female associates of the two great members of the hindoo triad, are numerous. The Saiva and Vaishnava sects, believe in Swerga, in Kylas, and in Vykoonth, but the Saiva regards Vykoonth, and the Vaishnava regards Kylas as merely a second Swerga. Each sect believes that the heaven of their opponents passes away with Indra's paradise at the Maha Prulay, but that their own heaven is not so much destroyed as re-created, Kylas merging into Maha Kylas and Vykoonth being elevated into Go Lok.

SHUKUR KHOREE lit., eating sugar, or shookrana, a mahomedan ceremony.

SHUKUR BHAT, lit., sugar and rice.

SHUKUR-ALOO, Beng. Sweet potato. Pachyrrhizus angulatus.

SHUKURKUNDA, Beng. Pachyrrhizus angulatus.

SHUL, Arab. Beta vulgaris, *Linn.*

SHUL, Hind., Pushtu, Pistacia terebinthus.

SHULA, see Hindoo.

SHULGUM, Hind. Brassica rapa, Turnip.

SHULMANI, a race settled about the Tira range, who came from the banks of the Korrum, which was their earliest locality. They were in Hust-nuggur in the 15th century. whence they were expelled by the Eusofzye.—*Latham, p.* 196.

SHUMA, Arab. Wax.

SHUMAC or Sumach.

Tum-tum,	Ar.	Sumakh,	Pers.
Shi-chu-yu,	Chin.	Sumagre,	Port.
Smak,	Dut.	Sumak,	Rus.
Sumac roure, Roux,	Fr.	Zumaque,	Sp.
Schmack, Sumach,	Ger.	Sumak,	Sw.
Sommaco,	It.		

The true Shumac or Sumach, sometimes called young fustic, is the powder of the leaves, peduncles, and young branches of Rhus coriaria, a small deciduous plant, native of the South of Europe, but which is also grown in Syria and Palestine, for its powerful astringent properties, which render it valuable for tanning light coloured leather, and it imparts a beautiful bright yellow dye to cottons, which is rendered permanent by proper mordants. It is principally imported into England from the Ionian Islands and the Morea. A species grown for the purpose in Spain, Portugal, and Italy is R. cotinus, a shrub with pale purple flowers, whereas R. coriaria has greenish yellow blossoms. They may be propagated by cuttings of the roots and layers. R. typhina and R. glabra with their varieties, are North American species, which are also used for tanning purposes. In Montpellier and the South of France the twigs and leaves are known under the name of redoul or roudo. They are gathered every year, and the shoots are chipped or reduced to powder by a mill. The imports into the United Kingdom were

1846,	10,256	Tons.	1849,	12,590	Tons.
1847,	11,975	,,	1850,	12,929	,,
1848,	9,617	,,	1852,	9,758	,,

which were all retained for consumption. In 1841, came about 9,000 tons from the port of Leghorn. There were exported from Sicily in 1842, 123,305 tons, valued at £68,894. It is imported in packages of about a cwt., wrapped in cloth. America takes a large quantity of sumach. The imports into the port of Boston alone, were 19,070 bags in 1847, 34,524 in 1848, and 30,050 in 1849. The prices in Liverpool, duty paid, in the close of 1851 were per cwt.

Messina,	10 to 10¼*s.*	Verona,	5½ to 6½*s.*
Palermo,	12 to 13*s.*	Tyrolese,	8 to 9*s.*
Trieste,	7 to 7½*s.*		

The trees producing Shumac, are,

Rhus coriaria, Hide or Elm-leaved Sumach.

Shumuk,	Pers.	Tumtum,	Arab.

A native of Persia, Syria, Palestine, and the south of Europe, about 8 or 10 feet high, divided into numerous irregular branches. All parts of this plant are inodorous, but have a styptic taste; it owes its properties and value in the arts: to the abundance of tannic acid, M. Tromsdorf has found in the berries a large quantity of bi-malate of lime. Leaf

5-7 pairs of villous leaflets, elliptical, bluntly and coarsely toothed, petioles naked. Flowers in large loose panicles of a whitish-green. Drupes villous. This plant is extensively used for the purpose of tanning, and it is said that all the leather made in Turkey is tanned with the bark of this species of Rhus. The fruit is acid and astringent, and the seeds are often used as a tonic for exciting the appetite.

Rhus cotinus, Venus-sumach, or Wild olive. Flowers hermaphrodite, arranged in loose panicles of a greenish-yellow colour : leaves simple, entire. This is a very ornamental shrub, and is one of the European species, growing wild in various districts of the south of Europe. It is made use of, like many other of the species, for tanning, in Italy, and is called Scotino. The wood is used by the modern Greeks for dyeing wool, which is said to be of a beautiful rich yellow. It is frequently cultivated on account of its beauty.

Rhus glabra, smooth leaved Sumach. Leaf like the last, but broader and glabrous. Branches also glabrous. Fruit red, covered with silky hairs. This species, as well as another named R. viridifolia, is considered by some botanists as only a variety of R. typhina, like the last, this species is abundant in North America, over-running sometimes a whole district, and forming a troublesome weed. Its fruit is very sour, but may be eaten with impunity. Bees are very fond of the blossoms.

Rhus typhina, Fever-rhus, or Stag's-horn Sumach. Leaves with 8-10 pair of leaflets and an odd one, lanceolate-acuminate, serrated, pilose beneath. There are two forms of this plant ; the one R. arborescens, in the form of a tree, from 10 to 25 feet in height ; the other R. frutescens, shrubby, and only from 2 to 10 feet high. The young shoots are covered with down, which, with their somewhat crooked and stunted branches, give them the appearance of young stag's horns : hence their name. The flowers are in dense spikes, at the ends of the branches, the pistilliferous ones developing themselves into woolly drupes, which are very conspicuous when ripe. It is found in every part of North America, and its dark-red leaves add much to the beauties of an American autumn. The fruit of this plant is exceedingly sour, and on this account it is frequently called vinegar plant, and is even used in some parts as a substitute for vinegar.—*McCulloch's Com. Dictionary, p.* 1,025 ; *Simmond's Commercial Dictionary ; Hogg's Vegetable Kingdom* ; *Poole's Statistics of Commerce* ; *O'Shaughnessy, p.* 282.

SHUMAJ, Hind. Buxus sempervirens.

SHU-MAI--KHA, see India.

SHUMAMBU VALLI, Maleal. Vitis latifolia, *Roxb.*

SHUMBALI, Duk. Vitex negundo and V. trifolia, 5 and 3-leaved chaste tree.

SHUMBURRI, Sans. Evolvulus emarginatus.

SHUMBARARI, Sans., from shambara, a giant, and ari, an enemy.

SHUM-DULAM, Beng., Hind. Elephantophus scaber.

SHUMI, or Shu-meri, Beng. Prosopis spicigera, also Premna spicigera, *Linn.*

SHUMIM, also Shum, Hebrew. Garlic.

SUMLA, Hind. The worked or embroidered end of a turban, or kummurbund, left flying loose.

SHUMPANGHI-PU, properly Saṁvangi-pu, Tel. Michelia champaca.

SHUMSHAD, Hind. Dodonæa burmanniana, also Buxus sempervirens.

SHUM-SHUM, a range which forms about half the wall of the Aden crater, and reaches an altitude of above 1,760 feet. There is a huge crack or slip which cuts above a third off the eastern side of the volcano, and through a portion of this, constituting a narrow gorge or pass, ten feet wide, and twenty or thirty high, the road from Steamer Point enters the crater, and leads to the cantonments. Dr. J. P. Malcolmson supposes this to have been the remains of the latest great eruption of which the effects are chiefly manifest on the tableland on the eastern buttress of Sham-Shum : by this the ancient crater was shattered nearly through its centre from the northern to the southern pass breaking into pieces, and separating the whole of the eastern side of the edge of which Seera Island is a fragment—and in these views Dr. Buist concurs.

SHUMUNA, Sans., from shum, equal.

SHUN, Hind, Salix, *sp.*

SHUNDA, see Chaldeo.

SHUNDAPANA, Maleal. Caryota urens.

SHUNI, see Vahan.

SHUNIZ, Ar. Fennel, Nigella sativa.

SHUNKINI, Sans. Andropogon aciculata.

SHUNKOO-PUSHPA, Maleal. Clitoria ternatea, *Linn., Roxb., W. & A.*

SHUNKURJUTA, Beng. Uraria picta, painted doodia.

SHUNKURA, Sans., from shang, good, and kri, to do.

SHUNKU-VANIK, Sans., from shanka, a shell, and vanik, a tradesman.

SHUNNU, Hind. Fraxinus floribunda.

SHUN, Beng. Crotalaria juncea, Indian hemp.

SHUR, Hind. Juniperus excelsa, also J. arborea, lang shur, Hind., is Juniperus communis.

SHUR, Beng., Hind. ? Sindi ? Saccharum sara, *Roxb.* See Graminaceæ.

SHUR, a wilderness, a journey of three days, is the desert tract between Suez and Howara, where, no water is found.—*Wellsted's Travels, Vol.* ii., *p.* 43.

SHURA GUNDRA, also Sur, HIND. Saccharum sara.

SHURAH SHIGGHI, HIND., PUHSTU. Whetstone.

SHURANAMA, SANS., from shash, six, and anana, face.

SHURBAT, Eau sacré, sugar and water. Sharbat khori, (lit., drinking lemonade), or Shookrana, a ceremony. Run ka sharbat, war lemonade.

SHUREEF, AR. The progeny of a sheik father and a syudani,, amongst mahomedans.

SHUREERA, SANS., from shree, injure.

SHURGHU, HIND. Juniperus excelsa, also J. arborea, Pencil cedar.

SHURLI, HIND. Corylus colurna.

SHURRA, AR. The precepts of Mohummud. See Sharra.

SHURUKHS, lies north of the Turbut Hyderee tract, and about 100 miles from Meshid. I: was long the seat of Toorkmuns, who plundered Khorasan. In 1832 Burnes saw it rich in the spoils of others, but in a few months after it was surprised by Abbas Mirza in person, who either captured or killed its entire population. Those which were ransomed returned to Shurukhs, but in the following year the Khivans, who claim some power over it, insisted on their removing further into the desert to Merve, where they are located. Shurukhs has abundance of cultivable land on the banks of the Tijind, but the excesses of its population scared away the traveller and the merchant; and if not now the residence of robbers, it lies on the route by which these sons of the desert issue to plunder on the frontiers of Persia.—*Burnes in Persia, p.*

SHURUNGRU, HIND. Acacia speciosa.

SHUSH. The ground about Shush is very uneven, and numerous mounds, or tepeh, are scattered in different direction to a considerable distance; some of them being partly covered with brushwood. The highest tepeh among them, of which Major Rawlinson gives rough measurements in his notes on Khuzistan, lies to the east of the Shover stream, but very near it, and to the west of the river Dizful, which is discernible at some distance, plying its course to the south-east. This mound, which may be the place where the Prophet Daniel had his vision, (although much has been written to the contrary,) commands the whole country. From the top of it are seen the ruins of Ivani-Kherk, beyond the river of Kherkheh about a farsang and a half (perhaps less) to the west. A minar, or column, with the ruins of Shapur, are likewise discernible, in a north-westerly direction, on the right side of the above-named river.—*Baron C. A. DeBode's Travels in Luristan and Arabistan, Vol.* ii, *pp.* 194-95.

SHUSHAH, AR. A tuft of hair on the poll. When travelling, the shushah is allowed to spread over the greatest portion of the scalp, to act as a protection against the sun; and the hair being shaved off about two inches all round the head, leaves a large circular patch. Nothing can be uglier than such tonsure, and it is contrary to the strict law of the Prophet, who ordered a clean shave, or a general growth of the hair. The Arab, however, knows by experience, that though habitual exposure of the scalp to a burning sun may harden the skull, it seldom fails to damage its precious contents. He, therefore, wears a shushah during his wanderings, and removes it on his return home.—*Burton's Pilgrimage to Meccah, Vol.* i, *p.* 239.

SHUSHAN, see Luristan.

SHUSTEE, see Shusti.

SHUSTER. The Sabeans of Shuster recognise the divinity of Jesus Christ and believe in the Holy Trinity. According to their creed, God, whom they call Khei-reb, or the Great God, although one in his essence, is formed by three persons, Khei-reb Kadmoi or High and Almighty God; Khei-tenioni, (which Mullah Hatir translated by the word Naib, or acting-assistant), and Khei-Telithoi, God the Creator. The last bears sometimes the name of Khivelzivos. A learned Mullah related the history of the first man and first woman, Adam and Hevve, likewise of their son Shithel (Seth), who appears to be the most conspicuous person in their book on the creation. The Sabeans make, likewise, the sign of the cross, beginning from the right to the left shoulder, then touching the forehead, and lastly, the pit of the stomach. Baron Silvester de Sacy entertained other opinions of the religious tenets of this sect, founded on their sacred books. This learned orientalist in the Journal des Savans, expresses himself in the following manner relating to the Sabeans:—"The name of christians of St. John is quite as little founded in reason, since their doctrine (that of the Sabeans) has nothing in common with christianity, to which they are greatly averse. This name has been bestowed on them erroneously by certain missionaries and travellers, who fancied they had discovered, in certain of their religious ceremonies, resemblances with some of the rites of the christian religion. The Sabeans recognize St. John the Baptist as the greatest prophet, whom they call Paighambar Yaghia, and hence their name of the followers of St. John. As the mussulmans believe in the existence of Mehdi, the twelfth Imam, so the Sabeans are of opinion that St. John (Yaghia) is still alive, although invisible, and that he inhabits Syria (Sham). He is expected to return among them with Shethel (Seth, son of Adam), who, for his virtues, is supposed to have been taken up to heaven. Independently of their book of Adam, the Sabeans have two other works: the one contains the life of Yaghia, and the other is their ritual. The first, which they call the Sidra, is said to contain twelve thousand questions, with appropriate answers.—*Baron C. A. De Bode's Travels in Luristan and Arabistan, Vol.* ii, *pp.* 172-76. See Arabistan, Khuzistan, Saba.

SHUST'HEE, Sans. She who is worshipped on the sixth (shust'ha) day.

SHUSTI, the goddess of fecundity, a hindoo deity, represented as a yellow woman sitting on a cat; regarded by the hindoos, says Mr. Ward, as the protectress of children, and is especially worshipped by females who have not been blessed with any. She is also worshipped monthly by women who have lost their children, and is generally invoked by parents as their protectress. The cat being sacred to Shustee, the hindoos avoid hurting one, lest the goddess should injure their children. She is honoured with six annual festivals, celebrated chiefly by females.—*Ward's View of the Hindoos, Vol.* i, *p.* 39; *Cole. Myth. Hind., p.* 396.

SHUSTI, Hind. Scrophularia kotschyi.

SHUTA PUSPHA, Hind. Anethum sowa, *Roxb.*

SHUTAR-KHAR, also Us-shutar-khar, Pers. Hedysarum alhaji, Alhagi maurorum.

SHUTHIF.

Curcuma zedoaria, *Roxb.*

Banhaldi, Kakuri, Karchu-ramu	Hind.	Kakhura,	Beng.

SHUTA, Beng. Curcuma zedoaria. *Roxb.*

SHUTRA, in the religious doctrines or philosophical systems of the hindoos, an aphorism. The body of Vedic literature is immense. In the Brahmanas, moral precepts, religious instruction and information are conveyed. Professor Wilson supposes them to belong to the eighth century before Christ, and they are said to recognize the institution of caste or at least of social distinctions from which this institution has arisen. Very little is known of these works, which are less interesting than the Sanhita, as being of later date. The Brahmana are chiefly liturgical and legendary, and, in the Upanishads, passing into the rationalized state, and becoming metaphysical and mystical. It would be difficult to find two sets of opinions more absolutely irreconcileable than Vedic hymns and Vedantic philosophy. The Shutra (aphorisms) or Brahmashutra, the chief authorities of the Pantheistic Vedanta school, though much later than the rest, are still mnemonics, as also the Vaiseshka or atomic school of Kanada. The study of this supplementary mass of Vedic literature, including philosophy, commentaries, aphorisms, &c., might furnish occupation for a long and laborious life. See Vedas.

SHUTRAGHNA, Sans., from shatroo, an enemy, and han, to kill.

SHUTR, or Shootr, Pers. A camel.

SHUTRI RANG, Hind. Camel colour.

SHUTR-MURGH, Pers. Ostrich. See Struthionidæ.

SHUTRANJEE, or J[illegible] cotton carpet.

SHUTTAM, Tam. Civet.

SHUTU-DWIPA, Sans., f[illegible] a hundred, and dwipa, an island

SHUTU-MOOLEE, Beng. [illegible] Asparagus racemosus.

SHUTUKA, Sans. A hundred. Shutumunyoo, Sans., from shata, a hundred, and manyoo, a sacrifice. Shutu-roopa, Sans., from shata, an hundred, and roopa, form.

SHUVA-SADHANA, Sans., from shava, a dead body, and sadhana, to perfect.

SHUWAL, Arab. The tenth month of the mahomedan year.

SHUYUKH. Babylon was a narrow tract along the river Euphrates from Erech or the modern town of Sheikh ul Shuyukh to Kalneh on the Khabur river, and eastward till it joined Assyria.

SHWÆPAYUNG, Burm. Cucurbita maxima, *Dech, W. & A.*

SHWAN or Shwawan, Hind. Olea europæa.

SHWARI, Hind. Vitex negundo.

SHUAY DAGON PAGODA of Rangoon, is in height 321 feet above the platform and 487 feet above the ground level. The height of the great Shwe Madan at Pegu is 334 feet above the platform, the Shuay Dagon, lies about two miles north of Rangoon and is built on a laterite hill that rises gradually from the river side to a height of seventy or eighty feet. The pagoda is a stupendous mass of solid masonry: and stands on two terraces which face the four cardinal points. The upper one is 900 feet long and 685 feet broad: the face of the building is octagonal with a circumference of 1,355 feet. The area on which it stands is 800 feet square. Its surface is one dazzling blaze of gold and forms a magnificent object, as it rears its lofty height on the isolated hill.—*Yule, p.* 283; *Winter's Burmah, p.* 8.

SHWE MADAN, the great Burmese Pagoda at Prome.

SHWE-OO-DOUNG, see Tsan-pe-nago.

SHWET, Beng. White, hence

Shwet akund. The white variety of Calotropis gigantea, *Brown.*

Shwet, or Sada sabuni, Trianthema obcordatum.

Shwet-bach, Acorus calamus, Sweet flag.

Shwet-bariala, Sida rhomboidea, *Roxb.*

Shwet-buruna, Randea stricta.

Shwet busunda, Acalypha indica.

Shwet busuntu, Leucas procumbens.

Shwet-chamni, Herpestes monniera, Gratiola monniera, *H. B. & Kunth.*

Shwet-gothoo-bee, One-headed Kyllinga, Kyllinga monocephala.

Shwet-gurjun, Dipterocarpus turbinatus.

Shwet-hoolee, Zeuxina sulcata.

Shwet-kamaluta, Quamoclit album.

Shwet keerni, also Shwet kherna, Euphorbia thymifolia, *Linn.*

Shwet-koonch, Abrus leucospermus.

Shwet-kudum, Nauclea tetrandra.

Shwet-kurubee, Nerium odorum, N. albosimplex.

Shwet-mash, Phaseolus torosus.

Shwet-moorga, Silvery spiked cockscomb, Celosia argentea.

Shwet-pai, Eleocarpus lauræfolius.

Shwet-paneemu-rich, Downy persicaria, Polygonum lanigerum.

Shwet-poorna, Boerhaavia alba, B. procumbens.

Shwet-pudmu, Nelumbium album, N. speciosum.

Shwet-pudmu-kurubee, Nerium albo-plenum.

Shwet-raee, Sinapis alba.

Shwet-sal, or Shwet-shal, Blackwood tree, Dalbergia latifolia.

Shwet shim, Lablab albiflorum.

Shwet shimal, Eriodendron anfractuosum, Gossampinus rumphii, *DC.*

Shwet-surbujuya, Canna flava.

Shwet-sursha, Eruca sativa.

S[illegible]bunee, Trianthema viridulum.

[illegible]ja-muni, Hibiscus albiflorus.

[illegible]parajita, Clitoria albiflora, C. ter[illegible]nn., *Roxb., W. & A.*

[illegible]ETA, Sans. White. Shweta-giri, white mountain.

SHWUY-YIN, Chin. Mercury.

SHYAKOOL, Beng. Zizyphus benoplia.

SHYALAI, Beng. Boswellia serrata.

SHYALEE, Uria. Bauhinia vahlii, *W. & A.*

SHYAMA, Sans. Black.

SHYAMA LUTA, Beng. Ichnocarpus frutescens, *R. Brown.*

SHYAN, or Ahom, see India.

SHYOU, or Shyu. Their number is about 27,000, their language is unwritten.

SHYTAN, Ar. Satan. According to mahomedan belief he has four khalifa, or deputies, Muliqa, Hamoos, Mubloot, Yoosuf.

SHY-YOK, a tributary to the Indus, rises near Karakorum pass, runs S. E. to N W., into Indus near Iskardo, length 300 miles; it receives the Chang-Chen-mo, 58, and Nubra river 66 miles. See Shayok, Shyok.

SIA, Hind. Rosa webbiana.

SIAGA of Tartary, Cervulus pygargus.

SIAH, Pers. Black.

SIAH DANA, Hind., Pers. The black cummin of Scripture. Fennel seed, Nigella sativa. See Nigella seed.

SIAH MUSLI, Duk., Pers. Curculigo orchioides. See Musli.

SIAH POLKI, Hind. See Polkee.

SIAH POSH KAFIR, a name applied to a mountain race, the ancient Paropamisadæ, the literal meaning being black-clothed infidel. The countries north of the Hindu Kush, which lie in the valley of the Oxus and its tributary rivers, from Balkh upwards, have no general designation. Eastwards of that city lies Kunduz, the Mir of which has subdued all the smaller provinces, and it has another dependency, Badakhshan, further eastward. To the north of this territory are the hill states of Wakhan, Shughnan, Darwaz, Kulab and Hissar, whose peoples claim a descent from Alexander the Great. To the eastwards of Badakshan lies the plain of Pamir inhabited by the Kirghis and beyond the Belut Tagh mountains are Chitral, Gilget and Iskardo, that extend towards Kashmir. South of Badakhshan is the country of the Siah Posh Kafir, who occupy a great part of the range of Hindu Kush and a portion of Belut Tagh. It is bounded on the north-east by Kashkar, or Budukhshan, and on the north-west by Koondooz in Balkh. On the west it has Inderab and Khost, also in Balk, and the Kohistan of Cabul; and on the east it extends for a great distance towards the north of Cashmeer, where its boundary is indistinctly known. The whole of this country is composed of snowy mountains, deep pine forests, and small but fertile valleys, which produce large quantities of grapes, wild and cultivated, and flocks of sheep and herds of cattle, while the hills are covered with goats. Grain is inferior both in importance and abundance. The common kinds are wheat and millet. The roads are only fit for men on foot and are often crossed by rivers and torrents which are passed by means of wooden bridges, or of swing-bridges made on ropes of withy or some other pliant tree. All the villages are described as built on the slopes of hills so that the roof of one house forms the street leading to the one above it, and this is said to be the constant practice of the country. The people have no general name for their nation. Each tribe has its peculiar appellation, for they are all divided into tribes, though not according to genealogy, but to geographical position, each valley being held by a separate tribe. The fair complexion and regular features of the Siah Posh Kafir, the variously coloured eye, and shaded hair, indicate them to belong to the European family of nations, and disconnect them from the Tajik, the Hazara, the Uzbek or the Kirghis. The region now inhabited by the Siah Posh is surrounded by the countries in which the Greek dynasties ruled, and is encircled by the colonies, posts and garrisons, which they are known to have established, and by military colonies of Macedonians at Alexandria ad Caucasum, Arigæum and Bazira, and of the garrisons of Nysa, Ora, Massaga, Peuceleotis and Aornis. Those who suppose that the Siah-posh Kafir are descendants of the Greeks have their speculations strengthened by the fact, that many petty princes and chiefs, some of whom are now mahomedans, but originally Siah-posh, claim descent from the Macedonian hero, and have preserved vague accounts referrible either to their reputed ancestor's marriage, with the fair Rozana, or to his amour with the captive queen of Massaga. Mohun Lal states that the women who possess great beauty, manage all the out-door business, while their stout and handsome husbands remain in the house, feeding the children in their arms. If the Siah-posh place their corpses in deal boxes, and without interring them, expose them on the summits of hills, like the people of Tibet ; it is not explained whether this is a final disposition. The Siah-posh speak a dialect of the Sanscrit and worship the hindoo Mahadeo.—*Mohun Lal's Travels* ; *Elphinstone's Caubool.* See India, Kafir, Kush or Cush.

SIAK RIVER, in lat. 1° 13′ N., long. 120° 10′ E., on the western side of Bremer's straits, is about ¾ of a mile wide. The natives of Asia are all acquainted with the modes of preserving fish. The roe appears among their articles of Materia Medica under the name of Butarookh, but the roe of the fish in the Siak river is celebrated. Mr. Crawfurd and Dr. Cantor inform us, that the roe of enormous size of a kind of shad which frequents the great river of Siak in Sumatra, constitutes an article of commerce. The Malacca cane, the Heotau, of Cochin-China, is the long internodes of the Calamus scipionum of Loureiro, of which a thousand reach Liverpool annually, to form walking sticks. Dr. Griffith believed these canes to be produced from the Calamus scipionum, the Heo-tau of Cochin-China. They do not occur about Malacca, but are brought from Siak, on the coast of Sumatra. Some of them are simply mottled or clouded, others of a brown colour, in consequence, it is said of their having been smoked. The most slender specimens, with the longest internodes, are the most valued.—*Seeman, on palms* ; *Crawfurd's Dictionary* ; *Cantor* ; *Griffiths.* See Johore.

SIAKAI, TAM. Fruit pods of Acacia rugata, *Buch.*

SIALI, HIND. Pueraria tuberosa, also Dœmia extensa.

SIALIAN, HIND. Cyperus junicifolius.

SIALKANTA, HIND. Argemone mexicana.

SIALKOT, one of the most ancient of the forts and cities of the Punjaub : it was founded by rajah Sala Byne or Salivahanna, father of Russaloo. The fort, which adjoins the city to the westward is a high, oblong mound, with rectangular defences of curtains and round towers, massively built of brick and mortar. Bactria or Indo-Greek coins are found in the ruins, but not in any numbers. The commonest perhaps is the copper coin of Apollodotus.—*Beng. As. Soc. Jour., No. of* 1854, *p.* 146.

SIALU, HIND. On the Wardan, Kashmir, Marlea begonifolia.

SIAM. The diplomatic relations of the British Government with Siam may be said to have commenced with Mr. John Crawfurd's mission in 1821. In 1826 a treaty was negotiated by Captain Burney, with the view chiefly of preventing the Siamese from co-operating with the Burmese during the first Burmese war, in which the British Government was then engaged, and of providing for the peace of the Malayan peninsula then disturbed, in consequence of the occupation of Quedah by the Siamese. In 1850 Sir James Brooke was deputed to Siam armed with plenipotentiary powers from the queen of Great Britain. The dependencies of Siam in the Malayan peninsula are Quedah, Ligor, Tringanu, Calantan, and Potani. In 1831, after the rajah of Ligor had defeated the ex-rajah of Quedah in an attempt to recover his country, the Resident of Pinang visited him at Quedah and concluded an engagement with him regarding the boundaries of Province Wellesley, in conformity with the third Article of the Treaty of Bangkok.

Pellegoix estimates the population of Siam at six millions, which can at best be only approximative to the truth ;

Siamese proper, (the T'hai race)	1,900,000	Malays	1,000,000
Chinese	1,500,000	Cambodians	500,000
Laos	1,000,000	Peguans	50,000
		Kareen, Houg, &c.	50,000

Siam, with its dependencies, may be considered as occupied by the dominant race, or T'hai, a vast but for the most part migratory Chinese population, the Laos people, the Cambodians in such parts of Cambodia as recognise the Siamese authority, the Peguans in a part of the Mon or Pegu territory, numerous Malayan tribes, with a variety of mountain races in the state of greater or less subjection to the Government of Bangkok. The Siamese are located principally on the two banks of the Meinam, and on those of the tributary streams which flow into that great river from the latitude of 13° to about 20° north. They also occupy the gulf from the head of the peninsula down to lat. 7°, where the Malayan races are settled. To the east of the British possession on the Tenasserim coast, in lat. 11° up to lat. 16° 30', about two-thirds of the peninsula is peopled by Siamese races The kingdom of Siam is composed of forty-one provinces, each governed by a Phaja, or functionary of the highest rank. There are a considerable number of their districts under the authority of officials of lower ranks. There are five provinces in the north, viz., Sang Kalok, Phitsalok or Phitsanulok, Kamphang Phet, Phixai, Raheng. Ten eastern provinces, viz., Phetxabun, Bua-Hum, Sara-Buri, Nophaburi, Nakhon-Najok, Pachin, Kabin, Sasong-Sao or Petriu, Battabong and Phanatsani Khom. Seven western provinces, viz., Muang-Sing, Suphan or Suphannaburi, Kanchanaburi or Pak-Phrek, Rapri or Raxaburi, Nakhon, Xaisi, Sakhonburi or Tha-Chin, Samut-Songkhram or Mei-Khlong. Ten southern provinces, viz., Pakhlat or Nakhon-Khuen-Khan, Paknam or Sanauthaprakan, Bangplasoi or Halaburi, Rajong, Chantabun or Chantaburi, Thung-Jai, Phiphri or Phetxaburi, Humphon, Haija, Halang or Salang.

Siam has been divided by Siamese annalists into two regions, the northern, Muang-Nua, and the southern, Muang-Tai; the northern being that first occupied. The southern annals are sometimes denominated the "Records of the Royal City" (Ayuthia), and take their date from the period when Ayuthia became the capital of Siam. The native name of the kingdom of Siam is Thai, meaning the Free, or Muang Thai (the Free kingdom, or kingdom of the Free). Bishop Pallegoix says that the modern name, Siam, is derived from one of the ancient titles of the country, Sajam, meaning "the dark rice." In the Siamese books, border wars between the Malayan and Burmese races on one side, and the Cambodian and the Cochin-Chinese on the other, are recorded as of constant occurrence; but the present boundaries of Siam extend from four to twenty or twenty-one degrees of N. lat. Borgman estimates the whole area of Siam and its dependencies at two hundred and ninety thousand square miles, Crawfurd at one hundred and ninety thousand miles. Siam itself pays tribute to China; the king of Siam seeks from the emperor at Peking a special recognition of his right to reign. Siam proper may be deemed a vast plain from which the mountains rise higher and higher as we reach the Laos dependencies. What the Nile is to Egypt is the Meinam to Siam, with the distinction that while deserts and desolation bound the green line which fringes the borders of the Nile, there is, along the banks of the Meinam, wherever labour has failed to redeem the soil, a vast, fertile and feracious jungle, which has to be reclaimed. The people of this country, consist of the Siamese proper, the Khamti, the Laos and the Shan, who form the T'hay or Siamese group. The Siamese are physically superior to the natives of the Indian Archipelago, if we expect those of Bali; indeed the Balinese and Siamese bear a striking resemblance to each other. The natives of Siam often attain a height about the middle size, and are generally well made. The hue of their skin is a shade darker than that of the Chinese, but they have fairer complexions than the Malays and Javanese. The dress of both males and females consists of a piece of cloth wrapped round the waist, one end being brought between the legs and fastened behind, which gives this portion of their attire the appearance of a pair of trowsers. In addition to the abovementioned drapery, the women wear a piece of cloth wrapped round the body, under the arms, but the men content themselves with the nether garment before described, not even those belonging to the higher classes, cumbering the upper part of the body with a single particle of clothing except upon state occasions. Both men and women have the hair shaved from their heads, with the exception of a small round patch which is left between the crown and the forehead. This being brushed up, is made to stand on end, which gives them a scared appearance. The number of the talapoins or priests is enormously disproportioned to the rest of the inhabitants. In Bangkok alone their numbers exceed thirty thousand. The Siamese proper, occupy the lower part of the Meinam. Indeed the valley of the Meinam throughout its whole course, is exclusively T'hay, and the T'hay attain their highest civilization, on the alluvial delta of their river. The old capital Ayuthia, founded in 1351, was abandoned in 1751 for Bangkok, lower down the river. No dialect of the T'hay is intelligible to a Burmese. The alphabets also differ, but on the whole the essentials of their civilization is the same, the chief difference being in the language. The Laos alphabet slightly differs from that of the Siamese proper, but practically speaking, the language is spoken with remarkable uniformity over the whole T'hay area, and Siamese proper, the *Laos*, the Shan dialects and the Khamti are one. Many foreigners, Chinese and Cochin-Chinese, reside in Siam, also Portuguese, French, English and Dutch. Pali is the sacred literature of the Siamese, and is called Pali, Bali, and Pasa Makata (Bhasha Magadha) the language of Magada. Gambling in every form, as with the Chinese and Malay, is common, in cock-fighting, fish-fighting, cricket-fighting and lotteries. The Meinam rises and falls like the Nile, the Indus, the Ganges, the Brahmaputra and the Irrawadi. According to all accounts, Siam is a country abounding in mineral wealth. Gold, copper, and iron of great purity, have been discovered, and lead and tin mines are worked by the Government. Gold was discovered in Kabin, copper and iron at Lapaburi, and lead and tin at Kanburi. A mountain is celebrated among the Siamese as the precious-stone mountain where the topaz, the ruby, the sapphire, the garnet, and others are found. Pallegoix says he himself picked up precious stones from the ground.

Chantaburi, one of the ports of Siam, probably the second in commercial importance. It is at the mouth of a river, which, though not long in its course, fertilizes a considerable district by its inundations during the rainy season. The rocks at the entrance of Chantaburi present all the appearance of a colossal lion couchant. Chantaburi, which means the nutmeg country, is also a range of mountains east of Siam whose defiles are held by the Xong or Ching, who are said to be an offshoot from the Karen. The wax sold by the Xong is the produce of a wild bee of gigantic size, which build cells on the top branches of trees at the height of 150 feet. Sir R. Schomburg, British Consul at Siam, states that a rapid development of the commercial resources of Siam has taken place since the treaty, negotiated in 1855, came into operation. The principal export is of rice to China, and next to it sugar, of which ten times the present quantity might be produced if there were sufficient labour to be had; but the extraction of the juice of the cane and its manufacture into sugar are carried on without any of the modern improvements for acquiring the largest possible quantity from the cane and a superior quality of sugar. The alluvial districts might produce as fine cotton as the United States, but there is a scarcity of labourers, and it is bulky for transport in canoes down the river. Her Majesty the queen of Great Britain's Government included among the presents forwarded to the sovereigns of Siam a hydraulic press to compress cotton into bales. Coffee grows luxuriantly, and is of a superior description ; it might be cultivated to an unlimited extent. A number of woods, the produce of the forests of Siam are of importance. The teakwood is considered the strongest and most durable timber of India, or perhaps of the world, only the greenheart of Guiana vieing with it ; but it has become scarce. The sa-king might perhaps rival it in size and quality. Sir R. Schomburg saw, at the building sheds of the first king, a log of this wood, which was being prepared for the construction of a war canoe, measuring 135 feet and perfectly sound and without a flaw. It possesses the property of being easily bent by artificial means. There are many ornamental woods, the colour of which and suitableness to receive high polish would render them valuable articles of export. A beautiful dye of a brilliant colour is prepared from the heart of the jack tree, which might also become of importance. Sir R. Schomburg had seen silk cloth manufactured in Siam of a green colour, with much more lustre than that from sap green ; this green dye, he was told, was extracted from a vegetable substance procured in the forests of the interior. A varnish is said to be obtained by incision from a tree, probably the theet, on which neither the sun nor the rain has influence, and hence it is employed for securing the gilding of idols ; it might be advantageously employed for gilded monuments and ornaments which are exposed to the influence of the atmosphere. The balsamic resins of Siam also deserve attention. The betel-nut is extensively cultivated, to be used as a stimulant ; and so is hemp, for the sake of its intoxicating and narcotic qualities, it being used in the preparation of ganja, a considerable quantity of opium of inferior quality is produced in the tributary provinces of Siam, on the China border. Elephants abound in the interior of Siam. The hides are sent to China, where, having undergone a process similar to that of obtaining gelatine, they are considered a delicacy. The horns of the rhinoceros are said to possess medicinal virtues. The Chinese likewise attach fanciful virtues, medicinal and invigorating to the bones of the tiger and crocodile, and to the hairy-covered young horns of the deer.

Of savage and predaceous animals in Siam, the rivers and swamps are populated by crocodiles and rhinoceroses ; the forests by tigers, bears, and deer of various descriptions. In spite of the buddhistic prohibitions, the Siamese chase the latter animals energetically, and generally kill them with fire-arms, which any man is allowed to possess. Their rhinoceros-hunting is remarkably daring and peculiar. Armed with a bamboo stake, pointed and hardened in the fire, they proceed in parties of three or four into the jungles where they startle the animals with shouts and yells. As the rhinoceros does not fly, but rushes ferociously at its assailants with widely-opened jaws, the Siamese wait for this moment, and thrust their bamboo lances down the brute's throat. Then they run off in various directions and allow the animal to become exhausted by loss of blood until they can approach without danger and despatch it. There are many tigers, spotted and striped, and tiger-cats, but they rarely attack men because they have no want of game. There are also two varieties of the bear, which however, shun the vicinity of man. Stags and deer are also very numerous, and during the inundations are brought by hundreds to the market-place of the capital. These animals, as the water rises, fly to the higher-spots on the plain where they are killed by the Siamese. Apes with which the forests swarm, carry on their tricks unimpeded in the immediate vicinity of Bangkok, and impudently plunder the gardens. Many otters live in the rivers; they are frequently tamed, and become as familiar as dogs. Rats and mice are an enormous nuisance. Amongst the Siamese birds, crows exist in extraordinary numbers, and when they seek their night-quarters in Bangkok—the temples—they almost darken the air. Before daybreak they stalk about the streets in dozens, to steal everything that comes in the way. They snatch edibles from the hands of children, and even of elderly persons, force their way into the kitchens, knock off the covers of pots and take out the meat, which, if unable to swallow on the spot, they try to conceal in some corner, on a roof, or upon a tree. They fight boldly with dogs and cats for a bone, and when so engaged will hardly get out of the way of passers-by. If shot at, or stones thrown at them, they collect in hundreds and make an almost unendurable cawing. They combine with the dogs in acting as scavengers, clearing the towns and villages from all rotting substances. In consequence of the great quantity of water and fish in the country, it swarms with aquatic birds. Vultures are also seen in large flocks; especially the black ones with bare necks, which eat all animal substances and devour the dead, for in Siam the dead are not buried. The rich and well-to-do have their dead burned, while the corpses of the poor, whose relations cannot afford to pay the priest for the incremation service, are torn and devoured by vultures and dogs. For this object the corpses are previously cut into pieces, which are laid out on a stone platform. On the trees around hundreds of black vultures keep up a constant watch, and plump dogs lie about in the neighbourhood. So soon as the relations have retired, the animals and birds rush on the corpse, and in a very short time only the bones are left which the relations eventually collect and keep in an urn. The eastern shore of the gulf of Siam stretches from Bangkok to Chantiboon, and beyond Kampoot; but the lofty range of mountains along the coast impedes communication, and the Petrio canal is exclusively used by travellers to or from the eastern provinces. Pallegoix gives on the whole a favourable description of the moral qualities of the Siamese. "They are," he says, "gentle, cheerful, timid, careless, and almost passionless." They are disposed to idleness, inconstancy, and exaction; they are liberal almsgivers, severe in enforcing decorum in the relations between the sexes. They are fond of sports, and lose half their time in amusements. They are sharp and even witty in conversation, and resemble the Chinese in their aptitude for imitation. Marriages are the subject of much negotiation, undertaken not directly by the parents, but by "go-betweens." In the marriage procession a tray is carried, gaily adorned with flags and accompanied by music, and is laden with garments, plate, fruits, betel, &c. In the centre is a huge cake or cakes, in the form of a pyramid, printed in bright colours. The bridegroom accompanies the procession to the house of his future father-in-law, where the lady's dowry and the day for the celebration of the marriage are fixed. It is incumbent on the bridegroom to erect or to occupy a house near that of his intended, and a month or two must elapse before he can carry away his bride. No religious rites accompany the marriage, though bonzes are invited to the feast, whose duration and expense depend upon the condition of the parties. Music is an invariable accompaniment. Though wives or concubines are kept in any number according to the wealth or will of the husband, the wife who has been the object of the marriage ceremony, called the Khan mak, takes precedence of all the rest, and is really the sole legitimate spouse; and she and her descendants are the only legal heirs to the husband's possessions. Marriages are permitted beyond the first degree of affinity. There is an extraordinary usage connected with child-birth. The event has no sooner taken place, than the mother is placed near a large fire, where she remains for weeks exposed to the burning heat: death is often caused by this exposure. So universal is the usage, so strong the prejudice in its favour among high and low, that the king himself has vainly attempted to interfere; and his young and beautiful wife, though in a state of extreme peril and suffering, was subjected to this torture, and died while "before the fire," a phrase employed by the Siamese to answer the inquiry made as to the absence of the mother. The Siamese have learnt from the Chinese the art of salting and preserving eggs, which, in their estimate, rather improve than deteriorate by time. The egg is covered with a thick paste of ashes and lime. Eggs so prepared may be sent on long voyages, and have become a considerable article of export to California and other places. They are fond of ablutions, and their bodies are thus kept quite free from vermin. They must be deemed a cleanly people: they pluck out the hairs of their beard as soon as they clean their teeth, foul breath is scarcely known among them; they constantly change their garments, exposing them to the action of the sun's rays. Houses in Siam are raised above the inundations, to a height of twelve or thirteen feet. They have but one floor and the sides and roofs are composed of interwoven bamboos. The ascent is by a flight of steps. The food is chiefly rice, often cooked in a cocoanut shell, and the condiment used is fish, generally small and often in a putrid state. On the whole, the condition of women is better in Siam than in most oriental countries. In Siam, with laymen of rank as with the priesthood, the dead are embowelled and the body preserved embalmed for a long period before being consumed in the funeral pile. In Ava this practice is confined to the priesthood, and in this case the funeral pile is on a car on wheels and the body is blown away from a huge wooden cannon or mortar. Immense crowds are collected on the occasions of these funerals which are occasions of rude mirth and boisterous rejoicings. Ropes are attached to each extremity of the car and pulled in opposite directions by adverse parties, one of these being for the consuming of the body and the other opposing it. The latter are at length overcome, fire is set to the pile amidst loud acclamations and the ceremony is consumed.

Among the mountain tribes the most remarkable are the Kareen, the Lawa, the Ka, and the Hong. The Kareen inhabit the mountain ranges on the Burmese frontier up to lat. 21°; the Lawa, a more numerous people, the same regions farther south; the Ka, the mountainous district between the Meinam and the Meikong. The Hong dwell on the hilly region in the N. E. angle of the gulf of Siam, from the latitude of about 11° 30′ to 13° N.

The kings of Siam, from the time the old city Ayuthia was built, Choola Era 712 = A. D. 1351.—Furnished by P'ra Alak, the chief of the king's scribes, and doubtless with the approbation of His Majesty, designed by him it is supposed to correct the list of the kings published in the Calendar for 1860. That within the brackets does not belong to P'ra Alak.

First Dynasty—Names.	Choonla Era.	A. D.	Length of reign	
			Ys.	Ms.
1 Somdet P'ra Rama T'ibawdee the, I	712	1351	20	
2 Somdet P'ra Rame-sooan, —son of the 1st	732	1671	1	
who abdicated for,				
3 Somdet P'ra Bawroma-Rach'a-T'irat	732	1371	13	
4 Chow oo-t'awng lan,—son of the 3rd	744	1383	7 days	
5 Somet P'ra Rame-sooan,-assassinated the 4th ...	744	1382	6	
being the same person of the 2nd reign				
6 Somdet P'raya P'ra-Ram,—son of the 5th .. .	759	1398	15	
7 Somdet P'ra Nak'awn -In...	763	1402	18	
8 Somdet P'ra Bawroma Rach'a-T'i-Rat,—son the 7th	780	1419	17	
9 Somdet P'ra Bawroma Trei Lokanat,—son of the 8th.	796	1435	16	
10 Somdet P'ra Int'a-Rach'a, son of the 9th	811	1450	22	
11 Somdet P'ra Rama-T'ibawdee,—the II	832	1489	40	
12 Somdet P'ra Bawroma-Rach'a Naw P'oot-Tang, son of the 11th... ...	871	1510	5	
13 P'ra Ratsat'a T'i-Rat,—son of the 12th, 5 years old...	875	1514	0	5
14 Somdet P'ra Ch'ei Rach'a T'irat	875	1514	15	
son of the 12th killed by the 13th.				
15 P'ra Yawt Fa,—son the 14th, aged 11 years ...	889	1528	2½	
The 15th was slain by K'oon Warawongsa-T'i, who took the throne, and reigned 5 months. Being a usurper, his name is not allowed to have a place among the names of Siamese kings. He was assassinated by K'oon P'irenat'ep, who placed on the throne P'ra Teean Rach'a who bore the name.				
16 Somdet P'ra Maha Chakra-P'atdi-Rach'a-T'irat ...	891	1530	27	
17 P'ra Mahin Ta-Rach'a-T'irat —son of the 16th ...	917	1556	1	
The Capital of the kingdom was taken in 918 by the King of Hongsawadee or Pegu.				
18 Somdet P'ra Maha Tama, Rach'a-T'irat...	918	1557	23	
19 Somdet P'ra Naret,—son of the 18th...	940	1579	16	
20 Somdet P'ra eka-Totsarot				

First Dynasty—Names,	Choonla Era.	A. E.	Length of reign.
—a younger brother of the 19th	945	1584	9
21 Chow Fa Sri-Sawara-P'ak—son of the 20th ..	962	1603	1 2
Here closes the dynasty of Somdet P'ra Rama-T'i-Bawdee, being 20 different kings, one of them having reigned twice.			
Second Dynasty.			
22 P'ra Chow Song-T'am,—slew the 21st and reigned. [He acquired a great name by his pretended discovery of Boodha's footprint at P'rabat.]	964	1603	26
23 P'ra Ch'et'a-Otsarot,—an elder brother of the 22nd	989	1628	1 7
The Prime Minister Chow P'aya Kralahom Sri Sooriwong assassinated the 23rd, and placed on the throne.			
24 P'ra At'itaya Wong,—a brother of the 23rd, 9 years old	992	1631	0 5
Here closes the dynasty of P'ra Chow Song-t'am 3 reigns			
Third Dynasty.			
The former king was driven from the throne by the Siamese Nobles and Lords, whose place they filled by the Prime Minister abovementioned, viz,			
25 P'ra Chow Prasat T'awng.	992	1631	26
26 Chow Fa Ch'ei.—son of the 25th...	1017	1656	0 9
27 P'ra Soot'ama Rach'a,—killed the 26th and reigned	1018	1657	0 2⅜
28 Somdet P'ra Narai,—son of 25th killed the 27th ...	1018	1657	26
29 P'ra Pe't Rach'a,—He is called a usurper, and is not allowed an honorable place among the kings ...	1044	1683	16
30 P'ra P'oot'a Chow Sua,—son of the 27th, ...	1059	1698	10
31 Pra Chow Yoo-hooa t'ei,—son of the 30th	1069	1708	27
32 P'ra Chow Yoo-hooa Bawromakot, brother of the 31st...	1094	1733	26
33 Chow Fa Dawkmadua,—son of the 32nd	1120	1759	10 days
And then abdicated the throne for his elder brother			
34 P'ra Chow T'inang Sooriya-Marin-t'ara...	1120	1759	9 days
The close of the dynasty of P'rasat-t'awng, being 9 kings in all, the usurper being excluded.			
The whole term in which the above named 34 kings reigned is 417 years, averaging 12·3 years each.			
[The Burmese sacked the capital in the year 1767, and carried away many captives. The chief of the Siamese army rallied the Siamese under him at Tont'a-Booree, which is now the site of H. R. H. Kromalooang Wongsa-t'iat-sait's palace. He built a walled city in this place, and reigned as king P'aya 35 Tak,]	1129	1767	15
The 4th and present Dynasty.			
[A Siamese General of great celebrity under P'aya Tak, took the throne, named.]

P'rabat Somdet P'ra Pin-Klow, second king do.]	1213	1851	

The population of Siam is probably nearly stationary. The number of the bonzes condemned to celibacy, the multitudes of men who, being slaves, are unable to marry—the prodigious proportion of women who are childless in consequence of the practice of polygamy,—all seem to check the generally prolific character of tropical regions. The annual influx of Chinese being confined to males, does not bring with it the ordinary augmentations of a vast emigration, nor is there an adequate supply of women for the demand produced by the constant flow of men from China, who are brought down by every north-east monsoon. The bulk of the Laos people who are subjects of Siam, are spread over the great valley through which the Meikong, or principal river of Cambodia flows, between the lats. 13° and 21° N. The country is reported to be thickly peopled, except in the mountainous parts contiguous to Tonquin and Cambodia. Though the limits of Laos are not accurately laid down in the maps, and the country is but little known, it is said to contain more square miles than Siam itself. All its princes are tributary to Siam. Though possessing a quasi independence, the Shan States of Zimmay, Rahaing, and Labong are clearly feudatories of the present sovereign of Siam. Written contracts, or agreements are necessary with the Shan foresters and timber-cutters, and such documents to give them a binding effect, must be laid before the present Shan chief, who, if approved of by him, will direct his seal to be affixed to them. On the demise of any of the chiefs of these States, the king of Siam appoints the successor, and although it is customary to allow the eldest son of the former chief, to succeed to the vacancy, yet on the death about A.D. 1860, of a chief of Zimmay, one of the minor chiefs not of his family, was appointed to the post." In Siam, nobility is not hereditary. A modification of buddhism is the prevailing religion. A class of nuns exist, but women are not admitted till above 50. In Siam, the poor are buried or exposed to beasts of prey; if above the lowest class the deceased after the bowels have been extracted, is laid in a wooden coffin externally lackered and gilt, and this is placed for some days on a high table. In the meantime, the priests light up tapers, burn perfumes under the coffin, and chant funeral hymns at night. A procession of relatives and friends dressed in white and covered with white veils follow the corpse. Beside it, are borne figures of various animals or singularly-shaped monsters carved out of bamboo and the accompanying talapoins exclaim, "We must all die, we are all mortal." The mourners attest their sorrow by their tears and often hire women for the express purpose. The body is then taken from the coffin and placed naked on the pile which is set fire to and the remains are scorched. The body is then replaced in the coffin and deposited under one of the pyramids erected about the temple. Graves are held sacred among the Siamese and their violation is considered as a heinous offence. They refuse the honor of burning to persons killed by accident, by lightning, to the still-born, to those who die in child-birth, or from small-pox, and to suicides. The remains of such are either thrown into the water or exposed to the beasts of prey.

Between the buddhists of Siam and Ceylon, there has been much intercourse, and it is probable that almost identical doctrines are held in the two countries. During the efforts made by the buddhist monks of Ceylon, in the defence of their religion and in their attacks on christianity and on Jehovah, the king of Siam and one of the native chiefs of Kandy contributed largely towards the publication of the numerous tracts, pamphlets, and serials that were sent forth from the buddhist printing presses of Ceylon. When Siam was visited by Sir John Bowring he found a king upon the throne who in early life, when a late king had usurped the throne, had withdrawn from political squabbles to the safety and sanctity of the religious profession, and was residing in a buddhist temple from whence he was brought forth to occupy the throne, after the seclusion of a quarter of a century.

In stature the Siamese are shorter than the hindoos, the Chinese, or the Europeans, but taller than the Malays. The average height of twenty men, taken indiscriminately, was found on trial, to be five feet three inches, the tallest being five feet eight inches, and the shortest five feet two inches. This would make them about an inch taller than the Malays, and an inch and a half shorter than the Chinese. Their lower limbs are well-formed, contrary to what obtains among the natives of Hindostan. Their hands are stout, and destitute of the extreme softness and delicacy which characterize those of the hindoos. Their persons in general are sufficiently robust and well-proportioned, being destitute, however, of the grace and flexibility of the hindoo form. On the other hand, their make is lighter, less squab, and better proportioned, than that of the Indian islanders. Their complexion is a light-brown, perhaps a shade lighter than that of the Malays, but many shades darker than that of the Chinese. It never approaches to the black of the African negro or hindoo. Writers on the natural history of man, judging from the remote analogy of plants, have been disposed to undervalue colour as a discriminating character of the different races. But still Dr. Bowring was disposed to consider it as intrinsic, and as permanent a character, as the form of the skull, or any other which has been more relied upon. The hair of the head is always black, lank, coarse, and abundant. On every other part of the body it is scanty, as with the Malayan and American races, and the beard especially is so little suited for ornament, that it is never worn, but on the contrary, plucked out and eradicated, according to the practice of the Indian islanders. The head is generally well proportioned, and well set upon the neck and shoulders, but frequently of remarkable flatness in the occipital part. The face differs greatly from that of the European or hindoo, the features never being bold, prominent, or well defined. The nose is small, round at the point, but not flattened, as in the negro, and the nostrils, instead of being parallel, diverge greatly. The mouth is wide, but not projecting; the lips are rather thick; the eyes are small, having the iris black, and the white of a yellow tinge, following as usual the complexion of the skin. The outer angles are more turned up than in the Western races; the eye-brows are neither prominent nor well marked. But, perhaps, the most characteristic feature of the whole countenance is the breadth and height of the cheek bones, which gives the whole face the form of a lozenge, instead of the oval figure which constitutes the line of beauty among the nations of Western Asia and Europe. Upon the whole, although we often meet among the Siamese with countenances that are not disagreeable, and admit that they are certainly a handsomer people than either the Chinese or Indian islanders, beauty, according to British notions of it, is a stranger to them. The physiognomy of the Siamese, it may be added, conveys rather a gloomy, cheerless, and sullen air, and their gait is slow, sluggish, and ungraceful. The dress of the Siamese is sufficiently singularly and extravagant. Both sexes wear fewer clothes than any other tolerably civilized people of the East, the head and feet being always naked, the upper part of the body generally so, and the loins and thighs alone therefore being covered. The garment for the latter consists of a piece of silk, or cotton cloth, of from five to seven cubits long, which is passed round the loins and thighs, and secured in front in its own folds, leaving the knees entirely bare, a practice considered by their Malayan neighbours—such is the force of custom—at once rude and indecent. The better classes permit the ends of the dress to hang loosely in front, but the lower orders tuck them under the body, securing them behind. This is not a matter which is left to the discretion of the parties, but enforced by law, or by a custom equally imperative; for the plebian who infringes it is liable to summary punishment from the followers of any person of condition who may casually meet him. The only other material portion of dress is a narrow scarf, about four cubits long, and commonly of silk. This is worn either round the waist, or thrown carelessly over the shoulders. When in this last situation it forms an imperfect covering for the bosoms of the females, the lower orders of women wear a tight vest for comfort or convenience, when engaged in labour. The colours of which the Siamese are fond are dark and sombre, and light colours or white seldom enter in any considerable quantity into their dress. The last, except in mourning, is worn only by the lay servants of the temples, and by mendicant nuns, neither of whom are much respected.

The mode of dressing the head is singular and grotesque. A man when he is full-dressed ought to have the whole hair of the head closely shaven, with the exception of a circle on the crown, about four inches in diameter, where the hair is allowed to remain of the length of about an inch and a half or two inches. As the process of shaving the head, however, is not very punctually performed, it commonly happens that the common hair of the head is an inch or two long, and the circle on the crown double that length, the whole, from its natural strength, staring and standing upright, so as to convey not only a whimsical but a very wild look. Women do not shave the hair of their heads but always crop it short, leaving also a circle on the crown, which is effected by plucking out the hair in a narrow line from the brows backwards. No turban or other covering to the head is worn by either sex, with the exception of a fantastic conical cap put on by the chiefs at certain formal court ceremonies. In this respect, as well as in the mode of wearing the hair, the Siamese agree entirely with the Kambojans, but differ from the people of Pegu and Ava, who wear their hair long, and cover the head with a handkerchief. The Siamese of both sexes in upper ranks wear a kind of slipper. The Siamese, like the Chinese and other nations of the farther east, permit the nails of their hands to grow to an unnatural and inconvenient length. All the nails of both hands are treated in this manner, and the practice is general with both sexes, and with persons of all ranks; the only difference being that persons of condition carry the practice to the greatest extreme. Some successful amateurs may be seen with nails two inches long, and as cleanliness is not a national virtue, this usage has a very offensive appearance to a stranger. The Siamese have the same prejudice against white teeth with many other eastern people, and at an early age they stain them of an indelible black colour, without, however, filing and destroying the enamel of the front teeth, like the Indian islanders. In other respects, they evince no disposition to disfigure the natural form of the body, and are especially to be distinguished from the Burmans and Peguans, by the absence of general practice of tattooing the whole body, which prevails among the two last tribes. Marriage ceremonies, as in other countries of the East, are accompanied by theatrical representation, gymnastics, music, and distribution of presents. The actual ceremony is performed by the senior male relations; it consists in joining the right hands of the bride and bridegroom with a white cotton thread, and passing a similar one round their heads, brought into juxta-position. The priests repeat hymns in the Bali language, and an elder of the family pronounces the words, "Be man and wife, and live together until death part you." The Siamese week is of seven days, and these correspond generally with those of the other nations of the old world. They are as follows: viz., Sunday, Athit; Monday, Chan; Tuesday, Angkhan; Wednesday, Phut; Thursday, Prahat; Friday, Suk; and Saturday, San. The nature of the marriage contract among the Siamese does not differ essentially from its condition among other oriental people. Indeed, it may be remarked, that there is no feature in eastern manners in which there is so general an agreement as in this. The Siamese suitor usually pays a price for his bride—a betrothing precedes marriage, the marriage is a civil contract, in which the Talapoins do not meddle, except by offering prayers for, and bestowing benedictions upon the parties, and both concubinage and a plurality of wives are legal. Divorces appear to be obtained without difficulty, and are frequent among the lower orders. An unequivocal and reciprocal expression of the desire of the parties for a separation, seems all that is requisite. When the divorce is desired by one party only, there is a little more difficulty. The party suing in this case, pays a fine for the benefit of the other. In any case of a divorce, each party receives back what it originally contributed to the common stock, the wife, however, receiving no share of the gain or accumulation. If the children be grown up, they follow the father or mother at their own option ; but in the event of their being young, the distribution which the law enacts is remarkable, the female children going to the father, and the boys to the mother, on the alleged principle that the girls are most likely to prove useful to the first, and the boys to the last. The Siamese are a small, well-proportioned race, their skin is of an olive hue, they have black hair, of which they keep a coarse tuft (which has somewhat the appearance of a brush) on the top of the head, all around being closely shaven. Women adopt the same practice of cherishing a tuft of hair, which, however, they carefully oil and comb. The preservation of the tuft and the changes it undergoes under different circumstances, are objects of great interest and attention in Siam. The head of a child is frequently shorn. At the age of three or four the tuft begins to be cared for, but it is more in front than is usual after the time of puberty. It is prettily knotted and kept together by a golden or silver pin, or, in case of poverty, by a porcupine quill, but it is generally garlanded by a wreath of fragrant flowers. As among the Chinese, long nails are appreciated as a mark of aristocracy ; and every art is used for making the teeth black, which is deemed a sine quâ non of comeliness. The use of betel and areca helps to accomplish this object. The ordinary dress of the Siamese is a long piece of cotton printed cloth, passed round the waist between the thighs, the ends of the cloth being stuck in behind. They wear no covering over the head, or upper part of the body ; and the legs and feet are quite naked. The higher class sometimes wear sandals, and have generally a piece of white cloth hanging loosely about the shoulders, which they sometimes use to wrap round their head. Young women employ a sort of silk scarf to screen the bosom ; a refinement which, after marriage, is much neglected : indeed, no sense of delicacy or impropriety appears to be connected with the exposure of the body above the waist. In the sun, a light hat, which looks like an inverted basket, made of palm-leaves, is used by both sexes. On all ceremonial occasions, and in visits from inferiors to superiors, it is usual to wear a silk scarf round the waist. In the presence of the king, the nobles have a garment with sleeves made of tulle, of the most delicate texture, and richly ornamented, which they often take from their shoulders and fasten round their waist. The women who ply on the river wear rather a graceful sort of white jacket, fastened in front. In cold weather an outer garment or robe is worn, whose value depends on the rank and opulence of the wearer. There is a universal passion for jewellery and ornaments of the precious metals, stones, &c. It is said there is scarcely a family so poor as to be without some valuable possessions of this sort. Rings of silver and gold adorn the arms and the legs of children, rich neck-laces, ear-rings, and belts, are sometimes seen in such profusion as quite to embarrass the wearer. Female children, up to the age of twelve or thirteen, wear a gold or silver string with a heart in the centre, performing the part often assigned to the fig-leaf in exhibitions of statues. To the necks of children a tablet called a bai soma, is generally suspended, bearing an inscription as a charm against mischief ; and men have a metallic ball attached to a belt, to which they attribute the virtue of rendering them invulnerable. A neck-lace consisting of seven lumps of gold or silver is worn by girls as a protecting influence, the panuug, is one of the garments worn by the Siamese, called by the Portuguese panks, the Siamese have no family names or titles. Few therefore can trace back their descent above two generations. In their disposal of the dead body of a Khroopacha Achariya, or spiritual guide of superior sanctity, the rewards awaiting those who perform the funeral rites are innumerable. In a Siamese funeral, the bier, with a layer of wet earth laid upon it, upon which is placed a heap of a dried fuel, constitutes the funeral pile. This circumstance distinguished the funeral from a more ordinary one ; for on common occasions the bodies are simply burned upon a low earthen terrace. In one case, the pile being prepared, the body is replaced in the coffin, and carried three successive times round it, borne by the sons and son-in-laws of the deceased, and followed by the favourite daughter, uttering loud lamentations. It was then deposited upon the pile. A number of wax tapers and little incense rods were now distributed to the bystanders. A priest, ejaculating a prayer, set the first fire to the pile, and was followed by the rest, and among others, by the European bystanders for the spectators had been offered tapers, and particularly requested to join in the ceremony. As soon as the first flame had ascended, the daughter began to distribute small pieces of money to some beggars who were present, and who consisted chiefly of elderly women, dressed in white, who reside in the temple, and who perform menial services for the priests. The male relations of the deceased at the same time tied the clothes in a bundle, and standing on each side of the pile, tossed them over it six successive times, taking great care not to allow them to fall to the ground. This ended the ceremony—the relations, however, continuing by the pile until the body was consumed. The Siamese practice polygamy. Marriage is only allowed beyond the seventh degree of blood affinity, but a widow may marry her deceased husband's brother, and a widower his deceased wife's sister. Sovereigns may marry a sister or a daughter to preserve the royal race. A wife may be pawned for a debt.

On the east the dominions of Siam touch the frontier line of the Tenasserim provinces. As the crow flies, the British boundary of Tenasserim and the Siamese capital are not more than a hundred miles apart.

The city of Bankok lies in lat. 13° 58′ N., and long. 100° 34′ E. It is about twenty miles distant from the sea, up the Menam river, which is navigable for vessels up to two hundred and fifty tons, at all seasons of the year. The river is the highway for communication with all parts of the country, though several ancient canals have connected rivers in the interior and made passages to the coast. The city is divided into three portions. One section includes the palace, its gardens, grounds and enclosure, which is entirely surrounded by water from a canal and forms an artificial, not a natural, island. The second portion of the city embraces the abode of the settled part of the population. The houses stand on both sides of the river, and are built pretty much in the same style and with the same materials, as they are in Burmah. All the well to do people live in wooden houses, while the poorer class occupy huts composed of bamboos and palm leaves. The third section of the city comprises those who live on rafts or other floating structures. Many of the people have their permanent homes on these rafts. They open shops and sell bazaar articles on them. These floating houses are moored along the banks of the river, and they present a most picturesque appearance, as you ascend the river from sea. Many of the noblemen, and connections of the court, occupy brick-houses, and of the countless number of shrines and temples and pagodas, which are seen scattered about in every direction, all are built with the most durable materials and in the most costly manner. Bankok is supposed to have a population of about two hundred thousand people, of whom three-fifths are Chinese, and the remainder are Siamese, Peguans, Laos, Cambojans, Tavoyans, Cochin-Chinese, Malays, Moors, Hindoos, and Christians the descendants of Portuguese born in the country. All the thrift, enterprise and inland trade is with the Chinese. Large numbers of these industrious people immigrate every year from the provinces from the sea coast of China, and particularly from Canton. The Siamese population are lazy, apathetic, and filthy, destitute of all ambition, or national aspirations. Europeans and Americans are being attracted to Siam, as either temporary or permanent settlers, and they receive every encouragement from the king's government. There were in 1863 in Bankok, one hundred and twelve European residents and about thirty-eight Americans, many of the two classes having their families with them.

The first and second kings administer the affairs of the kingdom between them, though in point of etiquette and in reality, the first king is supreme. The executive branches are conducted by different ministers, who have two audiences each day with the first king to receive instructions. The Prahklang is the chief minister. The revenues of the kingdom amount to about four millions sterling, and are derived principally from the land, a conscription tax for exemption from military service, a poll tax on the Chinese, customs duties, opium tax, gambling licenses and profits on the trade conducted in vessels belonging to the king. In 1863 the ruling Siamese majesty was the fourth sovereign of the existing dynasty. He is officially styled Prabat Somdet Pra Paramendr Maha Mongh Kuk. He is the second eldest son of Pra Pootti Lot La, the thirty-sixth king from the foundation of the monarchy in that country. The second king has the title of Prabat Somdet Pra Pin Klow, brother of the first king. There have been four dynasties, of kings. The first dynasty had a succession of twenty-one kings, whose united reigns, extended over a period of 252 years, or from year A. D. 1351 to 1603. The next dynasty had three sovereigns. who reigned twenty-eight years. The third dynasty began by the Siamese nobles putting aside a minor of nine years old, and setting up the prime minister as king, who began to reign in A. D. 1633, and occupied the throne for twenty-six years. This dynasty had nine kings, who were in power one hundred and thirty-six years, "when the Burmese sacked the capital in 1767 and carried away many captives. The chief of the Siamese army rallied the Siamese under him, at Tonta Booree, which is now the site of a palace. The ancestor of the present dynasty was a Siamese general, of great celebrity, who took the throne A. D. 1782 and reigned for twenty-seven years. The king ruling in 1863 had a family of sixty-one children. Of this large number of children, eleven had died up to the end of 1862, seven were by one mother, two royal mothers had five children each, one royal mother had four, two of them three each, four of them two each, and all the others, making the number of royal mothers up to twenty-seven, one each. Besides these twenty-seven wives, the king had thirty-four concubines. In addition to this establishment there were seventy-five daughters of noblemen, who served as maids of honor. Each lady receives a salary from the royal treasury of from twelve-hundred to two-hundred ticals a year. His majesty the second king, says the Bankok Calendar, for A. D. 1863, has now twenty Laos and five Siamese wives. The whole number of his children is 60, of whom only 30 are now living. His eldest son was born in August or September 1838, and is commonly denominated Prince George. The name given him in his infancy was George Washington. His present official name is Krom Mun Bawarawich ei chan. At Bankok and its vicinity in 1863 there were ten American missionaries and families located. The first mission planted in that city was by the Baptist sect of christians in the year 1833. It has since maintained a very feeble existence. A Presbyterian Mission is strong in numbers. A Roman Catholic Mission with ten priests is stated to have commenced in 1662. The Vicar Apostolic of Siam, the Right Rev. J. P. Pallegoix, Bishop of Mallos died on the 18th of July (1862.) The Governments of Portugal, America, Great Britain, France, Denmark, Hanseatic Republic, Sweden and Norway, the Netherlands,. and Prussia are represented each by an accredited Consul, residing at the Court of Bankok. Connected with these Consular establishments are various employés, as interpreters, secretaries, assistants, clerks, constables and medical officers in charge. With all of these European Governments the kings of Siam have entered into treaty relations. The Portuguese Consulate takes the lead, in point of priority of time, having been established in 1820. The others date from the year 1856. There is a Harbour Master and Master Attendant's department, besides an Inspector of imports and exports and the Bankok Police, all under the executive charge of Europeans or Americans.

The heavy bulk of the trade with Siam seems to pass round from Batavia and Singapore. Hongkong and other ports in China contribute toward it. The value of the export trade for the year 1861 was fifty-six lakhs and a half of ticals.

The principal articles of export from Bankok are rice, sapan wood, sugar, pepper, hides and horns, cardamums, teel seed, tin, stick-lac, silk and paddy, teak timber, ebony, rose-wood and mangrove bark used in tanning, gum benjamin or frankincense and gamboge. All the spices of the southern peninsula and the islands seem to grow in that country. The growth of sugar is a new branch of industry introduced into Siam about a century ago by the Chinese.

On the eastern side of the peninsula there is a river, called the "Xumphon," at the Isthmus of Krau. From this river across the gulf, to the mouth of the "Menam, chowphya," the distance cannot be more than sixty or seventy miles.

The Siamese mountains run north to south along the Tenasserim provinces, and attain elevations from 3,000 to 5,000 feet. The mountains in Ye province, run in three parallel ridges, from 3,000 to 4,500 feet high, gradually diminishing towards the coast to about 500 feet. The Buffalo mountains, about 700 miles from Moulmein, 1,543 feet. Coal of excellent quality has been discovered. Iron, tin, and gold are frequently met with. The Ahomo who once ruled Assam, were of the Siamese race. The alphabets of the Thay or Siamese of the Burmese and of the Mon of Pegu are of Indian origin.—*Latham's Des. SIBERIA, a great region on the north of Asia ; the vast steppes of the Gobi, its sandy deserts, and high mountain chains, give a peculiar character to this region. The traveller, who attempts to force his way into the lands on the South of Siberia will find that his rifle will be required for more purposes than obtaining a dinner. His courage and determination will be tested by men who seldom show fear, and are ever on the alert. It is only with a steady hand, a quick eye, and skill with his weapon, that he can remain safe from acts of violence. Plunder is the common trade ; and what is still worse, the traveller, if not murdered, is carried off into certain slavery. Mr. Atkinson commenced his wanderings in southern Siberia beyond the river Narym, and crossed the Kourt Choum mountains, towards what has been called the Great Altai. But this chain can only be found on maps—in nature it does not exist. Numerous off-shoots from the Altai run down to the desert of Oulan-Koum, in which direction he turned his steps ; riding over many a rugged ridge and crossing numbers of picturesque valleys, treading his way eastward towards Oubsa Noor. There are many peaks in the Tangnou chain, rising far above the line of eternal snow, some more than 11,000 feet in height. His route was eastward, crossing the heads of several streams which run from the Tangnou mountains into the Oubsa. There are to be seen herds of antelopes and flocks of bustards, animals characteristic of a steppe ; with packs of ferocious wolves inconveniently numerous. A heavy sandy steppe—part of the Sarkha desert, extends into the Gobi,—and vegetation was so very scant, that even the steppe grass had disappeared. The salsola was growing in a broad belt around the small salt-lakes, its colour varying from orange to the deepest crimson. These lakes have a most singular appearance when seen at a distance. The sparkling of the crystallized salt, which often reflected the deep crimson around, gave them the appearance of diamonds and rubies set in a gorgeous frame-work. From the summit is a very extensive view over Sarkha desert, and there is no Great Altai but a low chain of hills only extends to the south, till lost in the Gobi desert. Of the vast network of mountains, which separates the enormous extent of level territory known as Siberia to the north, from the great Mongolian desert of Gobi to the south east, a comparatively small though lofty chain alone retains the name of Altai in Mr. Atkinson's map ; and this is continued eastward into the much longer chain of the Tangnou mountains, extending from about the 90th to the 100th meridians of east longitude from Greenwich : successively diminishing ranges occurring northward, till lost in the Siberian level of marsh and lowland forest. The true Altai, from its position, accessibility, and vast mineral treasures, and the important Russian mining establishments there in full operation, has perhaps attained undue celebrity as the grand mountain system of the region ; and the entire group of mountain chains, which as a group would appear to be tolerably isolated, is currently recognized as "the Altai" in popular estimation. There are no elevations comparable to the higher summits of the Himalaya ; but the difference of latitude compensates, as regards severity of climate in the higher ranges. The best idea of the magnitude of the mountain masses that run through Asia, separating Siberia and Mongolia, is by a comparison with the Alps, which can be crossed in four or five days : the wanderer among the Asiatic Alps has lost no time if he contrive to cross them in thirty-five. Baron Humboldt, was informed by Tartar merchants who cross the steppe with the caravans, that a volcano exists on an island in the Ala-kool. But the one nearest to this place is in the Gobi desert, and Peshan in the Syan-shan. In all his wanderings in the Karatou, Alatou, and Actou, Mr. Atkinson did not discover one crater. Beyond the Syan-shan mountains in Mongolia and its continuations westward under various names, is the vast depression of Yarkand. Mr. Atkinson's travels tended from Kokhan on the west to the eastern end of the Baikal, and as far south as the Chinese town of Tchin-si; including that immense chain Syanshan, never before seen by any European; as well as a large portion of the western part of the Gobi, over which Chenghiz Khan marched his wild hordes toward the west—scenes on which no pencil had previously been employed—comprising a distance traversed of about 32,000 versts in carriages, 7,100 in boats, and 20,300 on horseback—in all 59,400 versts (about 39,500 miles), in the course of seven years. The fauna of Siberia and even of the Altai appertains to the same immediate zoological province as that of Europe, with Asia Minor and the Caucasus, and to the same general region must likewise be referred that of all Middle and Western Asia, with Africa northward of the Atlas: again in North America, the differences are as nothing in comparison with the amount of resemblance; and the whole may be comprehended as the great northern or boreal fauna (or zoological region), with subordinate provinces, such as the Arctic, the American, the Central Asian, and the Sibirico-European (the last comprising Western Asia and Northern Africa); while China, the mountains of Indo-China, and the southern face of the Himalaya, having again so many peculiarities in common, that an Indo-Chinese province might be likewise recognised. The same types of form, characteristic of the region, even prevail in the north-west of India, where, as along as the sub-Himalayas, they become intermingled, gradually more and more to the east and south-east, with distinct types, which are mostly characteristic of South Eastern Asia and its archipelago, within the immediate influence of the monsoons.

The Saiga (*Saiga tatarica*), is a very remarkable antelope described by Pallas, whose great home is on the Kirghiz steppes, especially about the Aral, Lieutenant Woods' "herds of antelopes," observed by him on the plain west of Kunduz, must have been of this species; for it is not probable that the 'Ahu' (Gazella subgutturosa) inhabits northward to the Hindu Koosh; and lower down the valley of the Oxus, the Saiga is known to abound, especially about Lake Aral, into which that river flows. Once Mr. Atkinson mentions "a herd of small antelopes," when hunting with the Golden Eagle in Tchungaria; and these were not improbably the 'Dzerén' (Procapra gutturosa,) also described by Pallas,—whose great home is in the desert of Gobi, and which is the 'Yellow Goat' of the Ortous of M M. Huc and Gabet, and perhaps identical with the Tibetan 'Goa' (Pr. picticaudata of Hodgson),—at least Dr. J. E. Gray, of the British museum, suspects them to be one and the same animal, the former in its summer coat, the latter in winter vesture. The double-humped camel belongs properly to high Central Asia, south of the Gobi desert; and would even appear still to exist there in a state of nature. Its western boundary, where bred, seems to be among the Kuzak (or Cossacks), north of Bokhara. Lieut. Wood, of Sir A. Burnes' party, who explored the Oxus to its source in the Sir-i-Kol lake in Pamir, "had always supposed it to be a native of Uzbeg Tartary; but we here" he remarks, in Wakhan, "learned that it is bred only among the Kirghiz of Pamir and Kokan." Burnes remarks that—"The Bactrian camel, which has two humps, abounds in Turkistan; they are bred by the Kuzzak of the desert north of Bokhara." In its proper and more elevated habitat, this animal is employed together with the yak, as observed in an easterly direction by M.M. Huc and Gabet. In a westerly, Lieutenant Wood, ascending the valley of the Oxus, first encountered yaks when passing from Badakshan into Wakhan: they were grazing amid the snow on the very summit of the rugged pass of Ish Khasm (10,900 feet). Soon afterwards he came upon a Kirghiz encampment or horde which consisted of 100 families, and possessed about 2,000 yaks, 4,000 sheep, and 100 camels—not the ugly-looking camel of Arabia, but that species known as the Bactrian, and which, to all the useful qualities of the former, adds a majestic port which no animal but the horse can surpass. This was the first year of their abode in Wakhan, and the only instance of the Kirghiz having made this district their winter quarters." He subsequently remarks, that "the Kirghiz camel" (undoubtedly meaning the two-humped) is the beast of burthen in Shagnan, much lower down the valley of the Oxus. But other authors (Colonel James Abbott for instance) distinguish the one-humped camel of Turkistan as "the Kirghiz camel," from the two-humped, which they designate as "the Kuzak camel;" and it is clear that the Kuzak of some writers are the Kirghiz of others. According to Lieutenant Wood—"The Kuzak range, the low-lying plains between the vast empires of Russia and China. The Kirghiz domain is the table-land of Pamir, which, buttressed by Tibet, slopes northward upon Kokan, having the Chinese territories to the east, and the rugged country which feeds the rivers Oxus and Sirr to the west. Their language does not differ, or only in a trifling degree, from that spoken in Kunduz." The Kirghiz of the table-land of Pamir employ, the two-humped camel, which we follow into Kokan, where the main residence of the "Great Kirghiz horde" is understood to be on the vast steppes bordering the Jaxartes. The "Kirghiz middle horde" ranges to the north-east, across the Alatou chain, on what is called the "Kirghiz-Kuzak steppe," right on to the river Irtisch, and the eastern portion of which steppe was traversed by Mr. Atkinson into Tchungaria or Chinese Tartary, east of the great lake Tengiz or Balkash Nor, where camels abounded with his "Kirghiz," but of what particular kind does not appear.

In Bokhara, according to Professor Eversmann, there are as many as three species of camel (as he terms them, and we much incline to suspect correctly), all of which interbreed and produce fertile offspring. The descendants of hybrid camels, however, are stated by various authorities to degenerate rapidly. We allude to the particular hybrid which is known as the Armenian or Caramanian camel, which is raised from a male two-humped camel and a female one-humped camel of the Turkistan race. (*a.*) Air, is the two humped Camelus bactrianus, with long woolly hair; (*b.*) Nair, is the one-humped Camelus dromedarius, or common Arabian camel: and (*c.*) Luk, is the name given to a camel with one hump, larger than the other, and having quite crisp, short, dark-brown wool." The last should be the ordinary one-humped camel of Turkistan; the true Arab camel, though considerably less tall and more robust. According to Colonel Abbott, it is a stronger animal than the other; while Captain T. Hutton designates it as "an athletic dwarf, beside the Arab camel."

There is confusion in the writings of sundry authors respecting the camel and the dromedary. Thus Burkhardt notices the two-humped species by the latter name while numerous writers (and the French especially) so term the one-humped Arab species, which was named by Linnæus C. dromedarius. Pallas observed no dromedaries among the camels which he saw with the northern Kirghiz. The name 'Dromedary,' however, (from the Greek,) properly signifies a fleet camel, of racer proportions, the Ashari or Mahairi or Barbary, and Sindani of Upper India, which is a highly cultivated race of the Arab camel, conspicuously different from the heavy baggage animal of the same species. In Arabia, and in all Northern Africa, considerable attention is bestowed in regulating the propagation of the best breeds of camels, but especially of the lighter kinds, or dromedaries (properly so called). The smallness of the head is a characteristic feature of a well-bred one. "Those of Oman," remarks Lieut. Wellsted, "enjoy a deserved celebrity for strength and fleetness. Nejd is equally the nursery of the camel as of the horse; but the country of Oman, in all ages, is celebrated in the songs of the Arabs as producing the fleetest; their legs are more slender and straight, their eyes more prominent and sparkling; and their whole appearance denotes them to be of higher lineage than the ordinary breed of the animal." The ordinary breed of the true dromedary we take to be here meant, as opposed to the baggage camel of Arabia.

The one-humped camel of Turkistan, in common with other single-humped camels, authors miscall "the dromedary." According to Capt. (Col.) James Abbott, the dromedary of Khiva is a very noble creature. Its strength is greater than that of the Indian dromedary, and their appearance of power is increased by huge tufts of curled hair, which grow upon the muscles of the legs, and cover the neck. The intermediate breed between this and the two-humped camel is more powerful than either, and has generally, two humps though the contrary is mostly asserted. The dromedary will carry a burthen of 600lbs. at the rate of 30 miles a day, for almost any distance; provided that it be supplied with a sufficiency of the oil-cake, upon which alone it is fed while on the journey; grain being considered too expensive. It walks, under a burthen, about 2⅓ miles an hour. The camel of the Kuzak is the real, or double-humped camel. It is, however, of far more delicate make than that of Arabia, and it is preferred for the saddle to the dromedary. It is the smallest of Asiatic camels: long in the back, very fine-limbed, and covered with hair upwards a foot in length. It is a gentle and docile creature, better fitted for draught than the dromedary, owing to its greater length of its back; but as a beast of burden it is inferior in strength to the dromedary of Khiva and Bokhara, which is the finest anywhere seen." It is evident that there must be different breeds or races of the two-humped camel, which require elucidation. The one-humped camel of Turkistan is capable of enduring the severe winter of the Khiva steppe, as described in Colonel James Abbott's narrative of his winter journey over that desolate region, from Hirat via Khiva to the Caspian. Near the Aral he met with a double-humped camel, which he then regarded as a curiosity.

In the valley of the Ob, the Tetery or Black-cock may be shot in August; Rept-chicks or the Tree-patridge in September. When the first snow has fallen black-cock shooting is conducted in this way. A common sledge, sometimes with one horse, at others with two, is prepared and nearly filled with straw; upon this the sportsman sits down, and the man drives into the forest, keeping a good look out. When he sees the birds he drives along till within rifle distance, and then stops. The sportsman must shoot the lowest bird when this one drops, the others look down on their fallen mate and remain quite still in the trees. Mr. Atkinson more than once shot three out of the branches of the same tree, before the brood have taken flight. When the birds are going the man gathers up the game, throws it into the sledge and drives on again. In these woods it is not difficult to shoot from fifteen to twenty brace of black-cock in a day. This can only be done with a pea-rifle, which makes a very small report, and is certain in its effect. The valley of the Ob has great attractions for the sportsman from about the middle of June to the 1st of August. There are thousands of double snipes to be found on the banks of the river and the grass around the borders of the numerous lakes formed by the retiring flood.

Tungus, is a general name applied to a population common to a vast area in Siberia and China. Their physiognomy connects it with the tribes of Northern Asia in general, and their language forms a transition between the monosyllabic and agglutinate forms of speech. The Tungus, under the name Mantshu, constitute the dominant population of China itself. The tribes under Chinese rule, in Mantshuria, on the watershed of the Amur or Sagalin, are termed Mantshu. The Mantshu proper have a literature with an alphabet modified from the Mongol. They are agricultural and industrial.

Daurian, is a Tungus race dwelling on the Upper Amur, all well made, especially the women. The secretaries of the mandarins who are sent to this part, are privileged by a letter from the khan to select women or young girls, as companions.

The Ibex (Capra himalayana) frequents many of the lofty ranges of the western chains, and is known to the natives by the names "skeen" and "kail," which they apply indiscriminately in the districts of Aserung, Spiti, Kanawar, the Northern Cashmere mountains, Ladakh, Chinese Tartary, and the Altai. It is not clear that the European ibex is a distinct species. There appears to be a variety in Ladakh with shorter horns than the Himalayan, and specimens of the Siberian ibex possess the same peculiarity. Leopards, panthers, wild-dog and bearded vulture, are the common enemies of the ibex ; the latter preys on the kids only. The ibex is found on certain ranges in Ladakh, especially on the chains northward. The Caucasian ibex (Capra caucasia) frequents the mountains of Beloochistan, and it is likewise a native of the Murree and other ranges on the north-western frontier of Sind. The Caucasus, Asia Minor, Syria and Arabia, are also countries which it inhabits. It does not appear to travel any great distance eastward, and is probably re-placed on the higher ranges of Affghanistan and Persia by its noble congener the Himalayan ibex. The Caucasian ibex has the hair short and dark-brown, with a black line down the back. The beard is also black. Like the European and Himalayan animals, the horns are also bent backwards but they differ in being more slender and tapering. In the latter, moreover, the horns are three-sided, and the anterior and posterior surfaces sharp, and generally smooth, with the exception of a few irregular tuberosities on the frontal aspect. Like the other species, it frequents dangerous and inaccessible places, such as bleak and barren mountain tops.—*Z.* (*Mr. E. Blyth,*) *in Indian Field, April* 10, 1858 ; *Latham* ; *Ravenstein's Russians, p.* 365 ; *Atkinson's Siberia, &c., with reference to its Sport and Natural History* ; *Oriental and Western Siberia* ; *A Narrative of seven years' Exploration and Adventures in Siberia, Mongolia, the Kirgiz Steppes, Chinese Tartary, and part of Central Asia, by Thomas Witlam Atkinson,* 1858 ; *Hurst and Blackett.*

SIBERIAN RHUBARB, see Rhubarb.

SIBI, see Kadjak.

SIBIA GLOMERATA.

Thit-phyew, BURM. | Thayat-phyew, BURM.

This tree is very plentiful in Prome, Pegu and Toungghoo, as well as about Donabew, and it is a tree abundant on the sea coast from Amherst to Tavoy and Mergui. It yields a compact and close-grained wood, seven or eight feet in girth, and adapted for fancy work and cabinet-making. Its maximum girth is 5 cubits, and maximum length 30 feet. When seasoned, it floats in water. Thayat Pew, means white wood, and is a name equally applicable to "Calophyllum longifolium," "Dillenia speciosa," to a species of Dalbergia and to other woods.—*Dr. McClelland, Capt. Dance.*

SIBR, AR. Aloe indica. A. literalis, *Kœn.* Aloes.

SIBUKAS, TAG. Cæsalpinia sappan, *Linn., Roxb., W. & A.*

SICCA, HIND. A coin, to coin, a name of a rupee now uncurrent. The Sicca rupee of Bengal remained at 192 grains, but this coinage was discontinued in consequence of Act XVII of 1835, and since that date the Company's afterwards the Queen's rupee of 180 grains has been the only rupee coined at any of the government mints.

But the main purport of Act VII of 1833, was to fix the weight of the Furruckabad rupee at 180 grains. When the government of India decided on 180 grains as the tola, they in the same Act declared that this tola should be "the unit of a general system of weights in all government transactions."

SICHEL, a range of mountains, in the Dekhan. The Godavery river after entering the granitic table-land of the Dekhan, flows at the southern foot of the Sichel mountains into a sandstone and argillaceous limestone country. This district is similar to that of Bundlecund and Malwa; it also contains diamonds, and has been much broken up by erupted rocks.

SICHU, HIND. Cotoneaster obtusa.

SICKRONA, a river near Shekurgunge in Chuprah.

SICULIAN, see India, Khetri.

SID, or Cid, a mahomedan ruler famed in the history of Spain the Arabic Syud.

SIDA, a genus of plants, of the natural order Malvaceæ: 34 species of Sida are known to occur in the East Indies:

S. acuta, *Burm.*, Kureta, Bengal and both peninsulas of India.
S. alba, *Linn.*, Nag-bula or Nag-barjala, of Bengal, Coromandel.
S. cordifolia, *Linn.*, Barjala, Bengal, both peninsulas.
S. cuneifolia, *Linn.*,
S. humilis, *Willd.*, Bengal, both peninsulas.
S. microphylla, *Cav.*, Bengal.
S. retusa, *Linn.*, Bengal, both peninsulas.
S. rhombifolia, *Roxb.*, Lal-barjala, Bengal.
S. rhomboidea, *Roxb.*, Shwet-barjala, Bengal, both pen.
S. periplocifolia —? Malayana.
S. tiliæfolia — ? China.

The species vary much in habit, and in the structure of their fruit and seeds, but they resemble each other in abounding in mucilage, and in some of them having tough ligneous fibres, which are employed for the purposes of cordage in different countries. Several are employed as demulcents in India, in the same way that the mallow and the marsh-mallow are in Europe. S. rhomboidea and S. rhombifolia abound in very delicate flax-like fibres, which may be used for many of the same purposes as hemp and flax; but when the plants are grown for the sake of their fibres, they ought to be sown thick, under which circumstances, like other plants similarly sown, they grow tall and slender without branches. S. periplocifolia, a native of the Malay islands, which succeeds well in India, may be cultivated for the same object, especially as when cut near the earth it quickly shoots into long simple twigs which abound in flax-like fibres. A species, S. tiliæfolia, King-ma from Pekin, is cultivated for this purpose in China as a substitute for hemp and flax. Sida hemp, or Flax of Burmah is the product of Sida acuta and Sida stipulata, (Burmese, Pyen-dan-gna-len.) They are mere weeds, but the most troublesome in Tavoy.—*Mason*; *Eng. Cyc.*, *Wight's Icones*; *Roxburgh*, *Voigt*, *Hogg*. See Sida stipulata.

SIDA ACUTA, *Burm.*, *Rh.*, *Roxb. W Ic.*

S. lanceolata, *Retz.* S. scoparia, *Lour*, *Rheede.*
S. stauntonia, *D.C.* S. acuta. *Burm.*

Jeru pana,	MALEAL.	Muttav pulagam chettu	,,
Pata ?	SANS.	Sahadevi chettu,	TEL.
Arua manopondu,	TAG.		

An emollient and demulcent plant boiled with rice, said to prove serviceable in dysentery, flowers small, yellow. It grows wild in many parts of the Dekhan; being a native of the peninsula of India, but found also in the hilly districts Grows to the height of about three feet; and no doubt, like the S. rhomboidea, a good fibre might be procured from it. The root resembles common liquorice but is very bitter. The infusion of the root combined with ginger is given in intermittents and in chronic diarrhœa. The leaves bruised with oil are applied externally as a poultice to accelerate suppuration. Dr. O'Shaughnessy used an infusion of the root with some advantage in the cases alluded to by Ainslie, but could not satisfy himself as to its febrifuge action. It promotes perspiration, increases the appetite, and is in many respects a useful substitute for more costly bitters. An electuary is prepared, in Bengal, from the expressed juice of the Sida and used in the treatment of worms in the intestinal canal, but experienced native practitioners say that no reliance can be placed on its efficacy. An infusion of the root is a very useful bitter tonic and astringent. Dose, one to two ounces, three times daily. Care must be taken not to confound the classical name of this plant with the Sidhee of the bazaar, which is a mixture of the dried leaves and young capsules of the Indian hemp, and a powerful narcotic. Pata is also the name of Corchorus olitorius.—*Drs. Roxburgh*, *Voigt*, *Ainslie's Materia Medica*, *p.* 87; *Riddell*; *O'Shaughnessy*, *p.* 214; *Beng. Phar.*, *p.* 304. See Pata root.

SIDA CORDIFOLIA, *Linn.*, *W. A.*, *Roxb.*

S. rotundifolia, *Cav.* | S. herbacea, *Cav.*

Barjala,	BENG.	Chiri benda, Tella antisa,

Kharanta; Kharenti,	,,	Tella gora chettu,	,,

Seeds.

Bijband,	HIND.	Kowar,	HIND.
Chuka; Hamaz,	,,	Simak,	,,

A plant of both peninsulas of India, of Bengal and the Panjab. It has middle-sized yellow flowers. Its mucilage, mixed with rice is given in dysentery and fevers, and its seeds in colic, tenesmus, and gonorrhœa, also taken as an aphrodisiac.—*Drs. Roxb., Voigt, J. L. Stewart.*

SIDA INDICA, *Linn., Roxb.* Syn of Abutilon indicum, *G. Don.*

SIDA PERIPLOCIFOLIA, a native of the Malay islands, flowering and ripening its seed, a great part of the year. Its bark abounds in serviceable flaxen fibres, and as it shoots quickly into long, simple twigs, particularly if cut near the earth, it answers well for procuring the fibre of good length for most purposes."—*Drs. Roxburgh, Voigt, Royle Fib. Plant, p.* 263.

SIDA POPULIFOLIA, *Roxb., Rheede.* Syn. of Abutilon indicum, *G. Don.*

SIDA RETUSA, *Linn.*

Kurun tudi,	MALEAL.	Karun tuti,	TAM.

A shrub with small yellow flowers growing in Bengal, Malabar and Travancore, and Bengal used in medicine.—*Roxb.; Voigt.*

SIDA RHOMBOIDEA, *Roxb., W. A.*.

Sida rhombifolia, *Wall.*

Shwet-bariala,	BENG.	Safed bariala,	HIND.
,, barjala,	,,	Atibala chettu,	TEL.

A plant with small yellow flowers, growing, in the rainy season, in Bengal and the peninsula of India, where the plants are indigenous the barks of S. rhombifolia and S. rhomboidea according to Dr. Roxburgh, yield abundance of very delicate flaxy fibres, which he thought might be advantageously employed for many purposes. When the seed is sown thick on a good soil, the plants grow full and slender, without branches, and are every way fit for such purposes. Major Hanney sent from Assam to the Agri-Horticultural Society in December, 1851, some of the fibre of Sida rhomboidea, which grows luxuriantly in that valley. Capt. Thompson thought from its length, its similarity to silk, and its great strength, that it would fetch a high price in England. A line half an inch in circumference after exposure to wet and sun for ten days sustained, 400 lbs.—*Drs. Royle, Roxb., Voigt.*

SIDA SCOPARIA, *Lour., Rheede.* Syn of Sida acuta, *Burm.*

SIDA STAUNTONIA, *DC.* Syn. of Sida acuta, *Burm.*

SIDA STIPULATA, this, the most troublesome weed in Tavoy, produces a very fine hemp or flax. The two species, Sida acuta and Sida stipulata, are not usually distinguished.—*Mason.*

S. abutilon,	ROXB.	King-ma,	CHIN.

SIDA TILIÆFOLIA. This is cultivated for its fibres in China, near Pekin. Dr. Royle saw plants in the garden at Chiswick, about eight feet high. The fibre is strong and pliable, very silky in its nature, and the plant of very rapid and luxuriant growth, three crops being obtained in one year. It may he says be brought *into England at an estimated price of £8 per* ton, which is about one-fifth of the price of hemp of the best quality. Some of Dr. Roxburgh's original specimens, marked July, 1804, are still in the Indian House; the fibres are from four to five feet in length, and display a fine soft and silky fibre, as well adapted for spinning as the jute, but are apparently superior.—*Drs. Roxb., Royle.*

SIDA ATSU, HIND. Datisca cannabina.

SIDA, see Greeks of Asia.

SIDALAM, TAM. TEL. Corypha umbraculifera, *Linn.*

SIDASHEGHUR, a port on the western side of the Peninsula. See Sedasheghur.

SIDDEE, prop. Syudi, an African or Æthiopian.

SIDDEE, TEL. A leathern bottle, the dubber of the mahomedans.

SIDDHA, TEL.? URIA. A tree of Ganjam and Gumsur of an extreme height 45 feet, and circumference of 4 feet, the height from ground to the intersection of the first branch, 22 feet. Wood is said to be not liable to be attacked by insects, it is used chiefly for rafters and is burnt for fire-wood. The bark and leaves are employed in tanning leather and are also used medicinally.—*Captain Macdonald.*

SIDDHA. The persons, character, and offices of the different inferior races of hindoo divinities are very ill defined in the heavenly polity of the hindoos. The Siddha and Vidyadhara are a class of ascetics, and a class of celestials beings of an intermediate order between men and gods, tenanting the middle regions above the earth, and are usually described as attending upon Indra, although they have chiefs and kings of their own. The Vidyadhara have much intercourse with men, intermarrying with mortals, and often having earthly princes and heroes for their kings. The Siddha are of a more retired race, and are rarely the subject of fabulous or mythological legend. Charana, and Sura, are terms used in place of Vidyadhara, implying inferior demigods.—*Hind. Theat., Vol.* ii, *p.* 308.

SIDDHA-MANTRU, SANS., from sidha, accomplished, and mantra, an incarnation.

SIDDHA, SANS. To perfect.

SIDDHANTA, SANS., conclusion, from siddha, proved, and anta, end.

SIDDHANTACHARI, SANS., from siddhanta, ascertained or proved, and acharin, practice.

SIDDHARTHA, see Jains.

SIDDHISHWARI, SANS., from siddha, to perfect, and ishwari, a goddess.

SIDDHEE, SANS., from Sidha, perfect.

SIDDI, a term by which the Moghul

admiral on the Malabar Coast was known. It is from Siddee and that, again, from Syud a lord. See Sidi.

SIDEROXYLON, a genus of plants of the order Sapotaceæ, natives of America, Africa, East Indies and Australia, of which the following species are known, viz :

S. cantoniense,—? China.
S. cinereum, *Lam.*, Mauritius.
S. tomentosum, *Roxb.*, Eastern Ghauts.
S. inerme, *Lam.*--?
S. regium, *Wall.*, Pegu.
S. wallichianum, *G. Don.*, Penang.

The species of Siderxylon are evergreen trees, with axillary and lateral fascicles of flowers. They are remarkable for the hardness and weight of their wood, which sinks in water, and the genus has hence derived the name of Iron-wood.

SIDEROXYLON CANTONIENSE.

Shan-kan-shii,	CHIN.	Cornel tree,	ENG.

A native of China.

SIDEROXYLON INERME, *Linn.*

Romeria inermis, *Thunb.*

Has small white flowers.

SIDETES, see Greeks of Asia.

SIDHA HATH-DAWAN-HATH, HIND. The Right and Left-hand castes of the South of India.

SIDHESWAR, see Burabur caves.

SIDHOUL, also Sir, and Sutti, HIND. Hedychium spicatum. *Royle, Illustrations of Himmalayan Botany.*

SIDI, KARN., TEL. The Charakh is so called in Karnatica and Telugoo.

SIDI, the term by which the Abyssinian and Negro races of Africa are known in India. They are often employed in the households of native sovereigns. Some of them, known as the Seedee or Janjera or Zanjera, were long a powerful and independent maritime people, occupying the coast a few miles south of Bombay. See Siddee, Siddi.

SIDILINGAM, MAL. Cinnabar.

SIDNEY SMITH, a Captain of the English navy who aided in the defence of Acre when attacked by Napoleon I. See Acre.

SIDON, or Tsaida, is the representative of the ancient capital of Phœnice. During the administration of Joshua, and afterwards, Sidon was governed by kings. He calls it "Zidon the great" by way of eminence. During the crusades, Sidon fell into the hands of the christians, who lost it in A. D. 1111. They recovered it from the Saracens in 1250, but were finally obliged to surrender it to the latter in A. D. 1289.—*Robinson's Travels in Palestine and Syria, Vol.* i, *pp.* 268 *to* 271. See Tyre.

SIDOR, RUS., Sidra, SP. Cider or Cyder.

SIDRAJ ruled Samavat 1151 (A. D. 1095) to S. 1201 (A. D. 1145.) In the Komarpal Charitra, or history of the kings of Anhulwarra Puttun, the reign of Sidraj is stated to have been from S. 1150 to S. 1201, or A. D. 1094 to 1145.—*Tod's Rajasthan, Vol.* ii, *p.* 242.

SIEGESBECKIA ORIENTALIS, *Tatarinov.*

He-kien,	CHIN.	Kau-kao,	CHIN.

A plant of the China provinces of Sechuen and Honan. It is esteemed for its emetic properties and is given in ague and rheumatism.

SIEBOLD, PH. Fr. de Siebold, C. J. Temminck, H. Schlegel, and W. de Haan, authors who have written on the East Indies. See Kamino-mitsi.

SIEGES and Campaigns, see Statistics of battles.

SIEMIE, also Iniane, POL. Flax seed. Linseed.

SIER AL BALAD, a book of travels by Kazvini.

SIERRAS, SP. Saws.

SIEU, also called Subnah, a river near Mundasore in Sindhiah's territory.

SIFAN, a race or nation lying between Tibet and China, possibly, the same as the Gyarung, but with Tibetan forms of speech. Sifan, is said to be derived from two Chinese words, viz., Si, western, and fan, barbarians. —*Latham.*

SI-FAN, or Kham-pa, see India.

SIFERAH, or Sipperah, the Siferah of the Arabs, its ruins are within the Medina wall, near the southern extremity. See Babel.

SIFTI-I-IMAN, articles of belief.

SIGAPU SHANDANAM, TAM. Saunders wood.

SIGAPU SINDURAM, TAM. Red lead.

SIGARETUS, a genus of molluscs.

SIGHIMEL, EGYPT. The harsh pronunciation of Jamal, a dromedary, Camelus dromedarius.

SIGHTA, also Suhota, HIND. Sinapis dichotoma.

SIGILLI, IT. Sigillum, LAT. A seal.

SIGIRI, an ancient capital of the island of Ceylon.—*Forbes' Eleven Years in Ceylon, Vol.* ii, *p.* 1.

SIGNS of the Zodiac. See Zodiac.

SIGRUMALA and Suhajuna, SANS. Horse radish tree. Moringa pterygosperma, Hyperanthera moringa.

SIGUR, a pass leading to the Neilgherry plateau, it is clothed with forests.

SIHARU, Hind. Nussiessya hypoleuca, a shrub yielding a fibrous bark.

SIH, Pers. Three, hence,

Sih-barga, Pers. A species of Trifolium. See Grasses.

Sih-pahi, a soldier, from the tripod rest for his matchlock.

Sih-pai, a tripod table, a teapoy.

Sih-yari, a term applied to the shiah mahomedans.

SIJ, Hind., Sans. Euphorbia neriifolia, also E. netiifolia, *Linn.*, and E. nivulia, *Buch.*

SIJARA, Malay. See Jahore.

SIJDAH, Ar. Prostration in prayer.

SIJISTAN, or Seistan. A province south of Herat.

SIJU, Hind. Fraxinus xanthoxylloides.

SIK, a leopard, in Tibet or contiguous countries. Tagh, is a tiger. Somb, is a red and a black species of bear.

SIKA KAI, Guz., Hind., Tam. Acacia concinna, A rugata, Mimosa abstergens.

SIKAKUL, a root like a carrot, brought from Cashmeer; used in Ajmere; as an aphrodisiac.—*Gen. Med. Top.*, *p.* 150.

SIKAMBARI, see Inscriptions.

SIKAND, Hind., of Cis-Sutlej, sandy soil.

SIKANDA, Hind. Rosa webbiana.

SIKANDAR, Sikandar Rumi. Alexander the Great. See Alexander, Kabul.

SIKANDAR-BUT-SHIKUN, see Zingarri.

SIKANDERABAD, in lat. 17° 26′ 7″; 78° 28′ 0″ long., a military cantonment of British India, 5 miles north of Hyderabad, 1,830 feet above the sea. See Secunderabad.

SIKARTEN, Ger. Chart.

SIKAYA, Tel. Acacia concinna, Mimosa abstergens, A. rugata.

SIKERWAL, a tribe, which never appears to have claimed much notice amidst the princes of Rajasthan; nor is there a single independent chieftain now remaining, although there is a small district called after them, Sikerwar, on the right bank of the Chumbul, adjoining Jaduvati, and like it now incorporated in the province of Gwalior, in Sindia's dominions. The Sikerwal was therefore in the early part of the 19th century reduced to subsist by cultivation, or the more precarious employment of his lance, either as a follower of others, or as a common depredator. They have their name from the town of Sikri (Futtehpoor), which was formerly an independent principality.

The Byce has obtained a place amongst the thirty-six royal races, though Tod believed it but a sub-division of the Sooryavansi, as it is neither to be met with in the lists of Chund, nor in those of the Komarpal Charitra. It is now a numerous tribe and has given its name to an extensive district, Byeewara in the Doab, or the land between the Ganges and Jumna.

The Dahia was an ancient tribe, whose residence was the banks of the Indus, near its confluence with the Sutlej; and although they retain a place amongst the thirty-six royal races, there is no knowledge of any as now existing. They are mentioned in the annals of the Bhatti of Jessulmer, and from name as well as from locale, we may infer that they were the Daha of Alexander.

The Joyha race possessed the same haunts as the Dahia, and are always coupled with them. They however extended across the Garah into the northern desert of India, and in ancient chronicles are entitled "Lords of Jungul-Desa," a tract which comprehended Hurriana, Bhatnair and Nagore. This tribe, like the Dahia, was, in the beginning of the 19th century, extinct.

Mohil.—All that can be learned of the past history of this race of Rajputs, is that it inhabited a considerable tract so late as the foundation of the present state of Bikaner, the Rahtore founders of which expelled, if not extirpated, the Mohil. With the Malun, Malani, and Mallia, also extinct, it may claim the honor of descent from the ancient Malli, the foes of Alexander, whose abode was Mooltan. (qu. Mohil-t'han ?)

Nicoompa.—Of this race, to which celebrity attaches in all the Rajput genealogies, we can only discover that they were proprietors of the district of Mandelgurh prior to the Gehlote.

Raj-Pali.—This race, under the names of Raj-palica, or simply Pala, are mentioned by all the genealogists, especially those of Saurashtra, to which in all probability it was confined. This tends to make it Scythic in origin; the conclusion is strengthened by the derivation of the name, meaning 'royal shepherd:' it was probably a branch of the ancient Pali.

Dahirya.—The Komarpal Charitra classes this with the thirty-six royal races. Amongst the princes who came to the aid of Chetore, when first assailed by the arms of Islam, was "the lord of Debeil, Dahir Despati." Dahir was the despot of Sind, whose tragical and in his capital, Debeil is related by Abul Fezil. It was in the ninety-ninth year of the Hegira that he was attacked by Cassim, the Lieutenant of the Caliph of Bagdad, and treated with the greatest barbarity. Whether this prince used Dahir as a proper name, or as that of his tribe, must be left to conjecture.

The Dahima has left but the wreck of a great name. Seven centuries have swept away all recollections of a tribe who once afforded one of the proudest themes for the song of the bard. The Dahima was the lord of Biana, and one of the most powerful vassals of the Chohan emperor, Pirthwiraja. The brothers of this house held the highest offices under this monarch, and the period during which the elder, Kaimas, was his minister, was the brightest in the history of the Chohan: but he fell a victim to a blind jealousy.

The same religion governing the institutions of all the Rajput tribes, operates to counteract that dissimilarity in manners, which would naturally be expected amidst so great a variety, from situation or climate. We have the same mythology, the same theogony, the same festivals, though commemorated with peculiar distinctions. There are niceties in thought, as in dress, of little interest; the tie of a turban and the fold of a robe are distinguishing badges of tribes.—*Tod's Rajasthan, Vol.* i, *pp.* 118, 119, 121.

SIKH, the name of a religious sect in the Panjab who are the followers of Nanuk. They are principally of the Jut race and under Runjit Singh obtained sovereignty over the Panjab. As a religious sect, the Sikh looks before him only; the ductility of his youthful intellect readily receives the most useful impression, or takes the most advantageous form, and religious faith is ever present to sustain him under any adversity, and to assure him of an ultimate triumph. The progress of this sect has not been great, and after four hundred years, their numbers are only estimated at from half a million to a million. The first converts were amongst the Jut peasants of Lahore and the southern banks of the Sutlej river, and the Jut of the Manjha and Malwa districts are mostly of this persuasion, but perhaps not one-third of the whole population between the Jhelum and the Jumna, ever embraced the tenets of Nanak and Govind, the other two-thirds being equally divided between mahomedanism and brahminism. The Sikhs in the time of the guru Govind, assumed the title of Singh. This literally means a lion, but since the time of guru Govind, it is applied to all Sikhs, as their distinctive appellation, meaning metaphorically, a champion warrior. The Sikhs should abstain from the use of tobacco and all intoxicating drugs, but they all drink heavily, the military life, which the most of them adopted not being conducive to moral purity. The Akali were the zealots of the Sikh religion, soldiers of God. They wore blue dresses and bracelets of steel and claimed for themselves a direct institution by Govind Singh. They combined warlike activity with the relinquishment of the world, became the armed guardians of Amritsir, but in a phrensy of zeal would win their daily bread at the point of the sword. It cost Runjit Singh both time and trouble to suppress them. So strong is the feeling that a Sikh should work, or have an occupation, that one who abandons the world, and is not of a warlike turn, will still employ himself in some way for the benefit of the community. Thus, Major Cunningham once found an Akali repairing, or rather making, a road, among precipitous ravines, from the plain of the Sutlej to the petty town of Keeritpoor. He avoided intercourse with the world generally. He was highly esteemed by the people, who left food and clothing at particular places for him, and his earnest persevering character had made an evident impression on a hindoo shepherd boy. The name of Sikh does not indicate a race, but a body of religionists, who take their name from the hindi word, "sikhna" to learn, Sikh meaning a disciple. For a short time, the Sikh religionists rose into a great nation in the country lying between India and Affghanistan. During the 16th and 17th centuries, Nanak and Govind, of the Khutree race with their succeeding gurus, obtained a few converts to their religious views among the Jat peasants of Lahore and the southern banks of the Sutlej. Towards the close of the 18th century, they grew to be a great nation, with an influence which extended from the Karakorum mountains to the plains of Sind and from Delhi to Peshawur. Their dominions were included between the 28th and 36th parallels of north latitude, and the 71st and 77th meridians of east longitude. This tract consists of broad plains, slightly above the sea level, or mountain ranges, two or three miles high. The Sikh population of the Punjab had commonly been estimated at 500,000 souls, but Captain Cunningham considered a million would be the more correct number. The total in all India is 1¼ million. In the former Sikh territory, all were not of the Sikh religion. The people and dependent rulers of Ladakh profess Lamaic buddhism, but the Tibetans of Iskardo, the Durdoo of Gilghit and Kukka and Bimba of the rugged mountains, are mahomedans of the shia sect. The people of Kashmir, Kishtwar, Bhimbur, Pukli and of the hills south and west to the Salt Range and the Indus, are mostly sunni mahomedans, as are likewise the tribes of Peshawur and of the valley of the Indus southwards, also the inhabitants of Mooltan, and of the plains northward as far as Pind-dadun-khan, Chuneeot and Depalpoor. The people of the Himalaya eastward of Kishtwar and Bhimbur, are hindoos of the brahminical faith, with some buddhist colonies to the north and some mahomedan families to the south-west. The

Jat of the Manjha and of the Malwa districts, in the Punjab territory, are mostly Sikh, but perhaps not one-third of the whole population between the Jhelum and Jumna, has, as yet, embraced the tenets of Nanak and Govind, the other two-thirds being still equally divided between mahomedanism and brahmanism. Most of the modern Sikh in no way separate from their tribes and are known as Jat or Khatri or brahman Sikh, one member of a family being frequently a Sing'h while others are not. The written character in use with them is called Gurumukhi. It is the Devanagari, in form, but with different powers to the letters. The Sikh are the only sect whose religion forbids them to smoke tobacco. They have, however, no objection to other narcotics, opium and bhang and snuff-taking are not so common. Smoking was first prohibited by the tenth guru, Govind Sing'h, whose chief objection to it appears to have been that the habit was promotive of idleness, as people would sit smoking and do nothing. The Sikh owes his excellence as a soldier to his own hardihood of character, to that spirit of adaptation which distinguishes every new people, and to that feeling of a common interest and destiny implanted in him by his great teachers. The early force of the Sikhs was composed of horsemen, but they seem intuitively to have adopted the new and formidable matchlock of recent times, instead of their ancestral bow, and the spear common to every nation. Mr. Foster noticed this peculiarity in 1783 and the advantage it gave in desultory warfare. In 1805, Sir John Malcolm did not think the Sikh was better mounted than the Mahratta; but, in 1810, Sir David Ochterlony considered that, in the confidence of untried strength, his great native courage would show him more formidable than a follower of Sindhia or Holkar, and readily lead him to face a battery of well-served guns. The peculiar arms of the contending nations of the 18th century passed into a saying, and the phrase, the Mahratta spear, the Affghan sword, the Sikh matchlock, and the English cannon, became a proverb. From the specimen which I have seen of the Sikhs, says the Marquis of Hastings, I should describe them as a bold, athletic, and animated race. The sect of the Sikhs traces its origin to Nanuk, a hindoo of the Kshatrya caste, who was born in A. D. 1469, at Hulwandi, or Talwandi near Lahore. From his infancy he was given to religious meditation. In riper manhood he wandered into various countries, and returned to his home with his mind matured with reflection and travel to preach the unity of God and charity to men. The new creed spread rapidly, but soon provoked the persecution of the mahomedans. The cruelty with which the Sikhs were treated turned them, under Govind, their tenth and last gooroo or teacher, from a band of religious devotees into a chosen religious and military commonwealth or "Khalsa," animated with undying hatred to the mahomedans. Gooroo Govind waged an unequal war with the emperor of Delhi. Frequently defeated and broken up, persecuted with inhuman cruelty, the Sikh religionists were driven to hide themselves in the valleys and caves of the hills from the fury of their enemies. Openly to profess their religion became a capital crime. The sect would soon have been exterminated had not the distractions of the empire which followed the death of Aurungzeb, given them a breathing time from persecution. Gradually the Sikhs emerged from their hiding places, and gathering in small parties, established themselves in petty isolated forts. Issuing from these, always well mounted, they scoured the country, burning and plundering, and giving infinite annoyance to the weak mahomedan governors of Lahore and Sirhind. After the return of Ahmed Shah, Abdali, to Cabool, from his fifth invasion of India, in which he had broken the Mahratta power in the decisive battle of Paniput, the Sikhs found themselves strong enough to possess themselves of the country round Lahore. But they drew down the vengeance of Ahmed Shah, who, in 1762, returned to India, disastrously defeated them, and destroyed and polluted their sacred temple at Umritsur. From this defeat the Sikhs soon recovered. In the following year they de- the Affghan governor of Sirhind, and themselves over the plains south and east of the Sutlej, as far as the Jumna. The eighth invasion of Ahmed Shah, which took place in 1767, ended in leaving the Sikhs masters of the country between the Jumna and Rawulpindee. Within three years their authority was extended over the Jumna and the Rajputs of the lower hills. The spread of the dominion of the Sikhs south of the Sutlej received a severe check from the Mahrattas, who, recovering from their disastrous overthrow at Paniput, again overran Northern India. In 1788 Sindia was in possession of Delhi, and by 1802 the Mahrattas had established their supremacy as far as the Sutlej; and exacted from the Sikh States to the south of that river a tribute of three lakhs of rupees. But the Mahratta power in the north was broken by Lord Lake in 1803; the chiefs of Khythul and Jheend tendered their allegiance to Lord Lake, and rendered occasional service, and all the chiefs of Sirhind became virtually dependents of the British Government. It was the policy of the day, however, to maintain a strict neutrality in regard to the affairs of the chiefs, north of the Jumna, and beyond establishing the Sikh chiefs in the territories which they then held, and rewarding those who had done good service, the British Government did not interfere in their affairs till 1809, when the Sikh chiefs threw themselves on its protection from the encroachments of Runjeet Sing. One of the sirdars, who earliest raised himself to power and influence, was Maha Sing, of the Sookurchakea Misl, one of the weakest and latest formed of the twelve clans. To him, on 2nd November 1780, was born a son, Runjeet Sing, by his wife, a daughter of the rajah of Jheend. During the invasion of Shah Zaman, in 1798, Runjeet Sing rendered service to the Affghan monarch by recovering for him several pieces of artillery which had been lost in the Jhelum, and he had the address to procure for himself the appointment of Governor of Lahore. By force and artifice, Runjeet Sing gained possession of the city, where he established himself, and whence, in concert with Futteh Sing, Aloowallia, he soon extended his supremacy over the neighbouring sirdars, and meditated the extension of his authority beyond the Sutlej. In 1803 he made proposals to Lord Lake for the transfer to the British Government of the territory belonging to the Sikhs south of the river Sutlej, on the condition of mutual defence against the respective enemies of himself and the British nation. The offer was declined. In 1805 Runjeet Singh was recalled from a campaign against the mahomedans between the Chenab and the Indus, by the sudden appearance of Holkar in the Punjab, closely pursued by Lord Lake. With the death of Runjeet Singh, the career of the Sikhs, as a nation may be said to have closed. Internal anarchy led to aggressions on British territory from which war twice resulted, and finally the whole of the Sikh dominions in the Punjab, were annexed to British India.

The Grunth is the name of the sacred book of the Sikh religionists. The Grunth is written in the Gooroomooki character, a modified species of the Nagari. It is placed in the holy temple of Umritsir.

Nanuk, was the son of a grain-factor: in early life he deserted the humble shop of his father to seek in study and retirement more genial occupation for a naturally reflective mind. The tenets of the hindoo and the mahomedan of that day alike dissatisfied him; and he came forward as a reformer of his country's faith. For the gross polytheism of hindoo mythology he substituted what may be defined a high philosophic deism, and succeeded in collecting together a body of followers, whom he called the Sikhs, or "disciples;" from Sikhna, to learn, and these he organised under a theocratic form of polity, being himself recognised as their gooroo, or "teacher." For many years this body of converts continued to lead a peaceful meditative life, absorbed in the study of their holy book, the "Grunth," which contained all the recorded dogmas of their founder. They gradually spread over other parts of India, a college of them was found to exist so far south as Patna, probably founded by gooroo Tegh Bahadur, and of which an interesting account is given in an early number of the Asiatic Society's Journal, dated March 17, 1781, by C. Wilkins, Esq. But in the beginning of the seventeenth century, Govind Singh, the tenth gooroo, gave a new character to this religious community. He was a man of a naturally warlike spirit and ambitious views and thirsting to be revenged for domestic wrongs, soon converted the hitherto contemplative Sikhs into a band of warriors. These were the men who a century afterwards formed the flower of Runjeet Singh's army, and who animated with a powerful religious sentiment, in the 19th century, presented so formidable an array on the different battlefields during the Sutlej and Punjab compaigns.

The highest class amongst the Sikhs, are the Bedee. Like the Synd, who claim a priority over all mahomedans, as being lineal descendants of Mahomed, the Bedee rank first among the Sikh, as being descended from gooroo Nanuk, the founder of their sect. They form, by virtue of their descent, the hereditary priesthood. They are to be found, in greater or less numbers in all parts of the Punjab: in the districts lying at the base of the Kangra hills, at Goojranwalla in the middle of the Rechna Doab, at Gogara on the Ravee, at Shahpore on the Jhelum, and a few at Rawul Pindee; they are also occasionally to be met with to the south of the Sutlej. But their home and stronghold is at a town named after their founder, Derah Baba Nanuk, on the Ravee, near Buttalla. So notorious has been the crime of infanticide among them, that a Bedee was generally known by the opprobrious title of Kooree Mar, or "daughter-slayer." The Bedee adopted as their patronymic the name of the tribe to which their ancestor, Nanuk, belonged. But there are Bedee still of that original tribe, who are not descendants of the Gooroo, nor, indeed, Sikhs at all. With these men, pride and pride alone prompted to the crime. The fear of poverty arising from marriage expenditure would have little weight with them, as, unlike the impoverished Rajputs, they were generally men of wealth and affluence ; they held fertile jagheers, and their priestly coffers were well filled with the offerings and dues of their race. But in defence of the unnatural custom, which they did not attempt to deny, they, like the Rajput races, were ready with a traditionary obligation laid upon them by an indignant ancestor. Major Herbert Edwardes, after the Punjab campaign, held a civil appointment in the Jullundhur district, and was then brought into close contact with the Bedee, and he thus relates their story ; A daughter had been married, and when the bridegroom and his party were departing, the two sons of Dhurm Chund, as in duty bound, accompanied them to give them the Rooksat, or permission to depart, leave, or the French 'conge.' The weather was hot, the party out of temper, and they took a malicious pleasure in taking the young Bedees further than etiquette required. When the lads returned home footsore, Dhurm Chund asked 'if the Khutrees had not bid them to turn back sooner ?' The boys said, 'No ;' and it was then that the old man, indignant at all the insults which the bridal of his daughter had brought down upon him from an inferior class, laid the inhuman injunction on his descendants, that in future 'no Bedee should let a daughter live.' The boys were horror-stricken at so unnatural a law, and with clasped hands represented to their father that to take the life of a child was one of the greatest sins in the Shastras. But Dhurm Chund replied, 'that if the Bedees remained true to their faith, and abstained from lies and strong drink, Providence would reward them with none but male children ; but, at any rate, let the burden of the crime be upon his neck, and on no one else's'. And from that time forth Dhurm Chund's head fell forward upon his chest, and he ever more walked as one who bore an awful weight upon his shoulders. With consciences thus relieved, the Beedee race continued for three hundred years to murder their infant daughters, and if any Bedee, out of natural feeling, preserved a girl, he was excommunicated by the rest, and treated as a common sweeper. Through the mists of this story it seems clear that religious pride, and horror of giving a daughter to an inferior caste, and not pecuniary considerations, first led the Bedees to adopt the custom of female infanticide.

The Akali are armed Sikhs, religious devotees. They were first established by the guru Govind, the founder of the Sikh faith, and they zealously supported him against the innovations of the ascetic Banda, the byragi. Their Boonga or temple, is a fine building on the side of the holy reservoir at Amritsir and Lahore, but others are met with all over the Panjab, though chiefly in the Manja territory, between Lahore and the Gharra where Tarantara is their chief town. A considerable number are settled at Nandair on the banks of the Godavery but they are quiet and peaceable. In reality wealthy, they affect poverty and beg ; but, in the time of the Sikh rule, their begging was an insolent demanding, and as they were a bold united body who made common cause, and did not scruple to expose their own lives or to make false accusations of crimes, these wild-looking men enforced their demands with an insolent independence, which those only could understand who have witnessed a band of drunken Akali, almost in a state of nudity, brandishing their naked swords, and bawling out abusive and obscene language : their power to enforce their demands therefore was very great. They particularly showered their angry words on Europeans ; but, until Runjeet Singh mastered them, even his life was several times in danger. Under the British rule, and with power to enforce toleration, they are never heard of. They were wont to extort alms from chiefs and others, by interdicting them from the performance of religious rights, and a chief unpopular with the Akali, who made common cause with each other, risked his authority. Their name is derived from Akali-purusha, 'worshippers of the Eternal,' the word Akal being a compound of kal, 'death,' and the privative 'a' meaning 'never-dying, or 'immortal.' It is one of the epithets of the deity, and is given to this class from their frequently exclaiming 'Akal, Akal,' in their devotions. They wear blue chequered dresses, and bracelets of steel round their wrists, which all Sikhs do not wear ; though it is indispensable for a Sikh to have steel about the person, and it is generally in the shape of a knife or dagger. They formerly initiated converts, and had almost the sole direction of the religious ceremonies at Amritsir. The Akali had a great interest in maintaining the religion and government of the Sikhs as established by guru Govind, upon which their influence depended. They often went profusely armed with half a dozen swords ; perhaps a matchlock and several steel discs on their turbans.

Another account describes Nanak, the religious reformer, and founder of the Sikh faith, as born in A.D. 1469, at the village of Kanakatch near Lahore, and he died at the age of 80, at Kurtarpoor on the Ravi, in A. D. 1549. He was a Khutree by race. After prolonged travel in search of truth, he returned to his family and passed his life in calling upon men to worship the one Invisible God, to live virtuously and to be tolerant to the failings of others. His believers were named his Sikh or disciples. The Sikhs believe the spirit of Nanak to have been incarnate in each succeeding guru. The fourth guru was Ram Das, who founded Amritsir. A piece of land was presented by Akbar to Ram Das, within which a pool or reservoir was dug, since well known as Amritsir, or the pool of Immortality, but the temples and the surrounding huts were at first named Ram-Das-pur, from its founder. Arjun, his son and successor, was the first who really understood the pure doctrines of Nanak, and made Amritsir the seat of his followers. This Arjun was the fifth guru of the Sikhs, was born A. D. 1553, and died 1606. Har Govind, son of Arjun, the sixth guru of the Sikhs, was the first of them who became a military leader, as well as spiritual teacher. This impulse effectually removed the Sikhs from the possibility of becoming ascetic monks or mendicants. He became a follower of the emperor Jehangir. After a tumultuous life, during which he was often engaged in repulsing attacks made upon him, he died at Keritpur on the Sutlej in A.D. 1645: Govind was the tenth guru of the Sikhs. He introduced the Khalsa. He was born A. D. 1662, and was killed in his 48th year by two Pathans, in 1708, at Nander, on the banks of the Godavery. Banda, a byragi ascetic, succeeded Govind as the guru of the Sikhs : he was a gloomy man and in 1708, was tortured to death at Delhi, in the reign of Ferokshir, son of Bahadur Shah. Briefly reviewing the several characters of the principal gurus of the Sikhs, we may mention that Nanak disengaged his little society of worshippers from hindoo idolatry and mahomedan superstition, and placed them free on a broad basis of religious and moral purity. Umar Das preserved the infant community from declining into a sect of quietists and ascetics. Arjun gave his increasing followers a written rule of conduct and a civil organization. Hur Govind added the use of arms and a military system, and Govind Singh bestowed upon them a distinct political existence, and inspired them with the desire of being socially free and nationally independent. Grunt'h is the name given to the religious books of the Sikhs, the first of which, the Adi-Grant'h, is attributed to Arjun, who seems to have arranged the various writings of his predecessors. Mr. Prinsep says that guru Angad wrote some of the sacred books. In 1581, Arjun Mal compiled the Adi Granth. The first warlike leader, Har Govind born 1606, in 1676 reformed the government. Between 1708 and 1774, the country was infested by predatory bands, when Nan-Singh extended his rule, and died in 1792. The most famed of the Sikhs however was Runjeet Singh, born 1780, who in 1805 established the Lahore independency. The Sikh government after his death, became torn by internal convulsions, was checked by Lord Hardinge, and finally closed in the time of Lord Dalhousie.

The Sikh or Nanak Shahi, in their religious doctrines, have seven sects, amongst whom may be mentioned.

The Udasi established by Dharma Chand, the grandson of Nanak. These, as their name denotes, profess indifference to worldly vicissitudes. They are purely religious characters devoting themselves to prayer and meditation, and are usually collected in convents or colleges called Sangat. They are ascetics, though they do not solicit alms, are generally well-dressed, and celebacy does not seem imperative. Many of them are well-read in Sanscrit, and are able expounders of the Vedanta philosophy, on which the tenets of Nanak are founded, and in the Gangetic provinces, their office consists chiefly in reading and expounding the writings of Nanak and Govind Singh, as collected in the Adi Granth and Das Padshah ki Granth.

Ganj Bakshi, a small sect of no note.

Ram Raya, a small political sect, claiming for their founder, Ram Raya, who flourished in A. D. 1660.

Suthreh Shahi, whose priests lead a vagabond life, begging and singing songs of a moral or mystic tendency, but are not unfrequently gamblers, drunkards and thieves. They look up to Tegh Bahadur, father of guru Govind, as their founder.

Govind Sinhi.—Are the most important of the Sikh community, and comprehend the political association of the Sikh nation generally.

The Nirmala, who observe celibacy, and go nearly naked, in other respects resemble Udasi Sikhs.

Naga, go without clothes, but otherwise resemble the Nirmala, and unlike the saiva and vaishnava Nagas, do not wear arms.

The Sikhs, as soldiers, are brave and trustworthy, with but a very small care for caste. Impulsive beyond any other Asiatic, still they think deeply, and fully appreciate a nation's means, offensive and defensive. They respect and trust British power, and are proud in being selected as instruments for supporting so great a nation. Great Britain might do worse than consider how far it would be well to introduce a system of relie[illegible]ong the irregular infantry in India, in t[illegible]vent of war with any foreign power, and [illegible]sity arising for the British Infantry line being employed on the continent or elsewhere, their places could be taken in garrison by Sikhs.

The two great classes of Sikhs are those of the Manjha and the Malwa. The first term Manjha, is applied strictly to the southern part of the Bari Doab near Lahore and Umritsur, but vaguely includes all Sikhs to the north of the Sutlej. Malwa comprises all to the south of that river as far as Delhi and Bikaneer. The head of the latter class is the house of Pathialla with the allied families of Nabha, Jhind, Bhadour, Malod, Badruka, Jiundan, Dialpura, Laudgharia, Rampur and Kot Dhuna, and the more distantly connected houses of Faridkot and Kythal. Their ancestors were simple Jat peasants who migrated from Jeysulmere about the middle of the sixteenth century. They continued to follow the hindoo law for a century, when they adopted the new faith then preached by Govind. In the anarchy which accompanied the decay of the Mogul power, the Cis-Sutlej chiefs arose and were saved only by British interference from absorption by Runjeet Singh. Under British firm rule their law of succession adopted a consistent form. The Manjha Sikhs similarly rose to power after the last invasions of Ahmed Shah and the Affghans, till Runjeet Singh subdued them, all except the rajah of Kapurthulla, who owed his existence to the fact that his house held estates on the British side of the Sutlej. Equal division among sons was the ordinary rule of Sikh succession, and primogeniture was known, though not followed consistently, but only in the three great sects of the Phulkian clan, Pathiala, Nabha and Jhind. In theory the estate descends to the widow for life, on the failure of male heirs, but a widow needs protection and hence the custom of marrying her to one of her brothers-in-law. But such a marriage, even when not Chaddar-dalna or Chadr-andazi (throwing a sheet) or inferior, has never ranked with the vya, shadi, or regular marriage with a virgin. In polygamous cases that widow has seniority who is of the same caste as the deceased husband. The re-marriage of Sikh widows is common, and not only with brothers-in-law. Third marriages, even, are met with and termed threwa, yet suttee was prevalent before British rule, the last instance being the widow of sirdar Sham Singh Attariwala, who burnt herself with her husband's clothes the day after the battle of Sobraon. Most of the principal Sikh families are sprung from Chaddar-dalna marriages, but the custom has ceased since the recognition by the British Government of the right of adoption, the rule of primogeniture and the exclusion of females from the succession.

The succession to chiefships were governed by a rule which recognized the right of a paramount state to succeed in certain cases as the ultimate heir. In the Jhind succession case, where sirdar Sarup Singh, of Bazidpur, claimed the estate of his great grandfather raja Gajpat Singh, he desired the territory to be considered as private property and subject to the ordinary rules of inheritance. But Gajpat Singh was a talukdar of the Delhi emperor, giving him service, and paying revenue, and he was, on one occasion, carried to Delhi and kept there a prisoner for three years on account of arrears of revenue, by bakshi Najif Beg; as, for similar reasons, the Pattiala chief was captured and taken to Sirhind in the reign of Muhammad Shah, and as Bhai Lal Singh, the chief of Kythal, was carried to Delhi and there tortured. The Malwa Sikhs, when, after a period of comparative independence, they placed themselves under the protection of the British Government, they assumed to it the same position which they had held to the emperor of Delhi. Their privileges were no greater than before; their competency to alienate estates was no further extended; their relations to the paramount power were no less clearly defined. If the right of claiming escheats, on failure of lineal heirs, was denied to the British Government, its assumption of the protectorate of the states was altogether a mistake. This protectorate was a source of constant anxiety, trouble and expense. The chiefs, the moment that they had escaped the danger of absorption by the Lahore maharaja, turned their hands against each other, and their perpetual disputes and intrigues, gave rise to innumerable political complications and necessitated the maintenance of a large force on the north-west frontier. The Government of Lahore, rapacious and unscrupulous as it might be, was a thousand times better, in very way, than that of the Cis-Sutlej chiefs. In the procedure followed by Runjeet Singh, the right of collateral succession was altogether denied; and, on failure of lineal male heirs, an estate lapsed, unless the maharaja re-granted it, as was generally the case, to some near relation, on payment of a large nazrana or fine. This nazrana, paid by a collateral succeeding, was a complete admission that such succession was by favour of the supreme power, not by right; yet the Sikhs of the Manjha had a far stronger title to secure, by collateral succession, the permanency of their chiefships than those of the Malwa, for they were true conquerors, possessing the lands they had themselves won, and independent of the Delhi Government, to which the Malwa Sikhs had been subordinate, and by connection with which their privileges and rights had been reduced or modified. This view has always been upheld by the courts, and was never questioned till chiefs with a grievance began to fee English officers to write pamphlets and petitions in their favour. It is well for the empire and still better for the people of British India that the law of lapse, as followed by hindoo and mahomedan powers and recognised by all chiefs, was put in force by all Governors-General down to Lord Dalhousie. But when the British India empire had received its natural boundaries and the treading out of the Indian mutiny enabled the British at once to reward loyal chiefs and exact strict guarantees if not for the good government at least against the mis-government of their subjects in feudatory states, it was no less well that Lord Canning should abolish, or restrict, the law of lapse, by his Adoption Charter. The Sikh doctrine bears the same relation to the hindoo, as that of the Protestant christian does to the Romish. Mohan Lal mentions that the Sikh Jat are polyandrous, and that one brother takes his brother's wife. Masson also states that the Sikhs are polyandrous: but in saying this they seem to allude to the custom of Curao, also written karao seemingly from "karana," to cause to do, this being the term given among the Jat, Goojur, Ahir, and other races and tribes in N. western Hindustan to concubinage generally; but more especially to marriages of widows with the brother of a deceased husband. This practice is known to the eastward of the Punjab, by the name of Oorhai, in the Dekhan of Put'hee and, in other provinces, by the term Dhureecha, is followed among several races, but is not very openly confessed even among them, as some degree of discredit is supposed to attach to it. Amongst the Jat, it is only younger brothers who form such connections, elder brothers being prohibited from marrying their younger brothers' widows, but among the Jat of Delhi even this is not prohibited. This practice has been common among several nations of the east. The Jews followed it, and in Egypt it was admitted for a childless widow to cohabit with a brother of the deceased husband. At the time that the laws of Menu were enacted, Curao appears to have been a recognized institution, but as is not unusual with the Institutes, there is much contradiction between the enactments relating to it. From a consideration of all the passages on the subject, it appears that failure of issue was the point on which the legality turned. He who was begotten, according to law, on the wife of a man deceased, or impotent, or disordered, after the due authority given to her, is called the lawful son of the wife (Manu, ch. ix, and 176). From the fact of Draupadi marrying the five Pandu brothers, it is shown that polyandry must have prevailed amongst the heroes of that period; and if polyandry, the practice of Curao was, no doubt, not uncommon: indeed, the compiler of the Mahabharata, Vyasa, was himself appointed to raise up offspring to his deceased brother. There is perhaps no circumstance which so strongly shows the northern descent of the deified heroes, as the marriage of the five Pandu brothers. Herodotus tells us that this practice prevailed among the nomadic Scythians, as it does at present among the Bhotia. The practice is adopted also with some modifications by the Nair race of Malabar, between whom and the people of the Himalaya, Wilson traces the obscure vestiges of a connection. Amongst the Jat, Goojur and Ahir, children born to Curao are considered legitimate, and are entitled to inheritance accordingly. Children begotten by the women previous to Curao, except in the case of fraternal Curao, are known by the name of Kudhelura, and do not inherit the property of the father-in-law. Sikh-ladies knot the hair at the crown and throw a white robe over it which entirely envelopes the body and gives a conical shape to the head. Their features are sharp and angular. When a Manjee Singh dies, leaving no male offspring, his brothers, or his nephews of the full blood, assume the right of succession, to which the widow or widows become competitors. According to the shastra (if they may be considered applicable to public property and chiefships), the prior title of the widows is held; but, as the Sikhs follow the custom, termed karao or chad'r-dala or chad'r-andazi, which obtains in every family, with the exception of those of the Bhaee, the eldest surviving brother of the deceased places a white robe over, and the nuth, or ring, in the nose of, the widow, which ceremony constitutes her his wife. This practice accords with the hindoo and Mosaic laws, (Deuteronomy, chap. xxv, 5 to 10) and acts as a counter-agent to the many evils attendant on female rule. If the free-will of the widow were consulted, it is scarcely to be doubted, she would prefer the possession of power, and the charms of liberty, to the alternative of sacrificing her claims to her brother-in-law, and taking her station amongst his rival wives. Judging from the masculine disposition, want of modesty and of delicate feeling, which form the characteristic features of Sikh females, necessity, and not choice, must have led them to yield to the adoption of an usage, which must often be repugnant to their natures, and disgusting to their thoughts. Yajnyawoleya says, "If a brother die without male issue, let another approach the widow in the proper season." And Menu ordains, "having espoused her in due form, she being clad in a white robe." The Bhaee tribes of Khytul and other places, although they reject the union by kurawa, yet set aside the claims of a widow, in favour of the brothers and nephews of one dying without male issue. The widows of the Bhaee tribes receive small jagirs for their support during life. Captain Cunningham, writing of the Sikhs whilst they were still a ruling nation, says a living spirit possesses the whole Sikh people, and the impress of Govind has not only elevated and altered the constitution of their minds, but has operated materially and given amplitude to their physical frames. The features and external form of a whole people have been modified, and a Sikh chief is not more distinguishable by his stately person and free and manly bearing than a minister of his faith is by a lofty thoughtfulness of look, which marks the fervour of his soul, and his persuasion of the near presence of the Divinity. This physical change has been noticed by Sir Alexander Burnes, (Travels, i, 285, and ii, 39), by Elphinstone; (History of India, ii, 564), and it also slightly struck Malcolm (Sketches, p. 129.) Similarly, a change of aspect, as well as of dress, &c., may be observed in the descendants of such members of hindoo families as became mahomedans one or two centuries ago, and whose personal appearance may yet be readily compared with that of their undoubted brahminical cousins in many parts of Malwa and Upper India. The whole character of individuals seems ennobled on their becoming mahomedans, and the natural dignity of the human race is never more beautifully seen than when a mahomedan calmly but proudly says mai moosalman hoon: and so it is with the Sikh sect whose open manly bearing is a conspicuous feature in their character. The Sikhs wear a kind of breeches instead of girding up their loins after the manner of the hindoos. The adoption of the "hutch," or breeches, is of as much importance to a Sikh boy as was the investiture with the "toga virilis," to a Roman youth. The Sikh women are distinguished from hindoos of their sex by some variety of dress, but chiefly by a higher top-knot of hair.

The Sikh, or Nanuk Shahi, are classed under seven distinctions, all recognizing Nanuk as their primitive instructor, and all professing to follow his doctrines, but separated from each other by variations of practice, or by a distinct and peculiar teacher. At the risk of some repetitions, the following notices of the sects may be given;

The Udasi may be regarded as the genuine disciples of Nanuk, professing (as the name denotes) indifference to worldly vicissitudes. They are purely religious characters; devoting themselves to prayer and meditation, and are usually collected in their sangat, colleges or convents, they also travel about to places of pilgrimage, generally in parties of some strength. They profess poverty, although they never solicit alms; and although ascetics, they place no merit in wearing mean garments, or dispensing altogether with clothes; on the contrary, they are in general well dressed, and, allowing the whiskers and beard to grow, are not unfrequently of a venerable and imposing appearance. Though usually practising celibacy, it does not appear to be a necessary condition: they are generally the ministrant priests, but their office consists chiefly in reading and expounding the writings of Nanuk and Govind Singh, as collected in the Adi Grant'h and Das Padshah-ki-Grant'h. With that fondness for sensible objects of reverence which characterizes the natives of India, the book is also worshipped, and rupees, flowers, and fruits are presented by the votaries, which become, of course, the property of the officiating Udasi. In return, the Udasi not uncommonly adopts the presentation of the Prasada. Mr. Moorcroft said he had seldom met with persons of more simple, unaffected, and pious manners than the Udasi.

The Ganj Bakshi division is not numerous, and little is known of it.

The Ramrayi derive their appellation from that of Ram Rai (son or grandson of Har Rai),' who disputed unsuccessfully the succession to the pontificate with Har Krishin, son of Har Rai. Their distinction from the other Sikhs is more of a political than a religious complexion.

The Suthreh Shahi are more common than the two preceding; they lead a vagabond life, begging and singing songs, mostly of a moral or mystical tendency. They are not unfrequently gamblers, drunkards, and thieves, and are held in great disrepute. They look up to Tegh Bahadur, the father of guru Govind, as their founder.

The Govind Singhi form the most important division of the Sikh community; being, in fact, the political association to which the name is applied, or to the Sikh nation generally. Although professing to derive their national faith from Nanuk, and holding his memory in veneration, the faith they follow is widely different from the quietism of that reformer, and is chiefly of a worldly and warlike spirit. Guru Govind devoted his followers to steel, and hence the worship of the sword, as well as its employment, against both mahomedans and hindoos.

By his institutions he separated the Sikhs, in political constitution as well as religious tenets, from the hindoos, though they still worship the deities of that people, and derive their legends from the same source. The Govind Singhi pay great veneration to brahmins, notwithstanding their avowed rejection of caste.

The Nirmala differ but little from the Udasi, and are, perhaps, still closer adherents to the doctrines of the founder (as the name imports), professing to be free from all worldly stain, and leading a wholly religious life. They observe celibacy, and disregard their personal appearance, often going nearly naked. They are not, like the Udasi, assembled in colleges, nor do they hold any particular form of divine service, but confine their devotion to speculative meditation on, or perusal of, the writings of Nanuk, Kabir, and other Unitarian teachers. They are always solitary, supported by their disciples or opulent individuals, and are often known as able expounders of the Vedanta philosophy, in which the brahmins do not disdain to become their scholars.

The Naga or naked mendicants, are not distinguishable from the Nirmala, except in going without clothes.

Masson says it is no unusual arrangement for the many brothers of a family to have a wife in common, and he had known the soldiers of M. Allard request permission to visit their homes, alleging that their brothers had gone on a journey, and their wives are alone. The plea was considered a good one. Such customs must not be imputable to them as Sikhs, they are rather the remains of an ancient and rude state of society. It must also be observed, that trespasses on the rules of decency must be made by themselves and amongst themselves ; liberties taken by strangers would be held as crimes, and resented accordingly.

The Sikhs in the time of the guru Govind, assumed the title of Singh. This literally means a lion, but since the time of the guru Govind, it is applied to all Sikhs, as their distinctive appellation, meaning metaphorically, a champion warrior. The Sikhs should abstain from the use of tobacco and all intoxicating drugs.

. The bulk of the Sikh sect are converts from the Jat, a great race, along the banks of the Indus from the Panjab to Sindh and to the banks of the Jumna in Hurriana, in the N. West Provinces, Bhurtpore, Dholpor and Bekanir, some of whom according to Wilson claim to have come from Ghuzni and the far west and others claim to be descended from the Yadu, the rajah of Bhurtpore is a Jat. They are supposed to be the descendants of the Getæ and Yue-chi of antiquity. They are a bold industrious people, and there are two sub-divisions of them, the Dhe and Hele, or Pach-hade and Deswale, but there are many tribes. They are partly of the Sikh, partly hindoo and partly of the mahomedan religion.

The Gurumukhi is a modification of the Devanagari alphabet devised by the Sikhs : it does not differ in shape, but the forms of many of the letters are interchanged. The institutionary discipline of a young Khalsa Sikh is very compendious : when he can bend a bow, wield a sabre, and mount a horse, his instruction is completed. Talking aloud is so habitual to a Sikh that he bawls a secret in your ear, a boisterous and rude habit due perhaps to their living almost constantly in a camp, in which the voice certainly loses that nice modulated tone which distinguishes the more polished inhabitants of cities. When Ranjit Singh died, his corpse was placed upon a splendidly gilt car, constructed in the form of a ship, with sails of gilt cloth to waft him into paradise. It was borne upon the shoulders of soldiers, preceded by a body of native musicians, playing their wild and melancholy airs. His four queens, dressed in their most sumptuous apparel, then followed, each in a separate gilt chair, borne upon the shoulders of their attendants ; the female slaves following on foot. Before each of the queens was carried a large mirror, and gilt parasol, the emblems of their rank. After them came the successor to the throne, the maharajah Kurruck Singh, attended by the whole of the Sikh sirdars, barefooted, and clothed in white, none but persons of noble rank being permitted to join the procession To the last moment, the queens exhibited the most perfect equanimity, far from evincing any dread of the terrible death which awaited them, they appeared in a high state of excitement, and ascended the funeral pile with alacrity. The slaves also appeared perfectly resigned, but less enthusiastic. The body of the maharajah having been placed upon the pile, his queens seated themselves around it, when the whole were covered over with a canopy of the most costly Kashmir shawls. The maharajah Kurruck Singh then taking a lighted torch in his hand, pronounced a short prayer, set fire to the pile, and in an instant the whole mass, being composed of very ignitible material, was in flames. The noise from the tom-tom drums and shouts of the spectators immediately drowned any exclamation from the wretched victims. It was with some difficulty that the rajah Dhyan Singh (Runjeet's minister), under strong excitement, was prevented from throwing himself into the flames. Considerable doubt has been thrown over the sincerity of this intended act of self-devotion; but the general opinion was that he fully intended it from the apparent absence of any motive for hypocrisy. The ashes of the founder of the Sikh dynasty were afterwards collected together and thrown into the Ganges, in conformity with the religious custom of the country.—*Malcolm's Sikhs, pp.* 7, 116, 129-130; *Steinbach's Punjaub, pp.* 18-19; *Major H. SIKHA, SANS. The tuft of hair which hindoos are accustomed to leave when shaving their heads is called in Sanscrit the Sikha, in Tamil the Kudumi; a considerable number of European missionaries have come to regard the wearing of this tuft as a badge of hindooism, and require the natives employed in the missions to cut off their kudumi as a sine qua non to their retention of mission employment. The idol-worshipping hindoos believe that the top of the head including the anterior and posterior fontanelles is the most sacred part of the body. They say that the fontanelle is the residence of the deity, and call it the 'top eye.' They think also that it is the fountain of the generating fluid of man which supplies the lower members of the body when required; they consider that such holy and useful parts of the body must not without good reason be left uncovered and hence they say is the necessity of protecting those spots by a tuft. A sect of sanyasi, however, walk about with bald heads pretending that they have entirely renounced the world, passed the lower steps of ritualism in the ladder to ascend to heaven and are living in close communion with God, constantly looking at him with their top eye. The sanyasi of this sect do away with their sacred thread, also, evidently showing that they regard the kudumi in the same light as the other ceremonies belonging to the lower step of the heavenly ladder. When a hindoo wife is in the family-way the husband allows his hair to grow without being shaved. After the confinement, if the child be a boy, he, on the 16th day, rises up early in the morning, performs ablutions, comes home with a wet head, enters the room where the child is laid, takes a few drops of water from his wet kudumi, pours them into the child's mouth and then for the first time sees and handles the child. After this ceremony he shaves his hair as usual. When the hindoo parents think it necessary to shave the head of the child they consult an astrologer who fixes an auspicious day when the barber is invited to do his duty. A small image of Pillayar, the son of Siva, is made, before which, on a plantain leaf, a thali or platter filled with paddy, a broken cocoanut, and some plantain fruit are laid and incense offered to the image. The barber puts his razor before the image and worships it, and then begins the sacred rite of shaving, by putting his razor around the "top eye" and leaving a circular portion of hair over the sacred spot unshaven. The brahmin father holds the hair of the child at the crown of the head, and puts the razor around it, while his guru repeats certain mantra and then shaves the rest of the hair himself, or asks somebody else to do it. It is the custom with certain castes to wet the head with the juice of the cocoanut kernel beginning with the circular portion of hair to be left as kudumi. A portion of the juice thus used is then poured at the foot of a palmyra tree as an offering to Parvati, the sakti or consort of Siva. The hindoo believes that the way of extracting toddy from the palmyra was taught by Parvati, and to this day it is the custom of the palmyra-climbers to make special offerings to her when they begin their career. The hair shaven from the head of a little child, especially from the head of the first-born, must not be thoughtlessly thrown away, inasmuch as it is derived from the father of the child, who allowed his hair to grow unshaven with a special vow for the safety of the child from the time of its conception till its birth. Some old men say that it was formerly the custom to burn the hair with certain ceremonies as the Nazarites of the Hebrews did theirs. The shaven hair is now in general carefully enclosed in a silver case, and tied around the waist of the child as an amulet to ward off sickness. Some people tie them in a cloth and carefully preserve them in pots. The circular portion left on the head must be carefully kept and oiled, while the rest of the hair shaven must thus be respectfully treated, otherwise the prosperity and welfare of the child is endangered If the parents lose their children successively one after another, they keep the kudumi at the back of the child's head on the posterior fontanelle, and if the child survive the period in which the one previous to it died, the parents go about asking alms, make a feast to the pandarams, take off the "tail" as it is called, and then remove the kudumi to the front of the head.

When a boy has become old enough to go to school, or has so far advanced in study as to begin to write on the cadjan or palm leaf, a feast is made by the parents and in one corner of the house previously daubed with cow-dung, a small image of Pillayar is made, before which is placed an offering of plain fruit and cocoanuts. The schoolmaster writes in a cadjan book, respectfully places it before the image, and worships it. The boy is then called before the image, and while he is standing there with great veneration and awe, the schoolmaster touches him by his kudumi, divides it into three parts, and after having plaited them together, puts over the kudumi at the crown of the head some raw rice and some sacred amgu grass and worships it. Some add to these things, a little raw paddy, sacred ashes and flowers, and tie them in the plaited kudumi. The schoolmaster then respectfully takes the cadjan book, and delivers it into the hands of the scholar, while the scholar respectfully puts the cocoanut and the other offerings into the hands of the schoolmaster, and while doing so, the scholar is taught to repeat some congratulatory words thus :—" Book and learning to me. Cocoanut and money to the teacher." It was formerly the custom with several lads to wear their hair long, tied up in a knot at the back of the head nearly after the manner in which women usually wear their hair. This, however, was not usual before they became of age unless under peculiar vows. The devotees of Parvati believe that their goddess is extremely pleased with this fashion, and in honour of her still wear their hair in this manner. The Maravar caste in South Travancore wear kudumi until they are about 12 years of age, and then allow their hair to grow long, and tie it up in a knot at the back of the head. Until very recently each caste differed from another in the way of wearing the kudumi. A Shanar never dared to imitate a brahmin, nor a Pariah a Soodra. Although the sacred spot of the head which ought to be adorned with the kudumi did not differ, yet the manner, quantity and position of the kudumi differed in each caste.. The chief use of the kudumi, however is in the performance of a funeral ceremony urgently necessary for the salvation of a married man. A Tamil poet in describing the lamentations of a king who performed penance for obtaining the gift of a son, says that a father can enter Siva's paradise in no other way than by his son performing the funeral ceremony. The hindoos believe that a man so soon as he is married, commits a serious sin that renders him liable to hell. When he dies he has no alternative but to suffer its torments unless prevented by the ceremony which his son performs. In order to quench the fire of hell, the son must uncover the sacred portion of his head by shaving off the kudumi, must put upon it a new pot full of water, that it may therefrom absorb the virtue of quenching the hell fire, must walk with it three times around the deceased parent, each time cutting a new hole in the pot that the water may sprout out as he walks along, and on the third time must break the pot at the head of the bed of the deceased parent, and pour a few drops of this sacred water into the mouth of the corpse in the same manner as the parent poured a drop of water into the mouth of the son while an infant. He also puts a small coin into the mouth that the deceased may reward with it the porter of the next world. The Romans also did so that the deceased might pay Charon the ferry-man of hell for a passage across the Styx. The cutting off of the kudumi on this funeral occasion is not regarded as a token of sorrow but is considered as an essential requisite for performing the funeral ceremony which is absolutely necessary for the eternal welfare of the deceased parent. No one but the heir of the deceased cuts off the kudumi, and that at no other time but on the occasion of the parent's death. A father may lose a dozen children but he never thinks of shaving off his kudumi as a sign of sorrow. On the 16th day it is generally the custom to perform another ceremony in order to send up the spirit of the deceased to heaven, for, until the ceremony is performed, the spirit of the deceased is supposed to hover about the grave. After this the son allows his hair to grow for one year as a token of sorrow, at the expiration of which he makes a feast to brahmans and others, shaves his hair and wears the kudumi. It is true that the hindoo races of brahmans styled the twice-born, do not cut off the kudumi on the occasion of performing the ceremony for the deceased parent, because his being regenerated by the sacred thread, imparts full power to his prayers and other ceremonial that are absolutely necessary for the salvation of the deceased parent. The Chinese who wear their hair very much like the kudumi, believe that unless certain ceremonies are performed with a knot in the kudumi, the deceased cannot go to heaven. From what certain Tamil poets have sung, it is evident that they have regarded the kudumi in the same light as the sacred thread of the brahmans. One says, 'What is caste but the sacred thread and the kudumi.' Another says, 'The sacred thread, kudumi and other ceremonies of the brilliant sacred writings were they born with you ?' In a letter sent by a learned caste hindoo, he says, wearing the kudumi is as important to us as the sacred thread is to a brahman. Not to wear the kudumi renders a man guilty, and liable to hell, Naraga-prerbathee. The goldsmiths say that their god Visvakarma sprung from the third eye of Siva with sacred thread and kudumi, and that his devotees wear kudumi in order to resemble him just as the Saivaite devotees wear the Chadei in order to resemble Siva. Herodotus says that the Arabians cut their hair in such a manner that the circumference of their head is found to be round all about as if they had been cut with a bowl in imitation of Bacchus and in honour of him. He says also that the Macians, a people of Sybia, cut their hair round so as to leave a tuft on the top of the head. We learn from Homer that it was customary for parents to dedicate to some god the hair of their children which they cut off when they came to manhood. Achilles at the funeral of Patroclus, cut off his golden locks which his father had dedicated to the river-god Sperchias. From Virgil it appears that the topmost lock of hair was dedicated to the infernal gods. In Athens it is said Hercules and Apollos were the chief deities selected for dedicating the hair, to the first by the humbler part of the community, and the latter by the more wealthy. Tertullian speaks of an extraordinary rite about the dedication of the hair of infants which was practised even before they well had any hair, and that cut off when they were named. One of the rites pleasing to Siva of the hindoos, is wearing sikha, and his son Pillayar is invoked when any infant's head is to be shaved. Parvati is said to be pleased with Kondei, another form of the sikha. Parvati the mother of the world corresponds with Magna Mater, the grandmother of Bacchus.

A remarkable command is given to the Israelites in Lev. xix, 27 :—" He shall not round the corners of your head or literally 'ye shall not go round,' *i. e.*, with a razor, 'the sides of thy head.' " The Septuagint renders this, 'Do not make Sisoen of the hair of your head.' The Greek Lexicographers say that Sisoen though not a Greek word means a lock, or circular portion of hair left unshaven, and consecrated to Saturn. This Saturn is the grand-father of Bacchus, who is thought to correspond with Siva. In some respects Saturn also resembles Siva. A recent commentator says on the above text, 'It seems probable that this fashion had been learned by the Israelites in Egypt, for the ancient Egyptains had their dark locks cropped short or shaved with great nicety, so that what remained on the crown appeared in the form of a circle surrounding the head. Frequently a lock or tuft of hair was left on the hinder part of the head, the rest being cut round in the form of a ring, as the Turks, Chinese, and Hindoos do at the present day.

Poole says, 'the Gentiles cut their hair for the worship of devils or idols to whom young men used to consecrate their hair as Homer, Plutarch and many others write.' Professor Vitringa looks upon this manner of trimming the hair in a circular form while the rest of the head is shaven, as a symbol of the sun equally diffusing his rays which the ancients called his hair. The Romans are said to have worn the hair of the head uncut, either loose or bound behind in a knot and consecrated it to Apollos.

The Kammalar, a sudra race of South Travancore, contend that the kudumi originally belonged to them, and that the brahmins afterwards copied it from them. The author of the Arunachala Purana describes the demons who accompanied Veeraputram in his expedition against Dacca, with kudumi. These demons can refer to no other than the aborigines of Southern India, who molested the Aryans in the performance of their religious ceremonies. See Hair.

SIKHAMHAT, Hind. ? A tree of Chota Nagpore, with a hard, yellow timber.—*Cal. Cat. Ex.* 1862.

SIKHARI, a mountain stronghold or hill-fort.—*Forbes' Eleven years in Ceylon, Vol.* ii, *p.* 2.

SIKHI, Hind., of Murree, &c. Euonymus fimbriata or E. hamiltonii.

SIKHUNAS, see Jatamansi.

SIKI, Hind. Euonymus fimbriata.

SIKIM is called See-i by the Nepaulese, and by the Sikimese themselves is styled Deejon or the Rice-growing place. Sikim occupies an intermediate position between Nepal and Bhotan : a considerable part of it belongs to the British, the rest is maintained by British influence and authority. Sikim is the country between the Teesta river and the Singhaleela ranges and consists of the valley of the Teesta river, which with its tributaries drain the whole territory. Its great tributary is the Ranjit river which, at first separated by a mountain range, joins it from the west, flowing for a short distance parallel to the plains, through a deep ravine not 1,000 feet above the sea, to the north of a transverse range elevated 28,000 feet. Being opposite to the gangetic valley, it is open to the full force of the monsoon, its rains therefore are heavy, almost uninterrupted, and are accompanied by a dense fog and a saturated atmosphere. The rainy winds sweep almost without interruption up to the base of Kanchinjanga, (28,178 feet) the loftiest mountain and most enormous mass of snow in the world. The snow-level is here 16,000 feet. The two principal sources of the Teesta river are the Lachen and the Lachung, these run in two valleys which are separated by a lofty snowy range projected to the south-west, the valleys are somewhat sheltered, and the perpetual snow-line rises to above 18,000 feet. From the level of the sea to an elevation of 12,000 feet, Sikim is covered with dense forest of tall umbrageous trees. At 10,000 feet, on the summit of Tanglo, yew appears. There are in Sikim about 2,770 species of flowering plants and 150 ferns. In the Darjeling district, in addition to the Europeans, hindoos and mahomedans from the plains, the population consists of Nepalese ; of the Bhoteah from Bhutan, Tibet and Sikkim ; of the Lepcha and Mechi who are considered the prior occupants of Sikim. The Rajbansi of Sikim are the Koch or Kooch race, of the same descent as the rajah of Cooch Bahar, on which account they call themselves Rajbansi. In the plains of Sikim, the Raj-bansi and Bengali are in equal numbers. The Mechi inhabit that portion of the Terai, which lies under the hills. They are a migratory race who have no caste distinctions and live by cultivating the virgin soil. The country of Sikim and Darjeling is the land of the Lepcha, a Bhot race who are hemmed in between the Newar and other Nepal tribes and the L'hopa of Bhutan on the east, the Lepcha area being barely 60 miles in breadth. His physiognomy is markedly Mongolian, stature short, from 4 feet 5 inches to 5 feet ; face, broad and flat, nose depressed, eye oblique, chin beardless, skin sallow and olive, with a little moustache on the lips: broad chest and strong-armed but small-boned with small wrists, hands and feet. The Lepcha is honest, timid and peaceful with mild and frank features. The Lepcha are a dirty, good-natured people, resembling in character the Mongol beyond the Chinese wall. The Lepcha throws over him loosely a cotton cloak striped with blue, white and red, and uses an upper garment with sleeves in the cold weather : a broad umbrella-shaped hat of leaves and a pent house of leaves in the rains. The women dress in silk skirt and petticoat, with a sleeveless woollen cloak. The Lepcha man carries a long, heavy and straight knife serving for all purposes to which a knife can be applied. They drink the Murwa, the fermented juice of the Eleusine coraçana, which gives a drink, acidulous, refreshing and slightly intoxicating, and not unlike hock or sauterne in its flavour. Their songs and the music of their bamboo flute is monotonous. They marry before maturity, the brides being purchased by money or service. The Lepcha, like the Borneo Dyak, kindle a fire by the friction of sticks. The Lepcha burn or bury their dead. In their food they use mountain spinach, fern tops, fungi and nettles. Their ailments are small pox, goitre, remittent fevers and rheumatism. Darjeling has a mixed population of the Sikim, Nepaul and Dharma Bhoteah, also Lepcha and Pahari. Dr A. Campbell tells us that a gradual increase of population has taken place under British rule ; from a few scattered tribes in 1853 to upwards of 60,000 in 1870. They consist of Brahmins and Rajpoots, few in number, with a sanscritic tongue, and an Indo-European physiognomy, confined to Nepal. The Rhu, Majar and Goorong, a mixture of hindoos and Mongolians with features of a type belonging to the latter, comparatively free from caste prejudices and speaking the Parbutta dialect. They are short and squat highlanders, and make good soldiers. The Bhoteah, Lepcha, and Moormi are buddhist and speak the Tibetan language. They are strong and active and incline strongly to the Mongolian race. The Limbo, Sunwar and Chepang possess a small Mongolian type, strongest in the Limbo, and their language is referable to either the Tibetan or Indian standard. The Mechi, Dhimal and Gharo are lowland tribes with a Mongolian physiognomy, but are neither hindoos, buddhists nor mahomedans. The Tharoo and Dhunwar are buddhists or mahomedans with fair and barely Mongolian features. The Bahir, Kebent, Amatti, Maralia, Dhanook and Dom are not Mongolian, but a dark race speaking Hindi or Bengalee. The Koch or Raj-bansi are a race of dark hindoos inhabiting the Terai of Nepal and Sikim, but who have spread into British territory. The term Sikim Bhotea is applied to the more recent immigrants from Tibet, who have settled in Sikim, and are an industrious, well conducted people. The Bhotea, again, of Bhotan, to the eastward, bear the worst reputation (and most deservedly) of any of the numerous people who flock to Darjeling. These should not be confounded with any other Bhotean tribes of Thibet, Sikkim or Nepal. The mountain slopes are so steep, that the spurs, or little shelves, are the only sites for habitations between the very rare flats on the river banks, and the mountain ridges, above 6,000 feet, beyond which elevation, cultivation is rarely if ever carried by the natives of Sikim. Firing the forest is so easy in the drier months of the year, that a good deal of cultivation is met with on the spurs, at and below 5,000 feet, the level most affected by the Lepcha, Limbo and Sikim Bhotea. The varieties of grain are different, but as many as eight or ten kinds are grown without irrigation by the Lepcha, and the produce is described as eighty-fold. Much of this success is due to the great dampness of the climate ; were it not for this, the culture of the grain would probably be abandoned by the Lepcha, who never remain for more than three seasons on one spot. The average rain-fall at Naini Tal is 88 inches. Naini Tal is elevated 6,500 feet on the last spurs of the Gogar, overhanging the plains of Rohilkhund. Almorah is 15 miles further than Naini Tal from the plains and it is at 5,500 feet, but only 34 inches of rain-fall. The fall at Darjeling is 165 inches. Oak trees, maple and other mountain trees throw out great knots in the places to which the Balanophora attach themselves. These knots are hollowed out into the wooden cups by the Lepcha of Tibet. Some of the Lepcha cups are supposed to be antidotes to poison ; they are of a peculiar pale coloured wood and cost a great sum, but common cups cost only 4*d*. or 6*d*. They are all imported into Tibet from the Himalaya. The Lepcha have no caste distinctions, but they speak of themselves as belonging to one or other of the following sections :—

Burphoong Phoocho.
Udding Phoocho.
Thurjokh Phoocho.
Sundyang.
Sugoot.
Tungyeld.
Lucksom.
Therim.
Songme.

Captain J. D. Herbert, when writing of the Lepcha race, described them as the same people whom he had met with at Nailang, at Jahnabbi, at Shipchi on the Sutlej, in Hangarang, and at Lari in Ladak. They are, he says, in fact the people who have been erroneously called Chinese Tartars and are in reality of the same race as the Tibetans, being a family of the great division of Eleuth Tartars or Kalmuks. Sikim contains the Lepcha and Limbu dialects. The Sikim Terai gives us the Dhimal, the Bodo or Mechi and the Koch which latter also occupy the plains of Koch Bahar, and the northern parts of Runjpoor, Dinajpoor and Purneah. At the base of the Sikim Himalaya, under the hill station of Darjeeling the great mass of the lofty hills is composed of schistoze rocks of various characters considerably disturbed and contorted. These are decidedly different from, and more recent than, the gneissoze rocks of the greatest portion of India. Near the base of the hills, and faulted against these rocks at high angles, there is a small extent of sandstone and black shales, which contain vertebrata, pecopteris, &c., similar to those occurring in the great coal-fields of Bengal. These fossils are peculiarly interesting, from the fact of their being changed into graphite, and occurring in beds which themselves have a very strongly marked graphitic character. They are of very limited extent ; the greater portion of the sandstones, which in this section exhibit a thickness of some thousand feet, belonging to a series of a much more recent date, and which has been subjected to a much smaller amount of disturbance and alteration. This upper group contains many large stems, in all observed cases prostrate, and in most cases giving evidence of great wear and long exposure previously to being imbedded ; and in some of the finer and more earthy deposits an abundance of leaves occur, of the same general character as those occurring in Burmah and Tenasserim. This group was therefore provisionally referred to the pliocene age. No traces of the great nummulitic series have been observed in this district. The whole of Sikim presents a region of flora which is the best investigated of any district east of Kumaon, and unites the floras of Nepal, Bhotan, East Tibet, and the Khassia mountains, being hence, in a geographico-botanical point of view, one of the most important provinces in India, if not in all Asia. In Sikim and Bhootan there are twelve Coniferæ, viz., three Junipers, Yew ; Cupressus funebris, Abies webbiana, A. brunnoniana and A. smithiana, Larch, Pinus excelsa and longifolia, and Podocarpus neriifolia. Four of these, viz., Larch, Cupressus funebris, Podocarpus neriifolia and Abies brunnoniana, are not common to the north-west Himalaya, west of Nepal, and the other eight are common. The region of Sikim is perhaps the most productive in fleshy fungi of any in the world, both as regards numbers and species, and Eastern Nepal and Khassia yield also an abundant harvest. The forms are for the most part European, though the species are scarcely ever quite identical. The dimensions of many are truly gigantic, and many species afford abundant food to the natives. Mixed with European forms a few more decidedly tropical, and occurring amongst those of East Nepal is a Lentinus which has the curious property of staining every thing which touches it of a deep rhubarb yellow, and is not exceeded in magnificence by any tropical species. The Polypori are often identical with those of Java, Ceylon, and the Philippine Isles, and the curious Trichocoma paradoxum which was first found by Dr. Junghuhn in Java, and very recently by Dr. Harvey in Ceylon, occurs abundantly on the decayed trunks of laurels, as it does in South Carolina. The curious genus Mitremyces also is scattered here and there, though not under the American form, but that which occurs in Java. Though Hymenomycetes are so abundant, the Discomycetes and Ascomycetes are comparatively rare, and very few species indeed of Sphæria were gathered. One curious matter is, that amongst the very extensive collections which have been made there is scarcely a single new genus. The species moreover in Sikim are quite different, except in the case of some more or less cosmopolite species from those of Eastern Nepal and Khassia : scarcely a single Lactarius or Cortinarius for instance, occurs in Sikim, though there are several in Khassia. The genus Boletus through the whole district assumes the most magnificent forms, which are generally very different from anything in Europe. Yoksnn, in Sikim, occupies a very warm sheltered flat and about it many tropical genera occur, such as tall bamboos of two kinds, grasses allied to the sugarcane, scarlet Erythrina, and various Araliaceæ, amongst which is one species whose pith was of so curious a structure, that Dr. Hooker had no hesitation in considering the then unknown Chinese substance called rice-paper to belong to a closely allied plant. The natives of Sikkim collect the leaves of many Aralias as fodder for cattle, for which purpose they are of the greatest service in a country where grass for pasture is so scarce : this is the more remarkable since they belong to the natural family of ivy, which is usually poisonous. The use of this food however gives a peculiar taste to the butter. In other parts of Sikkim, fig leaves are used for the same purpose, and branches of bird-cherry, a plant also of a poisonous family, abounding in prussic acid. The only Aralia occurring in S. E. Asia, is A. papyrifera. Others of this genus are well known in America : and the young shoots and roots of Dimorphanthus edulis are used as food in China and Japan.—*Dr. Latham's Descriptive Ethnology* ; *Gleanings of Science, p.* 939 ; *Dr. Campbell in Royal Geographical Society's Journal* ; *Hooker's Him. Journal, Vol.* i, *p.* 359 ; *Hogg's Vegetable Kingdom, p.* 390. See Bhothea, Himalaya, India, Lepcha, Limbu.

SIKOFF, see Japan.

SIKRAM-PO, TAM. A gig, a buggy.

SIKTHA, SANS. Wax.

SIL, HIND. Amarantus anardana, also Imperata kœnigii, also Celosia argentea.

SIL, HIND. A slab, a stone on which spices, &c., are ground, resembling an oilman's grinding stone and muller, but the surfaces are rough.

SILAAM, NEP. An oil seed from Nepal.

SILAHDAR, an armour-bearer, a mounted soldier providing his own horse and armour.

SILAJITU, TEL. Ophelia elegans, *R.W.*

SILAR, a river of Rewah.

SILARAS, TEL. Ophelia elegans, *Wight.*

SILARUMBA, SANS. Canna indica.

SILASSATTU, TEL. Agathotes chirayta, *G. Don.*

SILCHAR, the chief town of Cachar. It is 300 miles from Calcutta, on the Barrak river.

SILEIN, HIND. Alnus, *sp.*

SILENACEÆ, the Dianthus tribe of plants comprising 12 genera. They are natives of America, Mexico, Straits of Magellan, Europe, the Canaries, the Levant, N. Africa, the Altai Siberia, Tauria, Caucasus, Arabia, Persia, Tartary, China and Japan, 32 species have been found in Southern and Eastern Asia, in Arabia, Persia, Himalaya, Kashmir, Kunawar, China and Japan, all with unimportant properties but several species are cultivated as ornamental flowering plants.

Dianthus arbuscula, *Lindl.*, China.
" chinensis, *Linn.*, China.
Cucubalus bacciferus, *Linn.*, Europe, Himalaya.
Silene inflata, *Sm.*, Europe, Himalaya, Kemaon, Nepal.
Silene viscosa, *Pers.*, Europe, Levant, Kanawar.

A species of Silene, grows in China, called there, Wang-puh-liu-hing. Its dark reddish roundish seeds, resembling turnip seeds, are believed to be vulnerary, styptic, diuretic, galactagogue, discutient and solvent, and are a common remedy taken by soldiers after injuries. Silene compacta, the Catch-fly, are elegant flowering plants, of easy culture from seed, the flowers are of various colours, and require only the same treatment as the other species of Lychnis. The Silene inflata, or inflated Catch-fly or Bladder campion ; its young shoots combine the flavour of asparagus and peas.—*Riddell, Voigt.*

SILENUS VETER, *Gray, Blyth, Horsf.*

S. leonina, *Shaw.*		Inuus silenus,	*Less., Jerd.*
Nil bandar,	BENG.	Nella manthi,	MALEAL.
Shia-bandar,	HIND.		

The native country of this monkey, is Travancore and Cochin. It is black, with a reddish-white hood or beard surrounding the face, neck, and tail with a tuft of hair at the tip. The Wanderoo is closely allied to the Magot and Macaque of the same countries. Its hair is a deep-black throughout, with the exception of the long beard or mane which decends on each side of the face, in the form of a ruff extending downwards over the chest, and varying from an ash-grey to a pure white. The upper part of the face between the eyes, is naked and flesh coloured, the muzzle is perfectly black. It has large cheek pouches and flesh coloured callosities of considerable size. The tail is about half as long as the body, and, when perfect, which in captivity is not often the case, it terminates in a brush of tufted hairs. It extends up the west Ghats as far as the Ram-ghat, leading from Belgaum to the coast.—*Jerdon's Mammals of India.*

SILEX, known as Tabashir, is secreted by bamboos and obtained from their hollow interior. Siliceons substances are used in India medicinally. The following are principally known:

Rock chrystal. .	Bilur.	———?..	Sang-i-Asshar.
Carnelian..........	Akik.	Mill stone grit..	Sang-i-Assyum.
Agate	Sulimani.	Sand	Ret.
Onyx........	,,	Plasma....	Yashm.
Flint,............	Chakmak.		

SILHET, a district and town in Bengal, the town is 260 miles from Calcutta, in lat. 24° 53′ 0″, long. 91° 47′ 1″, 120 miles N. E. of Dacca and about 133 feet above the sea. Silhet lies between the Khasyah hills and independent Tippera, it is watered by the Barak and Surma rivers. Cachar and Silhet are in the valley, or rather marshy plain, of the river Surma, which lies to the south of the Khasyah mountains, and very much resembles the Assam valley in its general features. It is an open plain, scarcely raised above the level of the sea, which is three hundred miles distant and presenting here and there a few scattered hills; below, it expands into the jheels of eastern Bengal, and, contracts in its upper part as the spurs of the Tipperah and Naga hills encroach upon it separating fertile plains by narrow ridges covered with dense forest. The valley of the Surma is separated from that of Munipur by a meridional range of moderate elevation, which is continued to the southward, and separates Tippera, Chittagong and Arracan from the kingdom of Ava. Blue Mountain, which lies nearly due west of Chittagong, is said to attain the considerable elevation of 8,000 feet, and a peak on the same range forty miles to the south-west, in lat. 22°, is elevated according to Wilcox's map, 3,100 feet. Sitakund, thirty miles north of Chittagong, has an elevation of 1,140 feet. The provinces of Tipperah and Chittagong are throughout hilly. The rain-fall during the monsoon is about the same as in Bengal, at least on the sea-coast and in its immediate vicinity, averaging 86 inches annually at Chittagong; on the higher ranges in the interior it is probably much more considerable.—*Hook. Him. Journal.*

SILHOUETTE, in lat. 4° 29′ S., long. 55° 17′ E., is the highest of the Seychelle Islands. It abounds with timber.

SILIGOREE. Dr. Hooker here noticed a wild hog, the first wild beast of any size he had seen in the plains, except the hispid hare (Lepus hispidus) and the barking deer (Stylocerus ratna.) The hare he found to be the best game of this part of India, except the teal.—*Hooker, Him. Jour., Vol.* i, *p.* 369.

SILIDITYA, 3rd, was ruler of Balabhipura, when it was destroyed A. D. 524.

SILINDHRA, SANS. A tree, the name of which has not yet been found in botanical works on Indian plants.—*Hind. Theat., Vol.* ii, *p.* 100.

SILING, a Chinese and Yarkand manufacture from the wool of the shawl-goat.

SILIQUARIA, a genus of molluscs.

SILK.

The arts of rearing silkworms, of winding off the threads spun by them, and of manufacturing those threads into clothing seem to have been first practised in China. So many of the names applied to this substance by the many nations of the earth being from one root, this alone suffices to prove that they at least obtained the substance and its name from one region. The name seres by which China was known to the western nations was either applied to it from silk being a product of that country or the country gave its name to the substance known as silk. The Chinese terms see and szu, silk, are found in the Corean language or dialect in the form of sir, in Mongol sirkek, in Manchu sirghe. Klaproth supposes this word to have given rise to the Greek ser, the silkworm, and seres the people furnishing silk, and hence sericum, silk. The eggs were brought to Europe by monks. The country from which they brought their precious charge is called by Theophanes simply that of the Seres, but by Procopius Serinda. China may be intended, but of this there can be no certainty. Indeed it is possible that the term was meant to express a compound like the Indo-China, some region intermediate between Serica and India, and if so not improbably Khotan. "It would be curious," says Klaproth, "to know at what period the word silk was introduced in the English language. It appears to be the same as the Russian cbelk, which I believe to be derived from the Mongol silk : this is so much the more likely as Russia was for a long period under the Mongol yoke." Silk, then, seems to have given its name to the people who first fabricated it, and sent it to the west ; and the Seres of the Greeks and Romans were evidently the Chinese, whose empire was formerly separated by the Oxus from that of Persia. M. P. Mailla in his l'Histoire generale de la Chine, mentions that B. C. 2600, Si-ling-chi, wife of the emperor of China, Hoang-ti, was enjoined by him to utilize the thread of the silkworm in which she succeeded.

China.—Two of the principal manufactures of China are those of silk and porcelain, and could the Chinese urge no other claims to praise on account of their ingenuity, these two alone might serve to give them a high rank among the nations of the world. D'Herbelot justly considers that, as Rome obtained the silk manufacture from Greece, and Greece from Persia, so the last was indebted for it, according to the best oriental authors, to China. The tradition, indeed, of the invention is there carried back into the mythological periods, and dates with the origin of agriculture. Husbandry and the silk manufacture, the chief sources of food and clothing, form the subject of one of sixteen discourses to the people. It is there observed, that "from ancient times the Son of Heaven himself directed the plough : the empress planted the mulberry-tree. Thus have these exalted personages, not above the practice of labor and exertion, set an example to all under heaven, with a view to leading the millions of their subjects to attend to their essential interests." In the work published by imperial authority, called 'Illustrations of Husbandry and Weaving,' there are numerous woodcuts, accompanied by letter-press explanatory of the different processes of farming and the silk manufacture. The former head is confined to the production of rice, the staple article of food, and proceeds from the first ploughing of the land to the packing of the grain, the latter details all the operations connected with planting the mulberry and gathering the leaves, up to the final weaving of the silk. Notices of the cultivation of the mulberry and the rearing of silkworms found in Chinese works have been collected and published by Mr. Julien by orders of the French government. From his work it appears that credible notices of the culture of the tree and manufacture of silk are found as far back as B. C. 780 ; and in referring its invention to the empress Siling or Yuenfi, wife of the emperor Hwang, to B. C. 2602, the Chinese have shown their belief of its still higher antiquity. "The Shi-king contains this distich : The legitimate wife of Hwangti named Siling shi, began to rear silkworms." The best silk is found in the provinces of Sz'cheun, Hupeh ; Chehkiang, and Kiangnan, but every province south of 45° N. produces it of different degrees of fineness. Probably the kind called tsa-tle, brought from Hupeh, is the finest silk found in the world. In China, while the worms are growing, care is taken to keep them undisturbed, and they are often changed from one hurdle to another that they may have roomy and cleanly places; the utmost attention is paid to the condition and feeding of the worms and noting the time for preparing them for spinning cocoons. Three days are required for them to spin, and in six it is time to stifle the larva ; and reel the silk from the cocoons ; but this being usually done by other workmen, those who rear the worms enclose the cocoons in a jar buried in the ground and lined with mats and leaves, interlaying them with salt, which kills the pupæ and keeps the silk supple, strong and lustrous ; preserved in this manner, they can be transported to any distance, or the reeling of the silk can be delayed till convenient. Another mode of destroying the cocoons is to spread them on trays, and expose them by twos to the steam of boiling water, putting the upper in the place of the lower one according to the degree of heat they are in, taking care that the chrysalides are killed, and the silk not injured. After exposure to steam, the silk can be reeled off immediately, but if placed in the jars, they must be put into warm water to dissolve the glue, before it can be unwound. The raw silk is an article of sale; the sorts usually known in the Canton market are tsa-tle, taysaam, and Canton raw-silk. The Chinese loom is worked by two hands, one of whom sits on the top of the frame, where he pulls the treddles, and assists in changing the various parts of the machine. The workmen imitate almost any pattern, excelling particularly in crapes, and flowered satins and damasks, for official dresses. The common people wear pongee and senshaw, which they frequently dye in gambier to a dust or black colour ; these fabrics constitute most durable summer garments, and the pongee becomes softer by repeated washing, many of the delicate silk tissues known in Europe are not manufactured by the Chinese, most of their fabrics being heavy. The lo or law is a beautiful article, used for summer robes, musqueto curtains, festoons and other purposes, but is seldom sent abroad. The English words satin, senshaw, and silk, are probably derived from the Chinese terms sz'tiin, sensha and sze, intermediately through other languages.

Silk in Europe.—About the middle of the sixth century, the western world received a supply of silkworms' eggs : these were conveyed from China to Constantinople by two Persian monks, who had gone to the east as missionaries, and had observed in China the various processes connected with the rearing of the silkworm, the nature of the trees on which they fed, and the preparation of the silk. This occurred about the year 552, in the reign of Justinian, who gave every encouragement to the introduction of the valuable insect. The eggs were secretly conveyed from China within a hollow cane : at the proper season they were hatched, and the caterpillars were fed with the leaves of the wild mulberry tree. The monks continued to superintend, at Constantinople, the rearing of the insects, and the whole process of manufacturing the silk. From this small commencement the myriads of silkworms have sprung, which throughout Europe and western Asia have met the demand for silk, which has gone on increasing from that time to the present. The silkworm in Europe, is the caterpillar of the mulberry tree moth (Bombyx mori) belonging to the tribe Bombycidæ. The eggs of this moth are smaller than grains of mustard seed, very numerous, slightly flattened, yellowish at first, but changing in a few days to a blue or slate colour. In temperate climates they can be preserved through the winter without hatching until the time when the mulberry tree puts forth its leaves in the following spring. This insect, in many parts of China in the open air, goes through all its changes without any attention from man, whose only care is to gather in the harvest of silk cocoons at the right season. In some parts of China, however, the silkworm requires the same care in the way of shelter, feeding, and nursing which in other countries is found necessary to ensure success. The Morus nigra is not the best species for the nourishment of the silkworm, although the caterpillar feeds readily on the leaves. The white-fruited mulberry, M. alba, a native of China, is the best, and is greatly preferred by the insect. The latter is now cultivated into many parts of Europe, frequently as a pollard by road sides. It comes into leaf a fortnight earlier than the black mulberry, which is an advantage in the culture of silkworms. The white mulberry does not thrive in Britain, the winters being too severe. The Philippine mulberry is a favourite in the south of France, on account of the size and quantity of the leaves, and the ease with which it can be propagated. In the south of Europe, mulberry leaves are sold by weight in the market, and the buyer chooses them either young or mature, according to the age of the insects which are to feed on them. Young worms are fed on tender leaves, while full-grown caterpillars require the stronger nutriment of the mature leaf. Attempts have been made to store food for the silkworm by drying the leaves in the sun, them reducing them to powder, and placing the latter in jars. This powder, moistened with water is eaten with avidity by the silkworm and may prove a valuable resource in late seasons, or under circumstances which affect the principal crop. It is even thought that three or four crops of cocoons per year may be obtained in northern climates, by keeping successive hatchings of eggs in warm rooms, and supplying the worms with this food during winter. The silkworm, when first hatched, is about a quarter of an inch long, and of a dark colour. If supplied with appropriate food it remains contentedly in one spot : this is the case throughout its changes, so that there is no trouble in retaining it within bounds, as there would be with some other caterpillars. After eight days' feeding and rapid increase of size, it prepares to change its skin, the first skin having become too small for its body. It remains three days without food, during which time a secretion forms on the surface of the new skin, which helps the caterpillar to cast off the old one ; but the operation is further facilitated by silken lines which the insect casts off and fixes to the adjacent object : these hold the old skin tightly, while the caterpillar creeps out of it. The whole covering of the body is thus cast off, including that of the feet, and of the teeth and jaws, but it is done with difficulty, and sometimes the skin breaks, and a portion of it remains attached to the hinder part of the body, compressing it, and usually causing death. The newly moulted worm is pale in colour, and wrinkled ; but it immediately recovers its appetite, and grows so rapidly that the new skin is soon filled out, and in five days another moult becomes necessary. Four of these moults and renewals of the skin bring the caterpillar to its full size, when its appetite becomes voracious, and the succulent parts of the mulberry leaves disappear with extraordinary rapidity. The insect is now nearly 3 inches long; its structure consists of 12 membranous rings, which contract and elongate as the body moves. There are 8 pairs of legs; the first 3 pairs being covered with a shelly or sealy substance, which also invests the head. The mandibles are strong, and indented like a saw. Beneath the jaw are 2 small orifices through which the insect draws its silken lines. The silk is a fine yellow transparent gum, secreted in slender vessels, which are described as being wound, as it were, on 2 spindles in the stomach; these vessels, if unfolded, would be about 10 inches long. The insect breathes through 9 pairs of spiracles distributed along the sides of the body. The caterpillar has 7 small eyes near the mouth; the 2 spots higher up are not eyes, but portions of the skull. Arrived at maturity, the caterpillar is of a rich golden hue; it leaves off eating, and selects a corner in which to spin its cocoon. It first forms a loose structure of floss-silk, and then within it the closer texture of its nest, of an oval shape: here the caterpillar remains working until it is gradually lost sight of within its own beautiful winding-sheet. Taking no food and emitting this large quantity of silk, its body diminishes one-half, and on the completion of its cocoon it changes its skin once more, but then becomes an apparently inanimate chrysalis or aurelia, with a smooth brown skin, and pointed at one end. It remains in this corpse-like state for a fortnight or three weeks, when it comes forth a perfect winged insect —the silk moth. In escaping from the cocoon it pushes aside the fibres, first moistening the interior of the cocoon with tasteless liquid from its mouth to dissolve the gum which holds the fibres together. The mouth has no teeth, therefore it cannot gnaw its way out as generally supposed. In the perfect form, the insect takes no food, and only lives 2 or 3 days: the female dies soon after laying her eggs, and the male does not long survive her.

The common silkworm is not the only caterpillar from whose cocoons silk has been obtained for manufacturing purposes; but it is superior in the quality and quantity of its silk to all other insects. The larvæ of many European moths produce a strong silk, the native silkworms of America yield a material which has been manufactured into handkerchiefs, stockings, &c., by the inhabitants of Chilpancingo, Tixtala, and other places of South America. The ancient Mexicans used the internal layers of white cocoons, which strongly resemble Chinese paper, as a material for writing on. A quantity of inferior silk is obtained in British India from the Tusseh and Arindy silkworms. The first affords a coarse dark-coloured silk, which is woven into a cheap durable cloth; the second yields a delicate flossy silk, which cannot be wound from the cocoons, and is therefore spun like cotton. Of this, a coarse kind of white cloth is manufactured, which is loose in texture, but so durable that it can scarcely be worn out in a life-time.

The domestic treatment of the silkworm has been brought to great perfection in Italy. Formerly the eggs were hatched at uncertain periods, depending on the natural warmth of the season, or they were put in manure-beds, or were worn in little bags about the person next the skin. They are now hatched in an apartment heated to the proper degree by a stove; but they are first washed in water, and afterwards in wine, to separate light eggs, as well as dirt, and the gummy envelope which surrounds the heavy ones. The temperature of the hatching-room is at first 64°, but is gradually raised 1 or 2 degrees daily, until it reaches 82°, which it is not to exceed. Pieces of coarse muslin, or of white paper pierced with holes, are placed over the eggs when they are about to be hatched. Through these the worms creep to the upper surface, and are removed as soon as possible to a cooler place. Young leaves and sprigs of mulberry are laid upon the muslin or paper, when the worms eagerly settle on the leaves, and can thus be transferred to trays, and removed to the nursery. This is a dry room of regulated warmth, with windows on both sides, so that free ventilation may be attainable. Chloride of lime should be in use to purify the air, and a thermometer and hygrometer to regulate the heat and moisture; the latter is apt to abound where silkworms are kept, and is very prejudicial to them. Moist exhalations arise from the leaves and from their bodies; fermentation, also, soon takes place if litter and dung be not speedily removed from their trays; these are fertile sources of disease among the worms, and may carry off thousands in a day. One of the diseases to which silkworms are liable consists of the formation of a minute cryptogamous plant of mildew within the body of the living insect. Damp and fermenting food and litter produce, in the first place, among the fatty matter of the body of the caterpillar, an infinite number of sporules supported by minute stems. These increase to such a degree that the vegetation soon pierces the skin, gives a general mealy appearance to the body of the caterpillar, ripens its seed, which is borne by the winds to every part of the nursery, carrying contagion with it, and at length causes the death of the worms. The dead bodies of worms or moths (for the insect is infected in all stages) are sources of contagion unless immediately destroyed. This disease is called Muscardine in France, Calcinetto in Italy ; the French name arises from the resemblance of the diseased caterpillar to a mealy kind of sugar-plum made in Provence, and sold by the name of Muscardine ; the Italian name also refers to the chalky or mealy surface of the skin. Various fumigations and washes have been tried, in order to purify infected nurseries, and to preserve others from the ravages of this malady : a solution of blue vitriol, the sulphate of copper applied to the wood-work, frames, &c., of the nursery, is of great use in destroying the seeds of the fungus, but nothing is so good a preservative as rigid attention to cleanliness and good ventilation. The improved means, first employed in Italy, for preserving the health of these valuable insects, are due to Count Dandolo, who gave particular and scientific attention to the subject, and superseded many an absurd custom in the rearing of silkworms. According to his method wicker shelves are arranged in a room at convenient distances, and are lined with paper on which the worms are placed. Such worms only are placed together as have been hatched at the same time, the space allowed them being, for each ounce of egg, 8 square feet during the first age, 15 feet for the second age, 35 feet for the third age, 82½ feet for the fourth, and about 200 feet for the fifth age. The mulberry-leaves are chopped in order to present a large number of fresh-cut edges to the young insect. Four meals a-day, as a regular rule, and luncheons between when the worms are particularly voracious, is the liberal allowance for their subsistence. The temperature at which silkworms are healthiest appears to be from 68° to 75°, though they are able to bear a much higher temperature. Alternations of heat and cold are exceedingly injurious to them. In Europe, when the silkworms are about to spin they are provided with little bushes of broom, heath, or other flexible substance, which are arranged upright between the shelves, their tops being bent into an arched form by the shelf above. The bushes are spread out like fans, to allow plenty of space for the cocoons ; for if crowded, the worms are apt to form double cocoons, two working together, and these are worth only half the price of single cocoons. These bushes, laden with cocoons, appear like diminutive trees bearing golden fruit. In the department of the Drome, in France, the method of managing the insects is slightly different from that which now described. The culture is so extensive that upwards of 2,000,000 of mulberry-trees are required to supply the food of the myriads of worms. Instead of wicker shelves lined with paper, large bamboo-like rushes which grow on the banks of the Rhone, are cut down, split open, and attached together so as to form long cane beds about 2½ feet broad, called claies. These are arranged one above another on a rude frame-work erected throughout the chamber, spaces being left at intervals as passages for the attendants to traverse. The worms, as soon as they are hatched, are strewed among the claies, and the mulberry leaves at the proper moment scattered over and amongst them. The attendants make use of a short ladder to ascend to the higher claies. In other establishments the claies are arranged so as to hang from the circumference of large wheels placed at each end of the apartment ; by turning these wheels the ranges of shelves rise and fall, and are transferred from side to side at the pleasure of the attendant. The manufacturing treatment of the silk, when the labours of the silkworm are over, is as follows :—When the crop of cocoons is complete it is gathered from the bushes, and about one-sixtieth part is set aside for the production of eggs, the finest cocoons as to web and colour being selected for this purpose. A difference of weight generally determines which are the cocoons of male, and which of female insects : the latter are heavier and rounder than the former. The cocoons intended to produce eggs are preserved in a very dry room, and in about 10 days, they lose in weight to the amount of 7½ per cent. The main crop of cocoons is next sorted into 9 qualities, known in the factories as—1. Good cocoons, which are strong, firm, almost equally round at both ends, not very large, but free from spots. 2. Calcined cocoons, in which the worm has died after having completed its work, and is reduced to a powder substance. 3. Cocalons, which are larger and less compact than good cocoons. 4. Choquettes, cocoons in which the worm has died before finishing its work. 5. Dupian, or double cocoons, difficult to unwind, and often kept for seed. 6. Soufflons, cocoons of so loose and soft a texture that they cannot be unwound. 7. Pointed cocoons, in which one end rises in a point, which breaks off after a little silk has been unwound, and so spoils the thread. 8. Perforated cocoons, from which the moth has escaped. 9. Bad choquettes, in which the silk is spotted, rotten and blackish in colour. The vitality of the chrysalis is destroyed previously to unwinding the cocoons : this is done either by exposure to the sun, or by artificial heat, such as that of an oven after the bread is withdrawn. The floss silk is removed from the cocoon by opening it at one end and slipping out the cocoon. In reeling, it is necessary to use cocoons of one quality, as different qualities require different treatment. The natural gum of the cocoons is softened by immersion in warm water, kept at the proper temperature by a charcoal fire, or by a steam pipe. After they have remained in it for a few minutes, the reeler (generally a woman) gently stirs up or brushes the cocoons with a short birch-rod, and to this the loose threads of the cocoons adhere, and are thus drawn out of the water. They are then taken 4 or 5 together, twisted with the fingers into one thread (as many as 30 can be wound together) and passed through a metal loop, which rubs off dirt and impurities; it then passes on to the reel, which has a slight lateral motion, so that the thread of one revolution does not overlay the other. If it were allowed to do so, the threads would be glued together before the gum had time to harden by exposure to the air. When any single thread breaks or comes to an end its place is supplied by a new one, that the united thread may be of equal thickness throughout. The new thread is merely laid on, and adheres to the rest by its native gum, and as the filaments are finer near their termination than at the commencement, it is necessary to add other cocoons before the first set is quite exhausted. The cocoons are not entirely wound off, but the husk containing the chrysalis is used, together with the floss silk, under the name of waste. Improved methods of reeling are introduced from time to time, but they are on the same principle as the above. The length of filament yielded by a single cocoon is 300 yards, though some have yielded upwards of 600 yards. Eleven or twelve pounds of cocoons yield one pound of silk from 200 to 250 cocoons going to the pound weight: thus about 2,817 cocoons are included in that quantity. The reeled silk is made up into hanks for sale and use. The form and contents as well as the quality of these hanks differ according to the quarter whence they are received.

Madras.—The breeding of the silkworm is carried on to some extent in Denkencottah in the Salem district. There are about 41 persons (of all castes) in this town who breed the worm, and the value of the silk produced yearly is about Rs. 1,000, it being disposed of in Salem and Bangalore, at Rs. 1¾ per seer. The moth usually lays its eggs in the evening, and they take from 10 to 14 days to hatch, after which 40 days elapse before the worm commences to spin its cocoon. In the interval, the worm becomes sickly about 4 times for periods of 4, 5, 6 and 7 days respectively, during which it remains for 30 hours at a time without feeding. Fresh mulberry leaves are supplied seven times a day at intervals of three hours. Half of the worms are reported to perish during the extremes of hot and cold weather. The moth usually emerges from the cocoons in the morning ten or fifteen days after the completion of the cocoon. The male and female moths are allowed to remain together till 5 P. M. when the males are ejected and the females commence to lay eggs. When ready to spin, the worms are placed on a bamboo tray (exposed to the sun) in which are raised numerous circular walls of matting (one within another) the outer one measuring about four feet in diameter. The cocoons are boiled, and afterwards placed in hot water, when the silk is reeled off: 1,000 cocoons are supposed to yield from 2 to 6 Rupees weight of raw silk. The mulberry trees are planted chiefly in black and red soils, and require continuous moisture. With care they last ten years and yield fresh leaves six times a year, the stems being periodically cut down. One yield of leaves on an acre of ground sufficed for seven bamboo trays of worms, each tray measuring about four feet. As each tray of worms is calculated to produce one seer of silk, and as the trees yield leaves six times a year, the cost of production and the net profits on one acre are Rupees 27-4-0.

China.—There seems to be no doubt that China is the country where the product of the silkworm was first used as a material for textile fabrics, and that the industry has gradually radiated from China as a centre, till it covers, at the present day, a number of very widely distributed areas of very diverse climatic conditions. The Chinese historians carry back the cultivation of the mulberry and the breeding of silkworms to the period of myths. If they are to be believed, the art of silk reeling was known in China in the time of Fouh-hi, a century before the date usually assigned to the biblical deluge, and the empress Si-ling-chi, wife of the celebrated Hoang-ti (2602 years before the christian era) did not disdain to share in the labours attending the care of the insect, as well as in those of the loom, the invention of which seems to be attributed to her, and to have raised her to the position of a tutelary genius, with special altars of her own. But whatever the precise date of the discovery, it appears there can be no question of the very high antiquity of the knowledge of the worm and its product in China. A series of imperial edicts, and a voluminous literature of practical treatises, testify to the importance of the industry and the care that was taken to foster an art which was considered, according to M. de Rosny, 'best fitted to promote the morality of the people and extinguish pauperism in the empire.' The original cradle of sericulture in China, included the country of 'Yen, lying south-west of the present province of Shantoung; the country of Ts'ing, answering to the north-west region of the same province, the country of Siu, covering the south of Shantoung and the northern portion of Kiangsou; and lastly the country of King, which now constitutes the province of Houkouang.' The industry now extends to the whole of China except the extreme northern provinces. Not even an approximate estimate can be made of the amount of silk produced, but, besides exporting some 10 million pounds annually by sea, the yield is sufficient to clothe in silk all but the lowest classes of a population alleged to number 400,000,000. According to Captain Bowers, of Sladen's Expedition, the silk trade in the west of China is now nearly suspended. Large quantities used to be raised in Yunnan and Szechuen, but the industry has suffered from the Panthay revolt and consequent disturbances.

Corea.—The region indicated above, as the cradle of the silkworm in China, lies over against the peninsula of the Corea and the Japanese Island of Kiu Siu, where the civilisation of Niphon seems to have first taken root six or seven centuries before the christian era. The jealousy of the Chinese Government appears, for some centuries, to have kept the secret from spreading even to the Corea. But, according to a Chinese authority, the art of silk-reeling was introduced into that peninsula in the 12th century before Christ, and spread rapidly throughout the whole region; this account is confirmed by the narrative of an embassy from China to the Corea in the years 1119-1120 B. C., which describes the nobles and the chief officers of the court, with their wives, as dressed in the same kinds of silk fabrics as are still to be found in this extreme eastern peninsula.

Anam and Siam.—Later, the industry had spread southward in China far beyond its original limits, and it reached the Anamite kingdoms. M. de Rosny dates its introduction there from the third century before our era. In Tonquin and Cochin-China the manufacture of silk took considerable hold, and in the 17th century there appears to have been a large export of silk from these countries. At the present day the silk is mostly used for home consumption; and it is said to be markedly inferior to that of China. The Siamese appear to have learnt the art in the beginning of the 7th century B. C., but the manufacture made no great progress till the 18th century, when the opening of more frequent communication with China gave a certain stimulus to the traffic in silk. At the present day, according to Crawfurd, the industry has again fallen into disfavour, and the few places where it still maintains an existence, only produce a small quantity of a coarse fabric inferior to the manufactures of Java and Celebes. Some Siamese silk now finds its way to the looms of Ahmedabad.

In Labuan, silk was produced, from a multivoltine worm, in 1869 and 1870. The then Governor was sanguine of success, and a report by Mr. Cobb, on the silk and cocoons sent from Labuan in 1870, is favourable.

Into Indo-Chinese regions there seems reason to believe that the knowledge of silk passed from the Western Provinces of China. The breeding of silk-worms is now practised in the modern kingdom of Ava and the provinces of British Burmah.

Persia.—By the 7th century of the christian era, the breeding of the worm and the manufacture of silk fabrics had firmly established themselves in Persia, and probably, where sericulture has taken root in Affghanistan, it is an offshoot of the Persian industry. At the present day the mulberry grows almost throughout Persia; but the true silk region lies on the south shore of the Caspian, between the mouths of the Araxes and Gurgan, or, in other words, the provinces of Shirwan, Ghilan and Mazenderan. The first is a Russian province. The industry is also carried on in the Persian provinces of Kachan, Meshed and Yezd. A paper in the "Technologist" for 1865, states that the worms are very carelessly treated and the silk very variable in quality. England, Russia and France import raw silk from Persia. But its quality is low, it being ill-reeled and irregular. The Persian silk crop of 1863-64 is said to have yielded 1,129,536 lbs., valued at £734,198. The average price was 12*s.* to 16*s.*: for the best quality 18*s.* Of this produce 400,000 lbs. were shipped to Great Britain, 30,000 lbs. to France, and 141,600 lbs. to Russia. Within the last few years the yield has much diminished.

Japan.—The date of the introduction of the silkworm into Japan seems somewhat doubtful. But, commencing with the 5th century of the christian era, the industry has rapidly spread. In fact the people addicted themselves to the pursuit with such ardour that, in fear lest other branches of agriculture should be altogether abandoned, the Japanese Government has, at times, forbidden the extension of mulberry cultivation, or attempted, by sumptuary laws, to restrict the use of silk garments to certain classes. Sericulture has spread to almost all the islands of the Japanese Archipelago. But the northern isles are somewhat too cold, and the southern too hot, to be a favorable field for the enterprise. According to a report by Mr. Adams, Secretary of Legation, "the silk districts are confined to the principal island, and may be divided into three groups; the northern designated under the general name of Oshiu; the south-western, including those of Echizen, Sodai, Mashita, &c.; and the central, which produces the Mayebashi, Shinshiu and other varieties of hank silks, as well as the silks of the Koshiu and Hachoji." The opening of the ports has considerably increased the growth of mulberry in Japan. There are no statistics as to the internal consumption of silk: the Consul at Kanagawa estimated the total yield at 135,000 bales. In 1862-63 the exports rose to 25,800 bales (or a little over 100 lbs.) This year was exceptional. But the average exports of the four following years were about 15,000 bales. Cocoons and eggs are also largely exported. The following are given as the values, in dollars, of raw silk, cocoons and eggs, respectively, exported in 1868 and 1869:—

	1868.	1869.
Silk......	10,638,041	4,864,990
Cocoons....	123,040	177,805
Eggs......	4,199,138	2,728,500

Europe.—In the middle of the 6th century of the christian era the silk-worm was introduced into Europe. After an unsuccessful attempt to stimulate to competition "his christian allies the Æthiopians of Abyssinia, who had recently acquired the arts of navigation, the spirit of trade and the sea-port of Adulis, still decorated with the trophies of a Grecian conqueror," the emperor Justinian found by a lucky chance the means of gratifying his wish to defeat the monopoly of silk hitherto held by the Persians. This chance was the advent of two Persian monks who had been long resident in China, and who now offered to import the eggs of the silkworm. They were liberally encourged by Justinian, and Gibbon relates how they "again entered China, deceived a jealous people by concealing the eggs of the silk-worm in a hollow cane, and returned in triumph with the spoils of the east." "Under their direction," he continues, "the eggs were hatched at the proper season by the artificial heat of dung; the worms were fed with mulberry leaves; they lived and laboured in a foreign climate; a sufficient number of butterflies was saved to propagate the race, and trees were planted to supply the nourishment of the rising generations. And the Sogdoite ambassadors acknowledged, in the succeeding reign, that the Romans were not inferior to the natives of China in the education of the insect and the manufacture of silk."

Greece.—The industry rapidly took root in Greece, as is apparent from Gibbon's account of the manufactures of Corinth, Thebes and Argos in the 10th century, and silk is still produced in the Morea and in the islands of Cyprus and Crete. But the total out-turn does not seem to exceed 150,000 lbs. per annum, and the silk is of inferior quality.

Spain seems to have been the next country of Europe to see the silk-worm introduced. "The secret," says Gibbon, "had been stolen by the dexterity and diligence of the Arabs, and two cities of Spain, Almeria and Lisbon, were famous for the manufacture, the use, and perhaps the exportation of silk." In 1842 Spain produced about 2,000,000 lbs., of which Valencia yielded three-fifths and Murcia and Grenada each one-fifth. The cocoons are said to be excellent, but the silk, reeled by the peasantry, is irregular.

In Portugal, the silk-worm of the province of Traz-os-Montes alone in Europe escaped the 19th century epizoic. The average annual export of cocoons is 7,500 cwt. The industry is more generally in the hands of small producers than in other parts of Europe. The tree used was the black mulberry, which attains the dimensions of a forest tree; but of late many plants of the best varieties of French and Italian white mulberry had been planted. At the Exhibition at Oporto in 1867 ten provinces competed, and beautiful cocoons and manufactures are said to have been exhibited. A thriving factory had been established and three new reeling machines invented.

In Italy, till the out-break of the 19th century epizoic, the insect seems to have found a most congenial habitat, and sericulture has spread more or less all over the peninsula. The estimates of the total produce of Italian silk vary exceedingly. The report of the Turin Chamber of Commerce for 1870 estimates the out-turn of the preceding season at the value of 77½ millions of francs, representing about 13 million kilos of cocoons. It is not clear whether this is for the whole Italian kingdom; but at any rate it seems to include the northern provinces down to Tuscany, Umbria, and the Marches. Mr. Winkworth in the "Technologist," on the other hand, estimates the yield of Italy at upwards of 100 million pounds of cocoons, or more than three times the estimate of the Turin Chamber of Commerce. The British Trade Journal, too, puts the value of Italian cocoons at 11¼ millions sterling, or between three or four times the value estimated by the Italian authority cited above. By the year 1870 the epizoic disease had made great havoc in Italy, which was then largely dependent on imported seed.

In France, the culture of silk does not seem to have taken any hold till the commencement of the 16th century, when

Francis I, introduced silk-worms from Milan to Lyons, and the rearing of the worm was simultaneously commenced in the valley of the Rhone. This tract still continues the head-quarters of the industry in France, the Cevennes silk bearing the highest reputation. But sericulture had, up to the year 1857, been also much extended towards the north and west. In 1789 France produced 1,000,000 lbs. of raw silk, and in 1853 the out-turn of cocoons reached to 26 million kilos (corresponding to about 5 million English pounds of raw silk.) In 1857, however, the fatal epizoic broke out, and the yield of cocoons had fallen to 13 million kilos in 1867.

In Algeria.—France carried the industry to Algeria, and in 1861 that province produced 4,206 kilos of cocoons. A Government bounty was offered to encourage the pursuit, and about £1,000 paid in rewards in the same year. In 1869 the produce had risen to 22,754 lbs. (English) of cocoons. But the cocoons had carried disease with them.

Great Britain.—The manufacture of silk in England dates from the year 1585, when the sack of Antwerp by the Spaniards drove many Flemish artisans to England. The industry received a further impetus from the revocation of the edict of Nantes, just a century later, when a large body of French weavers crossed the channel and settled themselves in Spitalfields. The manufacture has always been fostered by Government, though not perhaps in the most judicious way, and now consumes some 12 million pounds of raw silk annually. Several efforts have been made to establish the breeding of the silk-worm in the United Kingdom, but none of these efforts have been successful.

United States.—At the end of 1869 it was calculated that there were upward of four million trees in the State, belonging in almost equal proportions to three species, viz., Morus multicaulis, M. alba, and M. moretti. The last is described as like M. alba, but with a purple berry. The worms introduced are also of three species, one annual, the second bivoltine, the third trivoltine. But the first is the species by far most common, and is indeed said to pay better than the others.

New South Wales, South Australia, Victoria, and Queensland have all produced silk, but the possibility of commercial success has not yet been demonstrated. The Ailanthus worm has been bred at Sydney, and both that breed and the Bombyx mori seem to have been tried in Van Diemen's Land so long ago as 1862.

In New Zealand experiments have been made with the Ailanthus worm (Attacus cynthia) and with Japanese (seemingly) trivoltines.

In Madagascar, there is said to be an indigenous silkworm of great size, fed in the open fields on the pigeon-pea (Ambira vatry) and yielding very large cacoons. Little attention, however, is paid to it by the natives. This is probably the silk of which Mr. Consul Pakenham writes:—There is another silk in Madagascar much esteemed on account of its strength, which I am told is collected in a state of floss in the interior, and afterwards treated much the same as cotton." (Compare the carding of the Eria silk in Assam.) Mr. Pakenham states that "the notorious M. deLastelle" imported Bombyx eggs from China, introduced the mulberry and set up a regular establishment at Tamatave, which produced "several thousand pounds" of fine silk. The letter containing these particulars is dated the 11th August 1869.

Bengal.—From 1793 to 1835 the supply of raw silk from Bengal fluctuated within wide limits as will be seen from the following table:—

Year.	Company's Bengal raw silk imported.	Private Bengal raw silk imported, warehoused by the Company.	Total.
	lbs.	lbs.	lbs.
1793	677,988	91,885	769,873
1794	494,487	......	494,487
1795	379,543	12,984	392,527
1796	340,060	21,046	361,106
1797	88,219	....	88,219
1798	352,780	....	352,780
1799	643,803	1,618	645,421
1800	454,600	....	454,600
1801	310,368	....	310,368
1802	78,950	35,794	114,744
1803	336,189	68,904	405,093
1804	415,917	205,793	621,710
1805	460,303	375,601	335,904

Dr. Forbes Watson's "Textile Fabrics of India" includes silk piece-goods, and "loongees" and "sarees" of cotton and silk used conjointly from Surat; embroidery of gold and silver on silk from Sattara; silk piece-goods, from Ahmednuggur; silk piece-goods and silk and cotton "sarees" from Belgaum; silk and cotton "loongees" from Bombay; and silk and cotton "sarees" from Dharwar. Berhampore near Khandesh also manufactures silk, and there are small colonies of weavers at Jinjeerra, Yeola, Tanna and Revdanda (in Colaba.) The establishment of the manufacture at the two last places seems to be due to the Portuguese. The Bombay Chamber of Commerce, writing under date the 28th December 1871, says that there is "no production of silk in any portion of the Bombay Presidency." At any rate there is no export trade. The raw silk used in Bombay manufactures is, according to the same authority, mostly imported from China. Very little Bengal silk is used. The Chamber seems to have overlooked the imports from Mysore. There is a considerable import both of China and Bengal manufactured silks. The China silk imported is chiefly "punjum," a very inferior sort, worth from Re. 1-4 to Re. 1-12 per lb. A better variety is, however, imported in small quantities, and some fine raw silk is imported from the Persian Gulf, and is in great request at Ahmedabad for fine kinkhobs. The imports of China silk into Bombay seem to be gradually increasing. For the years 1861-62 to 1865-66 they averaged about 1,200,000 lbs. In 1870-71 they had risen to 2,043,631 lbs.; the average price also having risen from Rs. 3 to 4. Bombay also imports some Bengal silk by sea; an average of about 100,000 lbs. was thus annually imported during the five years ending 1870-71. About 300,000 lbs. of China silk and a small proportion of Bengal silk is re-exported to Kurrachee. The importation of Persian silk seems to have fluctuated greatly. In 1861-62 86,303 lbs. of this silk were imported into Bombay: in 1865-66 the amount fell suddenly to 23,000 lbs. and in the following year to 10,000 lbs. It has now again risen, and in 1870-71, 42,558 lbs. were imported, valued at Rs. 2,12,449. As in regard to China silk so, here, the price seems to have risen, if the custom house valuation is to be trusted. The recent increase in the quantity imported is somewhat remarkable, as of late the silk crop in Persia has been short. Indeed, Sir H. Rawlinson (in his recent evidence on the Euphrates valley scheme) speaks of "a total failure." This must not, it would seem, be understood literally. There is nothing to show accurately the quantity of silk exported by rail from the Bombay Presidency.

Ahmedabad has long held a prominent place as a silk-manufacturing city. Its kincobs and brocades, though not quite so rich as those of Benares, are much sought after in consequence of their durability and non-fading qualities of their gold tissues. Its mushroos are supposed to be the best in India, and the ordinary silk cloths are also in good demand. But the improvement of machinery in Europe and the extensive traffic in cotton and woollen goods, which flows into this country from England and the Continent, and which places within the reach of the Indian people, cloths at comparatively accommodating prices, have affected it to a considerable extent. But the trade still gives occupation to a very large section of the population of this city, whose means of support depend wholly upon it, and the exports of kincobs, mushroos and other silk goods maintain even now a very fair position. Bombay, Kattywar, Rajpootana, Central India, Nagpore territory and the Nizam's dominions are among the provinces where these goods find a sale. The various processes in their manufacture, from the assorting of silk to the last touches of finish, are all conducted in the city itself. Raw silk is imported from China, Bengal, Bussora, and Bokhara *viâ* Bombay, and the quantity brought averages about 2,500 Indian maunds, the value of which may be estimated at Rs. 15,00,000. The imports of Bokhara silk are of recent origin; it was first brought three or four years ago, and the quantity imported is small. The silk is ready spun, and is used only for woof in a loom. Of China silk the consumption is large, and both descriptions are imported—white and yellow. The hanks or skeins are first reeled off on a circular bamboo frame, and the thread is then assorted according to quality. It is well known that the entire length of a hank is not of one uniform fineness. The assorting is made with particular reference to the degree of fineness or coarseness of thread, and the process, which is carried on also by reeling (a separate reel being assigned for each quality,) depends entirely upon the feel or touch of the silk on the finger of the person manipulating it. A hank is divided into five different sorts—

1. Tumbolia,	3. Takra,	5. Koree,
2. Serika,	4. Wana,	

and the value of the silk varies from Rs. 24 per Indian seer for the superior sort to Rs. 19 or 20 for the inferior description. Nos. 1 and 3 are used almost invariably for the woof, while No. 4 supplies the warp, and No. 5 is sold to the Putwas who make cords, tassels, &c., of it. When cloths of a superior texture have to be turned out, both the woof and warp are taken from Nos. 1 to 3. The best Bussora silk is valued at Rs. 18 or 19 per Indian seer. It comes in a raw state, and does not yield any Tumbolia. The Bengal silk stands in the same estimation as the Bussora, and commands the same value. Two descriptions are imported, viz., Radhanugree, which yields chiefly Tumbolia and Jadee or coarse-yielding Takra and Wana. A new trade has sprung up very lately in Siam silk, which is known here as Singaporee, from the fact of its coming from Singapore. It is very inferior in quality, and sells at Rs. 8 to 6 per Indian seer. It is used for warp in coarse manufactures. Manufactures in silk are carried on also at Baroda and Surat, though not to the extent obtaining in Ahmedabad. If silk were raised in Guzerat it is impossible to say to what extent the trade in the articles manufactured from it might not be developed from the impetus it would receive from a reduction in the prices of the raw material, not to speak of the means of livelihood the industry would give to hundreds of people who now fritter away their time in idleness and have no fixed occupation of any kind; and if the produce were large enough we might also have an export trade in the raw material itself to the positive benefit of the province.

Mooltan, in 1851, according to Mr. Cope, imported 370 maunds of Bokhara silk, the manufacture of which, minus 100 maunds re-exported, gave work to 811 persons. Mooltan also imported 60 maunds from Bombay. Lieutenant Corbyn, Assistant Commissioner, ascertained that about 300 packages of 1st, 2nd, and 3rd quality raw silk, weighing in all 750 maunds, the price of which averages Rs. 3,75,000, are imported annually into Mooltan from Kabul, Bokhara, Khorasan and Herat. Of this, 225 maunds, worth Rs. 1,12,500, are exported to the following places, viz., Bhawulpore, Kurrachee, Bombay, Dera Ghazee Khan, Shikarpore, Sukkur, Hyderabad, Suratbundur, Delhi, Furruckabad, Bikaneer, Sirsa, Ajmere, Benares, Lahore, and Umritsur, &c.; 225 maunds of cleaned silk, after being dyed various colours, valued at Rs. 1,12,500, are also exported to Jung, Kurrachee, Pindibhuttian, Chiniot, Bunnoo, Dera Ghazi Khan, Dera Ismail Khan, Leia, and Sukkur. The remaining 300 maunds of silk at Rs. 1,50,000, after undergoing the process of cleaning, are applied in the manufacture of dopatta, daryai, gulbadan, susi, mashree, and lunghi fabrics, which are partly used there and partly exported to Shikarpore, Hyderabad, Sukkur, Kurrachee, Dera Ghazi Khan, Dera Ismail Khan, Leia, Jhung, Chiniot, Kamaliya, Lahore, and Umritsur. The approximate cost of dyeing, per seer of silk is

	RS.A.		RS.A.

Panjab.—The silks generally manufactured in the Punjab are classed by Mr. Cope under two heads: (1) "gulbadan," very stout and mostly broad and of high price; (2) "daryai," of a lighter texture and to be had both plain and shot. Mooltan also produced two other kinds, viz., "khes" and "eklal," both very broad and much higher priced than anything made in Lahore. From Lahore come "loongees" of cotton with silk ends or borders, or silk and cotton mixed; rich "loongees" all silk, and piece-goods of pure silk or mixed cotton and silk. Kohat, Leia, and Pind Dadun Khan produce "loongees" in which silk and cotton are used in conjunction; Dera Ismail Khan sends all silk piece-goods; Jhelum "loongees," either all silk, or silk and cotton; Bhawulpore contributes rich silk "loongees" and silk piece-goods; Goordaspore and Rawul-Pindee also appear among the silk-weaving districts, sending silk "loongees." "Rutul Mudpore" (sic) is also mentioned as a Punjab silk centre. Bunnoo is said to produce mixed cotton and silk loongees.

Central Asia.—With regard to Bokhara, Mr. Cope gives the following account by Khanikoff:

Among the fruit-trees cultivated with great care, although not grown in orchards, is the mulberry tree of two sorts:—

(1) The donedar, which is properly the Bokharian mulberry; and

(2) The tut-i-balkhi, translated from Balkh.

The grafting of the one on the other gives a third sort called khaseki, the fruit of which is sweeter and more savoury than that from the former. The tut tree blossoms usually ten days after the vernal equinox, but the year we were at Bokhara it happened at the close of that month. The fruit of the tut is used in two ways, to make syrup and wine.

The value of raw and waste silk free of duty, imported from the Khanates, is for eleven years as follows:—

Year.	Value in roubles.	Year.	Value in roubles.
1857	.. 75,643	1863	.. 51,779
1858	.. 68,901	1864	.. 45,699
1859	.. 93,520	1865	.. 35,534
1860	.. 82,053	1866	.. 146,209
1861	.. 149,969	1867	.. 1,273,088
1862	.. 156,148		

Of the imports in 1867, Captain Kostenko gives the following further particulars. The weight of raw silk imported was 7,822 poods, the sources of which were as follows:—

Kirghiz steppe..	23	Bokhara.....	6,566
Khiva	336	Tashkend.....	2,887

Silk fabrics also to the value of 48,818 roubles were imported into Orenburg, Orsk, and Troitsk. The value of manufactured silk exported from Russia to the Khanates was:—

Year.	Value in roubles.	Year.	Value in roubles.
1857	.. 17,338	1863	.. 58,358
1858	.. 32,209	1864	.. 72,267
1859	.. 54,332	1865	.. 33,076
1860	.. 45,381	1866	.. 71,011
1861	.. 40,103	1867	.. 98,138
1862	.. 50,494		

Of the exports of 1867, 45,246 roubles worth was destined for the Kirghiz steppe, while the value of exports to Khiva was 3,850 roubles.
„ „ to Bokhara „ 10,902 „
„ „ to Tashkend „ 38,410 „

In 1867, moreover, 24 poods of raw silk, valued at 236 roubles, were exported to the steppe. The route of export was by way either of Orenburgh or Petropavlovsk,

Mysore has always produced a little silk. In the Bangalore District, in 1859-60, the yield of raw silk was estimated at 350,928 ℔s. In 1866, Signor deVecchj described the native reeled silk as the worst he had ever seen, the thread being bad in colour, "irregular, flat, knotted and dirty," and worth in Europe not more than 13 or 14 shillings per ℔. For the fourth time, in January 1870, a large quantity of newly imported Japanese cartoons was distributed in the Bangalore, Toomkoor and Kolar districts. The first results were favorable, and the demand for eggs was very large, but the worms did not seem to thrive in the second generation, and the foreign species became extinct. Again, in February 1871, 500 Japanese cartoons were distributed gratuitously; but proved a complete failure. In the Bangalore and Kolar districts a small number only of the eggs were hatched, and even in these cases the worms died within a few days. The symptoms preceding death appear to have been similar everywhere: the worms assumed a reddish colour, their heads became enlarged, and a greenish fluid exuded from the mouth. Colonel Meade is disposed to attribute the failure to the climate of Mysore, to which the cartoons were brought direct from Japan, without undergoing any preparation for so marked a change, and he is of opinion that no advantage would arise from continuing the experiments with that species of worm. On the other hand, the China species has successfully established itself, having been cultivated in the province for very many years, and though deteriorated by close breeding, it is possible that the cause of the sickness and mortality to which it is now subject, and which threatens to extinguish the industry, may be removed by importing fresh seed from the south of China, the climate of which approaches more nearly than Japan to that of this plateau. The Mysore Administration Report for 1870-71 states that 31 per cent. of the cultivated land was under mulberry, and the value of the silk produced in the province is estimated at 5½ lakhs of rupees. The Nundidroog division was said to have exported 4,610 maunds (Madras maunds probably.)

In the Central Provinces, silk is manufactured from the imported raw silk of the domesticated worm, but more largely from the indigenous tusser worm at Raipore, Bilaspore, Sumbulpur, the Upper Godavery, Chanda, Bhandara, Nagpore, Balaghat, Seonee, Chundwara, Baitool and Narsingapore. Sumbulpore is said to yield 3,500 seers of silk, Raipore 6,000, Bilaspore 900, and Chanda 22,500. The quantity used is very considerable, but varies greatly from year to year, the collection and rearing of the worms being pursued not steadily, but as an accessory to other employments. The tusser silk is, for the most part, woven up and used in the province. It seems to be chiefly employed for fringes, or for weaving with cotton into mixed fabrics, the woof being cotton and the warp silk; cloth all of tusser silk is rarely manufactured; in Seonee, according to Captain Brooke, only on the order of European residents. But, at any rate, in some districts, muktas (garments worn by brahmans after bathing,) cholees (women's bodices,) and doputtas and dorwas, seem to be made of pure tusser silk.

The Tusser is the most important and most widely distributed of the wild silk-producers of India. It is generally identified with Antheræa paphia, but Captain Hutton has shown that there are probably several species called under the name of tusser. At any rate the insect known by this name is found in the Sub-Himalayan tracts almost throughout the extent of the range, through the hills from Assam to Chittagong, in the Soonderbuns, everywhere in the great belt of hill and forest inhabited by the Sontal, the Kol, the Khond, and the Gond, in the western ghâts, and in portions of the Madras Presidency. The worm is multivoltine, but it is not very clear how many times in the year it goes through its transformations, or whether its periods of existence may not vary according to conditions of climate. But, on the whole, it seems probable that the apparent discrepancy in this respect between various accounts arises from the fact that in different tracts different crops are gathered, the intermediate ones being neglected and the worm left to shift for itself. It feeds variously on the ber (Zizyphus jujuba) the country almond (Terminalia catappa), the seemul (Bombax heptaphyllum), the asun (Terminalia alata), the saj (T. tomentosa), the sal (Shorea robusta) and other trees. Mr. Fretwell, in his paper on silk in Mysore, mentions a wild worm spinning large cocoons found in the jungles of Coorg and feeding on the Ficus elastica, Ficus religiosa and Isonandra acuminata. If this be a tusser, it furnishes here an important addition to the list of trees on which the tusser insects feed. Dr. Henderson of Shahpoor also mentions a wild worm as occurring in the Panjab Salt Range and feeding on the camel-thorn. This moth is noticed by the Bengal Board of Trade in a Minute of 1819. It is said to be reared in all the western forests from Ramghur to Midnapore, the goottee or cocoon being of three qualities, "mooga, teerah, and bonbunda." The mooga is the "most common and plentiful; the thread coarse, but winds easily:" the teerah is a "smaller goottee, said to be the male of the mooga;" the thread is finer, but not so easily wound; the bonbunda is the "largest of the wild silk-worms; being found in forests in its natural state" (as the name indicates), "and not stinted in its food, it attains a greater size than the mooga, which appears to be the only difference between them; but it is scarce. Thread coarser, but runs easily." These three kinds are bred in September. The mode of rearing is thus described: "The seed is purchased from the jungle people, and plots in the forest appropriated, where the ashun, sal, and sejah trees predominate, especially the first, which is the best food for the worm. * * * In all Baudoon (August—September) the grub eats out, and is immediately placed on the trees. * * * When eggs are produced on the leaves, they are carefully folded into a kind of cup, and gently rubbed with turmeric. In a few days the young worms appear, and are removed to the trees in which they are to remain. The rearers keep guard with pellet-bows. * * * About the beginning of Assin (middle of September) the worms begin to spin, and by the end of that month the goottee is finished." The grubs are killed with boiling water. "The rearers have advances from the pykars in money, rice, salt, cloth, and other commodities. After the collection the price is settled, and the advances adjusted accordingly. The rearers are of no particular caste, but a superstition exists amongst them that one of the party should keep neeaum (a ceremony which enjoins daily ablutions and restrictions as to particular food, &c.) for the success of their operations."

According to Dr. Walker, the tusser breeders of Hyderabad in the Dekhan, and Chinnore, at Chilpoor, Madapoor, are mostly Telugus of low caste, or Gonds. As the rains commence they collect a few cocoons which their experience teaches them to be females, and place them in a box of teak leaves dried. When the moths eat out the males speedily approach; the eggs number about 60, and are hatched in 10 days. The small worms are fed on Careya sphærica, and in six weeks begin to spin. The first crop of cocoons is preserved for seed, and the same process gone through, except that the second brood is fed on Pentaptera tomentosa. The cocoons yielded by this brood are sold, the moth being killed by heat and the winding being "accomplished by boiling the cocoons and twisting 8 or 10 filaments from as many cocoons on the middle of the thigh with the left-hand to be wound on a rude reel." Dr. Smith's account, obtained from the talookdar of Wurrangul, differs somewhat from the above. According to his account, the trees on which the worms are fed are Terminalia alata and Zizyphus jujuba; the male and female have generally to be approximated (a task requiring absolute ceremonial purity on the part of the person performing it;) the number of eggs is much larger than given by Dr. Walker, and three broods are reared in the year. The wild cocoons too are said to be gathered in the mowah season, not in the rains. A mixture of "dhobee's earth" with alkaline ashes of the sesamum, castor oil plant, or Butea frondosa is said to be used for boiling the cocoons.

Dr. Shortt of Madras, who observed the insect in the jungles west of Orissa, describes the eggs as of the size of a split peppercorn; nine of them in line occupy the space of one inch in length. They are circular and bi-convex, with a light creamy colour. The worm is very small, scarcely perceptible when first hatched, but before it attains maturity it is from 3 to 4 inches long and from two to three lines in girth (? diameter.) The larva is of a light green colour with a slightly yellowish streak on either side, the 6th and 7th segments are marked with an oblong yellow spot, and on the back are several round darker-coloured spots surmounted with a few dark coarse hairs, while smaller ones are scattered all over the body. The larva is chiefly found on the bher or Zizyphus jujuba, asan or Pentaptera tomentosa, and the teak or Tectona grandis. The larva when ready to undergo transformation forms a cord round a twig from a peculiar resinous substance it secretes, and with which it also encircles the selected part of the branch and then prolongs it to the extent of one or two inches. If the branch be thick, the cord is short and stout and about a line in girth, but if it be a twig, the cord is thin, from 3 to 4 inches long and fastened to an upper and thicker branch and prolonged to the end of the twig with several intermediate ties of the same material. From the end of the cord, which is solid, begins the expansion of the cocoons which is reticulated with fine fibres of the same stuff as the cord is made of, on the outer surface, thus giving firmness and solidity to the cocoon, and as it approaches completion, a few of the leaves in the vicinity are drawn to line and conceal the cocoon externally, and thus to a certain extent mask it from observation ; but this occurs only on the bher tree, for he had seen no such leaves attached to the cocoons found on other trees where the foliage is large and dense. The larva now imprisons itself within the cocoon, and the same secretion that forms the cord is freely applied to all parts to make it water-tight. Having done this, the transformation commences, and lasts nine months (?) before the moth is perfected, having its head at the upper part next to the cord, from whence it appears to discharge an acid secretion which readily dissolves the plastering from the cocoon, and the fibres of the silk giving way, the perfected moth emerges from its prison, as a rule, early in the morning about daybreak. That the secretion is an acid can be readily ascertained by examining an empty cocoon immediately after the moth has emerged ; as the part being moist, it can be readily tested with litmus, when it is seen to give an acid re-action. This knowledge Dr. Shortt practically applied by adding diluted sulphuric acid in the water in which the cocoons are boiled to dissolve the gummy substance out and loosen the thread, and it can then be readily wound off on a hand-reel The male and female moths differ in size, the male measuring from the tip of one wing to the other between four and five inches, whilst the female measures from six to seven inches in expanse of wing ; both are of a uniform yellowish brown having a couple of lunated transparent talc-like spots, on each wing, said by the natives to resemble Vishnu's "chakra" or discus, whence the sacredness of the insect, and it is chiefly in the form of these spots that they differ from other moths of the same kind. It takes from 10 to 12 days for the eggs to hatch, and from 6 to 7 weeks from the extrusion of the young larva to the completion of the cocoon. The cocoon is slightly rough, of a greyish white colour and slightly reticulated externally with an internal smooth varnished surface ; is of an oval form, measuring one and a half inches in length and one inch in breadth ; the average weight with the chrysalis is 150 grains, that of the chrysalis itself 130 grains, the empty cocoon 20 grains, and the prepared thread 12 grains. But the cocoons vary much in size.

In the northern half of the district, the Dheemuru fishermen is the principal caste engaged in rearing the tusser moth,—as a rule, they add the production of tusser cocoons to their ordinary calling, but in the jungles of the central and southern parts, the Kumhar (manufacturers of earthern vessels), Bussore (bamboo-mat weavers), and a few mahommedans are also engaged in the trade. In Seonee, the silk-producing worms may be said to be in a state of partial domestication, the rearers tending the insects through all their stages, but depending entirely on the wild cocoons for each year's stock. In the months of May and June, wood-cutters and graziers find the wild cocoons on the saj (pentaptera tomentosa), lendeya (lagerstrœmia parviflora), and dhowra (conocarpus latifolia). These they collect and sell to the rearers at the rate of 4 cowries for a small, and 8 or 10 cowries for each large cocoon ; the small cocoons nearly always yield male moths, the larger female ; the rule, however, is not without exception, although it generally holds good. These wild cocoons, from which the stock of the rearers is invariably replenished, are called in the north of the district, where a pure Hindi dialect is spoken, "ariya," and in the south bordering on the Nagpur province "ranwat." When the moths, "phudi," have cut their way through the cocoons, the males, "gaura," and females "kir," are placed together and allowed to remain so far nine or ten hours ; they are then separated, and the wings of the female broken off ; accepting this process as a hint that she is not to leave the place, she begins at once to deposit her ova, the larger and healthier insects continuing to lay about 12 hours. The eggs are then tied up in pieces of cloth and carefully opened on the same day in the ensuing week. The rearers have new little sacks made from one or two leaves of the tendoo (diospyros melanoxylon), which are apparently chosen for their toughness. In each of these packets, as soon as the worms begin to appear, which happens usually on the ninth day, from 50 to 100 eggs are placed, and the tendoo leaf sacks are then fastened to lendeya trees, upon the leaves of which the insects begin at once to feed. In a few days they are removed to saj trees, and are changed about according as they require fresh food. When the worms show signs of beginning to spin, they are known as "dunihaa." Some rearers at this time remove them from the saj to kowha trees (pentaptera arjuna), but this is not common ; the bulk of the cocoons produced are spun on the saj. During the feeding time the greatest care is necessary to preserve the worms from being destroyed by birds and ants. The outer covering of the cocoon, consisting of inferior silk removed by the Koshta before spinning of the true tusser, is not lost, but sold to another class of weavers called Patwa. The silk bracelets and armlets worn by all classes among the hindoos, in the month of Sawan at the feast of "rakhi bundun," are made from this refuse. Its value, however, is very small, being sold for one rupee per seer. In Upper Assam the tusser is not utilized as a fibre-producer. It is known as the kutkuri. In the Punjab the cocoons, from their extreme toughness, are cut into strips, and used to bind the stocks of matchlocks. In Bombay and Madras, though found, the tusser does not seem to be utilized, except, perhaps, in the jungles of Ganjam. M. Perottet, of Pondicherry, says it is generally found on the Terminalia catappa, (best cocoons) 50 weighed 'one French pound.' Syzygium jambolanum, Zizyphus jujuba, less frequently on Pentaptera coriacea.

These cocoons are exceedingly rich in silk; they reel by means of an alkali, or any other solvent, with great facility, and to the very end. The silk they produce is very elastic, and of singular brilliancy.

At the *Madras Exhibition*, of 1855, tusser cocoons were exhibited from several localities. They were formed by caterpillars of several species of moth, belonging to the genus Saturnia. That which is most commonly met with in Southern India appears to be S. paphia. The caterpillar feeds on the leaves of the country almond tree (Terminalia catappa), whence it is often called the almond moth. It is also found on the leaves of the ber tree, Zizyphus jujuba, the casuarina, &c. The cocoons are ingeniously attached to the twiggy branches of the ber by a long stalk, terminating in a ring, encircling the branch. In the thicker foliage of the casuarina the silk is woven among the leaves without the above provision. It has not been obtained in any quantity from this source in the Madras Presidency. Considerable quantities of the small silk cloth worn by the brahmins at their meals are imported into the Northern Circars from Cuttack. The only use to which the cocoons appear to be turned is that of a ligature for native matchlocks. They are cut spirally into long narrow bands, with which the barrels are tied to the stock.

In Assam, the moonga and eria worms are said by Colonel Agnew to be chiefly bred by low caste Hindoos, Mikirs, and Cacharees; whereas the pat or Bombyx textor is bred by the joogee caste. Colonel Agnew (writing in 1869) puts the price of the eria silk at from Rs. 2 to 3 the seer. The Attacus cynthia closely resembles and is nearly allied to the Attacus ricini; indeed, some naturalists hold the Attacus ricini to be only a domesticated form of the latter. However, the wild Attacus cynthia occurs throughout the greater part of the Himalaya, in the Dehra Doon, and in Assam and Cachar. It feeds on the Xanthoxylon hostile, the Coriaria nipalensis and some other indigenous shrubs, and will eat the castor-oil plant. In China, and in Europe, whither the worm has been transported from China, it is fed on Ailanthus glandulosa, and Dr. Bonavia, in an unsuccessful attempt to introduce it into Oudh, fed it on A. excelsa. In the wild state it is annual. Captain Hutton thinks by patience it might be domesticated. He has crossed it with Attacus ricini. The cocoons are wrapped into a leaf, and present the same difficulty in reeling as the eria cocoons. The silk is at first glossy white and changes to dull sandy brown or grey. The Attacus cynthia or Ailanthus worm was introduced into Europe in 1857 and tried in Piedmont, France, and Algiers. In 1860, M. Guerin-Meneville believed that he had proved that it could be profitably grown in the open air in the north of France, yielding two crops annually. From examination of the Chinese-made fabrics, he maintains that the thread must have been in some cases wound.

The Attacus atlas, the largest of the group in India, is found at Mussoorie, and is abundant in Kumaon and eastwards to Cachar. At Mussoorie it is found on the Falconeria insignis, Bradleia ovata and other plants; in Kumaon on the barberry. The silk is difficult to reel, though it yields partially if boiled in vinegar. The silk is said by Captain Hutton to be "decidedly good."

The Antheræa perotteti was found by M. Perottet of Pondicherry on the Odina wodier, *Roxb.*, and he could not make it eat anything else. The silk is reported strong, wiry, and brilliant, but had to be carded. The worm breeds in captivity, undergoes four moults, and yields four crops in the year. The chrysalis of the fourth generation remains in cocoon till the tree it feeds on (which is deciduous) is again in leaf.

Antheræa roylei is found at Darjeeling and in the Himalayas from Kumaon to the Punjab, feeding on Quercus incana. It is properly an annual, but can be made to yield two or three crops. Its silk is favorably spoken of, but not abundant. The true cocoon is contained in a large closely-woven glazed case and enveloped on all sides by the leaves of the tree, the impression of the nervures being deeply imprinted on the glazed surface. It is like the tusser moth, but smaller. It can be domesticated.

The Bombyx huttoni, a bivoltine, feeds on the wild mulberry and ranges westward in the Himalaya from Kumaon. The B. bengalensis found near Calcutta on the Artocarpus lacoocha, is apparently rare. Another species of Bombyx resembling the B. huttoni was found in Ranchee, Chota Nagpore, also feeding on the Artocarpus lacoocha. The Bombyx religiosa is found in Assam upon the pipal (Ficus religiosa.) Dr. Helfer identified this with Mr. Hugon's Deo-moonga found on the Ficus indica, and described as spinning a small cocoon, active, under 2½ inches long, slender, reddish in colour and glazed, the moth resembling the mulberry moth. The silk was declared a delicate white thread. Mr. Creighton of Maldah in 1839 mentions a wild cocoon on the mango tree; the silk was used to mix with that of the arindy worm. Mr. Hugon also mentions a worm called "haumpottonee." It forms an imperfect cocoon, feeds on "most leaves," is said to go through the same stages as other silk-worms, is two inches long, brown and covered with hair. The moth is of the same colour as the moonga, but only half the size. The cocoon is of a transparent yellow, with an opening at one end. The silk is capable of being spun like eria silk, but not used, because it excites severe itching. This is identified by Mr. Moore with the Circula trifenestrata which Captain Haughton found also at Moulmein feeding on the cashew-nut tree (Anacardium orientale.) Other species are Antheræa frithii, Saturnia sylhetica, Actias selene, Attacus edwardsi, and some kinds of Ocinara; but their value as silk-yielders is unknown.

Bombyx mori, Lin., is the largest of the domesticated Chinese bombyces, originally from China, about North latitude 32° to 34°, also in Japan. It has been cultivated in Europe, especially in France and Italy, as well as in Syria, Egypt, Persia, Bokhara, Affghanistan, Cashmere, in one or two localities of the Northern Punjab near the hills, and thrives well at Mussoorie, everywhere feeding upon various species of mulberry and everywhere an annual only except at Mussoorie, where Captain Hutton obtains two crops. This is the worm that lately failed in France after centuries of domestication. This species has been introduced into Australia, where it is said to thrive well. The best silk of all is produced by this species, and readily sells with good reeling, at 25 shillings per lb. When in health, the silk is golden yellow.

Bombyx textor, Hutton, is cultivated sparingly in several parts of India, but its constitution is thoroughly worn-out, and it ought to be sent to a hill climate. At Mussoorie it thrives well, and although like the last, an annual everywhere else, here it yields a second or autumnal crop also. It was originally brought from China, near Nankin, in North latitude 32°, but is fast fading away from Bengal. It is cultivated in France and Italy and in China, as well as in Bengal, and in those countries generally produces a pure white silk. This species is often termed the Milanese or Italian stock, and in Bengal is known as the Burra pooloo, because its cocoon is larger than those of the so-called desee worms or polyvoltines. It is cultivated in Assam, and, according to Dr. Royle, is there and elsewhere called "Pat major," although it is invariably confounded with B. mori, than which it is at least an inch smaller, though in other respects closely resembling it. The cocoons are of a different texture, with more floss. The silk varies in price from 18 to 22 shillings per lb.

Bombyx crœsi, Hutton, is the largest of the monthly worms, in Bengal it passes under the native name of the Madrassee or Nistry, and is as usual confounded by Europeans with B. mori, although the one passes as an annual, and the other as a monthly worm. The silk is good, of a golden yellow, and the worms thrive best in a temperate climate; in Assam according to Royle it is known as "Pat minor." This species is cultivated in several parts of India and thrives well at Mussoorie.

Bombyx fortunatus, Hutton, is known to the Bengalees as the desee worm, and like the others is dignified by Europeans with the name of B. mori. Silk—golden yellow, distributed over Bengal and other parts of Southern India. A sure mark of distinction between the worm of this species and that of any of the others exists in the fact that when near maturity, it becomes of a dull leaden blue colour. This species thrives best in the cold weather. It is very small, but yields a good cocoon, although the returns of silk are said to be uncertain; there are no dark worms observable among them.

Bombyx sinensis, Hutton, is known as the "Sina" of Bengal, but, like the others, it originally came from China; it is very prolific, and even at Mussoorie goes on yielding crop after crop, up to the middle of December. The cocoons vary in colour, some being white and others yellow, while others even have a beautiful faint greenish hue; all the other species hatch slowly during the morning, from six to twelve o'clock, the Sina worms come forth all in a batch, or continue hatching all day and all night.

Bombyx arracanensis, Hutton. This, Captain Hutton has only once been able to procure and the worms died off soon after hatching. The cocoon is said to be larger than those of the Bengal monthlies.

Bombyx huttoni, Westwood, the Theophila huttoni, is a wild mountain species, feeding on the indigenous mulberry of Simla, Mussoorie and Almorah. Captain Hutton first discovered it at Simla in 1837, and afterwards in great abundance at Mussoorie. In some years they swarm to such an extent, that by the end of May, the worms of the first, or spring brood, have thoroughly denuded even large forest trees, not leaving a single leaf. In this predicament they quit the tree in search of another which they generally find near at hand, and which is then soon thickly covered with cocoons spun in the leaves; but if, unfortunately, they fail to find a tree at hand, the whole brood perishes, the most forward worms spinning cocoons among shrubs and grass. The trees thus denuded instead of dying are in another month once more in full leaf, as if nothing had happened. It is a strong and hardy species, yielding a beautiful, soft, whitish silk, and although the worm is too intractable and wandering to be treated in the usual manner in the house, yet he thinks it might be turned to good account by collecting the cocoons from the trees, as was evidently done in the outset by the Chinese with respect to Bombyx mori.

Bombyx (Theophila) *bengalensis*, Hutton, of Chota-Nagpore, feeds on the Artocarpus lacoocha.

B. affinis, Hutton, of Chota-Nagpore, the eggs of B. huttoni are pale straw colour. glued to the trunk or branches of the tree, and quite naked, whereas those of B. affinis are of an orange colour and covered with dark hair. This renders it difficult to detect them on the bark, and the covering is probably used as a non-conductor of heat. The silk resembles that of B. huttoni, and is equally good, although from the smaller size of the cocoons there is less of it.

Bombyx (Theophila) *sherwilli*, Moore, larva is unknown.

Bombyx (Ocinara) *religiosæ*, Helfer.

Ocinara lida, Moore, is found at Mussoorie where it feeds upon the leaves of Ficus venosa, the larva being very like that of a geometra, and spinning a small white cocoon on the leaf or against a stone beneath the tree. It is too small to be serviceable. It is a multivoltine. It feeds on the wild fig also.

Ocinara lactea, Hutton, also occurs at Mussoorie, feeding on Ficus venosa and spins a curious little cocoon of a yellow colour, within the leaf; over the cocoon is laid a net-work of yellow silk, too small to be of use. It has several broods during the summer. The larva is smooth, whereas that of the preceding is hairy.

Ocinara comma, Hutton, moth is white, with a dark comma-shaped mark on the disc of the upper wings; hence the name. It occurs both in the Doon and at about 5,500 feet of elevation below Mussoorie.

Trilocha varians, Moore, is a small species found in Canara and Calcutta. As a silk yielder, it is of no value.

Cricula trifenestrata, a handsome and curious species is found in various parts of India, sometimes in such numbers in the larva state as to become a perfectly destructive pest; it denudes the mango trees of every leaf, destroys the foliage of the cashew-nut, and is even said to attack the tea plants. It occurs in Burmah, Assam, Moulmein, and Chota Nagpore in Central India. The cocoons are formed in clusters, more closely woven and scarcely reticulated at all. This will never prove productive as a silk yielder, unless the cocoons can be reduced to a gummy pulp, and used for some other purposes.

Antheræa paphia, Linn., a handsome species, is distributed all over India from Burmah to Bombay; but there are in this wide range several distinct species included under the name. To separate these effectually must be the work of time, and until it is done, there can no really good Tusseh silk be produced. That several of these species are capable of producing a very valuable article of commerce is an undoubted fact, and from its cheapness and durability it would be a boon to that class of the British population which cannot afford to indulge in expensive silks. Tusseh silk is compounded by the natives by the mixture of the silks of three, if not four, distinct species whose fibres are of different thickness. The silk of any one uncrossed species if reeled as carefully as is done with the produce of the Chinese bombyces, the product would be good. At present the native method is this: At the season when the cocoons have been formed, the jungles swarm with them, and men sally forth to pluck them from the trees. These jungles, however, contain several distinct species, a thing of which the natives are profoundly ignorant; these cocoons are all promiscuously huddled together, placed in hackeries or carts and carted off to the dealers. They are then sorted according to size, thickness, colour, &c., and named accordingly as a kind of trade-mark, but without any reference to species. The cocoons selected for reeling are treated in the roughest manner and all kinds spun off together; those that are kept for breeding are allowed to eat out of the cocoon, as it is termed, and to interbreed, still without reference to species; and as this has been going on from time immemorial, of course the species have become blended into a most confusing cross-breed. Hence it results that if a dozen cocoons are taken at random, no two moths will probably resemble each other.

Antheræa nebulosa, Hutton, is one of the species that has been crossed upon A. paphia, and it seems to be not uncommon throughout Central India. It is a well-marked species, and specimens have been sent to England.

Antheræa pernyi, Guer. Men., was discovered in Mantchouria to the north of China, where it feeds on the oak.

Antheræa yamamai, Guer. Men., is a Japan species and is well thought of both in England and in France, where great efforts have been made to introduce it, but as yet with very indifferent success.

Antherœa assama, is the Mooga or Moongah worm of Assam which produces a very excellent silk, which, if well reeled by skilful hands, instead of being carded, would be extremely valuable. Captain Hutton found this species in the Dehra Doon feeding upon a tree known to the natives as "Kirkee."

Antherœa perotteti, Guer. Men., is said to occur at Pondicherry.

Antherœa helferi, is found at Darjeeling, the cocoon resembling that of the common Tusseh.

Antherœa frithi, is another Darjeeling species.

Antherœa royle, Moore, is common at Simla, Mussoorie, Almorah, and, Capt. Hutton thinks, Darjeeling. It feeds upon the common hill oak, spinning a large but thin cocoon between three or four leaves. The outer coating is very strong, and Captain Hutton does not think it could be reeled; but within this case is the true cocoon, of an oval form and yielding a good silk. The worms are easily reared, and sometimes when treated in the house, give two or three crops.

Attacus atlas, Linn., is the largest of the real silk spinners, is common at 5,500 feet at Mussoorie and in the Dehra Doon; it is found also in some of the deep warm glens of the outer hills. It is also common at Almorah where the larva feeds almost exclusively upon the "Kilmorah" bush or Berberis asiatica; while at Mussoorie it will not touch that plant but feeds exclusively upon the large milky leaves of Falconeria insignis. The worm is perhaps more easily reared than any other of the wild Bombycidæ, producing a very large and well-stuffed cocoon of a grey colour and somewhat difficult to unwind; a strong ley of potash appears to be the best solvent. The species is also abundant in Cachar, Sylhet, and is found also at Akyab, in Arracan as well as in China.

Attacus edwardsi was discovered at Darjeeling, and is much darker in colour than the other, and rather smaller in size, but nothing seems to be known of its food and silk.

Attacus cynthia, abundant at Mussoorie, feeding on various wild plants; common in China where it feeds on Ailanthus glandulosa; found in Assam, Cachar, Saugor. It is commonly reported to be under cultivation in different places, yet such is not the case, the Attacus ricini being in India invariably mistaken for it. Indeed, until a few years ago, when Captain Hutton pointed out the fact, Attacus cynthia was not known to occur in India, the other species passing under that name, as the silkworms did under that of B. mori. Attacus cynthia has been imported into France and England and reared out in the open air on trees of Ailanthus glandulosa; it has likewise succeeded to some extent in Australia, and it is believed they have it also at the Cape of Good Hope. There are difficulties attending the reeling of the silk as there is with all the Attaci, but nevertheless the French have succeeded in turning out some very good silk pieces. In England it is not quite so highly thought of as it once was. In Australia Mr. C. Brady has produced silk from it.

Attacus ricini produces the silk known to the natives as the Arrindy silk; it is easily reared and feeds on the castor oil plant Ricinus communis. The silk is obtained by carding. The chief places of cultivation are Assam, Rungpore, and Dinagepore, in Eastern Bengal, not at Dinapore, as stated in one of Dr. Bennett's Reports. It is also cultivated in smaller quantities in other places. The Mekir to the eastward possess a very fine kind with white silk. Attacus ricini thrives well at Mussoorie, and has been introduced into France, Algeria, Malta, and other places.

Attacus guerini, Moore, is known only from a few specimens of the moth in some museum in England, and Captain Hutton regards it as no more than an ill-fed specimen of A. ricini. He failed to procure it from any part of the country, though he had seen an approach to it in his own trays in ill-fed specimens of the former. This under-feeding, or semi-starvation, was found well exemplified in some very Lilliputian specimens of Actias selene, received from a gentleman who reared it at Serampore, near Calcutta, where he only supplied the worms with food twice a day; the moths are only a quarter of the natural size.

Actias selene, very common in a wild state at Mussoorie, where it feeds on the wild cherry, wild pear, walnut, cedrela paniculata, coriaria nipalensis, and several other forest trees and shrubs. It occurs also at Almorah, Darjeeling, Assam, Cachar, Saugor, and at Serampore near Calcutta. Mr. C. Turnbull failed to reel silk from the cocoons sent down from this, but it has been reeled, though there is not much of it.

Actias mœnas, Doubleday, occurs at Darjeeling and is a very large species, but nothing has been recorded of its habits, food, or produce.

Actias leto, is another Darjeeling species, the economy of which has yet to be ascertained.

Saturnia pyretorum, occurs at Darjeeling and Cachar, but nothing more is known of it.

Saturnia grotei, has been found at Darjeeling, and one or two specimens have been captured at Mussoorie. Captain Hutton is inclined to think that the larva feeds on the wild pear tree (Pyrus kytul ?)

Saturnia lindia, Moore, occurred in a collection made by the late Captain James Lind Sherwill, and is supposed to be from Darjeeling or its neighbourhood. It is allied to Saturnia grotei.

Saturnia cidosa, Moore, from Captain J. L.

Sherwill's collection also, and from North-eastern India, but we have no information regarding it. From its being closely allied to Saturnia pyretorum, Captain Hutton is inclined to suppose it an inhabitant of Darjeeling or Cachar.

Neoris huttoni, Moore, found at Mussoorie at about 6,500 feet of elevation, feeding on the wild pear tree. The larva are to be found in April. The cocoon is an open net-work, and would produce no silk.

Caligula simla, occurs at Simla, Mussoorie, and in Kumaon, feeding on the walnut, Salix babylonica, wild pear tree, &c., but the cocoon is a mere coarse open net-work through which the pupa is visible, and yields no silk.

Caligula thibeta, occurs at Mussoorie on Andromeda ovalifolia, wild pear, and common quince. It occurs also in Kumaon, but the specific name is a misnomer, the insect never approaching Tibet. The cocoon is a coarse open net-work through which the larva is visible, but there is no available silk.

Loepa katinka, West, a very beautiful yellow moth discovered originally in Assam, occurring also at Mussoorie. The cocoon may yield silk, but there is very little of it.

Loepa sivalica, Hutton, closely allied to the last, and found at Mussoorie at about 5,500 feet and lower, will probably yield a smal quantity of silk.

Loepa miranda, Atkinson, found at Darjeeling; a good and handsome species.

Loepa sikkimensis, Atkinson, a very beautiful species found at Darjeeling. It may be known from the others, by the smaller size, and by the wings, being clouded with maroon. Of its economy nothing is known.

Three or four other species of this family occur in Darjeeling and Sylhet, but beyond their existence, nothing is recorded. Those species, which like Actias selene and Antheræa paphia, weave strong compact cocoons perfectly closed at both ends, are furnished on each shoulder with a hard wing spur for the purpose of separating the fibres when the moth is ready to come forth; it may be heard grating against the silk and the point may often be seen protruding. It is common to the genera Actias and Antheræa, and was discovered by Capt. Hutton. In Attacus, Neoris, and Loepa, the upper end of the cocoon is left open, the fibres pointing forward closely arranged, like the fine wires of a mouse-trap. No spine is needed in these genera. In Bombyx and others, although the cocoons are entire, the silk is loosely woven, and the fibres being moistened by an acid from the mouth, are then easily separated by the claws on the forefeet of the moths. This is about the state and extent of our knowledge of the Bombycidæ of India; that there are many other species yet to be discovered, no naturalist will think of denying. Nature is the book through which the Almighty teaches man to look from earth to heaven, and as His works and knowledge are boundless, so has this beautifully illustrated book no end.

Silk husbandry is extensively prosecuted in Italy, France, China, Persia, Siam, and India. Silk occurs in various forms. Cocoons, knibs or husks, are the balls as formed by the worm, about the size of a pigeon's egg, and of a golden yellow colour. Raw silk, the state when simply wound off the cocoons into skeins or hanks, is the thread composed of several fibres united by their natural gum. Waste silk, is that part which is first wound off the cocoons in the operation of reeling, and such cocoons as being eaten through by the worm, cannot be wound off the reel, but are afterwards carded and spun. Silk has long been imported into India from China. The earliest notice, though there is some doubt about the passage, is in the Mahabharat where the Cheena, Hoona, &c., are said to have bought silk, and silk-worms as presents to Yoodhistira.

For the eleven years 1850-51 to 1860-61, the Catalogue of the Exhibition of 1862, gives the following quantities and values of silk goods (exclusive of Chussums) as exported from India:

	Quantities—Pieces.				Values, £ Sterling.			
	Bengal.	Madras.	Bombay.	Total.	Bengal.	Madras.	Bombay.	Total.
1850-1	599,604	3,843	30.577	634,024	332,657	1,909	20,657	355,223
1851-2	439.615	637	38,955	479,207	239,734	392	20,099	260,225
1852-3	?	6,272	?	?	287,173	781	27,241	315.195
1853-4	569,763	1,788	?	?	301.671	861	13.799	316,331
1854-5	479,891	2,221	31,858	513,970	248,577	1,634	13,242	263,453
1855-6	585.969	3,678	27,036	616,683	325,008	2,450	13 577	341,035
1856-7	452,431	1,645	?	?	248,719	1,286	31,445	281,450
1857-8	?	2,119	?	?	103,261	987	53.976	158,224
1858-9	?	2,933	?	?	162,956	2,137	48.015	213,108
1859-1860	286,220	4,519	?	?	152,795	2,161	36,253	191,509
1860-1861	171,847	2,240	37,455	211,542	104,843	1,689	19,255	122,787

The bulk of these exports were sent to the United Kingdom, and France and Foreign Europe, America, China, Arabian and Persian Gulfs, Aden, Suez, Straits' Settlements, and other ports, took the remainder.

Mr. Powell, however, in his Panjab products gives the following as the value of the exports of Silk from all India to all parts of the world during the years, as under :—

1850-51	£ 619,318	1856-57	£ 782,139
1851-52	„ 688,640	1857-58	„ 766,673
1852-53	„ 667,546	1858-59	„ 799,252
1853-54	„ 642,475	1859-60	„ 817,853
1854-55	„ 500,116	1860-61	„ 1,036,728
1855-56	„ 707,705		

Mr. Powell in the above figures, seems to have mixed up the exports of Raw Silk and of Silk Goods. The following is a statement of the values of the imports and exports from India of these two products :-

	Imports.		Exports.	
	Raw Silk.	Silk Goods.	Raw Silk.	Silk Goods.
1849	£211,351	£123,506	£713,632	£302,322
1850	184,142	112,601	666,094	441,749
1851	240,101	111,554	619,319	355,223
1852	203,518	126,064	688,640	260,225
1853	229,943	110,546	667,545	315,305
1854	291,067	116,955	640,451	326,571
1855	260,768	197,510	500,105	263,453
1856	274,337	138,768	707,706	341,035
1857	120,130	106,333	782,140	281,450
1858	377,990	108,023	766,673	158,224
1859	504,903	147,740	725,655	213,108
1860	307,560	224,116	817,853	191,509
1861	404,870	259,596	1,036,728	134,831
1862	413,999	198,442	686,083	168,806
1863	392,359	342,111	822,892	165,136
1864	385,507	456,781	954,649	115,465
1865	329,315	443,948	1,165,901	106,612

Punjab.—Mr. Powell says the silk trade in the Punjab is stated by Mr. Davis to be nearly £200,000. Raw Silk, he adds, is imported from Kokand, Bokhara, Balkh, Khulm, Akhcha, Shibrgaum, Andko, and Kashmir; from Saidabad, Murshedabad, Rampur-baulia, and Radhanagi, in Bengal, and from China viâ Bombay. No silk has been imported from Khutan, for the last four or five years. The raw silk is sent from Amritsur to all parts of the Punjab for manufacture : raw silk is the staple import by way of Kabul. He describes the silk as secreted in a double filament from two orifices at the head of the worm, communicating with two secreting glands, one on each side ; as they pass out the two filaments are glued together into one by the secretions from a third central gland, of a resinous substance. After boiling in a solution of sajji or carbonate of soda, the silk is washed several times with soap and water, and finally exposed as in Europe to the fumes of sulphur. It loses much weight by this operation, (4 or 5 chittack out of 16,) showing that the coloring substance is separable and ponderable. In Kashmir it is said that paper called reshami kagaz, or haridi kagaz, is made from the refuse and from pierced cocoons unfit for reeling. When silk is reeled, the thread as it is wound from the cocoon being twisted to give it strength, is called singles ; two or more singles twisted together form tram, weaving thread, short or weft.

Central Asia.—The country bordering on the river Oxus and the canals and water-courses from Samarkand and Shahr-i-sabz, is full of mulberry trees, on the leaves of which silkworms are fed. About ten days or a fortnight after the mulberry trees put forth their leaves, the eggs of the silkworms are removed from the place where they had been preserved during the winter, and being wrapped in a cloth, are carried against the naked breast, or still oftener under the arm-pit. Three to five days are quite sufficient for the little insects to be hatched. They are then placed in a vessel and fed with the leaves gathered from the mulberry ; after ten days the worms, according to the expression of the Bukharians, fall into their sleep or trance, they take no nourishment three days running, repeating the same process every ten days, until the time they begin to spin the cocoon. When these are finished, the worm inside is destroyed by exposing the cocoon to the heat of the sun. That done, the Bukharians proceed to reel off the silk threads. The quality of Bukhara silk is much inferior to that of China, and even to the French and Lombard silks, both in colour and softness. The silk annually produced in the Bukhara territory is estimated to be worth 15 lacs. The greatest quantity is exported to India. There are several descriptions of silk. Lab-i-abi, produced on the banks of rivers and canals. Vardanzai, produced in the district of that name to the north-west of Bukhara. Chilla jaidar, produced in the environs of Bukhara, this is the best. A quantity of Kabul and Bukhara silk is also imported into Multan and other places, to meet the demands of the great silk factories. It has been ascertained from the best and most reliable sources that about 300 packages of first, second and third quality raw silk, weighing in all 750 maunds, the price of which averages to Rs. 3,75,000, are imported annually into Multan from Kabul, Bukhara, Khorasan and Herat.

Mulberry Trees.—The white mulberry (Morus alba) is infinitely to be proferred as food for the worms of the Bombyx mori, and this has been introduced from China into Europe as well as into India. Morus indica, the species most common in Bengal, is thought by Dr. Wallich to be only one of its varieties. Morus atro-purpurea is a species introduced into India from China, where it is employed as food for the silkworm, though Dr. Roxburgh states, that it had not been found to answer for that purpose in Bengal. Two varieties (one, the Doppa foglia) of the Italian white mulberry, received from Saint Helena, were established in the East India Company's botanic garden at Dapooree, in the Bombay Presidency. The then Superintendent, Dr. Lush, forwarded to Calcutta young plants, which, in September 1833, were reported by Dr. Wallich to be in a flourishing condition. Two other species are common in the plains of North-western India, and others have been introduced there from Caubul and Cashmere: one distinct species occurs, moreover, in the Himalaya. Col. Sykes has drawn attention to the great importance of introducing into India the mulberry called Morus multicaulis, a distinct species or variety introduced by M. Perrottet into France, in 1821, from the Philippine Islands, where it had been brought from China. It is now thought by many, both in Italy and France, to be the most valuable sort for cultivation, and has become a favourite variety in America. Besides growing easily, and affording abundance of leaves of the most nourishing kind, it is said, to be able to withstand a considerable degree of cold.

Other trees.—Wild silkworms feed upon different trees, such as the Jujube, Ficus religiosa or Peepul, the Castor oil plant, Terminalia catappa, some of the Laurel tribe, and others, which are found in almost all the forests of India. Besides the common mulberry of China, which differs somewhat from that of Europe, they occasionally, in feeding the worms, have recourse to a wild specimen of the morus tribe, as well as to the leaves of another tree, supposed to be a variety of ash.

Mulberry.—The principal object, in the cultivation of the mulberry for feeding silkworms, is to produce the greatest quantity of young and healthy leaves without fruit. For this reason the trees are not allowed to exceed a certain age and height. They are planted at a convenient distance from each other, on the plan of a quincunx, and are said to be in perfection in about three years. The mulberry-tree for silkworms is chiefly cultivated in Che-keang, which province, together with the only three others that produce fine silk, namely, Keang-nan, Hoo-pe, and Sze-chuen, is crossed by the thirtieth parallel of latitude. Che-keang is a highly alluvial country, intersected by numerous rivers and canals, with a climate that corresponds pretty nearly to the same latitude in the United States of America. The soil is manured with mud, which is dug from the rivers, assisted with ashes or dung; and the spaces between the trees are generally filled with millet, pulse, or other articles of food. The time for pruning the young trees, so as to produce fine leafy shoots, is at the commencement of the year. About four eyes are left on every shoot, and care is taken that the branches are properly thinned, with a view to giving plenty of light and air to the leaves. In gathering these, they make use of steps, or a ladder with a prop, as the young trees cannot support a ladder, and would besides be injured in their branches by the use of one. The trees, with their foliage, are carefully watched, and the mischief of insects prevented by the use of various applications, among which are some essential oils. The young trees of course suffer by being stripped of their leaves, which are the lungs of plants, and this is an additional reason for renewing them after a certain time. They endeavour in part to counteract the evil effects, by pruning and lopping the tree, so as to diminish the wood when the leaves have been stripped, and it is probable that a few leaves are left on. It is suprising, however, to observe how soon a tree in those climates will recover its leaves in the summer or autumn, after having been entirely stripped of them by a typhoon, or hurricane. Fresh plants are procured by cuttings or layers, or sometimes from seed. When the trees grow too old for the production of the finest leaves, and show a greater tendency to fruiting, they are either removed altogether, or cut and managed so as to produce fresh and young branches.

Rearing worms.—Mr. Barrow, who observed the management of the trees and silkworms in Chekeang, confirms the usual Chinese accounts, by saying that "the houses in which the worms are reared are placed generally in the centre of each plantation, in order that they may be removed as far as possible from every kind of noise; experience having taught them that a sudden shout, or the bark of a dog, is destructive of the young worms. A whole brood has sometimes perished by a thunder storm." The chambers are so contrived as to admit of the use of artificial heat when necessary. Great care is taken of the sheets of paper on which the multitudes of eggs have been laid by the silkworm-moths; and the hatching of these eggs is either retarded or advanced, by the application of cold or heat according to circumstances, so as to time the simultaneous exit of the young worms exactly to the period when the tender spring leaves of the mulberry are most fit for their nourishment. They proportion the food very exactly to the young worms by weighing the leaves, which in the first instance are cut, but afterwards, as the insects become larger, are given to them whole. The greatest precautions are observed in regulating the temperature of the apartments, and in keeping them clean, quiet, and free from smells. The worms are fed upon a species of small hurdles of basket-work, strewed with leaves, which are constantly shifted for the sake of cleanliness, the insects readily moving off to a fresh hurdle with new leaves, as the scent attracts them. In proportion to their growth, room is afforded to them by increasing the number of these hurdles, the worms of one being shifted to three, then to six, and so on until they reach their greatest size. When the worms have cast their several skins, reached their greatest size, and assumed a transparent yellowish colour, they are removed into places divided into compartments, preparatory to their spinning. In the course of a week after the commencement of spinning, the silken cocoons are complete, and it now becomes necessary to take them in hand before the pupæ turn into moths, which would immediately bore their way out, and spoil the cocoons. When a certain number, therefore, have been laid aside for the sake of future eggs, the pupæ in the bulk of the cocoons are killed by being placed in jars under layers of salt and leaves, with a complete exclusion of air. They are subsequently placed in moderately warm water which dissolves the glutinous substance that binds the silk together, and the filament is wound off upon reels. This is put up in bundles of a certain size and weight, and either becomes an article of merchandise under the name of raw silk, or is subjected to the loom, and manufactured into various stuffs, for home or for foreign consumption. Notwithstanding the apparent simplicity of their looms, they will imitate exactly the newest and most elegant patterns from England or France. The Chinese particularly excel in the production of damasks and flowered satins. Their silk crape has never yet been perfectly imitated ; and they make a species of washing silk, called Canton ponge, which becomes more soft as it is longer used.

Mr. Fortune who spent a few days in the vicinity of Nan-tsin, the centre of the great silk country of China, gives a description of the cultivation and appearance of the mulberry trees. The soil over all this district is yellow loam, well mixed and enriched by vegetable matter ; just such soil as produces excellent wheat crops in England. The whole of the surface of the country, which at one period has been nearly a dead level, is now cut up and embankments for the cultivation of the mulberry. It appears to grow better upon the surface and sides of these embankments than upon level land. The low lands, which are owing to the formation of these embankments, considerably lower than the original level of the plain, are used for the production of rice and other grains and vegetables. It is therefore on the banks of canals, rice fields, small lakes, and ponds, where the mulberry is generally cultivated, and where it seems most at home But although large quantities of rice and other crops are grown in the silk districts, yet the country, when viewed from a distance, resembles a vast mulberry garden, and when the trees are in full leaf, it has a very rich appearance. The variety of mulberry cultivated in this district appears to be quite distinct from that which is grown in the southern parts of China and in the silk districts of India. Its leaves are much larger, more glossy and have more firmness and substance than any other variety which has come under my notice. It may be that this circumstance has something to do with the superior quality of the silk produced in the Hoo-chow country, and is worthy of the notice of silk-growers in other parts of the world. This popular variety is not reproduced by seeds hence all the plantations are formed of grafted trees. Each plant is grafted from a foot or two feet above the ground, and rarely higher. The trees are planted in rows from five to six feet apart, and are allowed to grow from six to ten feet high only, for the convenience of gathering the leaves. In training them they are kept open in the centre ; the general outline is circular, and they are not unlike some of those dwarf apple trees which are common in European gardens. The different methods of gathering the leaves in these districts are curious and instructive and show clearly that the cultivators well understand the laws of vegetable physiology. Leaves are not taken at all from plants in their young state, as this would be injurious to their future productiveness. In other instances a few leaves only are taken from the bushes, while the remainder are allowed to remain upon the shoots until the summer growth is completed. In the latter case the leaves are invariably left at the ends of the shoots. When the bushes have attained their full size, the young shoots with the leaves are clipped close off by the stumps, and shoots and leaves carried home together to the farm-yard to be plucked and prepared for the worms. In the case of young trees, the leaves are generally gathered in by the hand, while the shoots are left to grow on until the autumn. At this period all the plantations are gone over carefully, the older bushes are pruned close in to the stumps, while the shoots of the younger ones are only shortened back a little or allow them to attain to the desired height. The ground is then manured and well dug over. It remains in this state until the following spring, unless a winter crop of some kind of vegetable is taken off it. This is frequently the case. Even in the spring and summer months it is not unusual to see crops of beans, cabbages, &c., growing under the mulberry trees. During the winter months, the trees are generally bare and leafless. Those persons who are accustomed to live in countries with marked seasons, where the winters are cold, and where the great mass of vegetation is leafless, would not be struck with this circumstance in the silk country of China. But the view one gets in this country in the summer months, after the first clipping of the shoots, is curious, and striking. As far as the eye can reach, in all directions, one sees nothing but bare stumps. It looks as if some pestilential vapour had passed over the plain and withered up the whole of these trees, and the view is rendered still more striking by the beautiful patches of lively green which are observed at this time in the rice fields and on the banks of the canals. This system of clipping close in to the stumps of the old branches gives the trees a curious and deformed appearance. The ends of the branches swell out into a club-like form, are much thicker there than they are lower down. After, says Mr. Fortune, I had completed my inspection of the country near the town of Nan-tsin, I proceeded onwards to the west in the direction of Hoo-chow-foo. A few hours' sail on a wide and beautiful canal brought me within view of the mountain ranges which form the western boundary to the great plain of the Yang-tse-kiang, through which I had been passing for several days. The most striking hill which came first into view was crowned by a seven-storied pagoda. It had a large tree by its side, equally striking in the distance, and which had probably been planted when the pagoda was built. I afterwards ascertained this to be the " maiden hair-tree" (Salisburia adiantifolia), a tree which attains a large size in this part of China, and is extremely ornamental. The greater part of the silks and crapes used in this part of China are manufactured in the adjoining towns of Soochow and Kang chow. Flowered crape, however, a very beautiful production, is made in Hoo-chow. The process of manufacture is thus described by the Rev. Mr. Edkins in the " North China Herald" :—" Two men were engaged at a loom in a cottage on the side of a stream. One sat at the end of the loom moving five pedals, and directing the shuttle and all that needed to be done with the threads that lay horizontal on the frame. The other was perched over head to superintend the pattern. This he did by means of vertical threads tied up in bundles, a large number of which, distributed transversely through the threads of the horizontal frame beneath him, were at his disposal. These he raised according to the requirement of the pattern, and thus caused that elevation in the threads on the frame below that constituted the flowered part of the piece." If there was little to notice in these temples with reference to buddhism and its rites there were objects of another kind which soon attracted my attention. The halls and outhouses of the monastery seemed to be converted for the time into a place for feeding silkworms. Millions of these little animals were feeding in round sieves placed one above another in open frameworks made for this purpose. So great was the number of the worms that every sieve, and there must have been many hundreds of them, was crammed quite full. In one large hall I observed the floor completely covered with worms, I shall never forget the peculiar sound which fell upon my ear as I opened the door of this hall. It was early in the morning, the worms had been just fed and were at the time eagerly devouring the fresh leaves of the mulberry. Hundreds of thousands of little mouths were munching the leaves and in the stillness around this sound was very striking and peculiar. The place too seemed so strange ; a temple—a place of worship with many huge idols, some from twenty to thirty feet in height looking down upon the scene on the floor. But to a Chinese there is nothing improper in converting a temple into a granary or a silk-worm establishment for a short time if it is required, and I suppose the gods of the place are supposed to look down with approbation on such scenes of peaceful industry. When from the large number of worms it is necessary to feed them on floors of rooms and halls, there is always a layer of dry straw laid down to keep them off the damp ground. This mode of treatment is resorted to when necessary, and not from choice. The sieves of the establishment, used in the framework I have already noticed are greatly preferred. Whether the worms are fed on sieves or on the floor they are invariably cleaned every morning. All the remains of the leaf stalks of the mulberry, the excrement of the animals, and other impurities, are removed before the fresh leaves are given. Much importance is attached to this matter, as it has a tendency to keep the worms in a clean and healthy condition. The Chinese are also very particular as regards the amount of light which they admit during the period the animals are feeding. I always observed the rooms were kept partially darkened, no bright light was allowed to penetrate. In many instances the owners were most unwilling to open the doors, for fear, as they said, of disturbing them, and they invariably cautioned me against making any unnecessary noise while I was examining them. At this time nearly all the labour in this part of the country was expended on the production of the silkworm. In the fields the natives were seen in great numbers busily engaged in gathering the leaves; boats on the rivers were fraught with them; in the country-market-towns they were exposed for sale in great quantities, and everything told that they were the staple article of production. On the other hand, every cottage, farm house, barn and temple, was filled with its thousands of worms which were fed and tended with the greatest care. On my way up from Hoo-chow-foo to Mei-chi, and about the 23rd of June, I observed that many of the worms had ceased to feed and were commencing to spin. The first indication of this change is made apparent to the natives by the bodies of the little animals becoming more clear and almost transparent. When this change takes place, they are picked, one by one, out of the sieves, and placed upon bundles of straw to form their cocoons. These bundles of straw which are each about two feet in length, are bound firmly in the middle, the two ends are cut straight and then spread out like a broom, and into these ends the worms are laid, when they immediately fix themselves and begin to spin. During this process I observed the underside of the frame-work on which the bundles of straw were placed surrounded with cotton cloth to prevent the cold draught from getting to the worms. In some instances small charcoal fires were lighted and placed under the frame inside the cloth, in order to afford further warmth. In some of the cottages the straw covered with spinning worms was laid in the sun under the verandahs in front of the doors. In a few days after the worms are put upon the straw they have disappeared in the cocoons and have ceased to spin. The reeling process now commences and machines for this purpose were seen in almost every cottage. This apparatus may be said to consist of four distinct parts, or rather, I may divide it into these for the purpose of describing it. There is, first, the pan of hot water into which the cocoons are thrown; second, the little loops or eyes through which the threads pass; third, a lateral or horizontal movement, in order to throw the silk in a zigzag manner over the wheel; and lastly the wheel itself, which is square. Two men, or a man and woman, are generally employed at each wheel. The business of one is to attend to the fire and to add fresh cocoons as the others are wound off. The most expert workman drives the machine with his foot and attends to the threads as they pass through the loops over on to the wheel. Eight, ten, and sometimes twelve cocoons are taken up to form one thread, and as one becomes exhausted, another is taken up to supply its place. Three and sometimes four, of such threads are passing over on to the wheel at the same time. The lateral or zigzag movement of the machine throws the threads in that way on the wheel, and I believe this is considered a great improvement upon the Canton method, in which the threads are thrown on in a parallel manner. The water in the pan into which the cocoons are first thrown is never allowed to boil, but it is generally very near the boiling point. I frequently tried it and found it much too hot for my fingers to remain in it. A slow fire of charcoal is also placed under the wheel. As the silk is winding, this fire is intended to dry off the superfluous moisture which the cocoons have imbibed in the water in which they were immersed. During the time I was in the silk country at this time, says Mr. Fortune, I was continually visiting the farm-houses and cottages in which the reeling of silk was going on. As silk is a very valuable production, it is reeled with more than ordinary care, and I observed that in almost all instances a clean, active, and apparently clever workman was entrusted with the care of the reeling process. The old temple at Hoo-shan, which I visited again on my way down, was in a state of great excitement and bustle. The quantity of silk produced here was very large, and all hands were employed; generally all, rather averse to work of any kind, were obliged to take their places at the wheel or the fire. But as the silk was their own, they seemed, notwithstanding their habitual indolence, to work with hearty goodwill. On the following morning, when I awoke, I found myself quietly at anchor close by the west gate of Hoo-chow-foo, my boatmen having worked all night. I spent the next few days in the country to the northward bordering on the T'aihoo lake, and partly near the town Nan-tsin, being anxious to see the end of the silk season. About the eighth, or from that to the tenth of July, the winding of the cocoons had ceased almost everywhere, and a few days after this there was scarcely a sign of all that life and bustle which is visible everywhere during the time that the silk is in hand. The clash of the winding-machines, which used to be heard in every cottage, farmhouse, and temple, had now ceased; the furnaces, pans, and wheels, with all the other parts of the apparatus in common use during the winding season, had been cleared away, and a stranger visiting that country now could scarcely have believed that such a busy bustling scene had been acting only a few days before. During my peregrinations in the silk- country I made many inquiries amongst the natives as to the price of raw silk in the districts where it is produced. At Meiche the price was said to range from twelve to eighteen dollars for 100 taels of silk. At Hoo-chow and Nantsin, where the silk is of a superior quality, the prices in 1855 were from eighteen to twenty-two dollars for 100 taels.

The Honorable Mr. Morrison tells us that the mulberry is cultivated in all the provinces of China, except the most northerly, and silk is raised wherever the tree grows. The best raw silk, called taysaam, comes from the province of Hookwang; the tsailee also comes from that province and Cheaking; both kinds are called Nanking raw silk, and are chiefly exported to England. In 1833-34, the price of the best sorts was from £ 300 to £ 350 per pecul, and the annual exportation was between ten and twelve thousand bales; in 1836-37, it was upwards of twenty thousand peculs, much of which was shipped off at $ 500 per pecul, since that period, for some undiscovered reason, the quantity brought to market has fallen off, and although the prices range between $ 400 and $ 450, still the whole amount hardly exceeds 5,000 bales in a twelvemonth. In the new tariff the duty is the same on the raw silk from all the provinces; for it is probable, that as the trade extends at Ningpo and Shanghae, inferior qualities of silk will be sent abroad; indeed, if the exportation of silk and tea does not increase, it is difficult to see with what commodities the Chinese are to buy the large amount of foreign goods that are likely to be brought to the new ports. The Nanking raw silk exported the past year will average $ 450 per pecul, or $ 100 higher than it is set down in the statement. The waste or refuse raw silk goes entirely to India. Silk organzine is "formed of two, three, or more singles (*i. e.*, reeled threads after being twisted), according to the substances required, twisted together in a contrary direction to that of which it is composed are twisted." It is included in the statements of trade under the name of silk thread. Organzine is also called thrown silk, though there may be some difference between the two, as it is said organzine is not made by the Chinese; it is used in weaving piece goods. Silk thread and ribbons go to the United States, and South America. Silk piece goods of all kinds are shipped for the most part to the United States, Mexico and South America; but considerable quantities go also to England chiefly for re-exportation: one-seventh of the total exportation in 1836-7 was in English ships. Instead of the annual export of $400,000 stated in the Table, it should be one million of dollars, and the duties put at $ 30,000. Most of the various descriptions of silk piece goods usually exported are enumerated in the Table; there are a few others, as gauze, crape shawls, levantines, taffeta, but all description of them is here omitted.

The system of growing the mulberry, as a standard tree, has been tried in Bengal, and, with as little success as attended the experiment of the St. Helena variety on the Bombay side of India. The common bush mulberry is very much preferred by the people at Surdah, commercially, Radnagore, and all other parts of Bengal, where silk cultivation prevails. More than one private speculation with standard trees failed at Chittoor and Coonoor, under energetic and intelligent European superintendence.

Hyderabad in the Dekhan.--The chief of the manufactures and the only one for which Warungul is famed is that of Persian carpets which are made of all sizes and of worsted, of cotton, or of silk. Silk cloth, of the width of the curtailed guz, is manufactured and sold for 12 annas a yard, but the quality is very inferior. It is dyed red with lac, green with indigo and turmeric, or yellow with turmeric alone. The tusser cloth manufactured is only half the value of the silk. Cholees, (women's bodices) are manufactured, but not in sufficient quantity to supply the district, as they are imported. The other manufactures in the Circar are tusser cloths at Hoosainpurty—and Chilpore silks at Mutwarrah. The tusser cloth—although the cocoons are the produce of the same insect as those of Bengal—bears no comparison in fineness or durability with the tusser cloth manufactured there. The silks are dearer, and the cottons of the same price as those produced nearer Hyderabad. Raw silk is imported from Madras and manufactured into sarees and women's bodices at Mutwarrah, Warungul, Maytpilly and Aimulwarrah, in Elgundel, at Maiduck and other Kusbahs. This manufacture is entirely for home use, and no great skill or taste is displayed by the weavers, the silk pieces are of a quality inferior to those sold at the same price in the Hyderabad bazaar, and were it not for the transit duties, the manufacture would become extinct. The silk cloths are dyed red with the lac dye and yellow with turmeric; no other dyes are used. Tusser is made into sarees, punchees, and scarfs, at several towns of the Circar of Warungul. But the chief seat of the tusser manufacture is the town of Mahdapore, on the right bank of the Godavery in the Ramgheer Circar, where the moth that yields it is carefully reared, and from whence raw tusser silk is sent to other parts to be woven into cloth. The insect in its grub state is first fed on the tender leaves of the Careya sphærica, and when more grown, on the leaves of the Pentaptera tomentosa; much watching and attention are bestowed in rearing the animal, subject as it is to destruction from birds, insects, and squirrels. The tusser cloths produced at Mahdapore are, in durability and fineness, very inferior to the cloths of the same kind manufactured in Bengal, they are dyed the same colour, and with the same materials as the silks, of which they are about one-half the price. The tussah worm-breeders are a class quite distinct from the weavers, and are either Telingas of low caste or Gonds; the former reside principally at Chilpore, Mahdapore and Chinnore. At Mahdapore, which may be regarded as the centre and head-quarters of the tussah breeders, there are at least seventy to eighty families employed in rearing the insect and in the manufacture of the cloth, which is prepared principally for the Hyderabad market. The tussah breeder never thinks of keeping up the breed of the insect throughout the year. When the leaf is off the tree about the middle of March, he deems his occupation gone, and he leaves the object of his former excessive care to shift for itself, thinking of nothing but the present ease which may be summed up in a few words, sloth, a bare subsistence, and an occasional debauch in his nectar, palm toddy. But with the rains returns his toil, and some little difficulty is experienced in procuring insects for a fresh campaign. If he can gather a dozen of promising cocoons which his experience tells him are of females, he is quite satisfied. Carefully does he watch the bursting of the cocoon, and much care does he take of its winged inmate, having previously prepared for it a house of teak leaves dried. The male is not tardy in approaching. Impregnation takes place, the male dies, and in four days after laying her eggs, the female also. The eggs are in number about sixty: of these one-half prove abortive, while the others are hatched in ten days. The small insect is fed on the tender leaves of the Careya sphærica, and in six weeks spins its cocoon.; the first brood are spared and allowed to burst their cocoons to supply a sufficient quantity of ova for the tussah harvest. The same process is described as again gone through, with this exception, that the young worms are at this time fed on the leaves of the Pentaptera tomentosa, as those of the Careya sphærica are by this period of the season, supposed to have acquired some influence noxious to the insect. It is during the progress of the worm from the egg to the formation of the cocoon that every energy of the tussah breeder is called into action for the preservation of his charge. Every animal, footed, winged and creeping, is said to be the enemy of the tussah grub. Ants destroy them, kites and crows prey on them, snakes devour them, and squirrels are said to make a repast of them. To protect them first from their insect enemies, the tussah breeder ascends the "muddy" tree (Pentaptera tomentosa), the leaves of which are the insect's food, he carefully clears every branch of the different species of ants by which they may be infested, preventing the access of others by surrounding the trunk of the tree at its foot with ashes. The other enemies are kept off by shouting, throwing stones, firing guns, &c. Their life at this time would appear by their own account, to be one of the most unremitting toil, to devote themselves to which they forswear not only every indulgence but every comfort, and it rouses the apathetic peasant of Telingana to eloquence when he recounts what privations he undergoes, what pleasure he derives himself, and what incessant labour he incurs, while watching the rearing of the worm, and the perfecting of its work. The tussah butterfly of the Dekhan, is a species of Saturnia, probably the paphia, described by Dr. Helfer as the most common of the native species. From four to five hundred of the cocoons are sold to the banya and weavers for one rupee; the moth is killed by means of heat. There are three tussah harvests, one at the end of the rains, the other two in the cold season. The winding of the silk is accomplished by boiling the cocoons, separating the floss, of which no use is made; and twisting eight or ten filatures from as many cocoons on the middle of the thigh with the left hand of the workman and to be wound on the instrument; this instrument, the middle bar of the wood, is held lightly in the hand of the workman and made to move in a semi-circle. An ounce and a quarter of silk is the average daily winding of a single workman, his wages are at the common rate of one pice for winding the silk of fifty cocoons, about three pice a day, as he cannot wind more silk than from a hundred and fifty cocoons. The pice, however, are large and go there by eight to the rupee. The only dyes used for the tussah silk, as far at least as observation or inquiry has gone, are the flowers of the palas, Butea frondosa, and turmeric; by the former the usual familiar colour is produced; by the latter golden yellow is brought out after the threads are for some time immersed in a solution of ashes. The warp threads are stiffened with rice congee. The tussah cloths produced at Madpore are in durability and fineness very inferior to the cloths of the same kind manufactured in Bengal; they are dyed the same colour, and with the same materials as the silks of which they are about one-half the price.

Mysore.—The manufactured silks sent to the Madras Exhibition of 1855, represented in a very partial degree the resources of the country in this useful as well as ornamental branch of industry. The finest were the shawls of Bangalore and the silk carpets of Tanjore and elsewhere. Bangalore shawls were very creditable from the harmony of colours and elegance of design. They have been much improved of late years both in quality of material and in beauty of pattern; white silk pocket handkerchiefs rivalling the China silk in softness and richness are also manufactured at Bangalore. The rearing of silk worms is carried on in all parts of the Mysore country. Still the state of the trade compared with that of the Bengal presidency shows that much is yet to be done, in 1841, 1,175,308 lbs. of raw and waste silk were exported from the East Indies and Ceylon, of which nearly the whole was from Bengal. The exports from the Madras presidency were, in 1853-4, 10,478 lbs. of raw silk and 1,688 pieces of piece goods. In addition to the exports of this material, a great quantity is used in the manufactures of this country. The native cloths owe their beauty in a great degree to the richness of the silk borders. The satins, kinkhabs, &c., of Hyderabad are well adapted to native costume, but hitherto little progress has been made in manufacturing articles for European costume, except in Bangalore. The silk of Tanjore and the lesser but elegant articles such as gimp, fringe, cords and tassels, braid for carriages, &c., are of every variety and of great excellence.

Many of the sarees or women's cloths, made at Benares, Pytun, and Boorhanpoor; in Guzerat; at Narrampett, and Dhanawarum, in the territory of His Highness the Nizam; at Yeokla in Khandesh, and in other localities, have gold thread in broad and narrow stripes alternating with silk or muslin. Gold flowers, checks, or zigzag patterns are used, the colours of the grounds being green, black, violet, crimson, purple and grey; and in silk, black shot with crimson or yellow embroidery, crimson, with green, blue, or white, yellow with deep crimson and blue, all producing rich, harmonious, and even gorgeous effects, but without the least appearance of or approach to glaring colour, or offence to the most critical taste. They are colours and effects which suit the dark or fair complexions of the people of the country; for an Indian lady who can afford to be choice in the selection of her wardrobe, is as particular as to what will suit her especial colour—dark or comparatively fair, as a lady of Britain or France.

At the London Exhibition of 1862, silk pieces, figured and gold embroidered, were sent from Bhawulpore, by H. H. the Nawab. The principal places of silk manufacture however are the cities of Peshawur, Lahore, Umritsur, Mooltan, and the capital of the neighbouring state of Bhawulpore. The silks of the latter place are considered the best, and the next those of Mooltan.

Assam.—As each householder reels, spins, and weaves his own cloth, the holiday attire of the Assamese is usually of silk. In Durrung, athan, of good silk measuring 10 yards, can be purchased for from 5 to 10 rupees, according to the fineness. The cloth is occasionally coloured, but the Assamese silks are usually of the natural colour as wound from the cocoon.

Tussah silk cloth is much used for ladies' and children's dresses, and in most parts in India for native use, being worn by hindoos for certain ceremonies and while bathing: it is an article of export.

Dr. Roxburgh in the 7th vol. of the Linnean Transactions, described the preparation of the tussah silk of Bengal, derived from two different species of Saturnia. One called bughy by the natives of Beerbhoom, appears to be the same as the Madras species (S. paphia), and is stated to feed on the ber tree and on the asana, Pentaptera glabra. The other termed jaroo by the natives of the same province, is the S. cynthia, and is domesticated. The caterpillars are fed on the leaves of the castor oil plant (Ricinus) whence it is called the arundy, or arundi silk worm, but it also eats the leaves of the ber and asana. Colonel Sykes, in the 3rd Vol. of Trans. Roy. As. Socy., London, described the cocoons of S. paphia, found by him in the Dekhan, under the designation of the kaliswar silk worm, which he stated is met with on the ber tree (Pentaptera glabra), teak tree and common mulberry. The Chinese tussah is said to be obtained from Saturnia atlas, which is also to be met with in Southern India. Another species of Saturnia (S. selene); the posterior wings of which are prolonged into a tail-like process is common in Southern India. The caterpillar may be observed feeding in considerable numbers on the Odina wodier, or Be-sharm tree, in February and March. Its chrysalis is enveloped in a silky covering, so like that of S. paphia that it would probably be found to yield a strong and useful thread. It may be worth while to direct attention to the silk spun by several smaller specimens of Bombyx moths, found on different species of Cassia, Acacia and Phyllanthus. A gregarious caterpillar (a species of Lasiocampus) may be observed clustering in great numbers on the stem of the guava, the jamoon (Syzygium jambolanum,) and probably other trees: the silky covering of these also seems deserving of examination. Lieut.-Colonel F. Cotton sent some of the cocoons gathered by him when exploring the Godavery. The Saturnia genus belongs to the order Lepidoptera and the family Bombycidæ. The antennæ are fringed in the male; the head is small, the wings are very broad and entire; the palpi and trunk are wanting, and some of the largest of the Lepidoptera belong to the genus Saturnia. Saturnia atlas, the giant atlas moth, has wings measuring 7 or 8 inches across. This species also with S. cecropia and S. luna have their wings produced into a tail. The cocoons of S. cynthia and S. mylitta are used in India for the production of silk. Latreille states that these are the wild species of silkworm of China. S. cynthia is the arindi silkworm of India (Roxburgh, 'Linn. Trans.,' Vol. vi.) At the Universal Exposition held in Paris, in 1855, samples of Indian silk were exhibited with the cocoons of the different species of the Bombycidæ from the Bombyx mori "pat." Saturnia mylitta, (tussah); Saturnia assamensis, "monga;" Attacus cynthia, eri or eriah.

The tussah silk moth of Ceylon, Antheræa mylitta, *Drury*, feeds on the country almond (Terminalia catappa) and the Palma christi or castor-oil plant.

China.—The best silk of China is obtained from cocoons of worms fed, not on the oak, but on the Tsin-tso-tsze.

Japan.—The account of the Yama-mai or oak silkworm in Mr. Adam's third report upon the silk culture of Japan is of less interest than his first report of 1870. The parasite "uji" (maggot), as the Japanese call it, preys upon the silkworm, and in some years kills from 30 to 84 per cent. of the worms, and threatens completely to ruin the industry, neither M. Guerin-Meneville, nor the Entomologists, nor the Moniteur des Soies have been able to arrive at the natural history of this insect. The state of mind of the Japanese peasant upon the subject is rebuked in a despairing despatch from Date, ex-prince of Uwajima and Minister of the Home Department. He says, "Is it not painful to attribute a plague like that of the uji solely to Providence because we have not yet ascertained its causes?" The theory regarding the uji to which Mr. Adams gave currency in his first report was that during the spring a fly having deposited its eggs on the mulberry leaf, they were introduced with the food into the silkworm's intestines. The better opinion, however, seems to be, as stated in the second report and confirmed in the third, that the fly pierces the silkworm and deposits its egg underneath the skin, where it is hatched into the uji or larva, which, feeding upon the body of the silkworm during its changes, gradually increases until it is nearly as large as the chrysalis itself, and in the end destroys its way out of the cocoon, which thereupon becomes useless. The uji then shrinks considerably in the course of four or five days into a small chrysalis of its own, which on dissection discloses the embryo of a fly, although it has not been sufficiently observed to ascertain the time of the fly's natural issue. The birth of the fly is, however, perhaps correctly supposed to occur about the time of the hatching of the first crop of silkworms in the following spring, when it deposits its eggs, and the existence of the next annual generation begins. This supposition is chiefly grounded on the fact that the second crop of the worms, the summer hatching is comparatively free from the uji. The ignorant Japanese, unfortunately, do not destroy the uji issue from the cocoons, but merely throw them away; and the efforts of the Japanese Government to circulate information on the subject have hitherto been unavailing. One notification warns the population to "remember the saying, 'Fear posterity,' and that it is impossible to affirm that the extreme limit of progress has been attained." 320,000lbs. weight of silkworms' eggs were exported from Japan to France and Italy in 1869.

Gheelan.—The raw silk of Gheelan is the most important Persian article of export. In 1844 the quantity of silk produced in Gheelan weighed more than one million pounds, and was worth £450,000.

Burmah.—Eastward of the little Lake of Rangoon, lies a suburb which has received the name of "Thay-bue-choung" or the white sand creek, from which nearly all the sand is obtained, for house-building in town. In the neighbourhood of the creek, there is quite a settlement grown up, of Cathays and Muneepoorians, who have been attracted from the Burmese capital to Rangoon. Many years ago, in the wars which were waged between the kings of Burmah and the rajahs of Assam, victory generally crowned the arms of the rulers of Ava. In those wars, the Cathays and Munneepoorians, whose territories lie on the borders of Assam, suffered greatly. Large numbers of them of both sexes were taken prisoners, and led into a condition of captivity at the Burmese capital. These people early turned their attention to different branches of industry, and among them was that of weaving silks for the use of the royal family of the kingdom. The king, queen and all members of the royal household dress invariably in silk garments. The putsoes worn by men is silk and the taming worn by women is also silk. Silk fabrics formed, therefore, a branch of home industry, in which Burmese kings and queens and princes and nobles and ministers and officers and priests all alike felt an interest. Hundreds of these Munneepoorian and Cathay captives were put to weaving. All the ingenuity, skill, and tact of which the people are capable, were developed in the prosecution of the art of weaving, the art of dyeing and the blending, and arrangement of colours. The humbler classes among the Burmese are passionately fond of gay and flashy colours, while those about the palace prefer garments which are rich and chaste, to mere gaudy splendour. These Cathay weavers understand ornamental work, and when they can obtain silver and gold thread, such as tassels and fringes as made of in England, they are able to work them up, to blend them up with silk, so as to make a very handsome pattern of an ornamented putsoe or tamine. About a hundred of the Cathay and Munneepoorian families gradually moved down the river, and took up their abode under British protection. Silk twist from the Straits and China found its way into the hands of these weavers and they use it to good purpose. All their weaving is done with the hand loom. They have only a simple loom and a spinning wheel, with which to accomplish the whole process of manufacturing these fabrics. The silk is imported in hanks. It has then to undergo a process of winding and cleaning and spinning and doubling, of throwing and reeling. If the colour of the silk is to be changed, it must then be dyed, washed, dried and wound on bobbins, a delicate series of manipulations through which it must pass before it can be woven. The patterns are a mere matter of personal taste and they can be woven after any fashion or design. The price of silk varies, but the weaver generally doubles it as the value of his work. An ornamented piece of Burmese silk is sold at from two to three rupees per cubit. Ten cubits make an ordinary putsoe, and six a taming. The silk fabrics of Burmah look coarse, compared with European manufactured articles, but they are very strong and durable.

Oxus valley.—Silk is produced in considerable abundance in the valley of the Oxus, which seems particularly suited to its production. The best specimens are brought from Koubadian and Hazrat Imam, on the north and south banks of the river Oxus.

Bengal.—Dr. Royle, writing on the silk culture in India, mentions that the silkworms which yielded the investments of silk, were 1st, The large annual worm reared once in the year, and yielding its produce from only the middle of March till May. 2d, The Desseey, or indigenous silkworm of Bengal, of which the cocoons are obtained throughout the year ; that is, there are four or five collections annually ; of these, the worm of the cold weather, or November breeds, and that of the dry weather, or March and April breeds, are superior to the others, from the more nourishing nature of the leaves at those seasons. 3d, The China silkworms introduced into Bengal, which are next in estimation to the annual and country breeds ; of these, both the yellow and white cocoons are abundant in the Radnagore district. The Nistry tribe of worms, is said to include three distinct kinds, the madrassie, soonamooky and cramee, and these yield a portion of what was formerly the E. I. Company's investment of silk ; secondly, the tusseh silkworms, of which the mooga, teerah, and bonbunda, are described as different kinds ; the cocoons of these are collected in September, and are called the Rain-weather sorts ; but there are others of the dry weather months which are denominated dabba, and buggoy. Tarroy is an inferior sort collected in December. The tusseh or tussar silkworm, is very extensively diffused, being reared in all the western forests from Ramghur to Midnapore. Dr. Roxburgh mentions it as a native of Bengal, Behar, and Assam, and that it is the same as the bughy insect of other districts. The jaroo is also described as a variety, by Dr. Buchanan Hamilton, and as occurring in the districts of Bhagulpore and Dinajepore ; by Col. Sykes it was found in the Bombay, and by Dr. W. Geddes in the Madras presidency. Mr. Hugon, describes six species of silkworm as being found in the central part of the Assam, province. Of these, the mulberry silkworm Bombyx mori ; the tusseh silkworm Saturnia (Phalæna) paphia, and the Eria, or Arindy silkworm, Saturnia (Phalæna) cynthia, were previously well-known ; but the others have been described by himself and by Dr. Helfer. The Mooga silkworm (Saturnia assamensis, *Helfer*). The Joree silkworm (Bombyx religiosa, *Helfer*), is a new species discovered by Capt. Jenkins on the Peepul tree (Ficus religiosa). This is said to yield a silk certainly equal to that of the mulberry silkworm. Saturnia sylhetica, *Helfer*, is a native of the Kassia mountains, and of Silhet and Dacca. It also yields silk, as do two other species, the wild silkworm of the Central Provinces, and another, which produces its cocoon upon the mangoe tree.* This the people of Malda gather, and mix with Arindy silk cocoons in spinning The wild silkworms do not yield the kind of silk most valued in commerce ; the culture of some in the forests, and the collection of all, affords employment to considerable numbers of the people in the parts of districts least productive of useful occupation. Silk from the Eria, or Arindy worm Saturnia (Phalæna) cynthia is the daily wear of the poor in Assam, and is used by every class in winter. It is remarkable for its very great durability. The Bombyx huttoni spins in all weathers, whereas the common silkworm is apt to be thrown off work by a passing cloud. A new process is announced of manufacturing silk directly from the bark of the mulberry tree. The inventor's name is Signor Lotteri.

Silk Goods of China, go mostly to the United States, and raw silk to England, the supply is not equal to the demand, and only about ten thousand bales are now exported, while upwards of twenty thousand were sent off, mostly to England, in 1836, some of which rate as high as $ 500 a picul. The refuse raw silk goes to India. The exportation to the United States for making silk thread is trifling. Silk goods are shipped to the United States, Mexico and South America, and elsewhere, to the annual value of about a million of dollars ; they consist chiefly of pongees, handkerchiefs, crape shawls, scarfs, sarsenet, senshaws, levantines and satins ; ribbons, sewing thread, and organzine or thrown silk, are not much shipped.—*E. SILKARI, HIND. French chalk or steatite.

SILK CARPETS are manufactured in several parts of South India. At the Madras Exhibition of 1855, some very handsome specimens were contributed from Tanjore and Hyderabad, and His Highness the rajah of Tanjore exhibited a very large silk carpet intended as a present for Her Majesty Queen Victoria. The colours were brilliant, the pile close and velvety, and the pattern harmonious. —*M. E. J. R.*

SILK COTTONS. The products of several plants, the Bombax, Eriodendron, the Ochroma lagopus, the feathery silk-like material in the pods of the Calotropis gigantea, and the Cryptostegia are so named. There are two genera of trees, known under these names Cotton tree or Silk cotton tree ; the red and white cotton trees, common in many parts of India. They belong to the natural family, Byttneriaceæ. The red cotton tree and silk cotton tree, Bombax malabaricum, and white cotton tree, Eriodendron anfractuosum. The species of Bombax, B. ceiba, B. malabaricum which are remarkable for their gigantic stature and their splendid inflorescence, on account of their capsules, which, on bursting, display a flocculent substance, often mistaken by travellers for cotton, and the tree is hence called Cotton tree. But as this substance is more silky than cotton, it has been distinguished by the name of Silk cotton. It differs also in not spinning like cotton. Some difficulty, therefore, is experienced in making use of this very abundant cotton-like produce ; but Mr. Williams, of Jubbulpore, succeeded in spinning and weaving some of it so as to form a very good coverlet. It might be easily made use of for stuffing pillows, muffs, or coverlets, for wadding, or for conversion into half-stuff for paper-makers, perhaps for making gun-cotton. In the Trans. of the Agri-Hortic. Soc., iii, p. 274, there is a report from the Society of Arts on two pieces of cloth made from the Simool or silk cotton tree ; and it is observed that, from the shortness of the staple of the down, and its elasticity, it could not be spun by cotton-spinning machinery. At the Madras Exhibition of 1855, small samples of the silk cotton from the Bombax, Ochroma lagopus, Calotropis and Cryptostegia were exhibited, but they appeared to have been put to no other use than stuffing pillows ; they might be employed for the manufacture of paper, and the silky down of the Cryptostegia being very strong might be applied to some textile manufactures. A trial has been given to the cotton of Calotropis gigantea, and Cryptostegia, as a material for cloth and cord, but their principal use hitherto has been for stuffing pillows : they might be employed as a material for making paper. Some difficulty is experienced in making use of the very abundant floss or cotton-like produce of the Bombax and Erudendron trees ; but it has been spun into cloth, and it might be employed for stuffing pillows, muffs, or coverlets for wadding, for conversion into half stuff for paper-makers : perhaps for gun cotton. From the shortness of the staple of the down, and its elasticity, it could not be spun by cotton-spinning machinery. The silk cotton of the Bombax pentandrumis used in England for stuffing the pads of trusses. The seed pods of various genera of plants supply a material which from its appearance, is called 'silk cotton.' It is deficient in strength and difficult to spin, on account of the smoothness of the individual fibres. Some specimens of cloth manufactured from an admixture of cotton and the floss of the Ak (Calotropis hamiltonii) were shown, the Mudar (Calotropis gigantea), and the Ak (C. hamiltonii) produce this floss in great abundance. One or other of these grow luxuriantly in all parts of British India and should the material, prove of commercial value, it could be finished at a cheap rate in large quantities. Attempts in Britain to work this material by means of machinery have hitherto, practically, failed. But Messrs. Thresher and Glenny reported their ability to turn it to account, if obtainable here in clean, good condition at 35*l.* per ton.

The charge of the down is merely that of the labour employed in collecting it, and the charge incurred in packing. It may be collected at about 1 R. 8 A. (3*s.*) per maund (82 lbs.) The plant is to be found in the greatest abundance everywhere, growing most luxuriantly in those dry sandy tracts where nothing else will flourish. The down ought to be collected in May and June, and its collection is spread at least over two months.—*Dr. Mason's Tenasserim ; Dr. Forbes Royle, Fibres ; Madras Exhibition, Juries Report.*

SILKEH, AR. Cassia lignea.

SILK WORM.

Puttoo poochie,	TAM.	Puttoo poorughoo,	TEL.
Reshm ke keere,	DUK.		

These are the names of the common sort, but there is frequently met with in the southern parts of India, a large species of caterpillar, of a dirty, brownish, yellow colour, which produces a very coarse kind of silk, or rather thread, and has, on this account, got from the weavers the name of "Nar puttoo pootchie," it is nearly three times as big as the common silk worm and its body is marked, not with seven, but eleven rings The introduction of the silkworm into the Roman empire, from Procopius De Bello Gothico.

According to Pusanias, the Greeks called the silkworm, Ser. The Tibetans call it Darkyi-srin, from Srin or Srin-bu, a beetle.

Procopius says about A. D. 500-565, certain monks arrived from the (country of the) Indians, and learning that the emperor Justinian had it much at heart that the Romans should no longer buy silk from the Persians, they came to the king and promised that they would so manage about silk that the Romans should not have to purchase the article either from the Persians or from any other nation ; for they had lived, they said, a long time in a country where there were many nations of the Indians, and which goes by the name of Serinda. Theophanes of Byzantium, writing at the end of sixth century says

"Now in the reign of Justinian a certain Persian exhibited in Byzantium the mode in which (silk) worms are hatched, a thing which the Romans had never known before. This Persian on coming away from the country of the Seres had taken away with him the eggs of these worms (concealed) in a walking stick, and succeeded in bringing them safely to Byzantium.

Diseases of the silkworm.—MM. Decaisne, Peligot, and de Quatrefages, were appointed members of a Committee to investigate the cause of the diseases of the silkworm and seek a remedy for it. These gentlemen, having visited various parts of France, found the mulberry leaves everywhere in excellent condition, so that the opinion which attributes the disease to bad food was deemed untenable. Of all the diseases to which the silkworm is subject, that most frequently met with is known by the name of pattes noires or poivre in France ; M. de Quatrefages proposed to call it the maladie de la tache, from the spots which appear on the worm when attacked with it. These spots are often invisible to the naked eye, and can only be perceived by the aid of a magnifying glass ; and this circumstance explains why the malady escaped the observation of silk-growers in the majority of cases until five or six days after the worm had cast its fourth skin. The spots exist in all the tissues and organs of the worm, and in its subsequent stages of a chrysalis and moth. In the latter the spots destroy the antennæ, the legs, or a portion of the wings. In the beginning the spot appears under the form of a yellowish matter pervading the whole system ; this matter gradually becomes darker, and is then concentrated into a number of tubercles, which are the spots in question. That such a diseased state should exercise an influence on the quality of the eggs is not surprising. An infected silkworm may spin its cocoon when the disease is not too far gone, but the insect generally dies, and the body, instead of putrefying, becomes dry and brittle. M. de Quatrefages tried several methods of cure ; first, the hygienic process, which consists in rearing the worms in open sheds instead of close rooms. The leaves of the wild mulberry, not stripped from the branches, he found very efficacious. He strongly recommends silk-growers to rear small lots of worms apart from the others, solely for the purpose of propagating the species. From his experiments, it appears that the silkworm does not refuse to eat the leaves of the mulberry sprinkled with Peruvian bark, gentian, valerian, mustard, &c., and the two latter powders especially would seem to produce good effects. But scraped sugar appears for the present to be preferable to all other remedies. The worms eat the leaves sprinkled with sugar with extraordinary relish, and experiments with this substance were accordingly repeated on a larger scale in the establishment of M. Augliviel, in the department of the Gard, where one of the silk sheds, fitted up for 27 trays, was reduced by disease to four. The worms of these were transferred to another shed and divided into four lots ; the first was fed in the common way, the second with moistened leaves, the third with sugared leaves, and the fourth was subjected to a rigorous abstention of food for 75 hours, and then fed chiefly with sugared leaves. At the end of 24 hours several worms of the latter lot began to spin, and made several small and imperfect cocoons on the tray ; the other worms began to shrivel up and diminish in size, but on receiving the sugared leaves they speedily rallied, and many of them spun their cocoons. The worms fed with moistened leaves fared very badly, and very few of them spun cocoons. Those fed in the common way presented nothing remarkable, and yielded a certain quantity of cocoons ; but those fed with sugared leaves thrived well and spun their cocoons sooner than the others. The quantities of silk yielded by these four lots were respectively :—1st lot, 210 grammes ; 2nd lot, nought ; 3rd lot, 392 grammes, and of a superior quality ; 4th lot, 152 grammes. Now, when it is considered that such a result was obtained from the use of sugar on worms the state of which was hopeless, it may reasonably be concluded that its effect will be much more satisfactory in less desperate cases. At all events, one great fact has been put beyond a doubt—viz., that medicine may be administered to silkworms in the same way as it is administered to cattle and poultry.—*Ainslie's Mat. Med., p.* 296 ; *F. W.* ; *Yule Cathay, Vol.* i, *pp.* 159, 160 ; *Cat. Ex. p.* 62; *Home News.*

SILK WORM GUT or Silk gut, a hard, white, transparent thread, about a foot in length, made in Italy and China, from the intestines of the silkworm, and used for angling. A number of the finest silkworms are selected when they are about to spin : they are killed by being immersed in strong vinegar, in which they are left for 12 hours closely covered up : should the weather be cool they may be left in the vinegar 2 or 3 hours longer. When removed therefrom, and pulled asunder, two transparent yellow green cords will be observed : this is the silkworm gut : the other portion of the entrails are of a dark-green colour. If the gut be soft, or break by stretching, that is an indication that the worm has been taken out of the vinegar too soon. When the gut is fit for drawing out, one end is to be dipped into the vinegar, and the other end to be gently stretched to the required length, and it must be kept extended on a thin piece of board by inserting its extremities into slits in the end of the wood, or fastening them to pins, and in this state it is placed in the sun to dry.—*Tomlinson.*

SILLAGO, a genus of fishes, of the family Trichinidæ and group Trichinina, of which the following species are known to occur in the S. and E. of Asia.

Sillago sihama, *Forsk.*, Red Sea, Indian Seas.

SILOAM, an artificial pool on the south side of Jerusalem, about 24 feet deep.

SILONG. The chain of islands of the Malay Archipelago, is inhabited or frequented by the Silong. Their language is peculiar but undescribed. They are a mild, peaceful and honest race, and little given to crime. They believe that nats or spirits dwell in the sea, land, air, trees and stones, but they do not invoke or sacrifice to them nor are they symbolised. Their number does not exceed 1,000. They are nomadic fishermen living in their boats or beneath trees on the beaches till the monsoon becomes severe, when they construct slight huts. They subsist entirely on turtle, fish and shell-fish. They are timid, reserved and difficult of approach. All these characteristics they possess in common with most of the Orang Laut (Sea men) who frequent the creeks, islands, and solitary shores of both sides of the Malay Peninsula and the Johore Archipelago, and they are probably a portion of the same race. In a small Silong vocabulary Mr. O'Riley notices its strong Siamese affinities. But it has relations to other Ultra-Indian and even to Chinese languages which show that it is not a mere off-set of the Siamese, but probably a sister language.—*The Silong tribe of the Mergui Archipelago, by J. R. Logan in Journal of the Indian Archipelago, No.* vii, *July* 1850, *p.* 411 ; *Dr. Helfer, Journal of the Bengal Asiatic Society,* 1839, *p.* 986. See India.

SILPHIUM. Ancient authors mention this plant and its juice, it is the Silphion of the Greeks. Two kinds of this substance are described ; one, from Cyrene, was probably yielded by Thapsia silphium, a native of North Africa, and the other was most likely assafœtida, which has been employed medicinally by Asiatics from very early times, though it has been known by this name in comparatively modern times. Silphium was however, remarkable for other properties, and hence has attracted the attention of modern travellers who have recently visited the countries where the Silphium is described as growing by the ancients. The army of Alexander, in crossing the mountain range which Arrian calls Caucasus (iii, 28, 10), and which is the same range that he afterwards mentions under the name of Paropamisus (v. 5, 3), met with the Silphium. Arrian says, on the authority of Aristobulus, "In this part of the Caucasus nothing grows except pines and Silphium, but the country was populous and fed many sheep and cattle, for the sheep are very fond of the Silphium. If a sheep should perceive the Silphium from a distance, it runs to it, and feeds on the flower, and digs up the root and eats that also. For this reason, in Cyrene, they drive the sheep as far as possible from the spots where the Silphium grows, and some even fence in such places to prevent the sheep from entering them if they should approach ; for the Silphium is worth a good deal to the Cyrenæans." Burnes, in crossing the Hindu Koosh, and seeing both the men and cattle eating the young parts of the assafœtida plant, supposed that it must be the Silphium of Arrian. But as this author describes the country where the Silphium grows as abounding in cattle, Dr. Royle had concluded that the Prangos of Mr. Moorcroft was the Silphium alluded to, and which is much fed on by sheep and cattle in the present day in Tibet, Mr. Vigne, when travelling in these regions, came to the same conclusion. It is probable therefore that both plants, being umbelliferous, and employed for the same purposes in nearly the same regions, may have contributed to form the accounts which are so brief in ancient authors. *Eng. Cyc.* ; *Hogg's Vegetable Kingdom, pp.* 381, 383 ; *Royle's Ill. Him. Botany.*

SIL-SAFED, HIND. A species of amaranth, having a fine white seed, grows on the hills and plains of the Panjab.

SIL-SIYAH, HIND. A glossy black and very small grain, the seed of Celosia cristata.

SILSILLA, AR., HIND., PERS. The descent of a family ; pedigree ; any continuation.

SILSUPARI, HIND. Quercus incana.

SILURIDÆ, a family of fishes of the order Physostomi.

SILURUS, a genus of the Siluridæ, of which the following are species of the South-east of Asia.

S. asotus, *Linn.*, China, Japan.
,, affghana, *Gtlr.*, Affghanistan.
,, cochin-chinensis, *C. & V.*, Cochin-China.
,, malabaricus, *C. & V.*, Malabar.

Parts of the sounds of Silurus glanis and barbel are boiled, but as the glue does not entirely dissolve, the liquid is strained to separate filaments from the gelatine. Besides these the cartilaginous and tendinous part of several fishes are boiled down to form fish-glue.

SILURUS MILITARIS, *Linn.*, syn. of Arius militaris, *Linn.*

SILURUS BOALIS, the Boalee fish of the Ganges. See Cotton manufactures.

Silver is one of the most anciently known of the metals, is found native and also combined with sulphur in considerable quantities, also as a chloride, and alloyed with other metals, especially lead, gold, antimony, arsenic, copper. It is separated from its ores by the process of amalgamation. The Arabs are thought to have been the first to employ it in medicine. In its metallic state it is inert, but being little liable to alteration, or to be affected by re-agents, it is much employed for surgical instruments and for vessels for chemical purposes. A rich ore of galena or sulphuret of lead at Jungumrazpillay in the vicinity of Cuddapah, is rich in silver, and is worked by the natives on this account, but all the lead is wasted and the silver is obtained by a tedious, clumsy, and expensive process. Mr. H. L. Pattinson's new process for separating the metals by careful, slow-cooling and crystalization, is applicable to this ore The Kurnool ore contains upwards of 1 per cent. of silver, or 374 ounces in the ton, the quantity of lead and silver together being only 45 per cent. which was occasioned by there being a considerable quantity of gangue disseminated through the portion examined. Another specimen from Kurnool was found to contain 175 oz. 3 dwts. in the ton. At least some portions are very rich in the precious metal, and this accords with the minute researches of Malagah and Durochet who found that when sulphide of silver is associated with the sulphides of other metals, it is always unequally distributed. It would be quite impossible to calculate, with any approach to accuracy, from the examination of any given specimen, what would be the average yield of silver in a silver lead mine, until it is actually worked for the separation of that metal. Considering however that nearly one-half of the silver now in circulation in Great Britain is recovered from silver lead ores similar to the above, and seeing that it is found to be advantageous to separate the precious metal where it exists to the extent of only 6 ounces in the ton, it becomes evident that these ores must be of great value provided they can be found in sufficient quantity. The Kurnool galena occurs abundantly in all probability ; therefore it would prove to be highly remunerative to work this mine, both for the lead and silver contained in the ores. Silver has been got, in trifling quantities, in Upper India. Mr. W. Mainwaring found it also in the Madura district in a native sulphuret of zinc (blende). Captain Arthur was the first who discovered this metal in Mysore, both in its native state (in thin plates adhering to some specimens of gold crystallized in minute cubes) and as a muriate in an ore containing sulphur and oxide of iron. At the Madras Exhibition of 1857, a rich ore of argentiferous galena was exhibited from Martaban by Dr. Brandis, granular or in minute crystals, with silver passing through it in thready veins. This ore, assayed by Dr. Scott, contains about 80 per cent. of silver lead. The quantity of silver was found to vary in the portion examined from 70 to 300 ounces in the ton of ore. It is impossible therefore to say what its commercial value may be, unless an average sample were obtained, but if the ore exists in any quantity and of the same quality as that examined, it is a most valuable one, and would be well worth working by Pattenson's mode for separating the silver, as the process proves remunerative where only 7 ounces of silver can be obtained from a ton of metal. This is probably the ore referred to by the Rev. Francis Mason, A.M., in his publication on the natural productions of Burmah, where, he says, the limestone of the Provinces probably contains a large quantity of lead : in the valley of the Salwen there is a rich vein of argentiferous galena, which is reported to appear on the surface. A specimen which Dr. Morton sent to England for analysis, was said to be a very valuable mineral, and destined to make a fortune for some one. Professor Mitchell in the certificate that he furnished Dr. Morton of the analysis, says, it contains lead, sulphur, silver, gold, (traces) lime, magnesia, iron, silica and carbonic acid. It is a sulphuret of lead or galena. The quantity of lead and silver appears to be considerable, but there was not sufficient of the mineral to estimate either." The ore is seen in the limestone precisely as galena is found in the limestone of the Mississippi, one of the richest known deposits of lead in the world. In a small hand-specimen from Martaban the amount of silver was found to vary in different portions of it, the percentage of lead being about 75. In the first trial, the silver was found to amount to about 70 ounces to the ton of the ore ; but in the second to not less than 300 ounces in the ton, or a little less than 1 per cent. Mr. O'Riley had a specimen of an ore of silver, antimony, copper, and sulphur brought him, which produced thirty-five per cent. of silver ; and the Tavoy gold, it would appear, contains nearly ten per cent. of the same metal.

Silver is brought from Yunnan near the borders of Cochin-China and the mines in that region must be both extensive and easily worked to afford such large quantities as have been exported. In China, silver is obtained from Lien-chau ; Shau-chau-fu ; Chau-chau-fu ; Shau-king-fu ; and Kau-chau-fu (Kwang-tung) ; also from the island of Hainan, from Kwei-lin-fu ; Liu-chau-fu ; King-yuen-fu ; and Sin-chau-fu in Kwang-si ; from Wu-ting-chau, in Yunnan ; from Chang-teh-fu and Honan-fu in Honan ; from Si-gnan-fu in Shensi and from Kung-chang-fu in Kansuh. Silver is associated with lead in various places. Much silver was brought formerly from Tonquin in Anam in exchange for zinc, and silver occurs in Corea, and is brought from Cambodia. Gold is found in many parts of the Japanese empire, sometimes it is obtained from its own ore, sometimes from the washings of the earth or sand and sometimes it is mixed with copper. The quantity in the country is undoubtedly great. An old Spanish writer of the seventeenth century tells us that in his day the palace of the emperor at Yeddo, as well as many houses of the nobility were literally covered with plates of gold. In the beginning of the Dutch trade the annual export was £840,000 sterling, and in the course of sixty years the amount sent out of the kingdom through the Dutch alone was from twenty-five to fifty millions sterling. Silver mines are quite as numerous as those of gold. In one year the Portuguese, while they had the trade, exported in silver £587,500 sterling. Copper abounds throughout the whole Japanese group, and some of it is said to be not surpassed by any in the world. The natives refine it and cast into cylinders about a foot long and an inch thick. The coarser kinds they cast into round lumps or cakes. Quicksilver is said to be abundant, but this, so far as we know, has never been an article of export. Lead also is found to be plentiful but like quicksilver it has not been sent out of the kingdom. Tin has also been discovered in small quantities, and of a quality so fine and white that it almost equals silver, but of the extent of this mineral little is known. Iron is found in three of the provinces, and probably exists in others, of which they make steel unsurpassed in excellency. "They have no want of coals in Japan," says Kœmpfer, "they being dug up in great quantities in the province of Sikusen and in most of the northern provinces." Dr. Siebold also speaks of coal as being in common use throughout the country, and on visiting one of the mines he saw enough to convince him that it was skilfully worked. For domestic purposes they convert the coal into coke. Viewed in the light of commercial intercourse between the two hemispheres, this coal is worth more than all the metallic deposits we have enumerated. In a region so volcanic, sulphur is, as might be expected, an abundant mineral. In some places it lies in broad deep beds, and may be dug up and removed with as much ease as sand. A considerable revenue is derived by the government from sulphur. On the island of Banca there are silver-mines, but the sultan had a great objection to their being worked : there are silver mines too in the kingdom of Ava. We also know this valuable metal to be a product of Siam, from which country it is occasionally brought to India as well as from Manilla and Batavia. Crawfurd however says that no veins of this metal have hitherto been discovered in any of the islands of the Malay or Philippine Archipelagos, many of which contain such abundant stores of iron, gold, tin and antimony. A small quantity of it, however, appears to be contained in all the gold of these countries. In Malay, the name for silver is perak, and in Javanese salaka. Both are native words of which the origin has not been traced. Silver was well known to the ancients : it is first mentioned in Gen. xx, 16 and afterwards frequently : in Abraham's time it was common, and according to Genesis xxiii, 12 and 15, traffic was carried on with it. It is the whitest of all the metals, and capable of receiving a lustre which is scarcely inferior to that of polished steel. In its polished state it reflects more light and heat than any other metal, so that it has a very low radiating power for heat, and hence a silver vessel retains the heat of the liquid contained in it longer than a vessel of any other metal. The preference given to a silver pot for making tea is founded on correct observation : a black earthen-ware vessel is such a powerful radiator of heat, that a hot liquid contained in it rapidly declines in temperature, and if used for making tea, the temperature of the boiling water soon falls below the point required for making the infusion. Silver ranks next to gold in ductility and malleability. Its density is 10·47 : it is harder than gold and softer than copper, and, when pure, it is so soft as to be cut with a knife ; the addition of a small quantity of copper increases its hardness ; it fuses at a full-red heat, corresponding to 1,873° Fahr. Exposed to the heat of a blast furnace, silver throws off metallic vapours, and when fused between the charcoal electrodes of a powerful voltaic battery it is readily volatilized. There is a large demand for silver not only for the purposes of coinage, but also for services of plate, for which it is admirably adapted, inasmuch as it is not attacked in the slightest degree by any of the substances used for food. The large demand for the metal thus occasioned is met by its comparative abundance in the native state or alloyed with various other metals ; it is also found mineralized by the non-metallic elements, and also in combination with certain acids. It is also obtained in large quantities from lead ores, as noticed under Galena. One of the richest and most abundant ores of Chili is the chloride, where it is often accompanied by native silver. A large proportion of the silver of commerce is extracted from ores which are too poor to allow of their being smelted or fused, even supposing fuel were abundant in the neighbourhood of the mines, which is not the case. Recourse is therefore had to the process of amalgamation founded on the ready solubility of silver and many other metals in metallic mercury. The Saxon process as adopted at Freyberg differs somewhat from the American process. The following was the

Value of Gold and Silver imported from and exported to Foreign countries at Ports in British India in each year from 1834–35 to 1868–69.

The great range in the quantities imported of gold and silver, from two millions in 1854-55 to 26½ millions in 1865-66, indicates that the import is chiefly regulated by the requirements of commerce, but it is generally believed that a considerable amount is bein absorbed in India by the manufacture of silver and gold ornaments. From the earliest historic times gold coins have been in use in India. The touch of silver in France (where, as in India, it is the legal standard of value) is ·900. In Britain it is ·925. Silver is found in Siam combined with copper, antimony, lead and arsenic. Silver and gold are both mentioned in Scripture. Joshua vi, 18, 19, says, "And ye in any-wise keep yourselves from the accursed thing But all. the silver and gold, and vessels of brass and iron, are consecrated unto the Lord." It is on this principle that the brahminical hindoos act: they will receive from any caste, however degraded, gold, silver, &c., but to receive from soodras food, garments, &c., would be considered as a great degradation. The silver-mines of Japan are described as being quite as numerous as the gold-mines, and their produce as excellent in quality. In one year we find the Portuguese exporting 2,350 chests of this fine silver, valued, in round numbers, at £587,500 sterling. To the east of Japan lie two islands, called, par excellence, the "gold and silver islands."—*McCulloch's Commer. Dict.. p.* 1037 ; *Royle, Mat. Med.* ; *Smith's Chinese Mat. Med.* ; *Madras Ex. SILVER COINAGE. In India, silver is the legally constituted medium of exchange in all money transactions throughout the British Indian possessions. Gold coin was till about A. D. 1835 a legal tender, at a fixed value of sixteen rupees for the gold mohur of Calcutta, and fifteen rupees for that of Madras and Bombay : but it was not demandable in payment and was left to find its current value in the market. By a notification of the government of India on the 22nd December 1852, it was declared that on and after the 1st of January 1853, no gold coin should be received on account of payments due, or in any way to be made to the British government of India. The motive and object of the order was to escape from the consequences of the condition of the gold coin of India, and the erroneous principles, adopted for its manufacture, at a time when the gold of California and Australia, began to affect the market. The first considerable increase in the import of gold at Calcutta was in the year 1848-49, and a large portion of it was sent to the mint, in that and the following years, for conversion into the low standard lion-device pieces, brought out by Act XVII of 1835. The sending of gold to the mint of this period, was in reality, a mere sale of the metal to government for silver, at the par rate of 15 to 1, which then began to prevail as the market rate. The mint certificates, obtained for gold delivered were immediately paid in at that par, in satisfaction of government dues, or were negotiated at the banks, where silver was always claimed upon them under the option then given of receiving the amount in rupees at the par in question. And thus the gold which had been coined at the mint remained as a dead balance in the government treasury, owing to its not being issuable at the par of 15 to 1, in the condition of base standard coin to which it had been manufactured. Besides the accumulation produced through gold deliveries at the mint of Calcutta, low standard coin, previously issued, began also to be paid into the treasury, at the established par rate in ordinary transactions, under the Proclamation of 1841, so that out of a total amount of lion-device gold mohurs, not exceeding in value seventy lacs of rupees, which was the value of the coinage up to that date, more than fifty lacs were, in 1852, in deposit in the government treasury, as a dead unserviceable balance.

In the eight years 1846--47 to 1853-54 the total quantities of silver bullion minted at the three presidencies, was Co.'s Rs. 20,02,27,653

1856-47	C.'s Rs.	1,78,29,573	1850-51	C.'s Rs.	2,27,20,836
7-48	,,	62,15,878	1-52	,,	3,73,55,808
8-49	,,	93,86,998	2-53	,,	5,45.13,630
9-50	,,	1,93,79,343	3-54	,,	3,28,26,087

At the Bengal Mint, total Rs. 10,68,53,021
,, Madras ,, ,, ,, 1,36,78,352
,, Bombay ,, ,, ,, 7,96,96,280

The currency in India has been increasing. The census for 1873 shows for British India 186,143,859 : for feudatory India 55,250,000 ; for all India 241,393,859.

The rupee is the unit or standard measure of value throughout India, and by the Regulation, a perfect assimilation in weight and fineness has been effected in this unit of currency of the three presidencies, so that the rupee of Upper India, of Madras, and Bombay are now identical in value. The great variety of coinage which formerly existed, the Arcot or Madras rupee, the Furrukhabad rupee, the Bombay rupee, the Moorshedabad or Sicca rupee, has thus ceased, and it is only in independent native states, that other local coins are current.

The following table exhibits the scheme of the British Indian monetary system :

	Gold mohur	Rupee.	Anna	Paisa.	Pai.
Calcutta....	1	16	256	1024	3072
Madras & Bombay	1	15	240	960	2880
		1	16	64	192
		...	1	4	12
		...	...	1	3

Copper coin is only a legal tender at the established rate of sixty-four paisa to the rupee, on payments falling short of a rupee.

Small shells called Cowrie or Kauri, are also made use of for fractional payments and are reckoned as follows :

4 Kauri make 1 Ganda.
20 Ganda „ 1 Pan.
5 Pan „ 1 Anna,

but their value is subject to considerable fluctuation.

Silver pieces, of eight annas, four annas, and two annas, are struck of equal proportionate weight with the rupee : and copper coins of half anna, quarter anna, and one-twelfth anna complete the coined currency.

The numerous mints, the great debasement of their coinage and the complications resulting therefrom, led the Government of India, on the 10th September 1824, to resolve on the abolition of several mints and to induce native sovereigns to equalise their rupees with those of other mints. At that time, none of the coins forming the circulation of Hindustan, bore any other name than that of Shah Alum.

The British mints in India are open to the reception of gold and silver bullion for coinage on private account, and the following is the course of proceeding in the Calcutta mint. After examination by the processes of cutting and burning, to ascertain that there is no fraudulent admixture, the proprietor takes a receipt from the Mint Master, for the weight of his bullion. A specimen is then taken for assay, and after that operation the mint receipt is exchanged at the Assay Office, for a certificate of the standard value of the bullion in gold or silver money. This certificate is convertible into cash at the treasury as soon as the new coin may be transmitted thither from the mint. A deduction is made from the assay produce of bullion, to cover the expenses of coinage, which vary at the different mints as follows :—

	On Gold Bullion.	On Silver Bullion.
At the Calcutta mint	2 per cent.	2 per cent.
„ Madras „	3 „	2 „
„ Bombay „	2½ „	2 „

On the re-coinage of rupees struck at the mints of the Bengal presidency, a charge of 1 per cent. only is levied.

The following notes on the names of the coins and the schemes of the coinage of Eastern and Southern Asia may be interesting :—

Ashrafi, Moorshedabad gold mohr, has a weight of 190·895 grains troy.

Adhela, from adha, HIND., half, signifies the half of a paisa.

The Burmese have no coined money, but, like the Chinese, make their payments in the precious metals by weight. Like the latter nation, also, they make use of decimal divisions in estimating the value or purity of gold and silver, and their systems of weight and measure follow the same convenient scale. Major Burney, Resident at Ava, gave the following particulars :—

Vis, Tikal, and Moo are the general terms used in the transactions of commerce and accounts : their sub-divisions and multiples are,

1 pe or be.
2= 1 moo.
2½ = 1 mat.
5 = 2 = 1 hkwe.
10 = 4 = 2 = 1 kyat or tikal.
1000 =400 =200 =100= 1 peiktha or vissom.

100 tikals are precisely equal to 140 tolas.

The expressions employed by the Burmese goldsmiths in declaring the quality of bullion require a knowlege of the Burmese numerals, and a few other words :

NUMERALS.		METALS.	ASSAY TERMS.
1. Ta.	6 Khyouk.	Shew, gold.	Det. better, or above.
2. Nheet.	7. Khwon.	Shwenee. Red or pure gold.	Mee, differing or –
3. Thoun.	8. Sheet.	Nguee, silver.	Meedet, better, in assay.
4. Le.	9. Ko.	Ge or khle, lead or alloy.	Meeshyouk, worse ditto.
5. Nga.	10. Tshay.	Nee, copper. Byoo tin.	Ma, adulterated.

The usual weight of the small lumps of silver current in the place of coin is from twenty to thirty tikals (thirty or forty tolas) : they bear a variety of names from their quality and appearance, the figures given by the action of the fire upon a thick brown coating of glaze (of the oxydes of lead and antimony) answering, in some degree, the purpose of a dye impression.

'*Ban*' signifies 'pure' or 'touch,' and is the purest obtainable of the Burmese process of refinage. The word Ban is synonymous with the 'Bani' of the 'Ayin-i-Akbari :' Banwari is the Indian name of the touch-needles used in roughly valuing the precious metals.

Kharoobat, 'shelly' or 'spiral circled,' is applied to a silver cake, with marks upon its surface, produced by the crystallization of the lead scoria in the process of refinement :

it is supposed to denote a particular fineness, which, by Burmese law, ought to be ten-ninths yowetnee in value, *i. e.*, nine tikals of kharoobat pass for ten of yowetnee silver ; or it should contain nineteen and a quarter ban and three-quarter copper.

Yowet-nee, red-leafed flowers or star, silver, is so named from the starry appearance of the melted litharge on its surface. Yowet is a corruption of rowek, 'leaf,' and the word is sometimes written by Europeans rowanee, rouni, rougahnee, &c. Yowetnee is the Government standard of Ava, and contains by law eighty-five ban and fifteen alloy per cent. Taking it at nine-tenths of purity of kharoobat, which last is 94·6 touch, its quality will be 85·2 fine : which closely accord with the legal value. The average of 60,000 tolas of yowetnee in an Ava remittance turned out two dwts. worse (90·8) but there was a loss of more than one per cent. in melting, from the exterior scoria.

Dain, the most common form of Ava bullion met with in circulation, is so called from an assessment, levied during the king's reign, upon villages and horses : dain signifying 'a stage,' or distance of two miles. These cakes also weigh from twenty to thirty tikals each. Their prescribed legal quality is ten per cent. better than yowetnee, which puts this species of silver on a par with kharoobat. In practice, however, the quality varies from one to ten per cent. better (five better to thirteen and a half worse) than Calcutta standard. The average of fifty-two lakhs of dain turned out three pennyweights better.

An adulterated dain silver, stated by Major Burney to be similar in quality to yowetnee, but in reality much worse (forty-two and a half pennyweights worse) was, about A. D. 1830, introduced and extensively circulated : it was made by admixture of lead, and was called Madain.

The following will serve as examples of the mode of valuing bullion :

Dain, ko-moo-det, is Dain nine per cent. better. Nga-moo-det, five per cent. better. Yowet-nee, standard, (eighty-five touch.)

Kyat-ge, or *ta-tshay-ge*, one tikal or tenth of alloy (meaning one-tenth weight of alloy added to standard.)

Kyouk-tshay nga-kyat-ge, six tens, five tikal alloy (meaning sixty per cent. of alloy added). Gyan, half yowetnee (and half alloy.)

Gold.—The purity of gold is expressed by moss or 'tenths' only ; ten moss, 'tshay moo,' (one hundred touch) being esteemed pure gold.

'*King's gold*,' or standard, is called Ka-moo-ta pe-le-yowe (nine moss, one pe, four seeds), or nine and three-quarter moss fine.

'*Merchant's gold*' is Ko-moo-ta-be, nine and a half moss fine. Gold muhrs are called eight and a half moss fine by the Ava assayers.

Bactria.—In the reign of Antiochus II, the third of the Seleucidæ, Theodotus, the Governor of Bactria, revolted and established an independent monarchy, his capital was the modern Balkh, and his extensive kingdom included parts of Cabul, Khorasan and Bokhara, by aid of their coins, the names of nine of their princes have been brought down to us. Coins have been discovered at Surapura and Mathura, between Agra and Etawah, and others in the Punjab. Indeed both Grecian and Persian coins are met with frequently in India. General Ventura and Sir Alexander Burnes collected many Greek coins in Ancient Bactria and the Punjab. Major Tod discovered one of Apollodotus and one of Menander at Mathura. From the coins, there is reason to believe that the Greek princes were succeeded by buddhist rulers.

Cash, HIND. A small coin current in Southern India till the earlier part of the 19th century. Twenty cash being equal in value to four falous. Kas, may be a corruption of the Sanscrit word Karsha : which is mentioned in Colebrooke's Essay on Indian Weights, as the same with the word pan. A Karsha, or eighty raktika (rati) of copper is called a Pana or Karsha-pana. It is now the eightieth part of a pan, but the simple word is all that can be identified as having survived the changes of system.

According to the old Madras system, accounts were kept in star pagodas, fanams and kas,

8 kas = 1 fanam.
336 „ = 42 (silver) fanams = 1 pagoda.

The Company reckoned twelve fanams to the rupee and three and a half rupees to the pagoda. But the bazaar exchange fluctuated between thirty-five and forty-five silver fanams per pagoda : fanams are also coined in a base gold. Copper 1, 5, 10, and 20 kas pieces were coined in England, by contract, for Madras, so early as 1797. The 20 kas, was also called "dodo" and falus.

The star pagoda weighed 52·56 grains and is nineteen one-fifth carats fine. It is, therefore, intrinsically worth 7 shillings, 5¼ sterling, but it is commonly valued at 8 shillings. Many varieties of the pagoda used to circulate on the Coromandel coast, but since 1833 they have been only obtainable when sought for.

In 1811, a coinage from Spanish dollars took place, consisting of double rupees, rupees, halves and quarters ; and pieces one, two, three and five fanams, the rupee weighed

186·7 grains. A silver coinage of half and quarter pagodas, of dollar fineness, also then took place; the half pagoda weighed 326·73 grains troy, and was equal to 1¾ Arcot rupees. By a Proclamation of 7th January 1818, the silver rupee of one hundred and eighty grains, was constituted the standard coin, and all accounts and public engagements were ordered to be converted at the exchange of three hundred and fifty rupees per hundred pagodas. The proportion between the old and new currency then became 3½ rupees per pagoda, and in copper (75) seventy-five kas old currency = 14 paisa new currency.

Chinese currency.—Sycee silver, in Chinese Wan yin, is the only approach to a silver currency among the Chinese. In it, the Government taxes and duties, and the salaries of officers, are paid; and it is also current among merchants in general. The term Sycee is derived from two Chinese words, Se-sze, 'fine floss silk,' which expression is synonymous with the signification of the term Wan. This silver is formed into ingots, (by the Chinese called 'shoes') and by the natives of India, khuri, or 'hoofs,' which are stamped with the mark of the office that issues them, and the date of their issue. The ingots are of various weights, but most commonly of ten taels each. Sycee silver is divided into several classes, according to its fineness and freedom from alloy: the kinds most current at Canton are the five following:—

(*a*) *Kwan-heang*, 'the Hoppo's duties,' or the silver which is forwarded to the imperial treasury at Peking. This is ninety-seven to ninety-nine touch. On all the imperial duties, a certain percentage is levied for the purpose of turning them into Sycee of this high standard, and of conveying them to Peking without any loss in the full amount. The Hoppo, however, in all probability increases the percentage far above what is requisite, that he may be enabled to retain the remainder for himself and his dependents.

(*b*) *Fan-koo or Fan-foo*, the treasurer's receipts, or that in which the land-tax is paid. This is also of a high standard, but inferior to that of the hoppo's duties, and being intended for use in the province, not for conveyance to Peking, no percentage is levied on the taxes for it.

(*c*) *Yuen-paou or Une-po*, literally 'chief in value.' This kind is usually imported from Soochow, in large pieces of 50 taels each. It does not appear to belong to any particular government tax.

(*d*) *Yen or Eem-heang*, 'salt duties.' It is difficult to account for these being of so low a standard, the salt trade being entirely a government monopoly. This class is superior only to

(*e*) *Mut-tae or Wuh-tae*, the name of which, signifying 'uncleansed or unpurified,' designates it as the worst of all. It is seldom used except for the purpose of plating, or rather washing, baser metals.

The tael of Sycee in the East India Company's accounts was reckoned at 6*s.* 8*d.* sterling. When assayed in London, this metal is frequently found to contain a small admixture of gold. Mercantile account sales give the following average out-turn of China bullion remittances to London, Calcutta and Bombay; that

100 taels of Sycee yield	£316 at 5*s.* an oz. including 1½ per cent. for gold.
	3,078 Sicca rupees, or with charges 3,062 rupees, at Calcutta.
	3335 Bombay Rupees, or with charges 3,302 rupees, at Bombay.

Copper coins of India.—Throughout Central India until the middle of the 19th century, and even to its close in the Nizam's territories, much perplexity existed in the varieties of paisa, and in the greater range of their value, as in the coins of the more precious metals; so that every town and village almost had its separate currency, and its established nirkh, or, rate of exchange, with the rupee, to the great inconvenience of the traveller and of the poorer classes. In weight they varied from 280 grains (the Jaipuri, &c.,) to 34 grains (the Maiwari): the former passing at about 35, the latter at 378, paisa for a rupee. From the small advantage of melting up copper money, it happens that much of the circulation in this metal is of very great antiquity; and not only many ancient hindoo coins are met with, but Bactrian and Roman copper coins are also frequently procurable at fairs and in the neighbourhood of old towns in Upper India.

The paisa was in some cases adopted as the unit for determining the larger weights of the bazaars, as the Gorukhpur paisa, of which 530 were held equal to a passeri (five seers) at Ghazipur, and generally through the Benares province, 2,881 'chalans' of Fatehgurh in like manner were assumed as the weight of a man in that district. The Delhi paisa, coined till 1818, was twelve masha or one tola in weight.

Most of the native paisa contained more copper in proportion to their value than the E. I. Company's coin, which was, however, originally one tola in weight, and was gradually reduced to one hundred grains: the Sagar mint was for several years employed in converting the native copper money into Benares or trisuli paisa of one hundred grains weight, and sixty-four to the rupee. At

Bombay, the old paisa were bought up by government, for the purpose of removing them entirely from circulation, and substituting the new coin. The Bengal government also adopted a measure to withdraw the trisuli paisa from circulation, in consequence of their becoming much depreciated in public estimation from a large admixture of spurious coin, and other causes; the Calcutta mint being ordered to grant sixty-four new paisa for seventy-two trisuli, for an amount not under twenty rupees in value brought for exchange.

The Cowrie shell, Cypræa moneta, has greatly fallen in value, in consequence of the facilities of commerce. In 1740, a rupee exchanged for 2,400 cowries: in 1756 for 2,500; and recently in Calcutta, so many as 6,500 cowries could be obtained for a rupee. In Madras, from 1850, cowries had ceased to be used in money, but in Hyderabad of the Dekhan, in 1856, 2,688 cowries were to be had for a rupee. Cowrie, in Persian, is simply khur-mohra, literally 'jack-ass or mule-shell,' because mules are ornamented in that country with trappings of shells, as a Gosain's bullock and riding horses are in India. In Arabic, it is known by Wuda, which Ibn-Batuta says were carried in large quantities from the Maldive islands to Bengal, where it was used as a coin, and therefore no doubt can be entertained that the Cypræa moneta was meant. It is employed throughout all Southern Asia, as an armlet, in sickness, and to avert the evil eye, provided the neck-shell is split or broken. Among European nations these shells, on account of the fancied resemblance of their shape to that of the back of a little pig, are known by the names of Porceli, Porcellain, Porcellanen and Porcelaine, whence we have Porcellain, the glaze or varnish on the China-ware being similar to that of the cowrie. If sound be taken, our English phrases, 'not a cowrie and not a cash' would seem derived from these two minute Indian monies.

Dam.—A copper coin of India, now obsolete. In Akbar's time, forty dams of copper were equivalent in account to one rupee, and the dam of copper is itself defined at five tanks, or 1 tola, 8 masha and 7 rati in weight, which at 186 grains per tola is equal to 323·5625 grains.

There seems to have been 9·29 chitals in each dam, and in the Shir Shahi rupee 371·8 chitals, instead of the old 320 divisional coins of that name and value, which went to the lighter silver piece of former days. In the Ayeen-i-Akbaree, and in most revenue accounts, the dam is considered the 40th part of a rupee: but to the common people it is known as the 50th of a tuka; 25, therefore, go to a pysa, and $12\frac{1}{2}$ to an adhela.

Denar, a Persian gold coin, from the Latin denarius.

Dirham, an Arabo-Persian silver coin from the latin drachma.

Dilli-All, or Dhili wal.—In A. H. 614, the ordinary coin of the country about Delhi. The original currency, it is supposed, corresponded with the billon money of Prithvi raja and others, which was imitatively adopted by the mahomedans in the early days of their occupation of Hindustan.

Dumree, or Damree is commonly known as a nominal coin, equal to $3\frac{1}{8}$ or $3\frac{1}{4}$ dams; or between 2 and 3 Gundas: so that a Dumree varies from 8 to 12 cowries according to the good-will and pleasure of the money-changers.

Fals, an ancient Arabic copper coin, named from the Roman follis, the modern falous of the Persian gulf.

Gunda, HIND., is four pice. See Cash.

Indian system of Coinage and Currency. The silver rupee was introduced according to Abul Fazl, by Shir Shah, who usurped the throne of Delhi from Hamayun in the year 1542. Previous to his time, the Arabic dirham (silver drachma), the gold dinar (denarius auri,) and the copper falus (follis), formed the currency of the Moghul dominions. Shir Shah's rupee had on one side, the mahomedan creed: on the other the emperor's name and the date in Persian, both encircled in an annular Hindi inscription. Since the same coin was revised and made more pure in Akbar's reign, we may assume the original weight of the rupee from Abul Fazl's statement, to have been eleven and a quarter mashas. Akbar's square rupee, called from its inscription, the Jelali, was of the same weight and value. This coin was called Char-yari, from the names of the four friends and immediate successors of Mahomed, Abubakr, Omar, Osman, and Ali, being inscribed on the margin. This rupee is supposed by the vulgar, to have talismanic power.

Masha. Concerning the weight of the masha of the mahomedans, some difficulty prevails, as this unit now varies in different parts of India. Mr. Colebrook makes it seventeen grains and three-eighths nearly: but the average of several gold and silver jelali of Akbar's reign, found in good preservation, gives 15·5 grains, which also agrees better with the actual masha of many parts of Hindustan. By this calculation the rupee originally weighed 174·4 grains troy, and was of pure silver or such as was esteemed to be pure. The same standard was adopted by the emperor Akbar, and according ly we find coins of Akbar's reign dug up in various places weighing from 170 to 175 grains. Cabinet specimens of Jahangir, Shah Jahan and Aurungzib, have also an average weight of one hundred and seventy-five grains pure, and the same prevails with little variation up to the time of Mahomed Shah, in the coins of opposite extremities of the empire ; or struck in the subahs of Surat Ahmedabad, Delhi and Bengal, as in the Akbari, Jahangiri, Shah Jahani, Delhi Sonat : Delhi Sonat Alimgir : Old Surat rupee : Murshidabad, Persian rupee of 1745 : Old Dacca Mahomed Shahi, Ahmad Shahi and Shah Alam of 1772. The Moghul emperors thus maintained a great uniformity in the currency of their vast empire, and they were very tenacious of their privilege of coining. On the breaking up of the empire in the reigns succeeding Mahomed Shah, numerous mints were established by ministers and by the viceroys of the principal subahs, who were assuming independence, and the coin was gradually debased as the confusion and exigencies of the time increased. The Maratti and other hindoo states also established mints of their own, retaining, for form sake, however, the emperor's name and superscription, as a titular avowal of Delhi supremacy. As the British dominion spread, these differences gave rise to the difference in the currencies of the British provinces, and by a happy chance brought those of Madras, Bombay, Farrukhabad to a close approximation. Regulation XXXV of 1793, was the first of those of the E. I. Company which treats of mint matters. At that time, the differences in the values of the currencies were very great, but the dates of the coinage on each coin facilitated the work of the sirrafs or money-changers in applying the batta to which the known debasement of each coin entitled it. In 1793, the E. I. Company resolved to remedy the inconveniences which had thus arisen, by declaring that all rupees coined for the future should bear the impression of the 19th year of Shah Alum, and thus by its adoption at that early period, it happened that the Sicca rupee was the only one of the Company's coins which retained the full value of the original Delhi rupee. About the same time, the Surat rupee of the Moghul emperor, weighing 178·314 grains, was adopted as the currency of the Bombay presidency. It contained 172·4 pure, and was thus nearly equal to the Delhi rupee. From depreciations made in the Surat coin, by the nawab, the coinage at Bombay ceased for 20 years, but in 1800, the Surat rupee was ordered to be struck at Bombay, and from that date it became fixed at 179 grains weight, 164·74 pure, and the muhr was equalised in weight thereto. Lastly in 1829, under orders from the Home government, the currency of the Western Presidency was equalled with that of Madras by the adoption of the one hundred and eighty grain rupee and muhr. The Arcot rupee, in 1788, still retained 170 grains of pure silver, and subsequently when coined at the mint of Fort St. George, it had a weight of 176·4 grains or 166·477 grains pure, until the new system was introduced in 1818, and the Madras one hundred and eighty grain rupee was established.

The former inscriptions upon the E. I. Company's gold and silver coins were in Persian as follow :—

Obverse of the Sicca rupee struck at the Calcutta mint.

"Hami-i-deen-i-Mahomed, Sayah-i-Fazll Oollah Sikkah zad bar haft Kishwur Shah Alam badshah. Defender of the mahomedan faith, reflection of divine excellence, the king Shah Alam has struck this coin to be current throughout the seven climes."

Reverse. " Struck at Murshidabad in the year 19 of his fortunate reign."

On the rupee of the Western Provinces, coined at the mints formerly of Farrukhabad and Benares, and at the Sagar mint, the obverse had the same inscription, but on the reverse the date and place of coinage was different.

"Struck at Farruckhabad in the year 45 of his prosperous reign."

The Madras rupee had a dotted rim on the face, and an indented cord milling : that coined in Calcutta had an upright milled edge : it has the symbol of a rose on the obverse. The inscriptions are as follow :—

" The auspicious coin of the warrior king, Aziz ood Deen Mahomed, Alamgir, (the father of Shah Alum)."

"Struck at Arcot in the 20th year of his auspicious reign."

The Bombay coin had a plain edge and the following legend :

" The auspicious coin of the warrior king Shah Alum, 1215."

"Struck at Surat in the 46th year of his propitious reign."

As before explained, the Bombay, the Madras, and the Farrukhabad or Sonat rupee had fortuitously happened to be of nearly the same intrinsic value,

Arcot rupee pure contents.	165	grains.
Bombay rupee	164·7	„
Farrukhabad rupee	165·2	„

The alteration of the standard of purity in 1818, did not affect the proportion of pure metal, and when the Sagar mint was established in 1825, it was ordered to coin the new Furrukhabad rupee of 180 grains weight the same as the standard of Madras, or containing 165 grains pure.

The inscriptions on the last of the Company's, afterwards adopted as Her Majesty queen Victoria's silver, rupee are as follow :—

Obverse—Victoria Queen.

Reverse—East India Company, 1840. One Rupee ; Ek-Roopiah.

It is milled upright on the edge.

The Rupee of Queen Victoria, after annexing India to the crown has

Obverse, Victoria Queen, with crowned bust.

Reverse, One rupee. India 1862.

The *anna* is the sixteenth part of a rupee ; there is no anna piece, in British India, but as the last coin of the E. I. Company and the first of Queen Victoria have a quarter anna and a half anna and a one-twelfth anna or one pai coin. That of the E. I. Company had

Obverse, a shield supported by a lion and a unicorn, rampant, surrounded with a lion rampant, and the words Auspicio regis et Senatus Angliæ.

Reverse, of half anna, of the East India Company, half anna. Do. Pai.

Reverse of quarter anna, East India Company, One quarter anna, Ek-Pae.

The *Pai* or one-twelfth anna, has

Obverse, Victoria Queen.

Reverse, One-twelfth anna, India, 1862.

Masha, A weight in India varying from 14·687 to 18·5 grains troy : the average being 15½ grains. The rupee of Akbar which was based upon that of Shir Shah weighed eleven and a half masha.

Muhr or mohur, from muhr, HIND, a seal, is a gold coin of value fifteen or sixteen rupees.

Nepal coins—Nepal was conquered by the Goorkhas in the Newar year 888, corresponding with A.D. 1768. Prior to this epocl the valley of Kathmandu was divided into three sovereignties, Patan, Bhatgaon and Kathmandu, each governed by a rajah Hence, on the Newar coins, three series o rajahs' names are found, those of Bhatgaon being generally distinguished by a shell those of Patan by a tirsool, and those o Kathmandu by a sword.

The old coins of the Mal or Newar rajahs are much valued for their purity, and ar worn by the women, strung to necklaces o armlets, as tokens in memory of their ancestors.

All money current north of the valley o Nepal, as far as the boundaries of Chinese Tartary, was formerly coined by one or more o the Nepal rajahs, this was a source of considerable profit to them, the Bhooteahs givin iem weight for weight in silver and gold ust : but Ranjeet Mal, the last reigning ajah of Bhatgaon, sent them such base coins s to occasion a decrease of nearly one-half of ieir intrinsic value, which was no sooner iscovered by the Bhooteahs than a desertion f the mint took place, and there has been no more Bhot coinage made in Nepal. The Bhooteahs who now visit Nepal for trade, rofit by this spurious coin, which they take n exchange for their goods at five ganda er muhr, and they pass off in their own country as of full value or ten gandas. As the Bhooteahs had no other currency they were compelled to cut them into halves, quarters, and eighths. They are the only coin current in Lassa.

The Nepalese procure all their silver from China, in the form of stamped lumps, as they are current in Lassa : for the Tibetans generally follow the Chinese custom in their money transactions, of paying and receiving by weight, and the merchants carry scales with them for the purpose. Since the Goorkha conquest the Vikrama era has superseded that of Newar for ordinary purposes, and the Saka, commonly used in Hindustan, has been ntroduced upon the Nepalese coins.

Pagoda—A Portuguese appellation of a gold coin, the Hoon, derived from the pyramidal temple depicted on one side of the coin. The proper hindoo name is Varaha "wild boar," and doubtless originated in a device of the Boar incarnation or Avatar of Vishnu upon the ancient coinage of the Carnatic, for the same figure appears as the signet of the rajahs of that country, in some old copper grants of lands in the Mackenzie collection. The hindoo name probably varied according to the image of the coin : thus we find the Rama tanka having the device of Rama and his attendants ; and the Matsya Hun of Vijyanuggur with four fish on the obverse. Other pagodas have Vishnu, Jaganath, Vencateswar, &c., on them : those with three Swami or figures are of the best gold, and are valued 10 per cent. higher than the common pagoda. Hun is the common term used by the mahomedan writers, and indeed generally by the natives, for the pagoda. It signifies " gold" in the old Carnatic language.

The Hun was subdivided into fanams and kas. Fanam or more properly panam is identical with the word pan, known in Bengal as one of the divisions of the hindoo metrical system, now applied chiefly to a certain measure of kauris and copper money. The old fanam was of gold only, and was the one-sixteenth of a hun. In the Lilavati we find

16 para = 1 dharan ; 16 dharan = 1 nishk, where the dharan (or dharam) seems to ac-

cord with the hun, which is identical in weight with the Greek drachma. The Ikkeri pagoda contains sixteen fanams: that of Varari and Anandrui, fourteen, and the Kalyan pagoda twenty-eight. The division adopted by the British was forty-two.

Pai, Hind. A small copper coin in Indian currency, the third part of a pice and twelfth part of an anna.

Pice, Paisa, Hind. A copper coin, the one-fourth part of an anna.

Panna. The standard of Panna under the Peishwa, was called the Ankusi rupee from Ankus the instrument used by the mahout to guide the elephant: probably a symbol marked on the coin.

The Parthian or Arsakian Monarchy was erected by Arsaces, who filled the office of satrap in Bactria, in the year 256 B. C. Vaillant wrote a history of this powerful dynasty and endeavoured to classify the coins of the twenty-nine Arsacidæ kings. It was subsequently absorbed in the Persian empire in the reign of Alexander Severus, A. D. 226. Their coins have often been found in Southern Asia, the greater number having the Greek word Arsakoy, with different epithets.

Persian ancient Coins.—According to Marsden, it was not until the kalifat of Abdool-Malik, in the year of the Hijra 76, (A.D. 695) that a distinct coinage was instituted with a view of superseding the currency of Greek or Byzantine, and Persian, gold and silver.

Pool—Pehlvi, or Phool, Parsi. Obolus et res quævis obolo similis ut squama piscis simil., (faloos) Borhani Katiu, inde. Be Poolee: Abd-ool-Malik, n. c. Pecuniæ defectus. Abul Fazl says that the Pool of olden, days was equal to four tolas, Ferishta again gives 1 or 1¾ tolas.

Rati—Colonel Anderson considers the rati may be assumed as high as 1·93 grains, and the masha at 15·44 grains.

Rupee, Rupiya, Hind. A silver coin current in India, value about two shillings: it derives its name from the Sanscrit.

Sanat, Arab, year, generally used in coinage.

Sikha, Hind. A coining die, applied to a coin formerly current in India.

Tibet.—Mr. Cosmo de Koros states that the English rupee circulates freely through Western Tibet. The common Chinese brass money, with a square hole in the centre, is likewise current in Lassa, as generally through the whole of the Chinese empire.

Tola, Hind. A weight in India, equal to 180 grains troy, the weight of the present rupee.

The following statement shows the weight, firmness and sterling value of the coins formerly struck, reckoning the value of gold at £3 17*s*. 10½*d*. per standard oz., and silver at 5*s*. 2*d*.

COINS.	Grains, pure.	Grains, alloy.	Grains, gross weight.	Value. £	s.	d.

SILVER AND GOLD FILIGREE-WORK The native silver-smiths of Cuttack have long been noted for the fineness, neatness, and lightness of their filigree work. This kind of work is executed, for the most part, under supervision, by mere boys, whose nimbler fingers and keener eyesight are supposed to enable them to bring out and put together the minute patterns with more distinctness and accuracy than their elders can; comparative cheapnes is, perhaps, another reason for their employment. The ruling rates for this filigree work are from two to two and a half rupees, that is to say, taking the first rate, two rupees or four shillings is charged for every rupee weight of finished silver work, namely, one rupee for workmanship, and one rupee as the price of the silver. The filigree work in gold of Delhi and other places, is famed. Next to muslins, and embroidered fabrics, filigree work is that for which Dacca is most celebrated, but the art is also practised in great perfection at Cuttack, and in Sumatra and China. The articles usually made at Dacca are ladies' ornaments, such as bracelets, ear-rings, brooches, chains, necklaces, &c., and attar-dans and small boxes for natives. A specimen on a large scale could be made, such as a vase for flowers, a stand for writing materials. The design best adapted for displaying the delicate work of filigree is that of a leaf. It should be drawn on stout paper, and of the exact size of the article intended to be made. The apparatus used in the art is exceedingly simple, consisting merely of a few small crucibles, a piece of bamboo for a blow-pipe, small hammers for flattening the wire, and sets of a forceps for inter-twisting it. The drawing of silver and gold (*i. e.*, silver covered with gold) wire, used as thread in embroidery is extensively carried on in several places. Benares is celebrated for this art. There are several varieties of silver and gold thread (badla) made at Dacca, as "goolabatoon" for the embroidery of muslins and silks; "goshoo" for caps and covering the handles of chowries; "sulmah" for turbans, slippers, and hookah snakes; and boolun for gold lace and brocades. Some of it is drawn almost as fine as a hair. In the time of Aurungzebe a quantity of this article was made yearly for the Court at Delhi. A hundred sticks covered with it, and plain gold, and silver "badla" to the amount of £2,000 in value, appear, among items composing the Mulboos Khas Nuzr, or present of royal clothing, which was annually sent to the emperor. The Trichinopoly filigree work is as light and elegant as that of Malta or Genoa. Among the manifold and various manufactures of China, the gold and silver tinsel cloths of Pekin stand deservedly in high estimation : their chief value arises from the peculiar property which they possess of never tarnishing or becoming discoloured. The gold and silver filigree work of the Chinese equals any ever produced by ancient Venetian masters, and their chasing in silver is unrivalled.

It is desirable that there should not be any alloy whatever in the gold or gilt silver thread used. This alone will preserve it from tarnish, and as gold thread enters very largely into the patterns of most native cloths, and it would be impossible to make any of high value acceptable without it. In the gold thread manufacture, a small bar, ¼ inch diameter, and about 6 inches long, of the purest silver is trebly or quadruply gilt by the highest touch gold, there is no alloy whatever used in the highest kinds, but the value of the thread depends upon the number of times the silver has been gilt with pure gold. The gilt bar is beaten out to a thick wire, with carefully polished flat hammers on a polished anvil, and afterwards drawn through a succession of holes in a plate, until the requisite fineness is obtained which is hardly more, probably than a fine hair. The wire is wound round upon reels, and is flattened by a delicate and peculiar manual operation as follows :—Three reels of wire are placed upright on the further side of a steel plate perforated, through which the wire is drawn, the workman draws these wires towards him over a highly polished steel anvil placed on a small stool, and as they pass, strikes them sharply with a somewhat heavy hammer, the face of which is also perfectly flat and highly polished. The operation is very rapid, and must require great skill so as to ensure uniform flatness and perfection in the wire thus prepared for use. To make it into thread it is twisted upon silk thread of various degrees of fineness, as required, by a simple process as follows : The thread passes over a ring or hook a few feet above the operator, and is wound upon a spindle with a long shank which hangs near the ground. A rapid twist is given to it by the workman, by rolling it sharply on his thigh, and as it spins, the gold thread is directed carefully along, so as to cover the whole exactly as high as the man can reach. The spindle is then stopped, the covered thread wound upon it, and the operation resumed. It is doubtful perhaps, whether any mechanical means would ensure such perfection as is attained by these simple manual processes, or whether they could ever be imitated by artizans unused to them.

The manufactures of Narrainpet and Dharwar, besides being consumed locally, and in the adjoining districts, are exported in by far the greater quantity to Nagpoor, Gwalior, and Indore, Bombay and Poonah, Southern Mahratta country, Hyderabad, Baroda, &c., and it is also asserted, that they find their way to the marts of Hindoostan, where they are much valued for their texture and durability. The following estimate has been given as approaching nearly to the truth. Agents from the several places mentioned reside at Narrainpett, and forward their consignments usually in the cold weather. Total from 3,86,000 to 4,58,000.

To Nagpoor annually, value	Rs. 8 to 10,000
„ Gwalior, Indore, Rajpootana, &c...	„ 1¼ to 1½ lacs
Bombay and Poona................	„ 1 lac to 1,25,000
Southern Mahratta country, Sattara, &c........................	„ 75,000 to 1 lac.
Hyderabad........................	„ 10 to 15,000
Baroda...........................	50,000
„ Shorapoor, &c......................	8,000

Cotton and silk sarees and roomals are the most material of the manufactures of the districts adjoining Shorapoor. Those of Gudwall, which are principally silk, were formerly more extensive and, have been supplanted by the sarees and dooputtas of Pyetun and Boorhanpoor, which are largely used and are of much superior quality. The principal trade at Gudwall is at the annual fair held in February, when purchasers, chiefly from the southward, attend and transact business.

Gulburgah cloths are sent to Sholapoor and Poonah, as also to Hyderabad and other markets in the Dekhan ; but the trade and manufacture have decreased considerably in late years.

Muktul manufactures.—The weavers at Muktul are comparatively few, and no great value of manufacture is attained. Shorapoor consumes a considerable amount of Muktul manufacture, and the cloths are also exported to the Southern Mahratta country, &c. The dyes of the Muktul sarees are considered more permanent than those of Narrainpett, and as the texture of the cloths is improving in quality, it is probable that the manufactures may increase.

Amurchinta Manufactures are principally turbans, selahs, or scarfs, dotees, roomals, &c. &c., and are held in much estimation for the fineness of the fabric and its durability. These manufactures are exported to Sholapoor, Poonah and the Southern Mahratta country, and much of the finer plain selahs and turbans to Hyderabad.

The thread or yarns from which the manufactures of Narrainpett, Dharwar, Muktul, Amurchinta and Gudwal are woven, is spun in the districts adjoining in which Shorapoor is included. The spinners are uniformly dhers, a class of the lower caste, but who are unrivalled in this branch of industry. They purchase the cotton in the seed, which is the produce of Shorapoor and the country around, and it is cleaned entirely by the hand, as the use of a churka or other cleaning implement they allege breaks or injures the fibre. The spinning wheel has a large circumference, and is in some instances worked by a treadle, and the spinning is carried on in a close room from whence wind is carefully excluded. Up to A. D. 1851 no English yarn had found its way into the country except of low quality—what was used, was principally red, orange, and green which is employed in place of silk for the borders of the lower priced sarees, dhotees, and roomals. It is considered too hard and too much twisted, to be used in the manufacture of whole pieces.

Wages of Weavers.—The expenses of weaving, as far as can be ascertained from the manufacturers, are already detailed in the memorandum of cloths, and the weavers would appear to have very fair amount of remuneration, if the prices of labour of other descriptions prevalent in the country is taken into consideration. The wages, average from 8 to 12 rupees per month, and independent of this, the weaver had a considerable profit in the excess of material, silk, cotton and gold thread which it is customary to afford him for the manufacture of each article.

Sarees of Dharwar are superior in point of texture, sarees, perfectly plain, and with narrow silk borders, are made to the order, some rajas in Central India and Hindoostan to the value of 60 and 80 rupees.

The perfection of the cotton manufactures of Narrainpett, Dharwar and Muktul as well in regard to colour as texture, is attributed by the native weavers to the quality of the water, in regard to which they are most particular, and to the clays and earths obtainable near those places in which the thread is washed after its long oil process. The water is represented as hard and unfit for culinary purposes or washing, yet without salt, and which, in washing the thread, and brushing it as stretched on the loom, contracts the fibre and renders it clean and smooth in working.

There can be no doubt of the permanency of the colours, and that all the madder reds and browns improve with washing. In imitating these manufactures therefore, it should be a point of essential importance to use none but permanent colours, as any others subjected to the rough treatment of Indian washermen, would speedily fade or change, and would be useless and unsaleable however fine, in comparison with native manufacturers.

The silk dyes, are perhaps less permanent than the cotton, but still they are sufficiently fast to last many years, and bear frequent washing. In the finer kinds of silk manufacture, none but China silk is employed ; as the value decreases, it is mixed with Mysore silk, and the lowest description of silk sarees are made from Mysore silk alone. These, as those of Gudwall, and Gulburgah, are at once known by their rough texture and great weight in comparison of the finer kinds of Narrainpett cloths.

Cotton-printing of Sholapore.—There is a branch of cotton-printing carried on at Sholapoor. The patterns of various kinds are printed upon coarse cloth, and are used for floor coverings, bed coverlets, &c. &c., the latter by the poorer classes. The colours are very permanent, and will bear any amount of washing, but are confined to mudder reds, and browns, black, dull greens and yellows.

The other manufactures of the country are of an ordinary description, dhotees or men's cloths, sarees, roomals for the head, and handkerchiefs, the coarser descriptions of muslins, turbans and selahs, and both for local use and exportation to the Southern Mahratta country, Poonah, Bombay, &c. They do not differ materially from ordinary manufactures in other parts of India, and could only be valuable in reference to price, texture and dye. —*Colonel Meadows Taylor*, 30*th September* 1850, *p.* 290 *of Madras Ex. Jur. Report* ; *Sirr's China and the Chinese, Vol.* i, *pp.* 384, 386. See Dacca.

SIMANG, the capital of the Bor Abor.

SIMANG and BILA In the northern portion of the Malayan peninsula, within the territories of the Malay provinces of Oveda, Perak, Pahang and Tringanu, is a Negro race known to the Malays under the names of Simang and Bila. The complexion of these is black, or sooty, the hair woolly, the features approaching to the African, and the stature dwarfish. An adult Simang male, said to be of the mean height of this people, was found to be only 4 feet 9 inches high. Some of the Simang, or Bila, have fixed habitations, and practise a rude agriculture, but the majority lead an erratic life, gathering the rude products of the forest to exchange with the Malays for the necessaries of life, or subsisting by the chase. The Simang and Bila appear to have several tongues, and that of the Simang though containing Malay and Javanese words is considered by Mr. Crawfurd to be an original tongue. The Simang like the Philippine negroes are of diminutive stature. The average height of the Simang is said to be under five feet.

In the remoter portions of Asianesia, some of the black tribes possess all the traits of the Guinea negro, but the Simang and Mincopi of the Andamans appear, like the greater number of the Asianesian negro tribes, to have been partially modified by mixture with other races. This is certainly the case with the Simang, some of whom are Australo-Tamulian in appearance, while others differ little save in their frizzled or spiral hair and dark complexion, from some of the adjacent Binua. The average height of the adults of a party of Simang Bukit on the Ijan, a feeder of the Krian was four feet eight inches, the highest four feet ten inches. Head small, ridged, that is, rising above the forehead in an obtuse wedge-shape, the back rounded and markedly narrower than the zygomatic or middle zone ; the face generally narrower and smaller than the Malay ; eye-brows very prominent, standing out from the forehead and projecting over the ocular furrow which extends across the face, the root of the nose sinking into it and forming a deep angle with the base of the superciliary ridge. The nose short and somewhat sharp at the point, and often turned up, but the alæ spreading ; eyes fine, middle-sized and straight : iris large piercing, conjunctive membrane yellow, the upper eye-lashes, owing to the deep ocular depression or prominent ridges are compressed or folded, the roots of the hair being hidden. The cheek-bones generally broad, but in some cases not remarkably prominent, save with reference to the narrow forehead. Mouth large or wide but lips not thick or projecting ; the lower part of the face oval or round but not square. The deep depression at the eyes and sinking in at the root of the nose give a very remarkable character to the head compared with the Malay. The projecting brow is in a vertical line with the nose, mouth and chin, and the upper jaw is not projecting or prognathous. The person is slender, the belly, protuberant, owing to their animal life in the jungle and precarious food. This induces them to cram themselves whenever they can and the skin of the abdomen thus becomes flaccid and expansible like that of an ape. The skin generally is fine and soft, although often disfigured by scurf, and the colour is a dark-brown, but in some cases lighter and approaching to the Malay. The more exposed hordes are black. The Simang of Tringanu are not of such a jet-black glossy colour as the Kidah tribe. An individual who, many years ago, was brought to Pinang, and who has hitherto represented the race in European ethnology, probably belonged to such a horde. His lips were thick, and Mr. Anderson says he exactly resembled two natives of the Andamans, who were brought to Pinang in 1819. Mr. Anderson adds that a Semang of Tringanu, who lived in Pinang was 'not of such a jet black glossy appearance' as the Semang from

Kidah whom he saw, and the two Andamani. The hair is spiral not woolly and grows thickly on the head in tufts. They have thick mustaches, the growth being much stronger than in the Malay race. The head is neither Mongolian, nor Negro of the Guinea type. It is Papua-Tamulian ; the expression of the face is mild, simple and stupid. The voice is soft, low, nasal and hollow or cerebral ; a line of tattooing extends from the forehead to the cheek-bones. The right ear is pierced, the orifice being large. The hair is cropped save a ring or fringe round the forehead. The Simang are found in all the rivers of Pera and are classed as the Simang Paya who frequent the low and marshy alluvium between the sea and the hills ; the Simang Bukit who wander in the forests of the hills, and the Sakai who are confined to the mountains of the interior. There are said to be thousands of the Simang in the interior of Patani, Tringanu, Kidah and Pera, wherever the country is covered with forest and there are few or no Malays. Simang tribes of Kidah and Pera have a language mainly dissyllabic like other Asianesian ones. Simang, is a Malay word and is applied by the mahomedans of Kedah, Perak, Tringanu and Salangore, to the pagan tribes of the interior, though the Semang Paya reside on the plains or borders of the morasses, the Semang Bukit, are the occupants of hills, the Semang Bakow reside in the neigbourhood of the sea, in the creeks and districts where the mangrove grows, frequenting the sea-shore, and occasionally taking up their quarters in the mangrove jungles. The Semang Bila are those who have been somewhat reclaimed from their savage habits, and have had intercourse with the Malays. According to Mr. Earl, the Semang are a mere remnant of tribes which, according to native tradition, occupied a considerable portion of the interior of the peninsula at a comparatively recent period. At the present time the race is only known to exist on the mountain Jerei, in the Kedah territory, a little to the north of Penang ; in the neighbourhood of the mountain range which lies immediately opposite to the latter settlement ; and in the uplands of Tringanu, on the east coast of the peninsula ; but it seems probable that scattered remnants are to be found in several other spots, which have not yet been visited by Europeans. The Sakai and Allas tribes of Perak, which have hitherto been classed with the Semang, or woolly-haired race of the neighbourhood of Pinang, have curly but not woolly hair ; and although they retain the Papuan custom of boring the septum of the nose, and also mark their skins with cicatrices they cannot be considered as Papuans ; indeed their language and leading characteristics show them to be wild tribes of the Malayan race. The Semang, however, who are identical in every particular with the Pangan of the interior of Tringanu, are Papuans in all their purity, with woolly and tufted hair in every respect similar to other unmixed tribes of the race. Of the origin of the Semang the Malays possess no tradition. Certain it is, however, that the tribes of them which inhabited various parts on both sides of the peninsula were much more numerous, before many of the present Malayan colonies were founded by emigrants from Sumatra.

They are at present most numerous in the interior of Jan, a small river to the north of the Mirbow, near the lofty mountain Jerei, in the Kedah territory. There are small parties also in the mountains, inland of Juru and Krian, opposite Pinang. Their huts or temporary dwellings, (for they have no fixed habitations, but rove about like the beasts of the forest), consist of two posts stuck into the ground, with a small cross-piece, and a few leaves or branches of trees laid over to secure them from the weather. Some of them, indeed, in the thicker parts of the forest, where the elephants, tigers, and other wild animals are most abundant, make their temporary dwellings upon the cliffs and branches of large trees. The Semang subsist on the birds and beasts of the forest, and roots. They eat the elephant, rhinoceros, monkeys, and rats, and with the exception of the scanty supplies they obtain from the Malays, they have no rice or salt. They are very expert with the sumpit, a blow-pipe for projecting small darts, and poison the darts with ipoh poison, procured from the juice of various trees. They handle the bow and the spear with wonderful dexterity and destroy the largest and most powerful animals by ingenious contrivances. It is seldom they suffer by beasts of prey, as they are extremely sharp-sighted, and as agile in ascending the trees as the monkeys. Their mode of destroying elephants, in order to procure the ivory, or their flesh, is most ingenious. They lie in wait in small parties of two or three, when they have perceived any elephants ascend a hill, and as they descend again, which they usually do at a slow pace, plucking the branches as they move along, while the hind legs are lifted up, the Semang, cautiously approaching behind, drives a sharp-pointed bamboo, or a piece of neebong which has been previously well-hardened in the fire, and touched with poison, into the sole of the elephant's foot with all his force, which effectually lames the animal, and most commonly causes him to fall, when the whole party rush upon him with spears and sharp-pointed sticks, and soon despatch him. The rhinoceros they obtain with even less difficulty. This animal, which is of solitary habits, is found frequently in marshy places, with its whole body immersed in the mud, and part of the head only visible. The Malays call the animal "Badak Tapa" or the recluse rhinoceros. Towards the close of the rainy season, they are said to bury themselves in this manner in different places, and upon the dry weather setting in, and from the powerful effects of a vertical sun, the mud becomes hard and crusted, and the rhinoceros cannot effect its escape without considerable difficulty and exertion. The wild buffaloes of North Australia are often found in a similar predicament, and are sometimes shot by the hunters before they can extricate themselves. The Semang prepare themselves with large quantities of combustible materials, with which they quietly approach the animal, who is aroused from his reverie by an immense fire over him, which being kept well supplied by the Semang with fresh fuel, soon completes his destruction, and renders him in a fit state to make a meal of. The projecting horn on the snout is carefully preserved, being supposed to be possessed of medicinal properties, and highly prized by the Malays to whom they barter it for their tobacco, &c. The adjacent Binua also tattoo. The practice is Indian among the Konds, the higher Abor tribes, &c., also ultra-Indian and Asianesian. Although the right ear is pierced, the orifice being large, they do not pierce the septum of the nose like one of the adjacent Binua tribes of Perak, and many of the Asianesian Papuas. The hair is cropped save a ring or fringe round the forehead.

The Semang Bila occupy the southern part of the Malay peninsula, along with the Semang, in the provinces of Quedah, Perak, Pahang and Tringanu.

The people of Kidah more often approximate to the eastern Negro type than in southern Malaya, and Mr. Logan was particularly struck with the repeated occurrence of the deep nasal depression of the Semangs, the Australians and Papuans. Small heads, with all the features as it were contracted or compressed, were common.—*Mr. Logan in Jour. Ind. Arch., Vol.* iv, *p.* 427 ; *Mr. Earl's Indian Archipelago.* See India.

SIMBAL, Hind. Bombax heptaphyllum.

SIMBALU, Beng., Hind. Vitex trifolia.

SIMBUL, an umbellifer, resembling the "jira," or cummin seed, it has an edible bulbous root said to be much relished by bears.—*Cleghorn's Punjab Report, p.* 100.

SIMEON SETH, at the command of Alexis Comnenis, made a Greek translation of the fables of Bedpai.

SIMIADÆ, or monkeys, a family of the mammalia of the order Primates : viz.,

Order. Primates.

Fam. Simiadæ, Monkeys.

Quadrumana,	Catarrhinæ, *Geoffrey.*
Heopitheci, *van Hæven.*	

Sub-fam. Simianæ, *Apes.*

Troglodytes niger, Chimpanzee, Africa.

Troglodytes gorilla, Gorilla, Africa.

Simia satyrus, Orang-utan of Borneo.

Simia morio, Orang-utan of Sumatra.

Simanga syndactyla, *Raffles,* Sumatra.

Sub-fam. Hylobatinæ, Gibbons of Indo-Chinese countries and Malayana.

Hylobates hoolook, Hoolook of Assam, Cachar, Khassia, and Sylhet.

Hylobates lar, Gibbon of Tenasserim.

Hylobates agilis, Gibbon of Malay peninsula: others from the Malay Islands.

Sub-family, Monkeys.

Gen. Presbytis illiger.

Sennopithecus, *F. Curier.*

Hanuman,	Hind.	Langur,	Hind.

Presbytis entellus.

Simia,	*Dufresn.*	P. anchises,	*Ell.*
Langur,	Hind.	Makur,	Mahr.
Hanuman,	,,	Musya,	Can.
Wanur,	Mahr.	Bengal Langur,	Eng.

Common in Bengal and Central India.

Presbytis schistaceus, *Hodgs., Horsf.*

Himalayan Langur,	Eng.	Langur,	Hind.
Kubup,	Bhot.	Kemba Suhu,	Lepch.

Occurs throughout the Himalaya.

Presbytis priamus, *Ell., Bly., Horsf.*

Madras Langur,	Eng.	Gandangi,	Tel.

Inhabits the eastern side of the peninsula and the north of Ceylon.

Presbytis johnii, *Jerdon.*

Simia johnii,	*Fisher.*	Semnopithecus cucullatus,	*Is. Geoff.*
Semnopithecus Dusmierii,	*Schinz.*	Semnopithecus hypoleucos,	*Blyth, Horsf.*
Semnopithecus johnii var.	*Martin.*		

The Malabar Langur, of Tranvancore, Cochin, Malabar and South Canara.

Presbytis jubatus, *Jerdon.*

Semnopithecus johnii, *Wagner, Blyth, Martin.*

The Neilgherry Langur, of Neilgherries, Anamallay, Pulney and Wynaad, not below 2,500 and 3,000 feet.

Presbytis pileatus, *Blyth,* Sylhet, Cachar, Chittagong.

Presbytis barbei, *Blyth,* interior of Tipperah Hills.

Presbytis obscurus, *Reid,* Mergui.

Presbytis phayrei, *Blyth,* Arrakan.

Presbytis albo-cinereus, Malayan Peninsula.

Presbytis cephalopterus, *Blyth,* Ceylon.

Presbytis ursinus, *Blyth,* Ceylon.

Sub-fam. Papioninæ, Baboons.

The true baboons of Africa and monkey-like baboons of India.

Inuus silenus, *Jerdon*. Lion-monkey.

Simia leonina, *Linn, Shaw.*		Silenus veter, *Gray, Bly., Hors.*	
Nil-bandar,	Beng.		
Siahbandar,	Hind.	Nella-manthi,	Mal.

Western Ghauts, Cochin, Travancore.

Inuus rhesus, *Jerdon*.

Inuus erythræus,	*Schreb.*	Pithex oinops,	*Hodg., Hors., Bl.*
Morkot,	Beng.	Marcut-banur,	Lep.
Piyu,	Bhot.	Banur,	„
Bengal monkey,	Eng.	Suhu,	„
Bandar,	Hind.		

Inhabits nearly all India.

Inuus pelops, *Jerdon*.

Macacus assamensis, *McLelland, Horsf., Blyth.*

Inuus Sikkamensis, *Jerd.?*	Macacus sikamensis, *Hodg.?*

The Hill monkey, high up on the Mussoorie Hills.

Inuus nemestrinus, *Jerdon*, Tenasserim and Malayana.

Inuus leoninus, *Blyth*, Arrakan.

Inuus arctoides, *Is. Geoffroy*, Arrakan.

Gen. Macacus radiatus, *Jerdon*.

Simia sinica, *Linn., Ell., Blyth, Horsf.*

Munga,	Can.	Wanur,	Mahr. of Sykes.
Madras Monkey,	Eng.	Kerda,	Mahr. of Ghauts.
Bandar,	Hind.	Koti,	Tel.
Makadu,	Mahr.	Vella Munthi,	Tam.

All over Southern India.

Macacus pileatus, *Shaw*, of Ceylon.

Macacus carbonarius, *F. Cuvier*, of Burmah.

Macacus cynomolgos, *Linn.*, of Burmah.—*Jerdon*; *Blyth Cat.*; *Horsfield*.

SIMI AGATI, Tam. Cassia alata, *Linn.*

SIMIAN, Hind. Vermicelli.

SIMI ATTI-PALLAM, Tam. Figs.

SIMI, Bohtia, Sokpa. Cat. Felis catus.

SIMI CHUNAMBU, Tam. Chalk.

SIMI ELUPEI MARAM, Tam. Achras sapota, *Willd.*, Diospyros sapota.

SIMI KAVI-KALLU, Tam. Bole armenian.

SIMILOR, also Tambac, Fr. Pinchbeck.

SIMI TAKALI PALLAM, Tam. Solanum lycopersicum.

SIMJANG, Hind. A tree of Chota Nagpore. Soft, yellow wood.—*Cal. Cat. Ex.*, 1862.

SIMLA, in lat. 31° 6′ 2″ N., long. 77° 9′ 4″ E., (taken at the church), is a hill station and sanitarium, 40 miles distant from the southern foot of the Himalaya. The entrance to the church is 7,156 feet above the sea. The height of Simla, taken trigonometrically, is exactly 7,206½ feet above the level of the sea, measuring from the magnetic observatory. The mountain called Jacko, said to have been so named from the myriads of monkeys found all over it, is much higher, and houses are built not only on the slopes of the hill, but to the very summit. The name is the hindi Shyea Malay, or blue house, from a house of blue slate. Simla was taken from the Jun rajah in 1815, and given to the Patiala rajah, but again obtained from him as a sanitarium. Simla has 1,000 Europeans and 14,000 natives in the season.

The range on which the Simla station has been formed bears wild thyme, wild strawberries, various oaks, pines, the deodar and all the forms of Europe. The hill dogs are covered with black wool which forms an article of traffic, they are large and ferocious to strangers but are useful as sheep-dogs, and are provided with an iron collar to secure the dog from a leopard's teeth. Simla district and town in the Western Himalaya, is in the district of Rohilcund. Simla is on the main (Cis-Sutlej) chain, and has an elevation of 7,000 to 8,000 feet; a little further north at Nagkunda it rises to 9,300 and to 10,700 at the Peak of Hattu. The Chor mountain, one of the most remarkable isolated peaks in the Himalaya is 12,100 feet. It is situated on a branch of the main Cis-Sutlej chain and is only thirty miles from the plains: the bed of the Sutlej is everywhere very low, being at Belaspur 1,500 and at Ranpur 3,300 feet. The plains at the foot of the Simla hills attain 1,000 feet elevation and the outer ranges are lower than those of Gurhwal and Kumaon. Rupar, close to the Sutlej amongst the outer hills, is under 1,000 feet. Subathu, a little further in, is 4,200 and Kassowlee 6,500 feet. From Kashmir, eastwards, all the easily accessible portions of the Himalaya are occupied by Arian hindoo as far as the eastern border of Kumaon and the Kali river separating Kumaon from Nepaul—the Tibetans being here confined to the valleys about and beyond the snow. People of Tibetan blood have migrated into Nepaul, throughout its whole length, and have formed mixed tribes, whose appearance and language is more Tibetan than Indian, but whose religion and manners are hindoo. East of Nepal, in Sikkim and Bhootan, the hindoo element almost disappears, and the Tibetans are altogether dominant. From Simla, for several hundred miles to the east all the passes through the snowy range are occupied by the Bhoti. They have a monopoly of the trade across the Himalaya, are carriers, loading the goods on the backs of sheep. Koli is the name given to the lower class of cultivators in the Simla hills. The Kanait are an agricultural race in the Simla hills and east of the Sutlej, holding most of the land in the Simla hills. They are inferior in position to Rajputs, more perhaps of the level of the Kurmi and Lodhi, but they are often educated, and are generally ministers to the Rajput chiefs. Their women are very nice-looking, and all the tribe who are not (in the upper hills) in contact with Tartars are quite Arian, though not very large. In certain places there is a partial and local practice of polyandry among them, but it is not the general custom of the tribe. The hillmen of Simla are offspring of the dark Kaet races and Rajputs who have, for eight centuries been flying to the mountains to escape mahomedan invasions. They are filthy in their persons: they have clear almost Anglo-Saxon complexion, many have goitres and they hate mahomedans. Their chiefs, as the Dati and Kat ranas, are of Rajput origin, and they have a municipal system with Shamilik or commons and a lombardar or mukhia, *i. e.*, chief. Polyandry prevails among the hillmen beyond Kotghur, but it is on the decline, polygamy often taking its place. In the winter the men almost hybernate spending months in eating and sleeping.

The trees furnishing the supply at Simla, are chiefly

Quercus incana,	Pinus excelsa,
Rhododendron arboreum,	and
Andromeda ovalifolia,	Cedrus deodara.

The fruit of the 'trimal,' or Ficus macrophylla, is sold in the bazaar at Simla. Besides an extensive bazaar or collection of shops, which may now almost be designated a small native town, Simla contains nearly 400 houses, scattered along the crest of different mountain ranges. Its situation is a most favourable one, on the main range of mountains south of the Sutlej river, at a point where a massive peak rises to a height of 8,100 feet, and on the nearest part of the ridge to the plains of India, which is sufficiently elevated, well-wooded, and situated favourably with regard to water. The greater part of the station is built on the main range, partly surrounding the peak of Jako, and partly on the ridge running north from it, at an elevation of about 7,000 feet, as far as a smaller culminating point of the range, which is by the inhabitants named Prospect Point. At this point the main range turns sharply to the west, and the station is continued for nearly a mile on a spur which runs towards the north, passing through the station of Jutog. From the scattered position of the houses, the extent of Simla is much more considerable than the bare statement of the number of houses might lead one to suppose. The northern ridge extends almost four miles, and the circuit of Jako by the principal road, which is from 500 to 1,000 feet below the summit, measures five miles.

Pinus excelsa is very common tree at Simla, particularly on the southern face of Mount Jako, which is the highest part of the ridge. Abies smithiana is rare, a few trees only occurring in a shady ravine facing the west; while the deodar is common on the southern and western slopes of Jako, above 7,000 feet; and again in shady groves at the bottom of the valleys on both sides of the ridge, as low as 5,000 feet. This beautiful tree, the cedar of the Indian mountains, seems limited to the western half of the Himalayan range, extending from the most part westerly of Nepaul, as far as the mountains of Affghanistan. It was first described by Roxburgh from specimens sent to him from Kumaon, at a time when the western Himalaya was almost inaccessible to Europeans, under the name by which it is known to the inhabitants of that province, as in Kashmir. It is, however, singularly enough, not known by that name in the Simla hills, where it is called Kelu, another conifer, Cupressus torulosa, a rare tree in the district, having usurped the name, as well as the sacred character, of deodar.

The view from the peak of Jako is one of the most agreeable and diversified, in any part of the Himalaya; although, from the rather too level top of the mountain, and the intrusion of the forest almost to the very summit, the whole panorama cannot be embraced at once. Immediately under the eye are the numerous spurs and ridges covered with scattered houses, and the deep ravine which terminates the steep slopes below the station; towards the plains, the whole valley of the Gambar is seen, with the stations of Sabathu and Kussowlee, the church and esplanade of the former appearing low down almost within a stone's throw, while the brilliant white of the houses of Kussowlee, more nearly level with the eye, sparkle in the sunbeams. The ridge of Kussowlee in one place excludes the view of the plains, but to the right they may be seen stretching away in the distance, and only recognizable at last by the track of the Sutlej river, which from the very remarkable curve close to its exit from the mountains, may be traced as far as vision can extend, a distance of 116 miles. To the north a valley stretches from Simla as far as the Sutlej river, distant about fifteen miles, so direct that the greater part of it is seen, though the river itself is concealed. East of north a long partially wooded ridge, about four miles distant at its nearest point, running parallel to the valley just mentioned, excludes the view of the nearer part of the Sutlej valley; but the lofty ranges north of that river, covered with dense forest, and backed by masses of brilliant snow, close in the view in that direction. Due east lies the Mahasu ridge, covered on the Simla slopes with a dense forest of deodar; and to the south, across the valley of the Giri, towards which numerous rugged ridges run, is the mountain called the Chor, the highest peak of the range which separates the Giri from the Tons, the crest of which is upwards of 12,000 feet in height. Pinus longifolia is common at the western or lower extremity of the Simla station, and prevails, to the exclusion of any other tree on the dry sunny spurs which run towards the south, at elevations from 7,000 to 5,000 feet. This species is, of all the Indian pines, (except its near ally P. khasyana), that which is capable of enduring the most heat, and at the same time the greatest variation in amount of moisture; as it is found at elevations of not more than 1,000 feet above the level of the sea, equally in the hot humid valleys of Sikkim, where it enjoys a perpetual vapour-bath, and on the dry sandstone hills of the upper Punjab, on which rain hardly ever falls. It is only, however, at low elevations, where the mean temperature is high, that it is capable of supporting a great amount of humidity.—*Cal. Review, No.* xci, *Nov.* 1867; *Dr. Thomson's Travels in Western Himalaya and Tibet, pp.* 16-19, 22-24; *Adventures of a Lady in Tartary, Mrs. Harvey, Vol.* i, *p.* 386; *Hooker and Thompson, Flora Indica, p.* 202; *Ann. SIMLI, HIND. Zizyphus flexuosa.

SIMLOTUN, a river near Raepoor in the Sabathoo district.

SIMLU, HIND. Berberis aristata.

SIMOA-MANIS, MALAY. Orange.

SIMODA, see Japan.

SIMONG, see Himalaya.

SIMOOM, a hurtful hot wind which prevails in the hot season on the Dasht or plain of Battekottee between Hazar-nao and Jellalabad, though its mountains on both sides are covered with perpetual snow. It is said to be generally fatal to all men, horses and cattle who encounter it. It is as malignant in its effects in the night as in the day. Besides earthquakes, Arabia is subject to sudden and most violent storms; one kind of which is the well-known simoom, samiel, or samm; the khamsin of Egypt, and the harmattan of the coast of Guinea. It is described as being hot and pestiferous, sweeping over the country with such speed and fearful violence that according to some statements, men and animals are often overwhelmed by clouds of moving sand; in fact, it is said, persons who have the misfortune to be travelling during one of these storms might be stifled in a moment; unless they throw themselves close to the burning sand and cover their faces with their cloths. Mr. Werry, Consul-General for Syria in 1838, had however a meeting of the chief Arghyle, and of the Aenizeh sheikhs who accompanied the last caravan of 2,000 camels from Baghdad, and though some of them had traversed the desert, in all directions, for 30 years past, they never heard of a caravan, nor even of a single animal or man, being buried alive in the sand raised by a whirlwind. They stated, that, generally speaking, the surface soil in the countries which they traversed, would not admit of being raised in columns sufficiently dense to inflict such a calamity, and that whatever may have occurred in the African desert, nothing of the kind, to their knowledge, has taken place in Arabia. The simoom, however, they added, is hot and suffocating, and has frequently caused the death of persons who have been unable to shelter themselves from its deleterious influence. They asserted also that earthquakes are experienced in the country. Ferrier says this terrible hot blast inflicts upon animals the same tortures as on the human race, it is called Sirocco in the south of Europe, Khamsin in Egypt, and Saum and Simoom in Arabia and Persia, and is the Sharkia or East wind of Scripture; in Egypt, Damascus, Arabia, and Baghdad, it blows by sudden squalls, the approach of which is indicated by a certain perturbed state of the atmosphere. But M. Ferrier here alludes to the ordinary hot blast of the deserts, and not the real saum or simoom. The latter seems a poisonous current of air, probably electric, of rare occurrence, and causing instant death, and peculiar to the deserts of Arabia. It has no injurious effect on vegetation, perhaps because it does not come in contact with it, as it rarely approaches within one or two feet of the ground. The camel, instinctively being aware of its approach, kneels down, and lays its head close to the ground, thus escaping its deadly effects. Rain is unusual and uncertain in Sindh, as it does not come within the influence of the south-west or north-west monsoons, though equinoctial storms and gales are generally experienced. Where the hot winds or simum blow, they often become above Sehwun, dangerous in their effects. The natives, aware of their power, avoid travelling at this season.—*Euphrates and Tigris, Col. Chesney, Vol.* i, *pp.* 578, 579; *Expedition, Vol.* iv; *Ferrier's Journ., p.* 272; *Postan's Personal Observations, pp.* 14, 15.

SIMRANG, HIND., of Kanawar, Rhododendron campanulatum, Alpine rhododendron.

SIMUKH, HIND. A wild grain of Dera Ghazi Khan, a species of Amaranth.

SIMUL, BENG., HIND. Bombax malabaricum.

SIMY ILUPI MARAM, Tam. Achras sapota.

SIN, Hind. Withania coagulans.

SIN, or Aba-sin, a name of the river Indus. Sin is a Scythic word for river (now unused) so applied by the hindoos. According to native carpenters the Indus or Aba-sin timber is the best, being more resinous. The next is the Swat timber, which is very good and free from knots. The Kabul river wood often appears to be immature.—*Cleghorn's Panjab Report, p.* 216.

SIN, Chin. The gods. Among existing religions of China, the Sin-tu (Sin, the gods, and Tu faith) and the buddhist are the most extended. The Sin-tu embraces a cosmogony, hero-worship, the Ten-sio-dai-sin the Sin goddess, being the principal object of worship. The religion has a trace of buddhism. See Japan.

SINA-BAJ, Pers., Push. A variety of the cold musk melon of Candahar and Cabul.

SINADIKA, Sans. Boerhaavia diandria.

SINA NAGA, Tam. Eugenia jambolana, *Lam., Roxb.*

SINAI, a mountain in Arabia, celebrated, amongst the followers of the Hebrew, christian and mahomedan religions, as that near which the Israelites encamped in their road from Egypt to Palestine. It was from Sinai that Moses proclaimed the Ten Commandments. The Arabs indicate Jabl Tur as the site.

SINAPIS, Mustard.

Kabbr,	Ar.	Sarson; Rae; Bunga-Sarson; Tooria,	Hind.
Sanchi-sarson,	Beng.	Sarshuf,	Pers.
Rae; Ban-rae; Bul-rae,	„	Rajika; Sarshapa,	Sans.
Shwet-rae; Sada-rae,	„	Tuverica,	„
Jooni-rae,	„	Surai-bij,	Sindh.
Mustard species,	Eng.	Gan-aba; Rata-aba,	Singh.
Napu,	Greek.	Kadaghoo,	Tam
Khardal,	Heb.	Avaloo,	Tel.

The Sinapis genus of plants, belongs to the natural order Cruciferæ. There are 40 or 50 species, all of them known as mustard plants. S. alba and S. nigra, the white and black mustard are best known in Europe. Five or six species are cultivated in all parts of India, for the sake of the valuable oil they yield, those most frequently seen are S. glauca, toria, racemosa, ramosa, dichotoma and juncea. —*M. E. J. R.*

SINAPIS ALBA.

Peh-lui; Hu-lui,	Chin.	Sarshapa,	Sans.
White mustard,	Eng.	Kadughu,	Tam.
Safed rai,	Hind.	Avalu; sursava,	Tel.

The word mustard is from the Latin mustum ardens. In China, the white mustard crop is sown in the autumn and the herbage is picked in the winter and spring for a pot-herb. A mustard seed was the buddhist unit of long measure. Sinapis alba, or white mustard, is a native of Great Britain and most countries in the south of Europe. It is frequently cultivated, and when young is eaten as a salad. The seeds of the S. alba yield by expression 36 per cent. of a bright yellow, pleasant tasted, edible oil, having a strong smell, and slight taste of mustard. The seeds of S. nigra yield only 28 per cent. of an oil in all respects similar to the above. The average price of mustard seed in eighteen large stations, in all parts of the Madras presidency, for the quarter ending 31st October 1854, was Rs. 1-2-8 per maund of 25 lbs., the maximum being Rs. 1-11-6 at Cannanore, and the minimum As. 15-5 at Nagpore. In Vizagapatam it costs Rs. 208 per Sicca garce. The oil is not exported from Madras, but the seeds have been shipped as follows:

1847-48...Cwt.	5,828	1850-51...Cwt.	9,909
1848-49... „	6,767	1851-52... „	3,636
1849-50... „	9,435	1852-53 .. „	16,075

The mustard plant is officinal on account of its seeds, or rather of the flour of the seeds, or mustard. Dr. Pereira was informed that the best flour of mustard is prepared by crushing the seeds of both black and white mustard between rollers, and then pounding them in mortars, when they are twice sifted to yield pure flour of mustard. Two bushels of black, and three of white seed yield, when ground, 145 pounds of flour; which, to diminish the pungency and improve the colour, is mixed with 56 pounds of wheat flour and two pounds of turmeric; and the acrimony is restored without the pungency, by the addition of a pound of (capsicum) chilly pods, and half a pound of ginger. Common mustard consists of the flour of the seeds of the black mustard, though generally mixed with that procured from the seeds of the white mustard, or Sinapis alba, and deprived of fixed oil by expression. Both species have been long used in medicine, being the *ναπυ* of Hippocrates, and the Sinapi of the Romans.

The Oil.

Mustard oil,	Eng.	Kadaghoo yennai,	Tam.
Rai ka tel,	Guz., Hind.	Avaloo and Sursava noona,	Tel.
Sarshapa-tailum,	Sans.		

This valuable oil is used in most parts of India in cookery, and is considered superior to all other oils for anointing the body, which it is supposed to invigorate. In medicine, it is sometimes given internally, but is more frequently applied as a rubefacient.—*Eng. Cyc.*; *M. E. J. R*; *Royle.* See Mustard.

SINAPIS BRASSICA.

Kurm kulla,	Hind.	Badshahee rai,	Hind.

Cultivated in the Saharunpore garden.

SINAPIS DICHOTOMA.

Tha-ba-mee,	Burm.	Suhota,	Hind.
Moung-ngyeen,	„	Sighta,	„
Toreea,	Hind.	Kali surson,	„

Cultivated in British India. Much prized for its oil.—*McClelland.*

SINAPIS JUNCEA.

Bunga surson,		Tsz'e-kai,	CHIN.

SINAPIS ERYSIMOIDES.

Raeo,		Mukura raee,	

SINAPIS GLAUCA.

Mustard,	ENG.	Raee,	PUNJ.

This is found in the Sutlej valley between Rampur and Sungnam at elevations up to 11,000 feet, and is much cultivated. Several species of Sinapis are grown in the N. W. Himalaya as salads and condiments.—*Cleghorn's Punjab Report, p.* 68.

SINAPIS RAMOSA, *Roxb.*

Rai,	BENG., HIND.	Kudagu,	
Indian mustard,	ENG.	Avalu,	
Kaduga,	MALEAL.		

The seeds are much used as a condiment.

SINAPIS RAJIKA.

SINAPIS RAGOSA.

SIND, a river of Gopalpore in Gwalior, near Rutwah.

SIND, HIND. Daphne oleoides.

SIND, a province of British India in the lower course of the Indus river, which runs through it. The name of this province is also written Scinde, and Sind'h, and seems to be derived from Sin, a Scythic name for a river, from which also have come the terms Hind and Ind for India—the letters *s* and *h* on the Western parts of British India being transmutable. To the Western Arabs, all eastwards of the Persian Gulf was known as Hind; but they distinguished the two regions on and beyond the Indus river by the terms Hind-o-Sind. The name of Sind is of great antiquity, and is mentioned both by Pliny and Arrian, the one writes it Sindus and the other Sind. We learn from the Nubian geographers that the Arabians called it Mekran. India, however, is supposed to have obtained its name from the Indus, the Sin, Sinda or Hinda or Hapta Hinda, the Aba-Sin of the Arabs, the great river met in the route from Europe and from Western and Central Asia. It is true that so far back as the reign of Darius Hystaspes, B. C. 521, the early writers placed Indians on both sides of the Indus and made India extend westward to Kandahar (Gandhara), embracing perhaps the fourteen Iranian provinces or nations, enumerated on the Naksh-i-Rustum as lying between Sogdiana and the Panjab and subject to Darius. But eastward of the Indus, the country was always India, and this name seems to have been chiefly used in the south of Asia for it first occurs in the Bible, in the book of Esther (i, 1; iii, 9) as the limit of the territories of king Ahasuerus in the east, as Ethiopia was on the west, and the names are similarly connected by Herodotus (vii, 9). The term 'Hoddu' used by the Hebrews is an abbreviation of Honadu which is identical with the names of the river Indus, for, to the present day, all along the course of that river, the letters S and H are interchanged, and, in the Vendidad, the Panjab is described as the 'Hapta-Hindu' and the native form 'Sindus' is noticed by Pliny (vi, 23.) The India of the book of Esther is not the peninsula of Hindustan, but the country surrounding the Indus—the Panjab, and perhaps Sind—the India which Herodotus describes (iii, 98) as forming part of the Persian empire under Darius, and the India which at a later period was conquered by Alexander the Great. The name occurs in the inscriptions of Persepolis and Naksh-i-Rustum, but not in those of Behistun. The Sind territory has been repeatedly overrun by conquerors, by Alexander of Greece, by hindoo dynasties, by the Arabs of the Caliphate, by the Moghul of Turkistan, by the Mogul rulers of India, by the Baluch and by the Affghans, by whom it was arranged in various political divisions. The British in India, usually distinguish but two parts, Upper or Northern Sind and Lower or Southern Sind, which the people of the country term Siro and Lar. Each of these divisions has its particular climate, soil and productions, and is otherwise distinctly marked by physical peculiarities. Northern, or Upper Sind, comprises all that tract from Sehwun upwards to the Bhawulpur territories; and Southern or Lower Sind, that from Sehwun, including the delta of the river to the sea. Each has its capital. But, the hindoo races occupying the valley of the Indus, arranged it into three portions, viz., Siro or Upper Sind, the capital of which was Alor; Vichalo or Middle Sind, with Brahminabad for its capital and Lar or Lower Sind, of which Patala was the chief town. In the second century of the christian era, Minnagar, the capital of the Min was the capital of Lower Sind. In the seventh century, Sind was divided into four principalities, viz., Upper, Middle and Lower Sind, and Cutch.

The river Indus flows through the three

parts, and at some comparatively recent time, it has changed its bed, but the old bed still exists under the name of Nara, and its course has been surveyed from the ruins of Alor to the Run of Cutch. From Alor to Jakrao, a distance of 100 miles, its direction is nearly due south. It there divides into several channels, each bearing a separate name. The most easterly channel, which retains the name of Nara, runs to the south-east by Kipra and Umrkot, near which it turns to the south-west by Wanga Bazar and Romaka Bazar, and is there lost in the great Run of Cutch.

The territory of Sind, as, until A. D. 1845, possessed by the Biluch chiefs of Talpur, lies between the 23d and 29th degrees of north latitude, and 67th to 70th degrees of east longitude, having the river Indus nearly in its centre, and comprising all the portion of its valley between the Bhawulpore territories to the north, the ocean to the south, east and west to the desert tracts which intervene between it and the province of Cutch, and the mountains separating it from the higher country of Beloochistan. Northern Sindh, which extends from Sehwun to Subzulkot, is an uninterrupted level, through which in serpentine course flows the river Indus. There are few countries more devoid of natural beauty than Sind. Pyramids seem only wanting to render its scenery Egyptian, and viewed from any eminence, the neighbourhood of Kurrachee is by no means prepossessing. Northwards as far as the eye can reach, is one vast plain of sand, studded with scrubs, or heaps of shingle. Westward, in the distance, are seen the desolate and sun-burnt mountains of Beloochistan. During December, and the two succeeding months, the cold at night is often severe, being frequently 32° Fahrenheit at day-break, while at noon it often mounts to 75° or 86° in the shade. In the time of Alexander the only places mentioned are Sindomana and a city of Brahmans named Harmatelia, by Deodorus and Sindomamana seems to be the modern Sehwan. The mahomedans built a city which they called Mansura close to Bahmanwa. In the middle ages, the great cities were Sadusan, Brahmana, or Bahmanwa, and Nirunkot, the modern Hyderabad. At the present day the principal towns of Middle Sind are, Sehwan, Nala, Hyderabad, and Umarkot. McMurdo says, Sehwan is undoubtedly a place of vast antiquity : perhaps more so than either Alor or Bahmana. The present name is said to be a contraction of Sewistan, which was called after its inhabitants, the Sewis, or Sabis. The Sindo of the Greek and the Sadu of the early mahomedans, point to the Sanscrit name of the country, Sindhu, or to that of its inhabitants, Sindhava or Saindhu, as it is usually pronounced. Their stronghold, or capital, would therefore have been called Saindhava-sthana or Saindhu-sthan, which by the elision of the nasal, becomes the Sadustan of the Arab geographers.

The district of Lar or Lower Sind, the ancient Pitasila, is the delta of the Indus, from Hyderabad to the sea. Ptolemy has preserved the names of several places, as Barbara, Sousikana, Bonis, and Kolaka, of which the first is most probably the same as the Barbarike emporium of the 'Periplus,' and perhaps also the same as the Barce of Justin. In the time of the author of the 'Periplus,' the capital of Lower Sindh was Minnagara, which the foreign merchants reached by ascending the river from Barbarike. In the middle of the seventh century, Hwen Thsang mentions only Pitasila, or Patala. About the ommencement of the christian era, the Rai dynasty ruled from Kashmir and Kanouj to Makra and the port of Dabal on the shores of the sea of Oman, and from Surat to Kandahar and the Solaiman range. The commencement of this dynasty has not been ascertained, but in the time of rai Dwaij the capital was Alor. He was a powerful chief who contracted alliances with the rulers of India. He was succeeded by his son rai Siharas I. Rai Sihasi was the celebrated son of rai Siharas, and the next was Siharas II, who reigned 42 years, and was killed in battle. He was a contemporary of Nousherwan. After Saharas II, a brahman dynasty succeeded. The reign of the Rai seems to have extended to 137 years and to A. D. 479.

Several places on the Indus are named after the Chach dynasty, viz., Chachpur, Chachar, Chachgaon, Chachi. Chach was a brahmin who usurped the kingdom of the Rai dynasty of Sind. He was a contemporary of the Shahram, or Shahrear, and he is supposed to have invented the game of chess. He seems to have reigned about A. H. 2, and to have been succeeded by his brother.

Sind was subject to perpetual incursions from the Ghori, Khilji and Taghaluk dynasties of Delhi and the Punjab as well as the still more ruinous devastations of the Moguls.

In the middle ages Debal was the chief seaport of Sind, hence called Debal Sindi. It was the emporium of the Indus, and seems to have been situated on the western bank of the Baghan river, below the junction of the southern branch of the Ghara or Sagara branch, five miles to the north of Lari Bandar. Lari Bandar has been deserted and the present part of the western half of the Delta is Dharaja, a few miles east of Lari Bandar. Dewal, or Debal, means a temple and several

Sind terms, had it as a prefix, as Debal Thatta, Debal Kangra. Debal Sindi seems to have been the port at which Zabeida of the Arabian Nights landed from Bussorah and found all the people turned into stone. In the reign of Walid (A. D. 705 to 715), Sind was invaded, and that caliph is said to have rendered all India to the Ganges tributary to him.

Al-Mansoor, when only the lieutenant of the caliph Abbas, held the government of Sind and of India, and made the island of Bekher on the Indus, and the adjacent Arore, the ancient capital, his residence, naming it Mansoora; and it was during his government that Bappa Rawul abandoned Cheetore for Iran. The celebrated Haroon-ur-Rashid, contemporary of Charlemagne, in apportioning his immense empire amongst his sons, gave to the second, Al-Mamoon, Khorassan, Zabulisthan, Cabulisthan, Sind, and Hindusthan. Al-Mamoon, on the death of Haroon, deposed his brother, and became caliph in A. H. 198 or A. D. 813, and ruled to 833, the exact period of the reign of Khoman, prince of Cheetore. The domestic history of the Rajputs brings the enemy assailant of Cheetore from Zabulisthan; and as the leader's name is given as 'Mahmood Khorasan Put,' there can be little doubt that it is an error arising from ignorance of the copyist, and should be Mamoon. Within twenty years after this event, the sword of conquest and conversion was withdrawn from India, and Sind was the only province left to Motawakal, (A. D. 850), the grandson of Haroon, for a century after whom the throne of Baghdad, like that of ancient Rome, was sold by her prætorians to the highest bidder.

From this time we find no mention whatever by mahomedans, of Hindusthan, or even of Sind, until Soobaktagin, governor of Khorassān, hoisted the standard of independent sovereignty at Ghazni. In A. H. 365 (A. D. 975) he carried his arms across the Indus, forcing the inhabitants to abandon the religion of their ancestors, and to read the Koran from the altars of Bal and Krishna. Towards the close of this century he made his last invasion, accompanied by his son, the celebrated Mahmood, destined to be the scourge of the hindoo race, who early imbibed the paternal lesson inculcating the extirpation of infidels. Twelve several visitations did Mahmood make with his Tartar hordes, sweeping India of her riches, destroying her temples and architectural remains, and leaving the country plunged in poverty and ignorance. From the effect of these incursions she never recovered; for though she had a respite of a century between Mahmood and the final conquest, it was too short to repair what it had cost ages to rear: the temples of Somnath, of Cheetore, and Girnar are but types of the magnificence of past times. The memorial of Saeti Komar proves him to have been the contemporary of Soobaktagin, and to one of his son Mahmood's visitations is attributed the destruction of the city of the Sun (Aitpoor), Saeti Koomar's capital. The first recorded attack on the Mori prince of Cheetore, which brought Bappa into notice, was either by Yezid or Mahomed bin Kasim from Sind. Though in the histories of the caliphs we can only expect to find recorded those expeditions which were successful.

The Arghun, a Sind dynasty who held a brief sway from A. D. 1521 to 1554-5, a period of 34 years, during which Shuja Beg and his son Mirza Shah Hussain reigned. Arghun Khan Tarkhan, was grandson of Hulaku, grandson of Chengiz Khan.

The Kullorah and Talpoori are tribes of celebrity in Sind, the first furnished a late, and the other the last dynasty of rulers; and though the one has deduced its origin from the Abbasides of Persia, and the other has advanced pretensions to descent from the prophet, both were alike Beluchees, who are said to be essentially Jit or Gete in origin. The Talpoori have their name from the town (poora) of palms (tal or tar) and are said to amount to one-fourth of the population of Lohri or Little Sind, which misnomer they affixed to the dominion of Hyderabad. There are none of the Talpuri in the Thul.

The Rajput dynasty who ruled in Sind are said to have been conquered about A. D. 711, by mahomedans from Arabia. About A. D. 1025, the country was annexed to the Ghaznivi empire by Mahmud, and after various changes of rulers it was incorporated into the Delhi empire by Akbar in 1591, from which it was again dissevered in 1740 by Nadir Shah, who exacted from it a tribute of above twenty lakhs of rupees. After the assassination of Nadir Shah, Sind became subject to the Dourani emperors of Candahar. Previous to the invasion of Nadir Shah, the Kalora, a religious sect, had risen to power in Sind, and the chief of the tribe, Noor Mahomed had been recognised as governor of the province. It was during the rule of his brother Gholam Shah that the connection of the British government with Sind, commenced by the establishment of factories at Tatta and Shah-bunder in 1758. In that year Gholam Shah granted an order for the establishment of the factories and for certain immunities to trade. This order was renewed in 1761. During the rule of Sirfaraz Khan, the eldest son of Gholam Shah, however, the trade was so much interfered with that in 1775 the British government found it necessary to withdraw their factories. The violence and tyranny of Sirfaraz Khan and his successors, who from jealousy put to death three of the chiefs of the Talpoor tribe; led to the overthrow of the Kalora dynasty. The Talpoor are a Beluch tribe, whose chiefs had long held the first place in the service of the rulers of Sind. To avenge the death of their chiefs the Talpoor tribe rose, and, headed by Mir Futteh Ali Khan Talpoor in A. D. 1786, expelled the Kalora ruler Abd-ool-Nubbi. The measures which Futteh Ali Kkan took to establish his authority alarmed his relatives, Mir Sohrab and Mir Thara, who fled, seized on Kheirpore and Shah-bunder, and renounced the authority of their kinsman. Mir Futteh Ali Khan was never again able to extend his authority over the whole province, which henceforth remained divided into three separate principalities, viz., Hyderabad or Lower Sindh under Futteh Ali Khan, Kheirpore or Upper Sindh under Mir Sohrab, and Meerpore under Mir Thara. In Hyderabad, Futteh Ali divided his power with his three brothers, Gholam Ali, Kurm Ali and Murad Ali, and from their real or apparent unanimity, the brothers received the appellation of the Char Yar or four friends.

In 1799, the commercial intercourse between the British government and Sind was revived, and Futteh Ali Khan issued an order granting certain privileges in favour of British trade.

Sind fell to the Indian government, from the mahomedan Talpur dynasty, after the battles of Meeanee, on the 17th February 1843, and of Hyderabad, on the 24th March 1843, both fought by Sir Charles Napier, and this gave the course of the Indus up to Multan.

In August 1842, Sir C. Napier was appointed to the military command in Sindh and Beloochistan, and invested with authority over all civil and political officers in these territories. On the 14th February 1843 the ameers, except Nusseer Khan of Kheirpore, signed the Treaty, leaving Mir Roostum's rights to future investigation. Next day the residence of Major Outram was attacked by 8,000 of the troops of the ameers. After a most gallant defence the escort made their way to the main army. The battles of Meanee and Dubba subjected the whole of Sind to the British government, with the exception of the possessions of Ali Murad, who was established as chief of Kheirpore in the territories which belonged to Mir Roostum, both by inheritance and in right of the turban, as well as in the lands of which he himself stood rightfully possessed at the time of the conquest. All the territory of Sind, with the exception of a portion continued to Ali Murad, was confiscated by the British government. But a fraud was clearly established by a commission, which met in 1850, and Ali Murad was degraded from the rank of rais of Kheirpore, and deprived of all his territories, except those which he inherited under his father's will. The revenue of his possessions in A. D. 1860, was estimated at 3,50,000 Rs. with power to try for capital offences any persons except British subjects. After the conquest, the deposed ameers were removed from Sind and pensions were granted them by the British government. Their descendants continue to receive liberal pensions.

The Desert of Sind lies between the frontier of Rajputanah and the valley of the Indus, and from Dawudputra on the north to Buliari on the Runn, 220 miles long and 80 broad or 17,600 square miles. It is one entire t'hul, with few villages and a few shepherds ; 50 miles without water, the wells 70 to 500 feet deep, and the sand-hills, little mountains. It was through this tract that Hamayun sought refuge to the Dhat country and its capital, then Oomerkote, where Akbar was born. Arore, there, is a ruined town. Oomerkote was wrested from the Soda race by the Rahtor tribe of Marwar, and since then the chiefs of the expelled clan have dwelt in Chore, 15 miles N. E. of Oomerkote. At one time, every third year brought famine. The Soda women of this desert tract of Dhatta are proverbially handsome. In this desert and in the valley of the Indus, are the Soda, Catti and Mallani, descendants of the Sogdi, Cat'hi and Malli, of Gete and Yuti, many of whom call themselves Baluch, or keep the ancient name of Numri, whilst the Zj'hut or Jut, retain their primitive appellation. Also remains of the Johya and Dahya who with the Gete, Jut or Hun, hold places amongst the 36 royal races of ancient India. The Baraha and Lohana tribes are there, the Sahrai, the great robber of the desert, the Bhatti, Rahtor, Joda, Chohan, Mallani, Kaorwa, Joshya, Sooltano, Lohana, Arorah, Khoomra, Sindil, Maisuri, Vishnavi, Jakhur, Shiag, Ashiag and Pooniah.

The origin of the mahomedan Kallora and Sahrai is doubtful, but the following professors of mahomedanism are "Nyad" or proselytes from Rajput or other hindoo tribes : viz., Zj'hut ; Rajur ; Oomra ; Soomra ; Mair or Mer : Mor or Mohor ; Baluch ; Lumria or Looka ; Sumaicha ; Mangulia ; Baggreah ; Dahya ; Johya ; Kairooee ; Jangurea : Oondur ; Berowee ; Bawuri ; Tawuri ; Chrendea ; Khossa ; Sudani ; Lohana. These converts are ferocious and intolerant.

The *Soda* is scattered over the desert, some are mahomedans, the *Sumaicha* is a mahomedan proselyte from the Soda.

Kaoorwa, a peaceable nomade race, chiefly in the t'hul of Dhat, rear cattle.

Dhote or Dhatti, like the Kaoorwa, a pastoral race of Dhat, their cows give 8 or 10 seers of milk daily.

Lohana, numerous in Dhat and Talpoora, they are scribes and shop-keepers.

Arorah, a thrifty race, tradesmen and farmers.

Bhattiah, formerly martial, now traders and like the Arorah, and both these have commercial agencies all over India.

Brahman, Bishnuvi, cultivators and graziers, numerous in Dhat, some in Chore, in Oomerkote, Dharnas and Mitti.

Rebarri, a race who in Hindustan profess mahomedanism and rear camels, here are a tribe who rear camels, or with the Bhatti, steal them.

Jakhur, Shiag'h and Pooniah, harmless, industrious, in the desert and the valley, are denominations of the Jit race, but most of these sections have become mahomedans and call themselves Zj'hut.

Sahrai, is the most numerous of the mahomedan tribes of the desert, of which he is the terror. The *Khossa* is a branch of the Sahrai, whom in habits he resembles, plundering on camels, but they are cowardly and faithless.

Sumaicha, converts to mahomedanism, from the Soda race, some are pastoral, some are plunderers. They are dirty, and never shave.

Rajur, a convert from the Bhatti, cultivators, shepherds and thieves and evil-livers.

Oomra and Soomra, are converts from the Puar or Pramara race, have mixed largely with mahomedans.

The Munchar Lake in Sind, was described by Professor Orlebar, Postans and Knight.

Mr. Campbell says the Sindi people and language are almost confined to Lower Sind, and there the Sindi has much Arabic mixed with it. The Sindi people are well grown and robust, with dark skins, immoral and idle, and given to hunting, fishing and pastoral pursuits quite as much as to cultivation, and the delta and country of the lower Indus, seem to be ill and insufficiently cultivated (p. 141). Mr. Campbell supposes a mixture of Arabic, Persian and Kol blood. The tribes in Sind are so mixed up one with another that excepting that just on the borders no part of the country can be marked off as occupied by any particular tribe; even on the borders, there is much intermixture. The great Murri tribe of Balooch, for instance, has a large, and the strongest, part of the clan in the hills to the north, and outside of the Sind border; but there are a great many of the Murri located in different parts of Sind even down to 100 miles south of Hyderabad. The following list of the tribes and races in Sind was prepared by General Mereweather, and it is believed to be very accurate :—

Kurrachee Collectorate.

Syuds.—Shirazee, Shakroor, Alahi, Mashedi, Maiindranee, Areefee, Rezuri, Bokhari, Ameerkhanee, Lukalivi, Mootalivi, Istrabadee, Khabrotee.

The Syuds originally descended from these tribes. Their forefathers came to Sind from different places on the Asiatic Continent.

Kooreshee.—Alvi, descended from Huzrut Ali from Iran.

Abasee derived from Abas from Irak.
Seedeekee do. Ababukur Seedeek.
Pharookee do. Ameer Oomur.
Oosmani do. Ameer Oosman.

Belooch.—Rhind, Juttoee, Chandia, Noohanee, Khosa, Chang, Lusharee, Kupree, Julbanee, Goonganee, Nizamanee, Almanee, Gopang, Moongwanee, Dluwanee, Sunjranee, Jumallee, Jurwar, Kolachee, Pitabee, Mugsee, Murree, Khowad, Daruck, Lugharee, Muhesur, Talpoor and Boogdee.

The Rhind tribe is the head of all the Belooch from Beloochistan, and from them the several tribes named have descended. The Talpoors, however, became rulers in Sind, while the Rhinds remained dependents. The Belooch generally are said to have come originally from Aleppo in Syria. They have all the characteristics of Arabs, sharp, well-defined features, and well knit limbs. All these divisions merely denote families or descendants of men of renown whose names the families bear.

Kurrumatee.--Pubranee mahomedans, Beeghad, Gubole, Bayee, Kachree, Kumba, Moogra, Ahmedanee, Ruzeeda, Soopad, Murwa, Ladia, Muheree, Sahtia, Alloora, Jingianee, Morsur, Beeramanee, Khirturee, Thuanee, Rajwanee, Soteeanee, Parwaree, Cheeranee, Gocha, Rahwanee, Gorewanee, Shereekhanee, Mindiar, Goramanee, Kulree, Mochir, Sholanee, Boonbanee, Dewanee, Jumallee, Said, Durayaee, Toremanee.

These have descended from the Belooch tribe, but have been sub-divided into the several tribes named.

Assundee, descendants of a tribe from Mooltan.
Mogul, do. do. from Persia.
Tooruk, or Turks, do. do. from Khorasan.
Affghan, do. do. do.

Arghonees came to Sind during the reign of the Summa, whom they overthrew. They succeeded the Summa, as rulers of Sind about the year 927 Hijree, and continued so until their defeat by the Turkhanee, in Hijree 962. The Turkhanee came to Sind, about the same time. They succeeded the Arghanee, as rulers of Sind about the year 962 Hijree, and were in power until Hijree 1021.

Miscellaneous.

Foreign tribes.—Tukzi, Tumeenee (Thainr), Alt-Mogelra (now known as Moria) Powanhar, Jubeeseea, Alootba, Binwalla, Soofean, Koral, Bayar, Soopeea.

Descendants of Harroon.—Mukranee, Loodee (now known as Loodea) Hubsha, Sidee, Jungeeanee.

Summa.— Buda, Shora, Suhta, Ageel, Ottur, Amra, Hajana, Rathore, Puria, Janspuwar, Nalica, Charshoo, Sind Summa, Chugra, Buttee, Koraja, Notiar, Oodhar, Oodha, Lookba, Muhur, Sootia, Potor, Lound, Oonur, Babria, Doongua, Gooba, Phool, Lukkha, Munapya, Munabiya, Kaka, Tukhra, Pullee, Randbheer, Moosra, Summa, Sumaja, Notia, Abra, Wahud, Nahia, *Phoolnabia*, Koria, Dissur, Mindra, Loodia, Odbaja, Kidri-Pota, Loond-Summa, Kakaja, Nara, Jaraja, Hingora, Jugseea, Virriah, Hingoja, Derra-Sumani, Halla, Oodbahingora, Jasingora, Ramabey, Sahad-Summa, Tellaruja, Nuria, Hapra, Rahooja-Joona, Granoe, Rahawa, Lukhatia, Soomra, Jamlakha, Soodaria-Summa, Joona-Summa, Budio, Saheb, Summa, Oto-Summa, Shekbab-Summa, Beeya, Bodia-Chellaria, Mungra, Abraja, Coor-Hingora, Sooltanote-Numria, Jokia, Jutt.

Summa, claim to be descendants of Sam, son of Noah. They have been the original inhabitants of Sind, and were in power as rulers from Hijree 752 to 927, when they were overthrown by the Arghanee. There are other numerous tribes from Summas. All the above sub-divisions are from one and the same tribe, and can be considered as merely surnames. These remarks are applicable to other sub-divisions under different tribes.

Sumra, claim to be descendants of Samra, Kumeerpota, Meetopota, Budeepota, and Norungpota.

The word "Samra" has been corrupted into "Soomra," and under this, the several tribes are found in the Kurrachee collectorate. They came to Sind about Hijree 445, and became the rulers of the Province in 609, from which year they were in power up to 751, when they were overthrown by the Summa.

Miscellaneous Tribes— Sindee Mussulmans.

Nakhooda, Machee, Solangee, Mochee, Memon-Khowaja, Memon-Sayata, Guda, Chuwan, Awan.

Hindoos.

Brahmins.—Kokanist and Deshast from the Dekkan. Goozrathee and Nagar from Goozrat. Gowar, Sarsat (Sindee) Pokarna, from Jeysulmere.

Khatri, or Khastria.

Vaish.—Containing the following tribes:—Wanhia, Kanooga, Amil, Meranee, Gadee, and Mahajan.

Miscellaneous Hindoos.

Doghra, Rathore, Meghwar.

Hyderabad Collectorate.

Mussulmans.

Belooch.—Talpoor, Rind, Lasharree, Lugaree, Jumallee, Murree, Chandia, Hajana, Nizamanee, Khosa, Gubole, Gadee, Mugsee, Kunbhiree, Kupprее, Noohanee, Buglanee, Chulgree, Hote, Nadanee, Chang-Juttoee, Porkhurree, Loond, Julbanee, Kurmee, Dewanee, Mubranee, Rusmanee, Mushoree, Kulloee, Zore, Kolachee, Buldee, Mungalja, Roose, Bhoorgree, Jiskani, Mari, Surgani, Lakhani, Hisbanee, Gubchain, Khatrian, Sanjarani, Rustomanee, Bozdar, Janwaree-Shaer, Amandanee, Kurmuttee, Zindpooree, Shahonee, Korai, Dulwanee, Sukranee, Nath-Konee, Goreehanee, Daidano, Dreeshuk.

The same remarks apply here as to the Belooch in Kurrachee.

Peers.—Nukshbundee, Jublanee.

Soomra.—Cultivators and oil manufacturers.

Syuds—Ruzvee, Bookharee, Barawala, Mutalavee, Katchee, Sunaimee, Lukiyaree, Nagoree, Quranee, Shirazee, Khabratee.

These are land-owners and extensive cultivators. Originally came from Arabia and Persia, 700 years ago. The several divisions derive their names from some distinguished ancestor, or from the place, where they originally lived, or where they settled down, when they came to Sind. Ruzvee from Imam Moossa Ruza, Shirazee from Shiraz. Lukiyaree from Lukki.

Kureshee.—Abasee, Usdee, Kalhora, Quazi, Insaree, Dukhiya, Sidikee, Faruki, Alanee, Humzori.

The Cazees are cultivators and scribes. Originally came from Syria.

Sumatra, or Summa.—Summa, Unar, Abra, Gandhai, Sahta, Dhera, Mitira, Bhawwar, Sethore, Bhata, Daliar, Bhawwaree, Setharua, Nangor, Mangria, Gangra, Kiria, Haliah, Hariah, Gundall, Nulipotra, Udyan, Maihiar, Pima, Tunia, Dĕpar, Lakha, Parihar, Chaua, Agara, Chachok, Patu, Sadar, Phail, Dahari, Bihan, Wagan, Buriara, Detha, Manlahan, Mahisar, Bughia, Kakepotra, Dahraja, Bhan, Malak, Laujara, Pali, Waria, Theba, Hathipotra, Sukhra, Gaba, Hingora, Rahu, Kaka, Juneja, Kaurija, Vistara, Wasan, Aradinja, Chanika, Juna, Kanreja, Sirachaja, Maira, Bhanoja, Mamar, Dokeja, Manahiu, Buga, Bhurt, Halleepoota, Powahar, Suheja, Shora, Soomra, Numriah, Jokhia, Kaloor, Pulleeja, Jugsia, Thora, Sama, Keeria, Chunchur.

The above are cultivators—Aborigines.

Sheikh, or Memon.—Hudokut, Quazee, Khebrana, Surha, Akhoond, Patolee, Katiyar, Puggir, Loosee, Bandroo, Kussabee, Mirzapooree, and Khiwaja.

These, originally Hindoos, are cultivators, shopkeepers, workmen, &c. Distributed throughout the collectorate. The Khwaja descended from the Memons, but are Sheeas, and call themselves descendants of Khwaja Sulliman Pharisee.

Gola.—Sheedee, Kubshee, Khaskelee, Sindee, and Zemghur.

These were slaves in former days.

Khiwaja.—Were also converted Hindoos.

Khaskelee.—Are the descendants of slaves purchased by the Belooch and others from foreign countries.

Raza, Luhar, and Wadha or Dakhan, are different tribes, and are called from the trades they follow.

Dhobi, Pinjara, are of varied origin.

Kalri, Kori, Mochee, Sonara, and Thathara. Some foreigners and some Sindees.

Muhana, Baleshahee and Machee. Machee and Shikaree are the lowest of the Sindee tribes, and are generally cultivators and fishermen.

Miscellaneous Races.

Goorjee, Mungri, Khokur, Hore-wala, Dubgur, Pooree, Patan, Silawut, Satee, Peenjora, Chakee, Lakhatee, Dhobee, Kumagur, Nukash, Solungee, Raza, Lohar, Matchee, Zurdoze, Dhingaee, Bazaee, Nagoree, Khudharee, Buthora, Hujjam, Siyal, Boora, Girana, Ghuryalchee, Kunjur, Gabee, Marwaee, Koraee, Siyal Kudra, Sahita, Maganhar, Hulya, Rajpur, Chabook, Dahirree, and Bubbur, Dyatra (Canzat), Sial, Babar, Julwar, Samtra Mushori, Naich, Subag, China, Buk, Dul, Panihar, Subaki, Jora, Lishari, Goracha, Pifera, Isran, Setar, Bhangir, Watia, Tagar, Ghanga, Dashk, Motimal, Zurdori, Naneal, Dridona, Majdona, Vidyola, Dangroj, Nougraj, Jokhia, Khokhar, Hatar.

Hindoos.

Brahmins,—Gowar, Drawar, Barhi, Bawanjabi, Seikar, Silar, Kawunchundra, Sarsad, Pokarna, Kitri, Sydpar, Dukhnee, Poorubee, Maharashtra, Tilung, Carnatic, Kokunt, Gujur, Sureesalee, Pokuma, Poorlee, Goond, Sarsedh, Canouj, Kankubh, Mital, Brahmpoot and Bhoochak.

Khastra.—Mangoh, Munijan.

Waish.—Lohana, Bhatia, Bhabira, Amil, Punjabee, Mehesirree, Oosuwar, Suhwanee, Khalsa and Shahdadpooree.

Khitree.—Gooroopota.

Soodur.—Khuttee, Sonara, Sootar, Bagoee, Sochee, Lohar, Mochee, Tumboolee, Kulal, Jakhiree, Jeysulmeranee, Kurmee and Ode.

Lohanas and ***Sarsoot*** Brahmans, descended from Sree Ramchund, Pokurna, Babra, Punjabee, Khoodabadee, Sehta.

Oodasee and ***Sunnasee.***

Sonaras, descended from Denee.

Hindoo ascetics.

Sunnasee, Beragee, Jogee, Jungum, Oodasee, Bhugut, Barra, Thukur, Bhut, Jajak, Birm-Charree.

Shikarpoor Collectorate.

Mussulmans.

1, Syud ; 2, Patan ; 3, Mogul ; 4, Brahoee.

5, Belooch ; Rhind, Juttooee, Talpoor, Chandia, Khosa, Luggaree, Mugsee, Booldee, Lasharree, Julbanee, Loond, Jumalee, Bunglanee, Boogtee, Muzaree, Gadee-Doondkee, Nizamanee, Bang-Jukranee, Dhoomkee.

Jhutt ; Surrai.

Sindee, Abra, Collora, Pholpota, Gopang, Mussem, Porrur, Seeal, Soda, Boogia, Budda, Sukta-Turrio, Machee and Bhutto.

Hindoos.

Brahmin, Chuttree, Bunyas, Amil, Thukkoor.

Upper Sind Frontier.

Belooches.—Tribes the same as given above, viz: Rhind, Dhoomkee, Jukranee, Murree, Boogtee, Lasharee, Goorchanee, Muzzaree, Boordee, Cosah, Jumallee, Mugzee, Chandiah. These people have all the characteristics of Arabs, both in features and customs. They are restless, and unwilling to labor, but will undergo the most wonderful fatigue for the purpose of stealing a camel or bullock. They have sharp, well-defined features, and very spare, but well-knit bodies and limbs. All their traditions agree that they originally came from Syria, probably about 1,200 years ago.

Khyheree, are a priestly set who attached themselves to the Belooch on their way eastwards, from Aleppo, joining them from Tabreez. In importance among themselves, the Belooch rank as follows :—

1, Rhind ; 2, Basharee ; 3, Jutoee ; 4, Dhoomkee ; 5, Jeekranee ; 6, Murree, 7, Boogtee ; &c.

Brahooee.—These have a different origin from the Beloochees, and have remained for the most part in the mountains of Beloochistan, giving the Khan to the country. The traditions of the Brahooee are not so clear as the Belooch, but they came also from the west, entering Beloochistan from Kerman, by Mekran.

Jhutt.—This is a wandering race, but attaching themselves to Beloochee, and other tribes. They were generally hindoos ; are squarer, and stouter in their build, and have broader features than the Belooch. They are all camel-breeders and dealers.

Hindoos.—Are principally of the Bunyah caste.

Thur and Parkur.

The Thur and Parkur district is inhabited by hindoos and mussulmans, more equally divided than in any other part of Sind. Each of these include several tribes which are divided into classes. Their manners and customs resemble those of Cutchee. They are naturally inactive. The chief occupation is breeding and grazing cattle, for which they evince greater preference than for agricultural pursuits. The language in use is a combination of Sindee, Marwarree, and Guzerattee, and is called Datee. In some parts of the district, they carry on business in Guzerattee, but the generality use the Datee, with which they are more familiarized.

Mussulmans.

1, Syuds ; 2, Beloochee, viz., Rhind, Chandia, Goorgage, Kullohee, Bunglanee, Dulwanee, Sugranee, Dhownkee, Luggaree, Nattikanee, Murree, Kuppree, Bhoorgee, Khoso, Noomriah, Bootranee, Lusharee, Bubber, Koriah, Nora, Kolachee, Zindpooree, Berohee.

Jhutt.—Chacher, Kalroo, Kokur, Syal, Poosiah, Thyme, Arie.

Summat.—Summa, Summaja, Dull, Roahma, Oomur, Bumbra, Gailra, Pullee, Saita, Rajur, Nookry, Powur, Powhore, Hallapotra, Molla, Diary, Durs, Sukkerdeonpotra, Kotriah, Vikiah, Dadpotra, Keriah, Sungrasee, Thabba, Noree, Seahra, Joga, Jinjee, Joonaja, Hingorja, Hingora, Bahun, Kullur, Bakoor, Durpar.

Hindoos.

Brahmin, Pooskurna, Veeas, Ackaraj, Cavata, Josee, Basoo, Changangree, Jundria, Prohut, Masara, Dhowra, Lora, Mahdave, Veeasurra, Takoor, Heerow, Panah, Kullah, Hojah, Sarsood, Nooriajoor, Saneechurree.

Soda.

Sooltan, Bhojraj, Gungdass, Bijara, Sadoor, Bhoojbur, Kalun, Sungrasee, Virjueed, Bhar-Mull, Askaran, Ooda, Bhowta, Gagilra, Sutta, Muddat.

Commercial Tribes.

Lohana, Kerar, Ooswur, Kutree, Chepa, Sonara, Durzee, Mallee, Sootar, Ooda, Barber, Rajpoot, Dohut, Balwaro, Kavrio, Charnee, Bhuttee, Rhye, Dhur, Jessore, Chowan, Jaraja, Purwar, Vurhun, Joga.

Broken tribes.

Mengwar, Bheel, Colee, Balashaee and Shikaree.

Miscellaneous races.

Shaik, Memon, Kumbranee, Gudda, Bujeer, Mohana, Jokiah, Dookur, Koliah, Amunda, Bhopa, Mahur, Hakra.

Captain Postans tells us that the Jut, like all the tribes in the Sind countries, are divided into innumerable sub-divisions called Koum, and are a hard-working oppressed race, occupying themselves in rearing camels, feeding flocks, or cultivating the soil. They are invariably found in large communities, often living in temporary huts or 'wands,' and migrating all over Sind and its confines, as shepherds, in search of pasture. Where this is not the case, they are farm-servants either of the Biluchi chiefs, or wealthy zamindars, who repay their labour with a modicum of the produce. The Jut in Sind, are a quiet inoffensive class, and exceedingly valuable subjects, but have hitherto been much depressed. Their women are, throughout the country, noted for their beauty and, to their credit be it also spoken, for their chastity. They work as hard as the men, and the labour of tending, driving home their flocks, milking the cattle, &c., is fairly divided. The Jut are very numerous and form a large division of the population of Sind, though seldom found in its towns, being dispersed over the whole face of the country particularly eastward to the desert tract which separates Sind from Cutch, known as the Runn on which this tribe rear large flocks of camels. There are other pastoral and peaceable classes besides the Jut, of mahomedan persuasion, such as the Khosa in Upper Sind, Sikh Lohana in the Delta, and emigrants from the Panjab, who have in many instances become amalgamated with the people of the country. The Khosa become a predatory tribe on the eastern confines of Sind, verging towards the Cutch territories, where Rajputs are located they are very troublesome. They are also in the eastern boundaries, as *wandering herdsmen*. The Daod Putras who inhabit generally the country of that name in the north are to be met with in various parts of Sindh. The Sumah are Juts, though they are generally known by the former title. Such also are the Machi and numerous other sub-divisions of the Jut tribes. The Jut is as inseparable from the camel throughout Sindh, as the Arab from his horse in Arabia ; they are invariably camel-drivers and feeders, and are consulted on every occasion where the health or efficiency of this invaluable animal is in question. According to one authority, the Jut occupying parts of the ancient Sikh territories, are sprung from barbarous hordes who emigrated from the plains of Upper Asia, but who have now long held the brahman language and belief. But if the Jut of Sind and Kach Gandhava be of the same stock, these have become mahomedans. The Jetki is everywhere, according to Mr. Masson, the language of the Jut.

The few Affghan zemindars settled in the north of the province still use the Pushto of their forefathers ; but the dialect is not sufficiently diffused among the people to be included in the languages of Sind. The same is the case with pure Panjabi, it is confined to the small number of Sikhs who are settled in the different cities and towns. The generally known tongues are the Belochi, the Jataki, the Persian, the Sindhi.

The Beluchi is a rude, mountain dialect, spoken throughout the country called Beluchistan, and by those hill tribes who have migrated to the plains of Sind. It belongs to the Indo-Persian class of languages, and though uncultivated, is said to be very ancient. It is remarkable for its similarity to modern Persian one-half of the words appear mere corruptions, or possibly similar forms of the polished tongue. Like its sister dialects, Brahuiki and Pushtu, the vocabulary contains a few Sanscrit and Arabic roots, together with a considerable proportion of other words. The latter, however, appear not to be the remains of an aboriginal tongue, otherwise they would be those expressing primary ideas : they are probably a new element, introduced by isolated position and the want of a standard of language. As must happen among a people divided into clans, and separated from each other, the dialect abounds in diversities of words and idiom, and being naturally poor, it borrows many vocables from the neighbouring countries. Its literature is confined to a few tales, legends, war songs, and the productions of the bhat or Beluch bards.

The earliest names of the inhabitants are those to be found in the *Beglar-namah* of A. D. 1625, where Bina, Tak and Nabumiya, are named. The Tahfat-ul-Keram names them as the Banya, Tank, Munid and Mahmir, but Lieut. Postans names them Nubeteh, Tak and Momeed. Of all these the Tak alone are now to be traced. The Bina and Banya may be the baniah or shop-keeper class : the Nabumiya, perhaps foreigners, from na not and bhumiya of the soil ; and the Nubetah, may be the nao-aita or new-comers. Though the older residents in Sind have become mahomedans, down to modern times, mahomedan converts have been allowed to retain their hindoo names.

The Jat, Jot, Jet, Jut or Jhat, partly hindoo, partly sikh, and partly mahomedan, occupy the north-west and bordering provinces, also the Panjab and Sind. They all refer to the west of the Indus and to Ghazni as their original seats, and the Dhe or Pachade reached India from the Panjab about the middle of the eighteenth century. The other section is the Hole or Deswale. The Jat seem to have descended by the Bolan pass, occupied the high pastoral lands about Quettah and thence descended into the plains of the Indus and to the districts on the east, which they still occupy.

Guda, a race in Sind, from intercourse between Sind'hians and Sidi women, they were equally slaves with their mothers, and could be bought or sold at will.

When a Sindhi is seen to be in the sakarat state (the agonies of death), all present recite the shahadat, or confession of the mussulman faith. If water from the sacred well, Zamzam, be procurable, it is squeezed into the man's mouth, and a traditional saying of the Prophet informs his followers that it is a meritorious deed : the holy fluid, however, is not common in Sind.

The Sindhi very are fond of fighting Ghata (rams). The best breed is the large and strong black animal of the hills.

The two great families of sayyids, viz., Hasani and Hosayni, are both numerous in Sind. Individuals belonging to the latter class have the title of Pir, as Pir Bhawan Shah. The Hosayni race is termed Sayyid, as Sayyid Jendal Shah. As is usual in the Sind province, these two large bodies are sub-divided into clans, called after their original place of residence, as Bokhari, Mathari, Shirazi, Lakhirai, Lakrulai, &c. Most of them are of the Shiah or Rafizi persuasion, and therefore they suffered severely during the various Affghan invasions. Many of these Sayyids are learned men, much respected by the commonalty, in spite of the discrepancy of belief. Under the Kalhora dynasty they became possessed of large landed estates, granted as Inam (or free gift) in perpetuum. When the Talpurs came into power the priesthood declined. The other religious families in Sind are—

1. Kurayshi, or Siddiki, descended from Abubakr. They are sufficiently numerous, and have the title of Makhdum, or master, as Makhdum Nuh Siddiki. Under the head Kurayshi (descended from the Koreish tribe), are included the Faruki family, that claims descent from Umar. Their name usually begins with Miyan ('master'), as Miyan Ibrahim Faruki

2. Alawi, the posterity of Ali by any of his numerous wives, except Fatimah. They are all Shiahs, are not often met with, and bear the title of Khwajo, 'sir,' *e. g.*, Khwajo Murad Ali.

3. Abbasi, the descendants of Abbas, very numerous in Sind. They are called Mullo ('priest'), or Buzurg (the 'great'), *e. g.*, Buzurg Maaruf Abbasi.

The other families, such as the Hamzawi, Musawi, Razawi, Mahdawi, &c., &c., so common in different parts of the mahomedan world, are here either unknown, too inconsiderable to merit any notice, or included under the above three heads.

The Affghans, or Pathans, are generally found about Hyderabad, and in the north of Sind. Many of them have been settled in the country for some generations, and become possessed of considerable landed property.

The women of Sind dress gaily, in bodices worked over with variously coloured silks in many patterns, into which they frequently insert pieces of looking-glass. There was, in Sind, in the time of the Amirs, a system of slavery common to it and all the countries to the north-west, viz., that of fathers selling their daughters as wives when very young, as also of the sale of girls for the zenanas of the wealthy. The Affghans are particularly distinguished for this traffic in Sind, but it is after all very limited. Hindoos are dispersed over the whole of Sind: in the wildest fastnesses of the Beluchi mountains, in the deserts and smallest collection of huts in the jungles of the plains, a hindoo and his shop of tobacco, spices, groceries, or cloths, is sure to be found; but their principal localities are in Northern Sind at Shikarpur, and in Southern Sind at the port of Karrachi. The hindoo merchants or bankers have agents in the most remote parts of Central Asia, and could negociate bills upon Candahar, Kelat, Cabul, Khiva, Herat, Bokhara, or any other of the marts in that direction. The population of Sind has been estimated in round numbers at about a million. Hindoos seem to have come from Amritsur, Multan and the north. They are divided into two great classes, Lohana and Bhotia. The language of Sind is of hindi origin, being a still greater corruption from the Sanscrit than that spoken in the Guzerat peninsula: it is written in a peculiar character, called the Khuda Wadi, and the hindoos keep all their own accounts and correspondence in it. The higher orders of the Sindi are fond of being uncivil to strangers, particularly if the latter permit it, but like true orientals, they seldom venture upon rudeness when they expect a rebuff. The easiest way of treating such individuals, is by a display of anger proportioned to the offence, or by some fiercely satirical reply. Sindi women are of fairer complexion and finer features and form than those of Western India: the latter, however, are superior in grace and delicacy of make. Sindi women are most indecent in their language, especially in abuse; they have very few expressions peculiar to their sex, but deliberately select the worst words used by the men. The prostitutes in Sind are of two kinds. The Rangeli, or Khobli, is a low courtezan of the Jatki race, from the districts of Ubbo and Jhangsiyal. They inhabit villages on the main roads, and support themselves and the men by the contributions of travellers. Some of these women have very fine features and forms, particularly in early youth. Another and a more respectable class is the Kanyari, who, like the nautch girl of India, generally unites the occupation of dancing with the immoral part of her profession. The principal of the cultivating and pastoral classes in Sind are the Jut, who in all probability are the aboriginal hindoo inhabitants converted to Islamism. The Sindians, those particularly of Upper Sind and the interior, are a very pastoral people, who breed and tend vast numbers of cattle.

Rennell, and Pottinger, notice the striking resemblance between Sind and Egypt, the level plain of each, the noble river annually overflowing and fertilizing the soil to a certain distance on both sides, and the sandy desert and range of mountains on right and left, Strabo, (Geogr. Lib. xv,) and Arrian, (Hist. Ind., c. 2,) compare the Delta of the river Indus to that formed by the Nile; and both, after Eratosthenes, declare India limited by the Indus westward. Yet, in this direction, modern Sind extends considerably beyond the river; whilst, it is generally assigned to. The more habitable part of Sind is a long narrow tract of country, yearly fertilized by the inundation of the Indus, with shifting sand-heaps on the east, and bare stony mountains on the west. Eastward, Sind is bounded by some of the most desert portions of Bhawulpore, Jeysulmir and Balmir, a dependency of Joodhpur, and the eastern portions of Sind itself, for from ten to sixty miles within the frontier, are desert wastes. Northwards and westwards are rugged ranges of inhospitable stone heaps, varying in height from 2,000 to 5,000 feet, where inhabitants, animal life, vegetation and water are altogether wanting and divide the province from the territories of the many Belooch clans that compose the kingdom of Kelat. In the Delta of the Indus, expansive lakes called "Dhund" abound ; from the easternmost mouth of the Indus to the Kurachee harbour, nearly the whole coast is a net work of channels, marine, lagoons, and of sand-banks and mud-banks, more or less covered by each advancing tide. The contrasts presented by this province are striking : in the central tracts liable to inundation, are picturesque looking villages with, in the cold season, waving fields, beautiful small lakes, and the land throughout its length and breadth, partitioned by numerous canals and irrigation channels, but outside of the fertilized tracts are bare mountains and sandy deserts. To the west the Mekran coast, as far as Gwader, much resembles Sind and the Kelat hills and the immediate neighbourhood of Muscat and the coast for a few miles on each side of Muscat is much like Aden.

The method of closing water-courses adopted by labourers is peculiar to Sind : they are attended in their work by musicians, and the excitement is kept up by beating drums and blowing horns : without these they make no progress, but with them the canal-diggers of Sindh will do more manual labour than any natives of India : they work uninterruptedly for twelve hours, and use a large hoe called a powrah, with a short handle. The period for clearing the water-courses is the first appearance of a rise in the river (March or April.) The seasons for crops in Sind are two, Rabi, or spring, and Kharif, or autumn, the produce varying in portions of the country : these divisions of the year do not apply to climate, for they hardly exist. Saltpetre abounds in the soil of Sind, particularly the lower country, and is collected in great quantities. In many districts the surface of the land is covered with a saline efflorescence. Sind is not a wool-producing country, though it is to be obtained in its western confines to a great extent, particularly in Cutchi and the Jhalawan mountains of the Brahui : the hindoos of the country carry on the trade, and thus much of the article coming into the Bombay market through Sind is misnamed Sindian wool ; many districts, however, accessible through Sind and the Indus, yield this important article abundantly ; that furnished by the Kelat territories finds its way to Bombay viâ the mountainous road to Sonmiani. The timber of Sind, though it may be considered inexhaustible in quantity, is generally indifferent. The principal jungle trees are the tamarisk and baubul (this latter is a species of Acacia.) The hunting grounds are rich in the babul and other Acaceæ.

The alcoholic drinks principally used are two in number, viz., 1, Gura jo darun, made from molasses with Babul bark and other ingredients. Though fiery and disagreeable in flavour, the people of Sind are remarkably fond of it, and some will finish as much as a bottle a day ; they drink it out of small cups, containing about a tea-spoonful, and repeat the dose every quarter of an hour ; 2, Kattala jo darun, a spirit extracted from dates, and very generally drunk by the lower orders. It is hot and nauseous. The principal wines, if they can be so called, are—

Anguri, made of the Sindh grape at Hyderabad, Sehwan and Shikarpur. It is generally qualified with the spirit of Gur. When wine is made of dried grapes, it is called Kishmishi.

Sonfi, extracted from aniseed with Gur brandy ; it is considered a superior kind of drink.

Mushki, perfumed with musk and other perfumes.

Turanji, extracted from citron peel.

Misri, made with sugar-candy, and perfumed. It is one of the most expensive preparations.

Gulabi, perfumed with rosewater.

Kaysari, coloured with saffron.

Very few Sindi would be restrained from theft by a feeling of honesty, or sense of duty ; though at the same time, the name of thief is offensive to them. This is not always the case among uncivilized tribes. Some of the chiefs of clans did not object to order robbery and divide the spoils with the thieves. Many took a pride in this procedure, as the non-interference of the native governments was considered to be a tacit admission of their being superior to the laws. The robber chiefs on the frontier were paid by the Ameers, and yet levied a black mail from travellers, and on occasions robbed them also. The people of the plains erected Thullæ or Martello towers, capable of containing from twenty to fifty men, or built mud forts, with ramparts and battlements, surrounding a space of level ground, where their cattle might be in safety when a raid was

Jatii of the Oxus, who are coupled together expected. Towards Kusmore, on the north-west frontier, the former traveller would immediately remark the number of maimed and wounded cultivators. Before the British took possession of the country, this was one of the points which the hill robbers often attacked.

In Sind'h the 'son' or "sugun" is a kind of divination by means of the position of birds and beasts, their cry, the direction of their flight, and other such particulars.

In Lower Sind, in the Kurrachi collectorate, are brahmins from the Kokun and Mahratta country, Guzerat and Nagar. There are also, however, Gour brahmans, the Sarsat or Sindi and the Pokarna from Jeysulmir. In the Hyderabad district, they are even from more distant countries, from the Dekhan, Telingana, Dravida, the Carnatic and Kanouj.

Khatri, or *Kshatri*, occur both in Hyderabad and Kurrachee.

Vaish, of these are several tribes, seemingly embracing all who engage in traffic and banking. In Kurrachee are the Amil, Godi, Kanooga, Mahajan, Merani and Wanhia; and in Hyderabad also the Lohana, Bhattia, Bhabera, Panjabi, Mehisirri, Oosuwar, Suhwani, Khalsa and Shahdadpuri.

Sudra hindoos, are the Bagoi, Jakhiri, Jeysulmiri, Khutti, Kulul, Kurmi, Lohar, Mochi, Ode, Sochi, Sonara, Sootar, Thumboolee.

General Cunningham mentions that the Mand tribe have occupied Lower Sind in great numbers from the beginning of the christian era. Edrisi describes the Mand as a numerous and brave tribe who occupied the desert on the borders of Sind and India, and extended their wanderings as far as Alor on the north, Mekran on the west, and Manehel (or Umarkot) on the east. Ibn Haukal records that "the Mands dwell on the banks of the Mihran, from the boundary of Multan to the sea, and in the desert between Mekran and Famhal (or Umarkot.) They have many cattle-sheds and pasturages, and form a large population." Rashid-ud-din locates them in Sind at a still earlier period. According to his account, Med and Zat, two descendants of Ham, the son of Noah, were the progenitors of the people of Sind prior to the Mahabharata. The name is variously written as Mer, Med, Mand, in all of which forms it is found even at the present day. To these he would add Mind, which is the form of the name given by Masudi. He identifies this people with the Medi and Mandrueni of the classical writers; and as their name is found in northern India from the beginning of the christian era downwards and not before that time, he concludes that the Mandrueni and by Pliny, must be the Sacæ Indo-Scythians, who occupied the Punjab and Sind, and who under the name of Mand and Zat of the early mahomedan authors, were in full possession of the valley of the Indus towards the end of the 17th century. Lastly, Wilford's surveyor, Mogal Beg, writes Mandyala, which is also the form that he received from two different persons, while in General Court's map it is spelt Mamriala. To this people he refers the name of Minnagar, or 'city of the Min,' which was the capital of Lower Sind in the second century of the christian era. That Min was a Scythian name in use is known from its occurrence in the list of Isidor of Kharax as one of the cities of Sakastene or Sejistan. The actual position of Minnagar is unknown and there are but few data to guide us in attempting to fix its site. If right in identifying Min-nagar, or the 'city of the Min,' with Manabari, or the 'place of the Mand,' there can be little doubt that the great Indo-Scythian capital was at Thatha. He adds that the Agari is a well-known caste, of low degree, who are employed in the manufacture of salt.—*Aitcheson's Treaties, Engagements and Sunnuds, Vol.* vii, *pp.* 14–15; *Tod's Rajasthan, Vols.* i, vi, *pp.* 241–45; *Elliot's History of the Punjab, Vol.* i, *pp.* 63, 489, 498; *Postan's Personal Observations, pp.* 3, 9, 64, 65, 66, 69, 73, 74, 86, 88, 95, 99, 110; *Masson's Journeys, Vol.* i, *p.* 374; *Vigne, Travels*; *Postan's Sindh, p.* 359; *Burton's Sindh, pp.* 164, 167–68, 232–34, 276, 288, 296 *to* 299, 376, 390; *Ouseley's Travels, Vol.* i, *p.* 149; *Hindoo Infanticide, p.* 170; *Pennant's Hindoostan, Vol.* i, *pp.* 1 *and* 2; *Rennell's Memoir, pp.* 94–98; *Rawlinson, Herod, Vol.* ii, *p.* 495; *Smith's Dictionary of the Bible, Vol.* i, *p.* 867; *Cunningham's Ancient Geog. of India, pp.* 251, 265, 278, 290-92; *Genl. SINDABAL, see Chenab.

SINDBAD, a voyager, well known to Europe as having his history incorporated in the Thousand and one Nights, but they form in Arabic a distinct and separate work, which Baron Walkenaer (in Nouvelles Annales des Voyages, tom. liii, p. 6) regards of equal value with those of Soliman and Abu Said. His first voyage appears to have been to the Western Coast of India when the Bejanuggur dynasty ruled, as he calls it Maharaj. Riha, was the termination of his second voyage, and was probably the Malay Peninsula as he describes it as producing camphor. And in his third voyage the island with ferocious savages seems to have been the Andamans. His fourth voyage would seem to have been the coast of Malabar, whence he went to the island of Nacaus apparently the Nicobars, thence in six days to the island of Kela, which Baron Walkenaer recognises as Quedah in the Malay peninsula. In his fifth voyage where he is shipwrecked and becomes the victim of the Old Man of the Sea, the site is supposed again to be the Malabar Coast. After his escape he visited the Maldives, Cape Comorin, for aloes wood, and to the Gulf of Manar for pearls. In his sixth voyage, he is thrown on an island where superb aloe wood trees, Santy and Comari, were growing, whence he finds his way to Serendib, the present Ceylon, which was the object of his seventh and last voyage where he was sent as an ambassador from caliph Haroon oor Rasheed.—*Ind. in the 15 Cent.*

SINDHAKATEE, Sans., to cut a passage, from sindha, and krit, to cut.

SINDI, the language of Sind. Some of the Hindi tongues, such as Kashmiri, Uria and Guzerati are the languages spoken in the smallest limit. But the Jataki, Sindi, Panjabi, Harauti, Marwari, and Konkani, are other Hindi dialects. This tongue has the dialect of the Siraiki of Upper Sind, containing numerous Jutki words. The Kachi, has in it elements of the Guzerati. That of the hunters and tanners. Dedh is another dialect, but the language of Lar is purest. See Hindu.

SINDHU, or Indus river, see India.

SINDHU. India was first known to the Chinese in the time of the emperor Wu-ti of the late Han dynasty, in the second century before Christ. It was then called Yuan-tu, or Yin-tu, that is Hindu, and Shintu, or Sindhu. At later date it was named Thian-tu ; and this is the form which the historian Mat-wan-lin has adopted. Sindhu was taken from the Romans, the Romans from the Greeks, the Greeks from the Persians. It is only in Persian that an initial *s* is changed into *h*, which initial *h* was as usual dropped in Greek. It is only in Persian that the country of the Sindhu (Sindhu is the Sanscrit name for river), or of the seven Sindhu, could have been called Hindia or India instead of Sindia. Unless the followers of Zoraster had pronounced every *s* like *h*, we should never have heard of the West Indies. The name of India i. e., *Hoddu*, does not occur in the Bible before the book of Esther, where it is noticed as the limit of the territories of Ahasuerus in the east, as Ethiopia was in the west (i, 1 ; viii, 9) : the names are similarly connected by Herodotus (vii, 9.) The Hebrew form "Hoddu" is an abbreviation of Honadu, which is identical with the indigenous names of the river India, "Hindu," or "Sindhu," and again with the ancient name of the country as it appears in the Vendidad, "Hapta Hendu." The native form "Sindus" is noticed by Pliny (vi, 23). But though the name of India occurs so seldom, in the Old Testament, the people and productions of that country must have been tolerably well known to the Jews. There is undoubted evidence that an active trade was carried on between India and Western Asia : the Tyrians established their depots on the shores of the Persian gulf, and procured "horns of ivory," "broidered work and rich apparel" (Ez. xxvii, 15, 24), by a route which crossed the Arabian desert by land, and then followed the coasts of the Indian ocean by sea. The trade opened by Solomon with Ophir through the Red Sea chiefly consisted of Indian articles, algummim, "sandal-wood," kophim, "apes," thuccum, "peacocks," are of Indian origin, (Humboldt Kosmos, ii, 133) ; to which we may add the Hebrew names of the "topaz," pitdah, derived from the Sanscrit pita.—*Muller's Lectures, p.* 215. See Hindoo, India, Indus, Jat, Bharata, Bharata Versha, Sind.

SINDIA, the title of the ruling family of Gwalior. The Sindia family, now the Gwalior rajas, came from a family near Sattarah. The first, 1724, Ranojee Sindia was an officer in the peshwa's army : in 1825, Baiza Bai, widow of Doulut Rao, adopted Jankuji, who assumed the reins of government in 1833. Rajputanah only has 123,000 square miles, with a population of ten millions. It contains the British district of Ajmir, and Mhairwarah ; Meywar, Marwar and Jeypoor, are considered first class principalities ranking with Sindhia, Holkar and Bhopal, and there are eighty of the second class and eighty of the third class. Jeypore is the most wealthy and its public revenue amounts to £440,000 or nearly half a million sterling ; this is excluding the incomes of its vassals, which amount to nearly as much more. The revenues of five other principalities range between £200,000 and £300,000, and three more between £100,000 and £150,000. In all, the revenues of the 19 states are estimated at £2,350,000, of which £1,500,000 are raised from the land. If to this be added the income of vassals holding their estates on feudal and military tenure, the gross public revenue will amount to about £4,500,000 sterling. In most of the chiefships, the land revenue is raised in kind. The chiefs' share of the gross produce varies in different localities from 30 to 55 per cent., which is much higher than ordinary in districts of British India. After the land revenue that from the customs and tribute, form the chief items. The courts have no written codes, but many civil cases are settled by arbitration or punchayet, and about four or five hundred interfeudatory cases are disbursed by courts of vakils, presided over by the political agents. Jeypore has a good college, and, as also Bhurtpore and Mhow, have good central and district and village schools. The Odeypore school also is well spoken of. The principal centres of trade are Pallee in the S. West; Jalra Puttun in the S. East and Ajmir and Tonk in central Rajputanah. The military establishments and armed police maintained by the chiefs number 11,500 horse and 63,000 foot, but by calling out feudal quotas, the horse could be doubled and the foot largely increased, but they are all badly mounted and equipped. As tributaries against a disciplined foe, they would be valueless except to guard communications or aid in the defence of fortified positions. Dholepore in Rajputanah has 1,250 sq. miles with 192,382 inhabitants. Shekawattee people from the earliest times have been robbers and addicted to the most cruel and worst of crimes; up to 1868, it continued simply a country of robbers. They carry on their depredations at long distances from their homes, to which they return by rapid marches, and share their plunder to pay for the protection at times which their own chiefs afford them. Ranajee, the first member of the Sindia family of note, commenced his career as the carrier of the slippers of Balajee Rao, peishwa. His care in the performance of this menial duty attracted his master's attention, who appointed him to a command in the pagah or stable horse. From this his rise to the first rank of Mahratta chiefs was rapid. He died in Malwa where he had acquired some possessions, and was succeeded in the headship of the family by Madhojee Sindia, his second son. Madhojee Sindia was present at the battle of Paniput, in which he was severely wounded. After the disastrous flight of the Mahrattas, Sindia's family, like other Mahratta chiefs, lost their possessions in Malwa. On the return of the Mahrattas to Hindostan in 1764, the most active of the predatory leaders was Sindia, whose formidable army, organised under French officers, made him in reality the ruler of Hindostan, though nominally the servant of the peishwa. Madhojee Sindia played a most important part in the struggle which took place for the peishwaship after the death of Madho Rao, Bullal. He was the chief support of the party of Nana Furnaves. Peace was concluded with the Mahratta by the treaty of Salbye in 1781, Sindia being the mutual guarantee of both powers for its observance. Under the 3rd Article of this treaty, the right of the British government to the Pergunnah and town of Barooch was recognised. By the treaty of Salbye the independendent power of Madhojee Sindia, in his relation to the British government, was first recognised, but in all other respects he continued ostentatiously to proffer subjection to the peishwa. Madhojee Sindia died in 1794 and was succeeded by his grand nephew Dowlut Rao Sindia who was too young to carry out any dangerous designs which Madhojee Sindia who died in 1794 might have entertained. During the distractions which followed on the peishwa Madho Rao Narain, Sindia was able to place Baji Rao in power. The power of Sindia, whose army was commanded by French officers, was at this time most dangerous to the British government. When by the treaty of Bassein the British government had recovered its influence at Poona and established a subsidiary force there, Dowlut Rao Sindia entered into a league with the rajah of Berar to defeat the objects of the treaty, and he opposed General Wellesley's plan. In the campaign which followed, the power of Sindia was completely broken, both in Upper and Central India, and he was compelled to sue for peace, and to sign the treaty of Surjee Anjenguam in 1803, by which he was stripped of his territories in Hindustan and south of the Adjunta hills, with the exception of some hereditary villages, and resigned his claims on his former feudatory rajahs with whom the British government had made treaties. A subsequent treaty was concluded on the 23rd November 1805, but Sindia countenanced the pindarahs in 1817. The subsequent open defection of the peishwa and the rajah of Berar shook the steadfastness of Sindia to his engagements. The strong fortress of Aseergurh was not surrendered as stipulated by the treaty, and it therefore became necessary to reduce it by force. In the captured fort a letter was found in which Sindia directed the governor to obey all orders of the peishwa, who, by attacking the Residency at Poonah, had declared war with the British government. In consequence of this want of good faith Sindia was required permanently to cede the fort of Aseergurh. Dowlut Rao Sindia died in March 1827. He left no son, and had repeatedly evaded the advice of the Resident to adopt a successor, leaving it to the British government to do what they might think proper. In accordance, however, with what was believed to be the last wishes of Dowlut Rao, a youth of eleven years named Moogut Rao, of an obscure branch of the family, but declared to be the nearest relation of Dowlut Rao, was adopted, married to the grand daughter of Dowlut Rao by Baiza Bai and placed in power with the title of Ali Jah Jankojee Rao Sindia under the regency of Baiza Bai. The Baiza Bai acknowledged this succession most reluctantly, and maintained that it was her late husband's intention that she should hold the regency during her life. The restraints under which the youth was held by the regent became at last intolerable to him and he fled from the palace and took refuge with the Resident. A reconciliation was with difficulty effected, but as government gave no definite decision on the rights of the parties, the seeds of dissension remained and the quarrel finally came to a crisis in 1833. The Baiza Bai's rule had become most unpopular and the cause of the young maharajah was espoused by a large portion of the army, the Bai was compelled to retire from the Gwalior territory, and the maharajah was acknowledged by the British government. To such a length was the principle of absolute neutrality carried at this time, that government declared its indifference as to which of the two ruled. Rajun Khan, a Pindaree leader, brother of the notorious Cheetoo, had received a life-grant of lands in Shuja Wulpore. The rule of maharajah Jankojee Sindia was very weak. Although the Baiza Bai had no strong party within Gwalior territories she did not cease to intrigue and to use freely for this purpose a sum of Rs. 37,00,000 which she had been awarded as her private property. Jankojee Sindia died on 7th February 1843, he had no children and had expressed no wish regarding the succession although repeatedly and earnestly urged by the Resident to do so. Tara Ranee, however, the maharajah's widow, a young girl of twelve years of age, with the concurrence of the chiefs of the state and the army, adopted Bugeerut Rao, son of Hunwunt Rao, usually called Babajee Sindia, the nearest though a very distant relative of the maharajah, and the adoption was recognized by the British government. The boy was then about eight years of age. He assumed the title of Ali Jah Jyojee Rao Sindia. The Mama Sahib, who appeared to possess the greatest influence and was attached to British interests, was chosen by the chiefs as regent. But troubles again arose through the instigations of Dada Khasji Wala who was at length delivered up. It remained now only to negociate measures for the formation of an efficient government and the reduction of the army. For this purpose an interview was agreed upon between the governor-general and the maharajah which was to take place at Hingoona on 26th December 1843. The day passed without the appearance of the maharanee and her son, who were held in restraint by the mutinous troops. On the 29th December when the British army was taking up its advanced ground, it was fired on by the Gwalior troops. The battles of Maharajpore and Punniar were fought the same day and ended in the total defeat of the Gwalior army, and the conclusion of a treaty by which it was agreed that territory yielding eighteen lakhs a year should be ceded to the British government for the maintenance of a contingent force, and other lands for the payment of the debts of the state to the British government and the expenses of the war; that the army should be reduced to 6,000 cavalry, 3,000 infantry and 200 gunners with 32 guns; that the government during the minority should be conducted according to the advice of the British Resident; and that the just territorial rights of the Gwalior state should be maintained by the British government. From this time till the mutinies of 1857 there was little change in the relations of the British government with the Gwalior state. By the mutiny of the contingent in June 1857, the political agent was forced to quit Gwalior. In June 1858 the maharajah was deserted by his troops on the approach of the rebels under Tantia Topee. He and his minister were compelled to flee to Agra. On 19th June, Gwalior was re-taken by Sir Hugh Rose's force and the maharajah was re-established in his palace. From that date the confidence of the maharajah was entirely withdrawn from his minister to whom he conceived an intense dislike. Dinkur Rao was at last removed from office in December 1859, and Balajee Chimnajee was appointed in his stead with the concurrence of the British government. Since that time the maharajah has himself superintended the whole of his affairs. For his services during the mutinies, Sindia received a Sunnud conferring on him the right of adoption. He was also informed that lands yielding three lakhs of rupees a year would be added to his territories; that permission would be given to him to raise his infantry from 3,000 to 5,000 men, and his artillery from 32 to 36 guns; that the arrears due to the British government on account of the deficiency in revenues of the districts assigned under the treaty of 1844 would be remitted, and that no payments would in future be claimed should these revenues fall short of eighteen lakhs; and the annual payment of rupees 10,000 out of the revenues of Burwa Saugor in the

Jhansi district would be hereditary. These modifications of the treaty of 1844 were embodied in a new treaty concluded on 12th December 1860. The rajah of Amjhera, tributary to Sindia, paid annually to the Gwalior state a tribute of rupees 35,000 under an engagement mediated by the British government. This tribute was part of the sums assigned in 1844 for the payment of the contingent, and is now payable by Sindia to the British government under the treaty of 1860. Besides this the maharajah contributes Halee rupees 20,000 towards the payment of the Malwa Bheel corps. Formerly Sindia contributed only rupees 8,000 to this corps, and the rajah of Amjhera contributed rupees 4,000. But when Amjhera was confiscated and made over to Sindia in consequence of the rebellion of the rajah in 1857 it was made subject to a payment of rupees 20,000, no further contribution being required on account of Gwalior. Including the cessions to Sindia under the treaty of 1860, the territories of the Gwalior state are estimated to contain a population of about 2,500,000 souls and to yield a revenue of rupees 93,09,102, of which rupees 78,38,900 are derived from the land tax, rupees 14,70,202 from customs, and the rest from the tributes of feudatories. The customs revenue is realized from transit duties on iron, tobacco, sugar, and salt, all other articles being free, and from Jaghire and other local taxes. No transit duties are taken on the portion of the Agra and Bombay road and its branches passing through Sindia's territories or on the roads connecting Gwalior with Etawah and Furrukhabad, Duttia and Jhansi and Calpee. After the capture of Gwalior by the force under Sir Hugh Rose in 1858, the fort of Gwalior continued to be held by British troops. During the negociations, however, which ended in the treaty of 12th December 1860, Lord Canning promised that the fort should be restored to Sindia, when this could with safety be done. It was, however, finally decided in 1864, that the cantonment of Morar should be maintained, and it therefore became necessary that the Gwalior fort should continue to be garrisoned by British troops. Gwalior is the capital of the maharajah Sindia.—*Treaties, Engagements and Sunnuds, Vol.* iv, *pp.* 199, 200, 203-204, 207-208, 211-12. vii, *p.* 391 ; *Annals of Indian Administration* ; *Friend of India, October* 1868. See Perron, Thomas, Mahratta governments in India.

SING, GUZ., HIND. Horn.

SING. No nation is more closely united by the ties of clanship, which they designate by the word sing, than the Chinese. All the many millions are divided into rather more than 400 sing ; those who belong to the same sing, consider each other as relations, descended from the same ancestor, and bound in duty to lend mutual help. This excellent custom degenerates frequently into that exclusive partiality, which is so repugnant to the spirit of true philanthropy. One sing is opposed to the other, one clan oppresses the other ; they proceed even so far as to engage in open hostilities. The ties of nearer relationship are still closer. A Chinese is taught by his sages to love his relations.—*Gutzlaff's Chinese History, Vol.* i, *p.* 207.

SINGAHAR, BENG. Nyctanthes arbor tristis.

SINGALESE, the people of Ceylon. See Singhalese.

SINGAPORE. The island of Singapore, at the southern extremity of the Malay peninsula, in lat. 1·17° N., long. 103·50° E., is separated from the continent by a narrow strait, in some places less than a mile in width. The island is 25 miles in length, and about a third of that distance in breadth, has an area of 206 square miles, and a population of 50,000, of whom a very large proportion are Chinese emigrants.

The settlement was obtained by purchase from the sultan of Johore on the mainland in the year 1819, and has since rapidly risen to importance. It is attached to the Bengal presidency. The town of Singapore, on the S. E. coast of the island, contains a number of public edifices, several churches, and an Anglo-Indian college. The island consists of a number of low hills and ridges with narrow and rather swampy flats intervening. In several places the sea-face is elevated but the greater portion of the circumference is fringed by a pretty deep belt of mangrove forest. Bukit Timah is a granitic hill, about 530 feet high, but the rest of the island is composed of sedimentary rocks, amongst which sandstone occupies a prominent place. There are other elevations on the island known as Oxleys, Scotts, Guthries, &c., hills. Singapore was first settled in A. D. 1160, by Sri Sura Bawana. From an inscription now destroyed on a sandstone rock on a narrow point to the left of the entrance of the Singapore river, it would appear that raja Suran of Amdan Nagara after conquering the state of Johore with his kling or Coromandel troops proceeded to Tamask, about A. D. 1201, returned to Kling or Bejanagar, and left this stone monument. Tam Sack is also called Singapura. In 1836 the population was 29,984, in 1840 it was 39,681, in Nov. and Dec. 1849, it was 59,043:

Europeans	360	Jews	22
Eurasians	992	Malays	12,206
Armenians	50	Natives of India	6,261
Arabs	194	Parsees	23
Balinese	149	Siamese	5
Boyanese	763	Military	609
Bugis	2,269	Convicts	1,548
Caffries	3	In Ships	2,995
Chinese	27,988	Others	1.000
Cochin-Chinese	27		
Javanese	1,649	Total	59,043

The gross value of the imports and exports at Singapore at stated intervals, during the 31 official years 1825-26 to 1854-55, was

Years.	Imports.	Exports.	Grand Total.
	£	£	£
1825-26	1,407,465	1,202,975	2,610,440
1830-31	2,000,373	1,948,406	3,948,784
1835-36	1,654,089	1,562,864	3,216,953
1840-41	3,178,543	2,673,381	5,851,924
1845-46	2,895,227	2,356,872	5,252,099
1850-51	3,085,587	2,551,700	5,637,287
1854-55	3,976,280	3,409,934	7,386,214

Singapore is a free port, the only charges being the Straits Light Dues, which are one anna or 2⅝ cents. per registered ton on merchant vessels. All national ships are free of this also.

In Singapore, measures of capacity are rarely used, and these only with certain articles, such as tobacco, &c.

16 tael make 1 catty equal to 1 lb., 5 oz., 5½ grs. or 1⅓ lb. avoirdupois.
100 catties, make 1 (Chinese) picul = 133⅓ lbs. avoirdupois.
40 (Chinese) piculs, make 1 royan.
2 (Malay) piculs, make 1 char.
The Malay catty weighs 24 Spanish dollars.
The Chinese catty weighs 22½ Sp. dollars.

Rice is sold by the royan of 40 piculs. The native merchants buy imported produce from the islands by the Malay picul, but sell it by the Chinese picul. Singapore timber is conveyed in huge rafts, 500 or 600 feet long and 60 or 70 feet broad with atap-leafed houses on the top: each raft containing about 2,000 logs, bound together by rattan rope. In 1852 the value of the British exports to Singapore was 637,981*l.*; in 1860 it had risen to 1,671,092*l.* The imports from Singapore amounted in value, in 1854, to 794,105*l.*, and in 1860 to 4,054,042*l.* In 1852 the exports of cotton goods to Singapore were of the value of 452,927*l.*; in 1860 they had risen to 1,079,098*l.* The Singapore of 1861, was a great city of 90,000 inhabitants stretching upwards of five miles from the Peninsular and Oriental Company's station at New Harbour on the west to the vast cocoanut plantations on the east. Spacious roads covered with Chinese, Kling, Malay, Jew and Arab; churches, town-halls, institutions and court-houses. Government hill is about 160 feet high. There are no hills higher than 300 feet in or near town. The highest hill Buket Temah is in the centre of the island and about 500 feet high. For a sum of 60,000 dollars and a yearly stipend of 24,000 dollars for life, the sultan of Johore made over the island of Singapore to the British in the year 1819. Sir Stamford Raffles lived but a few years to lay the foundation of the commerce of the port. Singapore was settled on the 6th February 1819. Singapore was finally ceded by treaty on 2nd August 1824 to the British by the sultan of Johore. The population of Singapore exceeds 90,000 souls, viz.:—

Europeans and Indo-Britons	2,445
Klings, (Madras Coast men)	10,888
Bengalees	11,736
Chinese	50,043
Burmese, Siamese, Bugis, Javanese and Arabs	14,581
Floating population and Convicts	8,000

The shipping frequenting the port equals that of Bombay and the trade is yearly on the increase. The prosperity of the island may be attributed to the fact of its ports being free of charge to all nations and to the encouragement being given to the innumerable native craft to convey thither the rich produce from the innumerable Eastern Archipelago group of islands, which they barter for piece goods from the home market.—*Quarterly Review, No.* 222, *p.* 513; *Calcutta Review, No.* lxxiii, *pp.* 36-38; *Trains in America, pp.* 83-90 *of No.* iii, *Sep.* 1847, *of Jour. of Ind. Arch.* See India, Jakun, Johore, Kyans, Malays, Pedra Branca, Raffles.

SINGARA, BENG., HIND. Trapa bispinosa or natans.

SINGARDAN, a toilet bag for containing a looking-glass, comb, tongue-scraper, meesee, soorma.

SINGARHUR, Beng., Hind. Nyctanthes arbor tristis.

SINGASUN is the ancient term for the hindoo throne, signifying 'the lion-seat.' Charuns, bards, who are all maharajas, 'great princes,' by courtesy, have their seats of the hide of the lion, tiger, panther, or black antelope.—*Tod's Rajasthan, Vol.* i, *p.* 293.
